Pablo de Heredia (ca. 1420–ca. 1490), a Jewish convert to Christianity, apparently was from Aragón. His Jewish name is unknown. He converted to Christianity in Rome, where he died. Prior to his conversion he wandered through various countries, including North Africa and Sicily, and apparently had lived in or visited several areas of Spain. Although he most certainly was not a rabbi, and in fact had a rather poor knowledge of Hebrew, he was influenced by doctrines of cabala, especially of the *Zohar* and that of Abraham Abulafia. He claimed to have had a revelation from Elijah and to have "discovered" in Sicily certain mystical Hebrew books, prior to his conversion to Christianity in Rome, that were the supposed source for his own writings.

His first work, and the only one published, was *Epistolae de secretis Neumiae fili Haccanae* (published in Rome, ca. 1488; also Florence, perhaps 1482; a copy of the rare Rome edition is in the Biblioteca Nacional, Madrid). The work was dedicated to Íñigo de Mendoza (not López de Mendoza, as some have written), who was ambassador to Rome (1486–1488). The work purports to be a translation from Hebrew of letters between Neumie (Nehemiah? Nehunyah?) and his son Hacanne. The main part of the work, however, claims to be taken from the *Libro gale razaya* (*Galley razaya*) and *Niggherth hazodoth* (*Igeret ha-sodott*) of the exchanges between Judah ha-Nasi (Rabbenu Judah ha-Qodeshll) and the Roman emperor Antonius. In fact, both of these works are spurious, probably the forgery of Pablo himself. To this he adds forged citations of the *Zohar*, all with the intent of proving the truth of the Christian religion. The work contains other citations of Jewish sources, some genuine (if misinterpreted to suit his arguments) and some spurious. Appended to this work is his *Corona regia*, on the virgin birth, original sin, and other topics. It is dedicated to Innocent VIII, and was written in 1488.

Still extant in manuscript, although excerpts have been published, is his *Ensis Pauli*, which he specifically says was written before the *Epistolae de secretis* (this fact has not been noted by scholars), and which deals at greater length with some of the same ideas. It also contains some references to Jewish works and mentions his "revelation" by Elijah. The dedication of this work to Fernando and Isabel contains harsh attacks on the Jews. The interest of the second work, which

deserves further study, is primarily in its relation to some of the cabalistic ideas of Abraham Abulafia, Moses de León, and others.

HERESY

Heresy, the "wrong choice" in religion, is a term used in the Catholic Church to refer to those who "choose" to reject the official teaching of that church and follow some other version of belief and practice. In the eyes of the ecclesiastical authorities, any such error leads automatically to hell and damnation, the signs of which may appear in this world and not just in the next. Up to the eleventh century, heresy seems to have been regarded largely in doctrinal terms, rather than as an error to be detected and punished in the mass of believers. In Iberia the Visigothic kings adopted the Arian heresy until Reccared was converted, partly through the intervention of Bishop Leander of Seville in 587, a decision ratified two years later by the Third Council of Toledo. The dispute between Arius and his followers and the Catholic Church was one of many that vexed Christians in late Roman and early medieval times: the proper interpretation of the relationship between the divine and human natures of Jesus Christ. Defense against the growing power of Islam in the Iberian Peninsula seems largely to have suppressed such disputes thereafter, as bishops devoted themselves to keeping the faith alive and protecting their flocks against conversion to Islam.

In much of western Europe the growth of papal authority and the desire for reform were beginning to lead, by 1100, to a greater effort to target not only poor performance by bishops and priests but also the resulting ignorance of the laity. Such developments reached Spain in the 1080s, when the Castilian monarchy became influenced by papal and monastic reformers, especially from Cluny in France. There is little evidence, however, that the preoccupation with heresy that resulted from such developments in France and Italy was transferred to the Iberian Peninsula. Indeed, heretical movements of the kind found north of the Pyrenees in the late Middle Ages seem to have been nonexistent, or else not sought out or discovered. Thus there are no known Spanish or Portuguese equivalents of French and Italian Catharism and Waldensianism, English Lollardy, or Bohemian Hussitism. It

is impossible to say whether Christian heresy was unknown in the peninsula, or whether ecclesiastical and secular hierarchies were so preoccupied with their struggle against Islam that they omitted to notice the laity's unorthodox views.

Only in the 1480s, when the newly founded Inquisition of Fernando and Isabel began its systematic investigation of "heretical" views among converts from Judaism to Christianity and their descendants, did such evidence come to light. For the church and the monarchs "heresy" in these people meant adherence to Jewish belief and practice, and if the Inquisition and its witnesses are to be believed (which they are, at least in part), then both these things were widespread among *conversos*. However, as the inquisitorial tribunals in Soria and Burgo de Osma revealed, numerous inhabitants of northeastern Castile in the second half of the fifteenth century were not simply harking back to a Jewish faith and practice formerly adhered to by themselves or by their ancestors, but expressing religious skepticism of a kind to be found in many other parts of Europe where Judaism was not an issue. They had little respect for the clergy, especially those known to them; they found the doctrines of the Catholic Church contradictory and absurd, and its practices abusive; and they doubted the existence of heaven and hell, on the grounds that such stories were invented to keep the laity in order. This should not be forgotten when attention is, quite properly, paid to the continued adherence of so many Spaniards, even after conversion, to Jewish faith and practice. Before the sixteenth century inquisitors paid little attention to such views, because "judaizers" were their main target, but many of the developments after 1500, such as the influence of Protestantism and the more indigenous illuminist (*alumbrado*) movement of the 1520s and later, developed in a climate of dissent as much as one of slavish orthodoxy.

Nevertheless, it does appear that the particular Iberian situation, in which a political as well as a religious confrontation between faiths had primacy for so many centuries, required at least an external adherence to orthodoxy from Christians, Muslims, and Jews alike. There were, of course, doctrinal disputes in the Muslim and Jewish communities, which at times impinged on relations with Christian authority. For example, the protests of some Iberian rabbis, in the early thirteenth century, against the supposedly "rationalist" views of Maimonides led to the burning of his works. Unfortunately, there are no inquisitorial records to indicate whether or not such defenses of orthodoxy by rabbis or imams had any more effect on the Jewish and Muslim faithful than the efforts of the Christian clergy to keep their own flock in order. It is probably

not a paradox that medieval Spain apparently was simultaneously a bastion of internal blasphemy and official orthodoxy.

HERMANDAD

The term *hermandad* (brotherhood) refers to associations of towns that first appeared in Castile and León on a regional basis at the beginning of the thirteenth century. By the end of the century, these associations had spread throughout the realm. Several Andalusian towns, for example, formed an association for mutual defense against the Moors in 1265. When Infante Sancho, following the policies of his father, Alfonso X, summoned the estates of the realm to Valladolid in April 1282, the towns of Castile, León, Galicia, Estremadura, and Andalusia organized to defend their liberties against royal violation of their rights and privileges. Each *hermandad* planned to meet annually, and they seem to have done so until Sancho IV dissolved them all in the *corte* Parliament of Valladolid in 1282.

During the turbulent minority of Fernando IV, the towns once again coalesced in *hermandades* to uphold the king's right to the throne against various claimants and to defend their own liberties. Again they proposed to hold annual assemblies, but when the king came of age in 1302, they seem to have disbanded of their own accord. No more is heard about them until the minority of Alfonso XI. For thirteen chaotic years the *hermandades* tried to preserve municipal rights and the authority of the king. At the *cortes* of 1315 the *hermandades* of Castile and León had an important voice in determining the regency for the child-king, and in 1317 the *hermandad* meeting at Carrión was quite blunt in its dealings with the regents. When Alfonso XI came of age in 1323 the *hermandades* again faded from the scene, and little more was heard of them until the reign of Fernando and Isabel.

As a means of curtailing the crime and disorder that prevailed at the outset of their reign, Fernando and Isabel revived the older institution, establishing the Santa Hermandad in the *corte* of Madrid in 1476.

The Consejo de la Santa Hermandad, whose members were appointed by the crown, was given full authority to direct its activities. In order to guarantee the safety of the highways and to suppress robbery and brigandage, the hermandad had at its disposal about two thousand mounted soldiers. The towns provided funds for the maintenance and support of this force. Local *alcaldes de la hermandad* were assigned to try persons accused of crime by the officers of the *hermandad*. The financial burden of maintaining the *hermandad* eventually prompted the towns to ask that it be suppressed, but it was not until 1498 that the monarchs dissolved the Consejo. The *hermandades* of the late thirteenth and fourteenth centuries were essentially controlled by the municipalities and at times were a threat to the monarchy, so much so that kings were glad to be rid of them, once an emergency situation had passed. Fernando and Isabel utilized this medieval institution as an instrument of royal policy but, like their predecessors, eliminated it once the crisis that brought it into being was over.

HERMENEGILD

The eldest son of Leovigild by an unnamed first wife, Hermenegild was made joint ruler with his father, together with his younger brother Reccared, in 573. This may have meant little in practice until, in 579, he was entrusted with authority over the south of the Iberian Peninsula and given a separate seat of government at Seville. This occurred at the same time as his marriage to Ingundis, the daughter of the Austrasian Frankish king Sigebert I and his wife Brunecildis, the latter was a daughter of the former Visigothic king Athanagild. This marriage, which should have cemented ties between the new and the old ruling houses of the Visigothic kingdom, had the opposite effect. In 580 Hermenegild was persuaded to revolt by his wife's grandmother Goisuintha, who, although she had become Leovigild's second wife, appears to have wanted to see an independent kingdom created for the descendants of her former husband, Athanagild. Significantly, this was also the name given to Hermenegild and Ingundis's only son.

From 580 on Hermenegild ruled over Baetica and southern Lusitania, and initially Leovigild made no

move against his son. In 582, however, Hermenegild converted from Arianism to Catholicism, as part of a rapprochement with Byzantium. Particularly involved in this was Bishop Leander of Seville, who had undertaken a diplomatic mission to Constantinople for Hermenegild. In 583 Leovigild launched an attack on his son's kingdom, taking Lérida and besieging Seville. In 584 he captured Hermenegild at Córdoba. Hermenegild was sent into exile but was murdered or executed the following year at Tarragona by a certain Sisbert. His wife and son had escaped to the Byzantine enclave in southeast Spain, but Ingundis died at Carthage on the way to Constantinople. There the young Athanagild disappears from view, despite efforts by his Visigothic grandmother Brunecildis to have him returned. Condemned by both John of Biclaro and Isidore of Seville, Hermenegild features as a martyr in the work of Valerius of Bierzo (690s), largely through the influence of the *Dialogues* of Pope Gregory I the Great, who presented him, somewhat erroneously, as a victim of Arian persecution.

HIDALGO See NOBLES AND NOBILITY

ḤIMYARĪ

About Ibn 'Abd al-Mun'im al-Ḥimyarī little more is known beyond his immediate North African origins. His *nisba* (kinship name) points ultimately to his forebears' South Arabian descent. We know that Al-Ḥimyarī was a man of religious law (*faqīh*) and a notary (*ʿadl*). He was the author of an extensive geographical dictionary entitled *Kitāb al-Rawḍ al-mi'ṭar fī khabar al-aqtār* (*The Fragrant Garden of Information Concerning the Regions of the World*). To the great French Arabist, Lévi-Provençal we owe the discovery and a partial edition of Al-Ḥimyarī's work. There are many manuscripts. The Timbuktu manuscript gives what may be the correct date of compilation: 1461. The *Rawḍ*, which draws on several important antecedents, including Al-Idrīsī's *Nuḥḥat al-mushtāq fī ikhtirāq al-āfāq* (*The Delight of the One Who Yearns to Traverse*

the *Horizons*), is arranged alphabetically (*alif-bā*). The lengthy section devoted to Al-Andalus begins with a substantial account of the Muslim conquest, followed by detailed descriptions of cities and towns, interspersed with poems, and including much historical material: the *tā'ifas* (party kingdoms) the taking, plundering, and recapture of Barbastro, the fall of Valencia to Jaime II, the battles of Zallāqah and Las Navas de Tolosa, among other subjects. There are also entries on Narbonne (the farthest town conquered by Muslims), France, the Atlantic Ocean, Bordeaux, and other extrapeninsular topics. The descriptions of the mosque at Córdoba, of Mérida's ruins, of Almería's famous textiles, and the account of King Solomon's fabulous table at Toledo are all worthy of note. Particularly intriguing is Al-Himyari's account, taken from Al-Īdrīsī, of the adventurers, eight cousins who set sail from Lisbon, westward and then southward and, after enduring storms and darkness, reached an island populated by tall, blond or red-haired men and beautiful women, where they were imprisoned, interviewed by a lone speaker of Arabic, and finally, after being blindfolded and taken eastward on a three-day boat journey, were released on the coast of Morocco. But, asks Sánchez Albornoz, in a thought-provoking study, if those twelfth-century Muslim adventurers actually had reached America and returned, how might the course of history have changed?

HISTORIA ARABUM See JIMÉNEZ DE RADA, RODRIGO

HISTORIA COMPOSTELANA

This Latin work is in all probability incomplete, and in the form that survives, postdates 1139. The *Historia* is a composite work of multiple authors. The largest portion of it consists of a history (*gesta*) of the episcopate of Archbishop Diego Gelmírez of Santiago de Compostela (1101–1140) that stops short of relating his death, which occurred on 6 April 1140. This history was the work of a canon of the Church of Santiago de Compostela, Gerald, who was French (probably from Beauvais). An earlier portion of the work is a register

of documents that records gifts to the church and short accounts of the circumstances surrounding the donations. This register was composed by Muño Alfonso, then treasurer of the church and later Bishop of Mondoñedo (1113–1136). Still earlier in the manuscript, and probably in time, is a *translatio* recounting the pious theft of some relics from churches in Braga by Bishop Gelmírez in 1102 and their redistribution to churches in Compostela. This piece was the work of Hugh, the canon and archdeacon of Santiago de Compostela and later bishop of Oporto (1113–1136). All of these are preceded by a brief history of Saint James the Great in Spain and the shrine church that had come to bear his name.

Despite some assertions to the contrary, the *Historia* had no effect on the historiography of medieval Iberia. It remained a local and unknown work. Nevertheless, it is important for the no less than 161 documents: royal charters, papal bulls, acts of church councils, and others are incorporated in its text and otherwise largely unknown. Though obviously biased in Gelmírez's favor, the *Historia* is also most important as a contemporary source for some of the events of the reigns of Alfonso VI (1065–1109) of León-Castile, of his daughter Urraca (1109–1126), and of his grandson Alfonso VII (1126–1157), in events of which Gelmírez was often deeply involved.

Today some nineteen manuscripts of the history are known, the oldest of which is a thirteenth-century copy in the library of the University of Salamanca. In most of the manuscripts the much shorter *Chronicon Iriense*, the *Chonicon Compostellam*, a list of the archbishops of Compostela, and a chronicle of the troubled episcopate of the fourteenth-century Archbishop Berenguer of Landoria are appended.

HISTORIA DE LA DONZELLA TEODOR

The *Historia* is based on a tale in *The Thousand and One Nights*. In it the beautiful and wise slave girl Tawaddud saves her impoverished owner from distress by answering correctly, in the presence of the caliph Harun ar-Rashid, to whom she had been offered for sale, the questions of specialists in very different fields of knowledge.

The tale, composed in Baghdad, probably in the second half of the ninth century, possibly has a Greek origin, was later reshaped in Egypt, and also circulated independently from *The Thousand and One Nights*. The frame is of secondary importance to the examination, consisting of questions and riddles. At some point in the transmission, the name of the heroine was misread as *Tudur*—hence *Teodor* in the Spanish translation or adaptation (thirteenth or, at the latest, fourteenth century).

The oldest Spanish versions of the tale—as an additional chapter of the *Bocados de oro* in four fifteenth-century manuscripts; a fragment of another manuscript of the same period; and an incunabulum without year and place (Toledo, ca. 1498) differ very widely from one another, thus presupposing a rather long and complicated transmission. The number of examiners has been reduced to three (a theologian and jurist, a physician, a grammarian and rhetorician); the scene transferred to Babilonia (i.e., Cairo) or, in the printed versions, in which *Teodor* is a Christian slave from Spain and her master a Hungarian merchant, to North Africa (“en los reynos de Túnez”), and instead of the caliph there is a king or an emir named Almançor.

The printed text was enriched with materials from various sources, such as the *Repertorio de los tiempos* by Andrés de Li and the Spanish version of the *Altercatio Hadriani cum Epicteto*, and in the course of several elaborations underwent profound changes. As a chapbook (*libro de cordel*) the *Historia de la donzella Teodor* (in some of the later editions *Teodora*) enjoyed extraordinary popularity through the centuries. More than forty Spanish editions before about 1890 are known, and the work was translated three times into Portuguese during the seventeenth and eighteenth centuries, and even into the Mayan language. In the form of ballads it still lives today in northeastern Brazil. Lope de Vega wrote a *comedia* about the wise slave, whose name has become proverbial.

HISTORIA DE LA LINDA MELOSINA

The *Historia de la linda Melosina*, an Old Spanish translation of Jean d'Arras's prose romance *Livre de*

Mélusine o Noble histoire de Lusignan (ca. 1387), was first published at Toulouse in 1489 by the German printers Johnnes Paris and Stefan Clebat. The translation was seemingly made from the 1478 Geneva edition of Arras's text printed by Adam Steinschaber, and follows the French closely. There is a second, less slavish Old Spanish version (1526), as well as record of a 1512 Valencia edition, of which there is no known extant exemplar.

The romance, based on written and traditional matter, recounts the establishment of Lusignan, its ruling line, and their conquests. Melusina, Lusignan's founder, is a fairy princess who, as punishment for acts against her father, is to be transformed into a serpent from the waist down every Saturday (although in some legendary accounts she adopts a mermaid's form). She must hide this metamorphosis from her husband in order to remain in the mortal world. In the end, however, her husband, Raimondin, discovers the secret, which forces Melusina to leave her human form forever.

The Spanish translations, like the French original, are rich in chivalric conquest and folkloric motifs. The romance contains many references to Aragónese and Catalan locations, which, as critics have suggested, could have influenced the Count of Cardona to grant asylum to Thomas of Lusignan after the Turks ousted him from Cyprus in the late fifteenth century. As Alan Deyermond has discussed, the date of the first Spanish translation coincides with those political actions, suggesting the importance of *Melosina* in the Iberian Peninsula.

HISTORIA GOTHORUM See JIMÉNEZ DE RADA, RODRIGO

HISTORIA SILENSE

The *Historia* is a Leonese chronicle of unknown authorship composed in the first third of the twelfth century. The author set out, apparently, to compose a history or *aesta* of Alfonso VI of León-Castile (1065–1109), but what he produced is, in large measure, the best surviving narrative account of the reign of Fernando I (1035–1065). All that he accomplished

for the reign of Alfonso is a short introduction to the period 1065–1073.

This history of León-Castille in the first two-thirds of the eleventh century is set against a fairly traditional chronicle background that begins with the late-seventh-century Visigothic kings and then relates the history of the kings of Asturias and León up to the time of Fernando and Alfonso. For these earlier reigns he draws upon the seventh-century histories of Isidore of Seville and of Julianus of Toledo, the ninth-century *Chronicle of Alfonso III*, the eleventh-century chronicle of Bishop Sampiro of Astorga (1034–1042), and the reworking of Sampiro's chronicle by Bishop Pelayo of Oviedo (1102–1130). The *Silense* has historiographical importance because the chronicle of Sampiro does not survive independently.

In actuality the title *Historia silense* is a misnomer. The author refers to himself as a monk of a monastery that he calls “domus Seminis” and that modern scholarship early identified with the monastery of Santo Domingo de Silos in Castile. It has recently been demonstrated that the author was a member of the Leonese monastery of Sahagún, which enjoyed the closest of ties with Fernando I, thus giving the account a peculiar authority for that reign.

The problems of composition and authorship of the text have been aggravated by the fact that none of the eight surviving known manuscripts is older than the fifteenth century.

HISTORIOGRAPHY: ESTORIA DE ESPAÑA AND ITS DERIVATIVES

Alfonso X's project for writing a history of Spain, the *Estoria de España*, was begun early in his reign, and a first draft was probably completed by the 1270s. Some four hundred chapters appear to have been completed by about 1272, when Alfonso's attention moved to the more universal *Grande e general estoria*. The more parochial project continued, however, and a number of succeeding attempts were made to finish it, albeit in a less professional manner than in the period of Alfonso's direct interest.

The earlier chapters, dealing with the history of Spain up to the Moorish invasion, exist in a relatively

definitive version and have attracted less critical attention; their sources are clear: Orosius and Eusebius of Caesarea figure prominently, and for the Visigothic period much use is made of earlier medieval Spanish chroniclers in Latin, particularly Rodrigo Jiménez de Rada, Archbishop of Toledo (*El toledano*) and Lucas, Bishop of Túy (*El tudense*). It is with the history of the Reconquest, however, that the historiographical tradition becomes more complex in a way which has attracted much critical attention. One of the reasons for this is undoubtedly the compilers' desire to introduce popular poetic material (“epic” poems) into their narrative. This often led to problems of both chronology and verisimilitude, and it is not uncommon for successive chronicle compilers to give substantially different accounts of the same event. Whether these differences are due to the chroniclers' own inventiveness or reflect knowledge of successively differing oral poetic traditions, is a matter of ongoing critical debate.

The title *Estoria de España* (EE), while useful as a name for the original enterprise, cannot properly be used for any one version or manuscript in its entirety. An older critical tradition used the name *Primera crónica general* (PCG), now best reserved for the version published under that title by Ramón Menéndez Pidal (originally in 1906). That version, covering the period from the start of the Reconquest on, is a composite one, belonging to what is called the *versión regia* of the EE. Contrasting with this is the *versión vulgar*, characterized by a more concise, and presumably more primitive, version of the original draft on which the EE was to be based. By contrast, the *versión regia* is marked by a tendency to expansion, sometimes merely rhetorical but on other occasions attempting to explain and justify the actions of characters or to make them more exemplary, and on occasion introducing new legendary material. Sometimes groups of manuscripts within what is recognizably the same version of introduce their own idiosyncrasies: thus a number of manuscripts of the *versión regia*, known as the *Crónica fragmentaria*, show a critical spirit toward their sources that demonstrates how the process of compilation continued, with a new chronicler deliberately introducing his own reservations about the narrative sequence he was relating.

Alongside the *versión vulgar* of the EE one should next place two other chronicle versions that seem to go back to the same early stage of the Alfonsine draft (*borrador*). These are the *Crónica de veinte reyes* (CVR) and the *Crónica general “vulgata”* (CGV). The CVR is relatively the most concise chronicle, of this group, though not consistently so. It is the first to make use of the legendary material dealing with the partition of the kingdoms by Fernando I, and it also offers a

substantially revised and reorganized version of the events of the reign of the succeeding king, Sancho II. The most interesting aspect of the CVR, however, is that it tells the story of El Cid in substantially the same terms as the extant *Poema de mio Cid*, while all other chronicles introduce much new material, either from different sources or on their own initiative.

The CGV, while apparently going back to the same *borrador* as the *versión vulgar* and the CVR, has its idiosyncrasies. It sometimes has minor structural peculiarities, adds editorial notes and some details, and on occasion strongly prefers a popular source over the historiographical tradition that is normally followed: this is the case in the novelistic story of the murder of Infante García of Castile, for example. The CGV was one of the first Alfonsine works to be printed, and this version was used for much of the text published in the sixteenth century by the historiographer Florián de Ocampo. In *Las quatro partes enteras de la Crónica de España* (1541), Ocampo used the CGV for the part of the story up to the union of Castile and León under Fernando I in 1037.

A final version of the original Alfonsine draft survives only indirectly, in that it seems to underlie the now lost chronicle possessed by Alfonso's nephew, Infante Juan Manuel, summarized in the latter's *Crónica abreviada*.

Turning to later, expanded versions of the EE, mention has already been made of the *versión regia*, which we know best as the PCG. This formed the basis for a number of later elaborations. The most common of these (in terms of numbers of manuscripts) is the *Crónica de los reyes de Castilla* or *Crónica de Castilla* (CrC). This version begins with the accession of Fernando I to the throne of León in 1037, and may be regarded as a greatly expanded and amplified version of the *versión regia* from this point on. Of all chronicle versions under discussion, the CrC makes the most frequent and uncritical use of legendary material, often in a highly novelesque way. This is seen consistently, but perhaps most strikingly in the account of the later years of El Cid's life and his death. The CrC gave rise to another early printed text, the *Crónica del famoso cauallero Cid Ruy Diez, campeador* (Burgos, 1512), commonly called the *Crónica particular del Cid*, which is an extract from the longer CrC.

Another later derivation from the Alfonsine EE, and probably the best known, is the *Crónica de 1344* (Cr 1344), whose genesis is complex. There a small number of Galician-Portuguese manuscripts that are composite versions, combining the *versión regia* of the EE up to 1037 and the CrC thereafter. These are the ancestors of the Cr 1344. The chronicle was originally composed in Portuguese in 1344, translated into Castil-

ian, revised in an expanded version (ca. 1400) in Portuguese, and then translated into Castilian once more. Of all the chronicle versions discussed, the Cr 1344 represents the most radical and critical rewriting of its sources, whether the *versión regia* or the CrC. Sometimes it involves new sources (the story of the Infantes de Lara is extensively revised, apparently from a poetic source) or other chronicle versions (the story of Fernando I's division of his kingdoms and the ensuing reign of Sancho II is apparently rewritten in the light of the alternative version offered by the CVR). It is always clear in the Cr 1344 that a new and critical spirit is at work, one with a strong tendency to rearrange structural elements and expand the narrative in ways that include the rhetorical but do not stop there.

Another version similar to the CrC and the Cr 1344 is the chronicle with which Ocampo completed his edition of the CGV. Generally referred to as the *Crónica ocampiana*, it takes up the story from the accession of Fernando I (1037) with what is in fact a blend of the *versión regia* and the CrC. It has more features in common with the latter, however, to the point where it might be argued that to talk about the *Ocampiana* as a separate chronicle family is misleading.

Brief reference must be made to two idiosyncratic versions. One is generally known as the *Versión interpolada de la CGV*, and is a one-manuscript derivative of that chronicle that interpolates material which is frequently of a sententious or religious nature and which may, on occasion, reflect the use of new, later versions of epic legends (e.g., the Infantes de Lara). The second is the *Refundición toledana de la Crónica 1344*, a novelesque and rhetorical expansion of the chronicle in question dating from the fifteenth century.

The chronology of the various texts discussed here is difficult to establish, given that few of the manuscripts contain dates of composition, and the majority of them were produced in the fourteenth and fifteenth centuries. One may provisionally divide the chronicle versions into four groups: (1) the first part of the *Estoria de España*, up to the Moorish invasion, completed in Alfonso's lifetime; (2) an early version of the remainder of the narrative, based on the Alfonsine *borrador* and completed at the end of the thirteenth century or the beginning of the fourteenth century: the *versión vulgar* of the *Estoria de España*; the *Crónica de veinte reyes*; the *Crónica general* "Vulgata"; (3) a series of more elaborate fourteenth-century versions comprising, in order, the *versión regia* or *Primera crónica general*, the *Crónica de Castilla*, the *Crónica de 1344*, and the *Crónica ocampiana*; and (4) later derivative versions, probably of the fifteenth century, the *Versión interpolada de la Crónica general* "Vulgata" and the

Refundición toledana de la Crónica de 1344, as well as other novelesque versions not discussed here, such as García de Salazar's *Libro de las bienandanzas* and Rodríguez de Almela's *Compendio historial*.

HISTORIOGRAPHY, HEBREW

Medieval Jewish chronicles of Spain are few in number and generally poor in quality. Fortunately, however, there are other Hebrew sources of greater value. Medieval Jewish historiography generally followed neither the Bible nor the Talmud, much less such sound historiographical "good sense" as exhibited in 2 Maccabees 2: 24–31. Rather, it was chiefly concerned with lamenting supposed "persecutions" and other disasters, real or imagined. This has aptly been termed the "lachrymose conception" of Jewish history, all too prevalent also in modern writing. Thus, there are such (non-Spanish) chronicles as *The Vale of Tears*. In Spanish Jewish historiography, this is most exemplified in the work of one of the latest writers, Samuel Ibn Verga (fifteenth century), one of the exiles, whose *Shevet Yehudah* (available in Spanish translation) is filled with misleading and false information about the terrible persecutions suffered. Nevertheless, it sometimes contains accurate details of certain events, and like all Spanish Jews, Ibn Verga showed his veneration for the rulers.

Turning from the last to the first, we find an entirely different plan in the work of Abraham Ibn Daud of Toledo (ca. 1110–1180), whose *Sefer ha-qabbalah* (available in both Spanish and English translations) describes the whole of Jewish history from the Bible to his own day. It is highly programmatic, however, as has been shown by its modern editor, with anti-Qaraite polemical intent and possible messianic views. Nevertheless, Ibn Daud, also an important philosopher

and scientist, is a generally reliable source for certain major personalities and events of al-Andalus in his own generation and the immediately preceding years.

The only surviving complete Hebrew chronicles from Spain are from the fifteenth and early sixteenth centuries. Joseph Ibn Saddiq of Arévalo (ca. 1467) left a brief chronicle, which served in turn as the main source for that of Abraham ben Solomon (of "Torru-tiel" is impossible; perhaps "Ardu-tiel," in 1510). Both (also in Spanish translations) are essentially records of the lives and activities of famous Jewish scholars, with only brief details on major "events" in Spanish-Jewish history, often with errors of dates, and other matters. Finally, Abraham Zacut, the noted astronomer of the late fifteenth and early sixteenth centuries (again, one of the exiles) wrote a much more valuable chronicle, *Sefer Yuhasin* (untranslated and virtually unstudied). Like Ibn Daud's work it details the whole of Jewish history, but without any obvious "program" or polemic. His chronicle of personalities and events of Jewish Spain is interspersed indiscriminately with general medieval Jewish history. However, he appears to have used reliable sources, and generally his information is useful and at times uniquely valuable.

Other Jewish writers of Spain, without intentionally setting out to be "chroniclers," have nevertheless left chronicles and other historically valuable material in their writings. Well-known examples include Menahem ben Solomon ha-Meiri of Perpignan (ca. 1300), who provides not only important information on scholars of Provence and Spain but also other historical notices; Menahem Ibn Zerah (originally from Navarre, also lived in Toledo; d. 1385), whose introduction to his *Sedehla-derekh* (untranslated) gives eyewitness accounts of important events, such as the massacre of 1328 in Navarre, and of personalities with whom he was personally acquainted. Less-known writers are Isaac ben Joseph Israeli of Toledo (1310), whose astronomical treatise *Yesod olam* contains a chapter chronicling various scholars and events (the text in the published edition is very poor, and must be read in Zacuto's *Sefer Yuhasin*; Kraków, 1581 only, chap. 18). Much of it is copied verbatim from Ibn Daud. Samuel Zarza of Palencia (1368) has left some important information in his *Megor hayyim* (appendix in Wiener's ed. of Ibn Verga, *Shevet Yehudah*, and in the Spanish translation). Isaac ben Jacob de Lattes (1372; often erroneously identified by Jewish scholars with a later Isaac de Lattes) wrote a chronicle, *Sha'arey Siyyon*, which is generally a mere catalog of rabbis but does have some important information. Sa'adyah ben Maimon Ibn Danan (Granada, 1468–1485) also left such a chronicle, of limited value.

Of importance for the history of Jews in Spain, though not written by Spanish Jews, are such chronicles as Joseph h. Joshua ha-Kohen's (Provence, fourteenth century), *'Emeq ha-baka* (available in English and Spanish translations) and, of a far different quality, the tremendously important work of Elijah Kapsali of Candia *Seder Eliyahu zuta* (1523; now available in a critical edition) on the Jews of the Ottoman Empire, which gives much valuable information on Spanish Jews before and after the exile.

Jewish historiography of medieval Spain is of interest not only for the Jewish historian. Since Spanish Jews were on intimate terms with Muslims and Christians, and often closely involved with the government, it is not surprising that these works reveal some awareness of the general events of the time. Ibn Daud, for example, compiled a Hebrew history of Rome up to the rise of the Muslim Empire, and in his *Sefer ha-qabbalah* there are references to Rome, Persia, and other places, as well as some of the Spanish kings. Yet while the other medieval chroniclers (Ibn Saddiq and his imitator Abraham ben Solomon) show some awareness and even appreciation of medieval kings and certain events of history (though often with erroneous names and dates), it is not until Abraham Zacut that we encounter a genuine awareness and appreciation of non-Jewish—history in a favorable or at least neutral manner; he mentions important church figures, the commentary on Job of Gregory I (which he calls a “great work”), the discovery of the Shroud of Turin, the Council of Basel. (Such relatively objective reporting of Christian personalities and events is generally considered to appear first in the work of Azariah de Rossi in Italy, in the sixteenth century; obviously this is incorrect.) Zacut was not unaware of Muslim history, he reports favorably on certain Muslim scientists and physicians. This work, particularly in its careful edition from manuscript, contains much valuable general historical information, and it is obvious that Zacut drew on Spanish and probably Latin (perhaps also Arabic) sources.

Finally, mention should be made of *Zikaron ha-shmaddof*, a supposed Hebrew chronicle of persecutions (lost, if it ever existed) that Grayzel, Baer, and others insisted was composed by Profiat Duran (fifteenth century). While quotations from such a work do appear, it is at best doubtful that Duran was the author. We also should take note of the specialized “historiography”—really polemics and philosophico-theological schemata—of such authors as Judah ben Barzilai (Barcelona, twelfth century), *Peirush Sefer Yesirah*, and his contemporary Abraham bar Ḥiyya (or Hayya), *Meqillat ha-Megalleh* (an excellent Catalan

translation), and in the fifteenth century, of the writer and statesman Isaac Abravanel.

HISTORIOGRAPHY: ANNALS AND LATIN CHRONICLES UP TO *DE REBUS HISPANIAE*

Christian historiography in the period 500–1250 produced relatively few works. Before the twelfth century in particular, histories that have survived are limited in number and in length, and there is little evidence that many have been lost. In the twelfth century there was some increase in activity that carried on into the thirteenth, when longer and more comprehensive histories finally emerged. In addition to the overall paucity of texts, problems arise because many earlier texts are known only in copies that have been amended, deliberately or accidentally, by their transmitters, while later texts are often reliant on earlier ones for their information.

The principal historical works from the year 500 on are basically annalistic, setting down events in chronological order, in a time frame expressed in relation to major sequences. These are principally the calendar year, expressed as the Spanish Era only or with the addition of *anno domini*, and the year of the reign of the monarch. Besides the latter there can be indicators of the year of the reign of the Roman emperor, the Muslim year, and other markers. For the most part, years are mentioned only when something of note occurs in them, and the length of the entries vary according to the events recorded. In addition to events there are often genealogies, important for ruling houses. Most (if not all) writers were clerics, frequently holders of high office and with close links to the ruling elite. These circumstances had predictable consequences both for the tone of the texts and for the attitudes toward royalty. Texts are in Latin, and the early ones in particular are short. (Those mentioned below are all longer than the annals that have survived from various parts of Iberia.)

Two models were established for later writers in the time of Visigothic domination, by John of Biclaro, bishop of Girona, and Isidore, bishop of Seville. Both described themselves as continuers of earlier historians, such as Eusebius of Caesarea and Jerome, and

considered their role to be to add to their writings in order to bring them up to contemporary times. John of Biclaro's model is the universal chronicle, which begins at the Creation, and includes biblical and classical history before reaching Iberia. The other model is provided by Isidore's history of the Goths from legendary origins to their rule of Spain. One task they both performed was to place the Visigoths within an continuum in a way that gave them historical legitimacy as rulers and provided a perspective that would inspire central Spain's view of itself for many centuries. John's chronicle adds to earlier writers the period 567–590, includes the conversion of the Visigoths to Catholicism and compares Reccared to Constantine. Isidore also produced a short history on the universal model, but his *Historia Gothorum*, with short accounts of the Suevi and Vandals, was more influential in the long term. Despite an inconsistent format resulting from its variety of sources, the *Historia* recounts the progress of the Visigoths to 625, portraying them as legitimate conquerors of, and successors to, the Romans. Its opening "Laus Spaniae," in praise of Iberia, became a commonplace. One other work of the pre-Conquest period is the *Historia Wambae* of Julianus of Toledo, which describes the election of Wamba in 672 and the rebellion of Paulus a year later.

After the Muslim entry into Spain, there is a long pause before histories appear in Christian-controlled areas. Elsewhere, in al-Andalus, a cleric aware of Isidore's writings composed the *Crónica mozárabe* (754). It includes Byzantine, Arabic, and Visigothic affairs, and, while bemoaning the Muslim Conquest, recounts events within the church in Muslim Spain without being anti-Muslim. The reign of Alfonso III of Asturias saw the first flowering of historiography in Christian Spain with the *Crónica albeldense* and the *Crónica de Alfonso III*, both probably composed in the 880s, although surviving only in much later texts. While differing over some matters, they focus on the historical context for the Asturian monarchy up to Alfonso III. The *Albeldense* uses the universal model, including Roman history, while the *Alfonso III* is more like Isidore's *Historia Gothorum*. In them, the Asturian nobility emerges as legitimate heirs of the Visigoths with a claim to all their lost kingdom. The *Alfonso III* ends with that king's accession in 866 and shows strong evidence of royal approval of its composition, but it is the *Albeldense* that includes events of Alfonso's reign up to 883.

It may also have been in this period that series of brief annals began to be recorded in religious houses. These laconic lists of events of variable significance, set down in chronological order, were not compiled by one author at one time, but grew up over many

years as different contributors added to a sequence sometimes stretching over centuries. Such annals, or evidence of them, have survived from most Christian zones, as in the *annales conimbricenses* in Portugal and the *annales compostellani* in Galicia. Annals of this type were compiled in Castile and in the more eastern areas of the Iberian Peninsula as well. After the emergence of historiography in Asturias in the 880s, another long period followed without major activity beyond the revision of older texts such as the *Crónica de Alfonso III*. For the tenth and eleventh centuries, all we have, apart from annals, is a history by Sampiro of Astorga of the kingdom of Asturias-León, from the end of the *Crónica de Alfonso III* to 984. Although likely to have been composed shortly after that date, it survives only in the twelfth-century compilations mentioned below.

It was not until the twelfth century that more, and more varied, historiographic activity began. In its early decades the disordered but interesting *Historia silense*, composed in León, used the works cited above and added new material to bring events up to the death of Fernando of Castile I in 1065, explicitly as preparation for a life of Alfonso VI that does not survive (and was probably never written). Of the same period, the compilation *Ab exordio mundi usque eram mclxx*, by Bishop Pelayo of Oviedo, adds to previous sources a brief and uninspired history of Alfonso.

But along with continuers of the previous patterns of historiography, the twelfth century also saw innovators. The *Chronica Adefonsi imperatoris* is a consciously literary eulogy of the life of Alfonso VII that becomes a poem on his capture of Almería. A nonroyal lay personage, Rodrigo Díaz, el Cid, is honored with a history of his own, the *Gesta Roderici Campi Doctoris*, which may have used documentary sources. In Galicia, the *Cronicón iriense*, although brief, is idiosyncratic, as is the *Historia compostelana*, which records the history of the see of Santiago. This broader geographical spread of activity is confirmed, in the second half of the century, by the composition farther east of the *Crónica najerense*, best known for its inclusion of more material from popular legends than in previous chronicles, alongside sources such as the *Silense*. In Catalonia, this period saw the creation of the first history beyond annalistic notes with the composition in the monastery of Ripoll of the *Gesta Comitum Barcinonensium*, continued in various versions for more than a century. In Navarre, shortly before 1200, the *Liber regum*, a series of genealogies, was put together, along with a brief text about El Cid. It is worthy of particular mention because it is the first historiographical text in a vernacular Spanish dialect, not Latin.

The first half of the thirteenth century saw the appearance of a *Crónica latina* concentrating on Castilian history up to 1236 and also the two most substantial histories of the period under discussion, both continuations of the semiofficial line of Visigothic-Asturian-Leonese-Castilian histories. The first of these, the *Chronicon mundi* of Lucas of Túy, takes the universal model, beginning with the Creation. The fourth of its four books describes Spanish history in the period 711–1236. Written in León in the late 1230s at royal behest, the chronicle combines sources mentioned above more skillfully and comprehensively than previously, and adds others—ecclesiastical, political, and popular—to create a work that enhanced not only royal prestige but also the status of León and its church. The other major work follows the alternative model. The *Historia gothica* or *Historia de rebus Hispaniae* of Rodrigo Jiménez de Rada, archbishop of Toledo, was completed in 1243. Though it relies on Lucas for much of its structure and content, it also exploits a variety of materials gathered and collated by a team employed by Rodrigo, who also composed histories of the Romans, the Moors, and various Germanic tribes. Rodrigo's principal interest was the promotion of Toledo as metropolitan see of Spain against rivalry from León, Santiago, and, potentially, Seville. To this end he was ruthless in amending his sources while making his final text sufficiently convincing to stand alongside the *Chronicon mundi* as a major structural basis for Alfonso X's vernacular history in the second half of the century.

HISTORIOGRAPHY: ANNALS AND CHRONICLES, FIFTEENTH CENTURY

The historiography of the fifteenth century can be taken to run from the vernacular chronicles of Pero López de Ayala to those of the reign of the Catholic Monarchs. Compared with the previous century, the variety of approach, of form, of spatial and temporal

scope, and of language has increased remarkably, as have the frequent observations on the nature and value of history, from Enrique de Villena through Fernán Pérez de Guzmán to Fernando del Pulgar and Lucius Marineus Siculus.

Several factors can be adduced to explain this development. First, there emerged a lay reading public independent of ecclesiastical influences. As libraries of the period show, the average noble drew upon history rather than fiction or collections of exempla for his education; new vernacular translations of Valerius Maximus, Livy, Caesar, Sallust, Quintus Curtius, Suetonius, and Justinus were frequent. Second, unstable political and social situations stimulated a variety of historical judgments. Third, there emerged a growing consciousness of the part to be played by historiography in national and international propaganda, to which may be linked the increasing use of Latin as a means of reaching a wider audience. Fourth, the increase in available texts of Latin and Greek historians allowed the elaboration of the prehistory of the Iberian Peninsula, together with its historical geography and topography. Finally, there was a gradual emergence of the post of royal chronicler, who could be a household scribe with some legal experience, a chaplain or a lay scholar with a university background, a native or immigrant working on commission.

A strong continuity of practice, however, was maintained, as can be seen in the traditional regnal chronicles of the crown in the vernacular, usually the responsibility of the chancellor of the realm. Pedro López de Ayala continues from Fernán Sánchez de Valladolid, covering the usurpation of the royal line by the Trastámaras across the reigns of Pedro I, Enrique II, Juan I, and Enrique III, which were meant to be read as a single block. López de Ayala's procedures are not significantly innovative, but his political insights are sharp. His material is coded according to the principles of chivalry, and exemplified in the deeds and misdeeds of magnates whose families were to dominate in subsequent years. The vision of his successor was politically and culturally less developed. Still maintaining the regnal itinerary as a structural guide, Alvar García took over in the reign of Juan II of Castile, leaving an unexplained ten-year gap. The *Crónica del rey don Juan el segundo* was taken over by others before mid-century, including Fernán Pérez de Guzmán, and revised at the end of the century by Galíndez de Carvajal; no complete, authoritative edition is yet available.

The first clearly documented appointment of an official historian came in the following reign, that of Enrique IV of Castile, in December 1456, when Alfonso de Palencia was named successor to Juan de

Mena as both chronicler and secretary of Latin letters. Nothing is known of the activity of Mena as historian, although many of his contemporaries refer to him as such. This combination of posts marks a change from the nomination of an *escribano de cámara* to an educated scholar with a knowledge of Latin. Palencia's *Gesta hispaniensis ex annalibus suorum dierum colligendis* (*Décadas* for short) was formally planned in ten books up to the year 1480. The Granada campaign was also to have ten books, but it breaks off in 1489, after the siege of Almería. This work has never been published in the original Latin, only in a modern Castilian translation. It contains trenchant and bitter attacks on the moral and political behavior of the nobility by a dedicated supporter of King Fernando V.

By 1460, however, the post of official chronicler proliferated into three further appointments. The only one whose complete work is known is Diego Enríquez del Castillo, the royal chaplain (born 1443). His working copy was captured by rebel troops at Segovia in 1469 and rewritten from memory in the reign of Isabel, who had little sympathy for him. His *Crónica de don Enrique IV* is an effusive eulogy of a king in the grip of circumstances too powerful for him to control, a vision quite contrary to that of Palencia, but infinitely better known at home and abroad.

The reign of Fernando and Isabel is treated extensively and variously by a range of historians, commissioned or otherwise, in both Latin and the vernacular. Juan de Flores, a nobleman from the household of the duke of Alba, author of the sentimental romances *Grimalte y Gradissa* and *Grisel y Mirabella*, has recently been identified as another official chronicler and the author of the *Crónica incompleta de los reyes católicos*. He was appointed in 1476, and what survives of the text covers from 1469 to 1476. Fernando del Pulgar, royal secretary in the previous reign, was appointed chronicler by Isabel in 1480 because she disapproved of Palencia's views. She supervised drafts of the *Crónica de los reyes católicos* sent in by Pulgar, who followed the court on active service up to the last years of the Granada campaign. This account became a quarry for subsequent narratives in Latin by Lucius Marineus Siculus and Antonio de Nebrija, all of whom gave wide currency to the concept of the reign of Fernando and Isabel as a dramatic climax to decades of strife and a portent of a glorious future. This was most fulsomely elaborated in the vernacular pulpit oratory of Andrés Bernaldez, chaplain to the archbishop of Seville and under the patronage of Rodrigo Ponce de León, duke of Cádiz. Andalusia is the main scene of this narrative, which includes the Granada campaign, the expulsion of the Jews, and the discovery of the Indies.

Diego de Valera, minor noble, wandering knight, royal councillor and envoy, and compulsive writer of letters and treatises on all manner of topics concerning chivalry and government, planned an extensive account of Castile's past and present history, ending in an detailed narrative of the reigns of Juan II, Enrique IV, and Fernando and Isabel. Its various parts are known as the *Crónica abreviada* (up to Juan II), *Memorial de diversas hazañas* (reign of Enrique IV), and *Crónica de los reyes católicos* (up to the middle of the Granada campaign). The whole is remarkably comprehensive for its time, if not innovative in method. It is dedicated to Isabel, and she and her husband looked upon as saviors of their kingdoms sent by providence to impose law and order. Galíndez de Carvajal's *Anales breves* of this reign are noteworthy not only for their precision and conscious attempt to avoid prejudice and eulogy, but also for the prologue dealing with the value of history, criticisms of previous historians, and the role of the official historian. He also wrote a *Crónica de Enrique IV* that drew in the main upon a vernacular version of Palencia's *Décadas* and Valera's *Memorial*. Galíndez was typical of the new bureaucracy of the Catholic Monarchs, a *letrado* conscious of his duties to the crown and unyielding to the pressures of aristocracy.

In the time of the Crown of Aragón, the most significant event, politically and culturally, was the annexation of the Kingdom of the Two Sicilies by Alfonso V. This king was credited with a voracious appetite for history; his court in Naples attracted many Italian scholars eager for patronage and willing to record, for payment, the lives and deeds of the royal line. Lorenzo Valla's life of Alfonso's father, Fernando de Antequera, *De rebus a Fernandoo Aragóniae rege gestis libri tres* was finished about 1445. It is valuable for the discussion in the prologue of the comparative educational merits of literature and philosophy, as well as observations on the nature of historical evidence and textual criticism. The narrative is derived from a version of Alvar García de Santa María's chronicle, and is structured around the moral and military virtues of the protagonist. The *De rebus ab Alphonso Primo Neapolitanorum rege commentariorum libri decem* by Bartolommeo Fazio is also an attempt to create a classical hero figure on the model of Caesar's *Commentaries*, illustrating through his campaigns the virtues of constancy and fortitude. Antonio Beccadelli (*il Panormitano*) has much more to say about Alfonso's cultural pursuits in *De dictis et factis regis Aragónum*, inspired by Xenophon's *Cyropaedia*, which he had previously translated. In the Crown of Aragón proper (with Navarre) there occurred a remarkable lapse in historical

writing on contemporary subjects. Carlos de Viana's *Crónica de los reyes de Navarra* goes only as far as Carlos III (died 1425) and was never finished.

In Catalonia the great fourteenth-century tradition of chronicle writing is broken, and resumed only with the advent of Fernando V, who issued commissions Gonzalo García de Santa María and Lucius Marineus Siculus to write biographies of Juan II of Aragón, His illegitimate son, Alfonso de Aragón, archbishop of Zaragoza, was a great patron of historical writing, encouraging both Lucius and the Aragónese Gauberte Fabricio de Vagad, who wrote a *Crónica de Aragón* (Zaragoza, 1499) covering the period from the election of Íñigo de Arista to the death of Alfonso V. There is little of consequence in Catalan chronicles until Miquel Carbonell's *Chroniques de Espanya* (finished 1513, printed at Barcelona in 1546). Both these chronicles mark the reign of Alfonso V as a cultural climax in the history of the Crown of Aragón. Carbonell does not take his praise for the kingdom to the exaggerated lengths of Vagad, eager to dismiss Italian claims of superiority.

This sense of cultural competition marks a number of historical works commissioned by Fernando IV. Antonio de Nebrija was asked to revise Pulgar's *Crónica de los reyes católicos* on the basis of a version edited by Galíndez Carvajal, *Rerum a Fernandoo et Elisabe Hispaniarum regibus gestarum Decades Duae* (Granada, 1545). In the same vein, Nebrija reworked Luis Correa's *La conquista del reyno de Navarra* (Salamanca, 1513), which is normally printed with the *Décadas* (Granada, 1545) under the title *De bello Navariensi libri duo*. Both of these Latin works, together with a sequence commissioned from Lucius Marineus, were intended for a wide European circulation and herald in their prologues and conclusions the apotheosis of Hispania restored to its ancient borders in Navarre, Rousillon, and Granada, and about to embark on a new age under the Catholic Monarchs.

The general chronicle of Spain in the Alfonsine tradition also underwent significant changes in the fifteenth century, not so much in the vernacular versions of the *Estoria de España* or Jiménez de Rada's *Historia gothica* as in the new Latin *rifacimenti*. The *Estoria* is reproduced with modifications and additions through the *Crónica general de 1344* and *de 1404*, the *Cuarta crónica general de 1460* and the fanciful *Crónica sarracina* by Pedro del Corral. The heritage is also evident in the *Suma de las crónicas de España* and the *Edades trovadas* of Pablo de Santa María, *converso* (Jewish convert to Christianity) bishop of Burgos. Both are written, in prose and verse, as educational treatises for Juan II of Castile.

Other examples of the general chronicle are the *Atalaya de las crónicas* by Alfonso Martínez de Toledo, the various compilations of Diego Rodríguez de Almela; *Copilación de las batallas campales que son contenidas en las estorias escolásticas y de España* (Murcia, 1487) and *Valerio de las hystorias escolásticas* (finished 1483; Seville, 1542), based formally on Valerius Maximus, but drawing mostly on the *Crónica de 1344*; and the *Crónica abreviada* or *Valeriana* of Diego de Valera, the *Bela Farfana* by Antón Farfán de los Godos, the *Compendio universal* by Alonso de Ávila (?) and Lope García de Salazar's *Bienandanzas e fortunas*. All of these lead back to some version of the Alfonsine heritage, with additions and regional variations, as in the *Bienandanzas*, which concentrates on the feuds in the Basque provinces.

More drastic remodeling rather than reorganization of traditional sources is manifest in the rebirth of Latin historiography in the mid-fifteenth century with the *Anacephaleosis* or *Recapitulation* of Alfonso García de Santa María, *converso* bishop of Burgos (Alfonso de Cartagena). In order to assert the claims of the throne of Castile to offshore islands and the coast of North Africa, Alfonso resurrects the old myth of unbroken royal lineage from the Visigoths and raises Castile to the dominant power in the peninsula. The work goes up to the first years of Enrique IV, and was printed at Granada in 1545. Rodrigo Sánchez de Arévalo's *Compendiosa historia hispánica* (Rome, 1470), the first general history of Spain to be printed, elaborates the same theme and goes further. Challenging Italian humanist accusations of cultural barbarity, Rodrigo draws on the evidence of newly available classical texts to extend the antiquity of Spain to before that of Rome.

This area of prehistory is specifically explored in Alfonso de Palencia's lost *Ten Books on the Antiquities of Spain*, probably in Latin, and in great detail by the Catalan bishop of Girona, Joan Margarit in his *Paralipomenon Hispaniae libri decem* (finished about 1480; printed at Granada, 1545). Margarit has no interest in the Gothic myth; his main intention is to destroy the misconceptions circulated by Jiménez de Rada about the ancient history of Hispania, using Roman texts and Greek texts in recent Latin translation. He also juxtaposes the Augustan unity of Hispania with the union of the crowns of Castile and Aragón. The last stage in this burst of political antiquarianism is marked by Nebrija's *Muestra de la historia de las antigüedades de España* (Burgos, 1499), a foretaste in Castilian of a five-volume Latin work that was never written. One assumes he intended to overshadow all previous efforts to eradicate mistakes, yet he in turn surrenders to the egregious fantasies of the Italian Giovanni Nanni (An-

nius of Viterbo; Rome, 1498), the first of many sixteenth-century pseudochronicles that push Iberian civilization well before that of the Greek city-states.

HITA, ARCHPRIEST OF *See* LIBRO DE BUEN AMOR

HOLY OFFICE *See* INQUISITION

HOMOSEXUALITY

Homosexuality was a key symbolic issue throughout the Middle Ages in Iberia. As was customary everywhere until the nineteenth century, homosexuality was not viewed as a congenital disposition or “identity”; the focus was on nonprocreative sexual practices, of which sodomy was the most controversial. Female homosexual behavior was ignored, and almost nothing is known about it.

In al-Andalus homosexual pleasures were much indulged in by the intellectual and political elite. Evidence includes the behavior of rulers, such as Abd al-Rahmān III, Al-Hakam II, Hishām II, and Al-Mu‘tamid, who openly kept male harems; the memoirs of Bādīs, last Zīrid king of Granada, makes references to male prostitutes, who charged higher fees and had a higher class of clientele than did their female counterparts; the repeated criticisms of Christians; and especially the abundant poetry. Both pederasty and love between adult males are found. Although homosexual practices were never officially condoned, prohibitions against them were rarely enforced, and usually there was not even a pretense of doing so.

During the final centuries of Islamic Spain, because of Christian opposition to it and because of immigration and conversion of those who were sympathetic, homosexuality took on a greater ideological role. It had an important place in Islamic mysticism and monasticism; the contemplation of the beardless

youth was “an act of worship,” the contemplation of God in human form.

Many Christians in northern Iberia and elsewhere in Europe were scandalized by or terrified of Andalusian sexual behavior, which relied heavily on slavery; homosexual indulgence, viewed as an incurable and contagious vice, was seen as a threat to the fighting strength of the army, and thus to the integrity of the state. The boy-martyr San Pelagio, executed for refusing the amorous intentions of Abd al-Rahmān III, was a hero and the subject of a poem by Hrotswitha. The Christian states worked to rescue captive Christians, prevent slaving raids, set up a bulwark to prevent Islamic expansion northward, and suppress homosexuality within the Christian states themselves. The Castilian emphasis on virginity and marriage, its rejection of lyric poetry, the delayed implantation of clerical celibacy in Castile, and the western European cult of the Virgin Mary all may well have their origin in this confrontation. The possible homosexual elements may be a reason why the theory of the Islamic origin of courtly love and troubadour poetry has had such a poor reception.

Juan II of Castile and his lover Álvaro de Luna were the most famous homosexual couple in medieval Christian Spain. The execution of Álvaro de Luna, arranged by Juan’s second wife, Isabel of Portugal, remained into the seventeenth century an event symbolic of the repression of homosexuality. In the Farce of Ávila, Enrique IV was dethroned in effigy as *puto* (faggot); his incapacity as ruler was seen as a result not of illness, as today seems likely, but of moral depravity. Homosexuality was tolerated in the court of Alfonso V of Aragón after its move to Naples.

In the background of the conflict over homosexuality in Iberia are the Jews. Throughout Spanish history Judaism and variant sexuality have been associated by those hostile to either. One reason Jews were excluded from some countries after their expulsion from Spain was because they allegedly took homosexuality with them. Judaism and homosexuality are linked in Golden Age literature (e.g., in Francisco de Quevedo’s poetry), and in the early twentieth century homosexuals were referred to as *judíos*, and in the aggregate called a “sect.”

The discovery and publication of much poetry thought lost, and the pioneering studies of it by Schirrmann and Roth, have given us surprising new perspectives on Sephardic sexuality. There are scores of pederastic poems by the greatest Jewish authors of the period: Ibn Gabirol, Samuel ha-Nagid, Moses ibn Ezra, Judah ha-Levi, and others. From this poetry, “refined, sensual, and unabashedly hedonistic,” we know that homosexuality was widespread among the Jewish elite

in al-Andalus, apparently more prevalent than among the Muslims. Zirid Granada, a Jewish state in all but name, was the center of "a courtly aristocratic culture involving romantic individualism [in which there was] intense exploration of all forms of liberating sexuality, heterosexuality, bisexuality, homosexuality." As with the Muslims, homosexuality and religious devotion were combined; Israel's love of God was sometimes expressed as the love of a male. The influence of Sephardic homosexuality has yet to be traced, but it is hard not to see it in the poetry of St. John of the Cross.

HOSIUS, BISHOP OF CÓRDOBA

Hosius (or Ossius) was said to have been approximately a hundred years old at the time of his death around 357 and to have held the office of bishop of Córdoba for nearly sixty years. This would appear to place his birth in the middle of the third century, and his elevation to the episcopate to around the year 300. He referred in a letter to having suffered during the last imperial persecution of Christianity (303–305). He came into contact with Emperor Constantine I (r. 306–337) soon after the latter's conversion in 312, and became his principal Western ecclesiastical adviser. The African schismatics known as Donatists later claimed that it was Hosius who persuaded Constantine to condemn them in 316, and he was certainly used by the emperor as his envoy to the church in Alexandria in 324, in an attempt to heal the conflict over the teachings of Arius concerning the Persons of the Trinity. After the failure of this mission, Hosius played a prominent part in the ecumenical council held at Nicaea in 325, which sought to settle the growing Arian controversy. For reasons that are not clear, this marked the end of his period of influence at the imperial court, and he spent the next twenty years back in his diocese. In his final years he was again involved in a series of councils and meetings intended to resolve the continuing rift in the church over the doctrine of the Trinity.

In 347 he presided at the Council of Serdica, in which the Western bishops made clear their support for Athanasius of Alexandria, the principal opponent of the Arians. But after Constantius II (r. 337–361) united both parts of the empire under his rule, attempts were made to force the westerners to modify their stand. Hosius was summoned to the imperial court at Milan in 355, and detained. He was eventually coerced into signing the acts of the council held at Sirmium in 357, which condemned Athanasius. He died soon after.

HOSPITAL, ORDER OF THE See MILITARY ORDERS

HOSPITALS

Hospitals were houses where pilgrims, the poor, the sick, and outcast could find lodging and, if necessary, medical assistance. In the early Middle Ages they usually were run by religious orders or lay confraternities, or even attached to cathedrals, as at Manresa and Vic. The first such institution in Christian Spain was founded in 580 at Mérida, and from then on, hospitals were to be found in all urban areas, some of them providing shelter for those with diseases like leprosy, smallpox, and the plague.

Few records remain to describe the majority of these institutions, but studies published on the hospitals of Barcelona and Valencia show that by the thirteenth century their number had increased significantly. New institutions had been founded by rich merchants like Bernat dez Clapers in Valencia and Arnau de Cloquer in Vic. Some, like the Hospital del Rey in Burgos and the Hospital de la Reina in Valencia, owed their existence to royal donations. Others, like the Hospital d'En Colom in Barcelona and the Hospital dels Folls in Valencia (1409), looked after the mentally ill; the latter is regarded as the first institution in Europe founded for this purpose.

Initially all hospitals were dependent on private donations, legacies, gifts in kind such as beds and linen, or received assistance from ecclesiastical or lay organizations; gradually the municipalities supplemented or replaced these groups, especially after the Black Death of 1348, when medical resources had been

strained to their utmost. By the end of the fourteenth century, throughout the Iberian Peninsula a need for consolidation and specialization became evident, and the separation of the sick from the poor began to take effect. Smaller institutions were incorporated into larger ones: the earliest example of this is the Hospital de la Santa Creu in Barcelona (1401), and in Zaragoza, Nuestra Señora de Gracia was formed in 1425 with the specific purpose of unifying hospital care in the town.

HOSTIGESIS

Hostigesis was bishop of Málaga in the mid-ninth century. What we know about him comes from the *Apologeticus* (864) of the abbot Samson, which was written largely as a defense against accusations of doctrinal deviance that Hostigesis leveled against Samson. The picture of Hostigesis—whose name Samson altered for polemical reasons to Hostis Ihesu (enemy of Jesus)—is, as a result, rather uncomplimentary and suspect. According to Samson, Hostigesis's father, Auvarnus, was a tax collector who had converted to Islam. His uncle Samuel had done the same after having been deposed as the bishop of Elvira. Through simony Hostigesis rose to the see of Málaga at the uncanonically young age of nineteen. He enriched himself through the corrupt administration of his office and spent most of his time at the emir's court. In conjunction with Count Servandus of Córdoba, he increased the tax burden on the Christian community. He arranged for Samson to be condemned for doctrinal deviance in an episcopal council in 862 and again, a short time later, at another council convened in Córdoba, at which Bishop Valerius of Córdoba was deposed. Samson devoted the second book of his *Apologeticus* (which he wrote at Martos, near Jaén, where he had fled after the second council) to his own defense, accusing Hostigesis of being a heretic for misunderstanding the extent to which God is present in the things he created.

HUELGAS CODEX, LAS

Las Huelgas (a musical codex, sigla *Hu*, listed in I. Fernández de la Cuesta under BUH 1) is an early fourteenth-century manuscript preserved at Las Huelgas, the famous Cistercian convent founded about 1180 on the outskirts of Burgos. The convent since its inception has been associated with the Church of Santa María la Real.

Surviving the nineteenth-century plunderings of the French during the Napoleonic Wars, as well as the

entails of Juan Álvarez Mendizábal, the manuscript was discovered in 1904 by Dom Luciano Serrano. With the twelfth-century *Codex Calixtinus* (of Compostela) and the mid-fourteenth-century *Llibre vermell* (of Montserrat), it constitutes the triumvirate of Spanish musical sources that contain examples of medieval polyphony. The music of the Las Huelgas codex, copied in Spain in early mensural pre-Franconian notation, bears a stylistic affinity with coexisting French models. A composer associated with several pieces in the codex was identified as Johan Rodrigues (fl. 1325).

Of its 186 examples, notated on 170 parchment folios, 45 are monophonic (20 sequences, 15 *conducti*, 10 *Benedicamus* tropes) and 141 are polyphonic, written for two, three, and four voices. The latter include the following genres: *conductus* (including a Credo), Latin motet, Sanctus settings, Kyrie, Gloria, Sanctus, Agnus Dei, *Benedicamus Domino* and *Benedicamus* tropes, proses (sequences), organa, graduals, alleluias, an offertory trope, an exercise in solfeggio, and a textless monody.

HUGO OF SANTALLA

Hugo of Santalla (fl. 1145) was a translator of scientific texts from Arabic into Latin. He presumably came from one of the several Leonese villages named Santalla and apparently spent his life in Aragón since the majority of his works are dedicated to Michael, bishop of Tarazona (1119–1151); the remaining works have no dedications. His patron acquired at least one Arabic manuscript for him from Rueda de Jalón. Hugo must be the "magister Hugo" who witnessed two charters at Tarazona on 11 November 1145. His principal interests were astronomy, astrology, and the divinatory sciences. He was apparently the first to translate a text on "sand divination," for which he coined the word "geomancy"; this kind of divination, using figures made up of four rows of single or double dots, became

extremely popular. His texts on divination from the shoulder blades of sheep (scapulimancy) had less influence, but are interesting for the insights they give on Spanish-Arabic society and politics. He translated a commentary on a set of astronomical tables and several sets of astrological "judgments." His *Aristotle's Book Based on 255 Indian Volumes of Universal Questions* is a translation of a lost Arabic text that offers precious testimony on the state of astrological knowledge in late eighth-century Baghdad. His translation of the cosmogony and set of questions on nature known in Arabic as the *Sirr al-khal-aga*, of Apollonius of Tyana, the earliest Latin text to include the Emerald Table of Hermes, became a key text for alchemists.

HUNTING LITERATURE

Hunting, the principal method of food gathering for pre-agricultural societies, had become a refined courtly pastime in parts of western Europe by the twelfth century. Monarchs and noblemen ordered books dealing with the subject to be written in order to establish a social etiquette, disseminate effective techniques of falconry and venery, and promulgate laws governing the well-being of huntsmen. The same texts usually contain information on the nature and care of falcons and hunting dogs, the accoutrements necessary for the chase, and the best locations for large and small game in all seasons. The earliest hunting literature in Spain is greatly indebted to Arabic scientific treatises, notably the *Kitāb al-yawāriḥ*, composed by Moamin, falconer and astronomer of Baghdad (d. 859 or 860). This text inspired a pan-European tradition, for there exist versions in Latin, Franco-Italian, and Spanish. The first of these was ordered by Frederick II of Sicily about 1240, and may have influenced his famous *De arte venandi cum avibus* (1248); the last, *Libro de las animalias que casan*, appears to have been produced at the command of the future Alfonso X, in 1250, while he was still a prince. (The most complete codices of the work are Biblioteca Nacional, Madrid, MS Res. 270; and Escorial, MS V.II.19, which also contains several brief falconry treatises, such as *Dancus rex* and *Guillelmus falconarius*.)

15th century. Pheasant hunt. Tacuinum Sanitatis. Ms.65, f.86v. Paper. Italy, Lombardy, ca. 1475. Astor, Lenox, and Tilden Foundations. Copyright © The New York Public Library/Art Resource, NY. Spencer Collection, The New York Public Library, New York, N.Y., U.S.A.

Three-fifths of the Spanish *Animalias* deal with falconry; the remainder are dedicated to venery, hunting with quadrupeds that kill “with their teeth”: dogs, leopards, and other animals. Each of these types would influence later hunting texts on *caza* and *montería* (i.e., falconry and venery, a lexical distinction that was generally maintained until the 1400s). Juan Manuel (1282–1348), nephew of Alfonso X, composed a *Libro de la caza* (ca. 1325–1335) in which he alludes to a *Libro del venar* ordered by his uncle—probably the *Animalias*. He tries to go beyond that work’s scope in developing a manual that is more practical, more up-to-date, and less theoretical. The *Caça* expounds on falconry and the nature of falcons in chapters 1–10, provides veterinary information for their care in chapter 11, and in chapter 12 describes the best locations for falconry known to the author. A work of apparently even greater circulation during its day than Juan Manuel’s is the *Libro de la caza de las aves* (1386) of Pedro López de Ayala (1332–1407). Possible examples of direct influence of the *Libro de la caza* in López’s

book are few: he prefers to rely on hunts in which he has participated, conversations with professional falconers from Spain and abroad, and details he has noted. A key written source is the *Livro de falcoaria* by Pero Menino, falconer of Fernão I of Portugal: this text is plagiarized almost in its entirety; López uses it as the basis for chapters 11, 15, 17–32, 34–37, and 39. The *Caça de las aves*, important for its sociological and literary aspects, would influence (among others) the following fifteenth-century writers: Alfonso de Madrigal (El Tostado), *Un libro . . . de curaralcones, azores gavilanes*, and Juan de Sahagún (falconer to Juan II), *Libro de cetrería*; and, from the sixteenth century, Joan Valles, *Libro de la cetrería y montería* (1556). There is also a Portuguese translation.

Books (*tratados*) 4–5 of the Spanish *Animalias*, which deal with *caza mayor*, would have considerable influence on the *Libro de la montería* (ca. 1345–1350), produced at the behest of Alfonso XI, great-grandson of Alfonso X. The *Montería* deals exclusively with the pursuit of deer, wild boar, bear, and *enzebra* (probably wild ass rather than zebra). A possible complement to Juan Manuel’s *Libro de la caza*, describes procedures for hunting large game and the nature of hunting dogs in book 1; provides information on veterinary surgery and useful pharmacological compounds in book 2 (in two parts); and in book 3 catalog over 1500 areas in Spain for *caza mayor*, encompassing more than 9000 place-names. Like López de Ayala’s falconry treatise, the *Montería* was a popular work: texts apparently modeled on or influenced directly by it include the Portuguese *Livro da montaria* (1415, written at the command of King João I; an anonymous *Tratado de montería del siglo XV*; British Library, MS Add. 28709); Gonzalo Argote de Molina, *Libro de la montería de Alfonso XI* (1582); and Pedro de Pedraza Gaitán’s *Libro de montería* (seventeenth century; Biblioteca Nacional, Madrid, MS 8285).

HURTADO DE MENDOZA, DIEGO

Eldest son of the magnate of Pedro González de Mendoza, who had allied himself with the new Trastámaran dynasty to become *mayordomo mayor* for King Juan I. Diego held the title of Admiral of Castile and continued his father's advantageous policy of active military and political support of the new royal house, going on to become one of the most powerful men in Castile by the beginning of the fifteenth century. Father and son helped transform the Mendoza family from a provincial military clan into a wealthy, aristocratic house that dominated an entire city and province and held the highest national offices. As such, they were able to extend their family ties to a powerful network of prestigious houses, including the royal family itself.

The admiral's career from early on was a glorious succession of victories, rendering important military services in the wars against Portugal by defeating Portuguese fleets in three separate naval engagements. In the power struggle during the minority of Enrique III (1390–1406), the admiral supported the winning side by allying himself with his uncles, Pedro López de Ayala and Juan Hurtado de Mendoza, thus becoming a counselor to the monarchy and joining that small group of men whose members were entitled to be known as the *consejo del rey* (council of the king). It was during this same period that Pedro López de Ayala served as *canciller mayor* (senior chancellor) of Castile. Immensely proud of his family's heritage and influence, Enrique III was known to have complained about the admiral's social daring and informal ways. Sometime before 1395, the admiral received a royal grant for the patronage of the city offices of Guadalajara. Earlier he had also been granted the right for himself and his descendants to name the city's representatives to the *cortes*, thus ensuring his family's dominance in the city and province of Guadalajara.

Diego inherited a large fortune from his father and added large tracts of land to the Mendoza estates, receiving *mercedes* (grants) from both Juan I and En-

rique III that increased his holdings in the provinces of Guadalajara and Madrid. In addition, he extended his interests into Asturias through a second marriage, to Leonor de la Vega in 1387. As the sole heiress of the large Vega fortune, Leonor brought extensive seigniorial lands in Asturias into the Mendoza estate, including sheep-grazing lands, salt mines, and harbors, sources of an important part of the Mendoza clan's income in a period of extensive wool trade between Castile and Flanders. Although the admiral's decision to marry Leonor de la Vega was his own, made after his father died in the Battle of Aljubarrota (1385), it appears that the couple were at odds from the beginning. The admiral was away when their first son was born, and Leonor had the child baptized Garcilaso in honor of her ancestors. In an early will, the admiral stipulated that the boy's name should be changed to Juan Hurtado de Mendoza in honor of his uncle. A poet as well as a man of intellectual interests, Diego was also the father of the greatest humanist and one of the most influential noblemen in Castile during the fifteenth century, Íñigo López de Mendoza, the first marquis of Santillana (1398–1458), whose reputation in Spanish history rests on his great literary achievements.

Before the admiral died, he tried to assure the inheritance of his small children by naming two of his powerful uncles as their tutors, Pedro López de Ayala, and Juan Hurtado de Mendoza, *prestamero mayor* (military governor) of Vizcaya. By the time of his death in 1404, Diego Hurtado de Mendoza was reputed to be the richest man in Castile. His efforts to ensure the inheritance of his children, however, were doomed to failure because of internal family disputes. The recuperation and preservation of the Mendoza fortune was left for Santillana to carry out, who during the next generation was successful in stemming off a series of threats to the family during period of internal and external attacks on the Trastámaran political order.

HYDATIUS

Bishop of Aquae Flaviae (Chaves, northern Portugal) and sole contemporary chronicler of the Suevic kingdom in Roman Gallaecia (now northern Portugal), Hydatius was born about 380 in Civitas Limicorum (now Ginzo). He was educated in the East, ordained in 416, and promoted to bishop in 427; he is presumed to have died shortly after his chronicle terminates in 469. His

unusual name is that of the persecutor of Priscillian, and he may have been appointed to resume the orthodox evangelization of Paulus Orosius. His chronicle professes to continue Eusebius's *Ecclesiastical History*, latinized by St. Jerome. Aquae Flaviae was not previously a see, and Hydatius was increasingly occupied in representing Galaeco-Roman interests against the Suevic rulers. This took him to Gaul to confer with Flavius Aetius in and brought about his arrest from August to November forty-five.

Hydatius covers the reigns of the first Suevic ruler, Hermeric; his son Rechila; and his grandson Rechiarus, the first barbarian ruler to be a Catholic, who was soon defeated and killed by Arian Visigoths (461); and a period of internal strife. He does not exult over the succession of a Catholic and, while not questioning the legitimacy of the Suevic kingdom, denounces the Suevi failure to observe the *foedus*. He negotiates with the Visigoths, but finds the imposition of Arianism even more abhorrent. He ends with the Gothic occupation of Mérida and a combined Suevo-Roman appeal to the emperor, the result of which is unrecorded.

Most of Hydatius's 253 entries are short, the longest being of twenty-two lines. His use of portents without interpretation creates problems, as does his adoption of olympiads, confusing to later scribes. Despite these difficulties he remains a unique source to which Isidore's pages on the Suevi add little.

HYMNS, CHRISTIAN

Latin hymnody in Iberia is on the whole one of the most original phenomena of medieval religious poetry. Its roots go back to the turn of the fifth century. The *Cathemerinon*, the first hymn collection of the Iberian statesman Aurelius Prudentius Clemens, was geared toward the daily spiritual needs of the christianized provincial gentry with traditional Roman culture. His other hymn collection, the *Peristephanon*, was the first collection of martyr hymns. It was conceived as a programmatic Christian substitute for pagan mythological poetry and included local, Hispanic, Italic, and Roman material. Along with some of the Milanese hymns by Ambrosius, they became models for later medieval hymns on martyrs and saints. The hymns by Prudentius, in their original forms too long for liturgical

use, were later adopted in the form of *centos* in Visigothic-Mozarabic and, from the eleventh century on, also in monastic liturgy beyond the Iberian Peninsula. Only a few other hymns can be identified as early Iberian products (such as a Saturninus hymn).

The hymns of the Visigothic and Mozarabic period are preserved chiefly in tenth-century liturgical sources. A precise chronological ordering of these hymns (as undertaken by Pérez de Urbel and Díaz y Díaz) is desirable but remains elusive. Among them are hymns celebrating saints as well as some that were inserted in the Old Iberian daily and seasonal liturgy. The number of hymns to saints of various backgrounds (including some Eastern saints) is remarkably large. In addition to local Iberian hymns there are adaptations of early northern Italian hymns with historical allusions. Ascriptions to Visigothic authors (Maximus and John of Zaragoza, Braulio of Zaragoza, St. Ildefonsus and Julianus of Toledo, Quiricus and Conantius of Barcelona) are based mostly on uncertain assumptions.

A great deal of the poetry of Eugenius III of Toledo is identifiable, but most of the ascriptions of hymns to Isidore of Seville cannot be verified today. The monastic hymns inserted into the daily prayer cycle of the liturgy through Fructuosus of Braga display strong affinities with models elsewhere in Europe. A peculiarity of Visigothic hymnody is the use of "politically accentuated" hymns (designed for state and ecclesiastical events, such as coronations, episcopal consecrations, wars, and departures of the army against the enemy). The Arab Conquest of Iberia promoted the creation of Mozarabic hymns containing allusions to the suppression of the Christian faith by the Arabs and the Muslim rule in Iberia. While the hymns on the saints (now including local martyrs) often reflect the influence of the Hispanic *Passionarium* and are mostly very long, the hymns for "De tempore" are far shorter and more traditional in wording and tone.

In the Carolingian period there are indications of contact with hymnody beyond the peninsula (e.g., a Peter and Paul hymn). An outstanding Iberian poet in the Frankish courtly circle was Theodulf of Orléans, whose production of hymns was limited. Among the Mozarabic hymnodists were the martyr Eulogius of Córdoba and his friend Paulus Alvaro, author of the only St. Jerome hymn existing before the fourteenth century. Another distinctive feature of the age is the use of nuptial hymns. Hymns on St. James of Compostela appear relatively late. The dramatization of the liturgy is signaled by a hymn for the "farewell to the Alleluia," and by a Holy Cross hymn with strong patristic-eschatological elements.

The number of hymns in sources from the tenth century (including some from Silos) is very large. In

the eleventh century Ripoll produced some remarkable hymns (on Saints Michael, Peter, and Paul). The long moralistic-religious poem "De vita christiana" was composed during the investiture conflict. The pontificate of Pope Gregory VII (1073–1085) brought the forcible general introduction of the Roman liturgical traditions at the expense of the Mozarabic rite, which survived in Toledo and reemerged at the end of the fifteenth century. At first there was only a limited use of sequences in the Iberian sources.

In hymnody and liturgical music Catalonia gained prominence from the eleventh century on. The sequence, which has a very important role in musical composition, achieved great visibility in Catalan sources, and the *verbeta*, the liturgical hymns (mainly associated with new liturgical feasts and local cults), poetic offices, and paraliturgical songs also were in greater demand. In the twelfth century an important document of the cult of St. James the Great, the *Codex Calixtinus*, stands out as an example of close links between Iberian and southern French culture. In this framework the *conductus* form with its musical implications attained special significance and polyphony took a central position. The spirit of the Reconquest is reflected in some Huesca sequences. There was a further accumulation of Catalan sequences at San Juan de la Peña (Aragón) and San Millán de la Cogolla (Castile), as well as the popularity of the liturgical *verbeta* at San Cugat (Catalonia) and new poetic offices. Some remarkable hymns were composed in the circle of Alfonso X by Juan Gil de Zamora.

The composition of polyphonic poetic offices attained a significant place in the musical and hymnic production of the last centuries of the Middle Ages, especially in the Portuguese realm. The pilgrims' songs of Montserrat, used as "spiritual dance tunes," stand between popular ritual and liturgical hymn compositions. The paraliturgical compositions often display very complex musical and poetic structures. Copied at the beginning of the fourteenth century, the Huelgas manuscript from Burgos was a depository of (mostly polyphonic) products of the *ars antiqua* (some 186 items). Among them are not less than 144 organa, motets, conductus, and sequences, along with a number of important secular songs (laments, etc.), some of which were entirely unknown before the edition of Anglès.

A large number of liturgical books, found or written in Tarragona, the Escorial, Tortosa, Alcobaça, Huesca, Vic, and Toledo, offer new or hitherto not recorded hymns. Fourteenth-century hymns celebrate the Christian victory at Río Salado (1340) over the ruler of Morocco and the king of Granada. In the late Middle Ages Portuguese poetic offices preserved Latin hymns (Soeiro in Braga, Coimbra, etc.). A number of

Spanish sequences also have survived from the fourteenth century.

Short hymns in the popular "private prayer books" (*horae*, etc.) of the fourteenth and fifteenth centuries present novel features. While a considerable number of handwritten liturgical sources with hymns for old and new feasts, and for cults, survive from the fifteenth century, books printed in German workshops also testify to the hymnological production of the Iberian lands. Some of these "new" hymns may have been taken from older manuscripts, later destroyed, and others are manifestly inspired by humanism. Some poets are known to have contributed to early sixteenth-century Spanish hymnody, which preserved its medieval features well into the middle of that century. The final act of the Reconquest, the victory at Granada (1492), inspired liturgical hymns. At the turn of the sixteenth century the canon Alphonsus Ortiz edited the ancient Mozarabic liturgical books (*Missale mixtum*, *Breviarium*) under the patronage of Cardinal Francisco Jiménez de Cisneros. A definitive history of the rich, and in some respects unique, Iberian Latin hymnody is still to be written.

HYMNS, HEBREW

About the middle of the tenth century, Spanish Jews became relatively independent from the East, but for several generations their liturgical poetry continued the tradition established by the Palestinian poets of the Byzantine period. The major genres, such as the *qerobah* and the *yotser*, conserved their fixed structure and

the sequence of their minor units in the poetry of the first Spanish liturgical poets, such as Yishaq Ibn Mar-saoa'ul from Lucena and Yosef ibn Abitur from Mérida, even if the deep changes that affected Spanish poetry, creating a new model of metrical patterns on secular themes in pure biblical language, left an increasing trace in the poems written for the synagogue. The components of those major genres attained an independent life, and in some cases they enlarged their extension.

Among the hymns cultivated in that period are mention the *'ofan*, in which the angels sing the glory of God; the *qedushah*, proclaiming his holiness; and the *me'erot*, depicting the wonders of the godly creation of the heavenly bodies. Others, such as the *zulat* and the *mi kamoka*, emphasize the uniqueness and greatness of God. The *'alvodah* is specifically for the Day of Atonement. New techniques, such as the Arabic-like meter, appeared in those hymns. Scholars opposed to radical changes elaborated another metrical system based on the number of full syllables. At the middle of the tenth century, a new Andalusian pattern of strophic poetry, called *muwashshah*, appeared in the liturgical hymns, particularly in *me'erot* and other compositions praising the glory of God, and in the *'ahabot*. The Jews of Sefarad were particularly fond of these *'ahabot*, which usually alluded to the mutual love of Israel and God, with expressions taken from the Song of Songs, and the *ge'ulot*, expressing the desire for redemption and the end of the exile.

At the middle of the eleventh century, during the *tā'ifa* kingdoms, the golden period of Spanish-Hebrew poetry began. Solomon Ibn Gabirol (ca. 1020–ca. 1057), born in Málaga, introduced new forms, tech-

niques, and content into the synagogue poetry, with some psychological, philosophical, and even mystical elements. One of his most famous compositions is "The Kingly Crown," written in rhymed prose, praising God and his attributes, describing the works of the creation, and contrasting the insignificance of the human being with the Lord's greatness.

Yishaq Ibn Gayat (1038–1089), spiritual leader of Lucena, wrote several hundred liturgical poems in pure Sephardic style, with many allusions to the science and philosophy of the epoch. Judah ha-Levi (ca. 1075–1141), a very prolific and delicate author, wrote, among many other well-known poems for the prayer of the communities, a long *qedushah* that has been called "Hymn of the Creation." Abraham Ibn Ezra (1089–1164) wrote more than five hundred religious poems, as well as a long composition, the *Hay ben Meqis*, describing a journey through creation as far as the highest heaven.

When the Almohads entered al-Andalus in the mid-twelfth century and destroyed most of the Andalusian Jewish centers, the legacy of this brilliant epoch passed to the north, to Christian Spain, where many leaders of the communities continued to write liturgical compositions that remained more or less faithful to the same tradition. But they never attained the same degree of brightness.

I

IBN ʿABDŪN, ABŪ MUHAMMAD ʿABD AL-MAJĪD IBN ʿABDŪN AL-FIHRI

Ibn ʿAbdūn, a poet, scholar, and statesman, was born in Évora (Yābura) and died there in 1134. Renowned for his elegant prose style, his prodigious memory, and his keen wit, and credited with being able to recite from memory such literary works as *Kitāb al-aghānī*, he began in 1080 to serve as *khātib* (secretary), and later vizier, to ʿUmar al-Mutawakkil (of the Banū l-Aḥṣas), ruler of Badajoz (Batalyaws). Al-Mutawakkil's father, Al-Muẓaffar, had loved scholarship and had made his court a haven for scholars and men of letters, a tradition maintained by his son, himself a poet. In 1095 Al-Mutawakkil and his two sons fell into the hands of the Almoravid army of Yūsuf ibn Tāshfin. An account by Ibn Khāqān has it that Al-Mutawakkil's sons were executed in his presence before he met the same fate.

Immortalizing this tragic event and the memory of these three persons, Ibn ʿAbdūn composed a seventy-five-verse elegy that has come to be regarded as one of the most outstanding elegies composed in Arabic, remarkable for its technique and originality. Vibrant with feeling and rhetorical power, it laments the fall of the Banū l-Aḥṣas, presenting this tragedy as the culmination of tragedies brought about by the vicissitudes of time. It recounts with emotion the hand of Fate in bringing about the demise of previous rulers, Persian and Greek heroes of antiquity and Arab heroes alike. Then it laments the loss to humanity of Al-Mutawakkil and his sons. The erudite historical references of this innovative ode occasioned the writing of several commentaries, the most complete of which is by Ibn Badrūn of Silves (twelfth/early thirteenth century). After the fall of the Banū l-Aḥṣas, Ibn ʿAbdūn became a *khātib*, perhaps by necessity, to the Almoravid ruler Ibn Yūsuf ibn Tāshfin.

IBN ADRET, SOLOMON

Solomon ibn Adret (ca. 1233–ca. 1310) was the most important rabbinical authority in Spain in his period, and one of the most important of all time. We possess from his pen several volumes of commentaries on most of the tractates of the Talmud and several more volumes of legal responsa numbering in the thousands. All of these are a major source of information on the history of the period, of both Jews and non-Jews. He was the student of two great masters, both of Barcelona—Rabbi Jonah Gerundi and Moses ben Naḥman (Naḥmanides; not a rabbi)—and succeeded them as chief authority of the Aragón-Catalonia Jewish community. He had many famous students, almost all of whom became outstanding legal authorities and rabbis of the next generation in Aragón-Catalonia, Tudela, and Castile. Aside from Moses ben Maimon (Maimonides), who left Muslim Spain in his youth, no other Spanish Jewish scholar had as lasting an influence as Ibn Adret. (Nevertheless, scholars have made incredible errors in naming his students, and Scholem attributed to him the founding of a “school” of *qabbalah* based on his confusion of two sources with similar names, one written by a student of Ibn Adret but having nothing to do with *qabbalah* and the other written centuries later.)

However, Ibn Adret was strongly influenced by *qabbalah* in ways unknown to Scholem. He sometimes borrowed whole sections verbatim from the *qabbalist* ʿAzriel of Girona in his commentaries on the *aggadot* (homilies) of the Talmud; indeed, the order of the commentaries is based on that of ʿAzriel. Additional *qabbalistic* interpretations of Ibn Adret are cited in his

student Meir Ibn Sahulah's (attributed) commentary on Nahmanides on the Torah.

Ibn Adret joined in the controversy against the allegorical interpretation of the Bible and commandments fostered by those who misunderstood Maimonides, and even signed his name to the ban against the study of philosophy. Nevertheless, while he frequently wrote harsh criticisms of philosophy, he was deeply indebted to it, and matter-of-factly accepted certain of Maimonides' most "extreme" interpretations. He was the first anywhere to cite Maimonides' commentary on the Mishnah, and in fact arranged for its translation from Judeo-Arabic into Hebrew. He had, indeed, the greatest respect for Maimonides, whom he frequently cited.

His importance as communal leader and representative of the Catalan Jews cannot be overemphasized. Ibn Adret served as adviser to three rulers: Jaime I, Pedro III, and Jaime II (the last addressed a letter to him as "faithful" servant). He frequently was appointed by the kings as executor of important estates, and also served at various times as tax collector and secretary of the Jewish community of Barcelona.

Late in his life Ibn Adret composed other legal works, such as the *Torat ha-bayit ha-arokh* and a commentary on his own earlier abridged version of that work, which also serve as important source material for certain issues of the time. He left two, or possibly three, sons who were also scholars but never attained to their father's importance.

IBN BĀJJA (AVEMPACE) See PHILOSOPHY

IBN BASSĀM

Abū al-Ḥasan ʿAlī ibn Bassām al-Shantarīnī (d. 1147) was a vastly knowledgeable and widely read Hispano-Arabic poet and anthologist. When his native Santarem fell to the Christians (1092–1093), he took refuge, first in Córdoba and later in Seville, where he began to compile his *Kitāb al-Dhakhira fī mahāsin ahl al-Jazīra* (*Treasury of the Good Qualities of the People of the Peninsula*), his only surviving work. Decrying his fellow Andalusians' obsession with the writings of Eastern Muslims—"If a crow croaked [in the East] or a

fly buzzed in the far reaches of Syria or Iraq they would kneel in reverence before such a remarkable achievement"—Ibn Bassām decided to collect, in seven volumes, an extensive anthology devoted to the works (both poetry and prose) of the best Andalusian writers. There are four parts, arranged geographically: (1) Córdoba; (2) the west of al-Andalus; (3) the East; (4) foreign writers residing in Muslim Spain. Each entry embodies a biographical section in rhymed prose, followed by laudatory comments and extracts from the author's works. A compendious version of the *Dhakhira* was redacted by the Egyptian littérateur, Ibn Mammātī (1147–1209), with the title *Latā'if al-Dhakhira wā-tarā'if al-Jazīra* (*The Subtleties of the Treasury and the Exquisiteness of the Peninsula*). The *Dhakhira* is, of course, an invaluable source for the study of Hispano-Arabic literature, including, among its selections, numerous unique texts preserved nowhere else. (For a survey of the authors covered, see García Gómez's review of the Cairo edition of *Al-Dhakhira*.) The *Dhakhira* is also an indispensable document for the history of Al-Andalus, preserving, for example, among other crucially important sources, extensive passages from Ibn Ḥayyān's otherwise lost, multi-volume *al-Matīn* (*The Solid [History]*). For Hispano-medievalists, Romanists, and comparativists, perhaps the most interesting feature of Ibn Bassām's anthology is his detailed commentary on the *muwashshaḥat* style of poetry and its origins. Comparing the Arabic original with all previous attempts to translate and interpret this difficult passage, James Monroe proposes a new translation (quoted here only in part): "The first to compose the measures of these *muwashshaḥat* in our country, and to invent their method of composition, as far as I have determined, was Muḥammad ibn Maḥmūd al-Qabrī, the Blind. He used to compose them after the manner of the hemistichs of classical Arabic poetry (except that most of them were [composed] after the manner of the non-existent, hypothetical meters [*muh-mala*] that are not used [in classical Arabic poetry]), adopting colloquial Arabic and Romance diction, which he called the *markaz* [= *kharja*], and basing the *muwashshaḥa* upon it. . . ." In agreement with such an appraisal, Ibn Bassām—with his profound knowledge of classical Arabic poetics—excludes the *muwashshaḥat* from his anthology, as alien to classical Khalīlīan metrics: "The measures of these *muwashshaḥat* lie beyond the scope of this anthology, since the majority of them are not [composed] after the manner of the meters [found] in the classical poems of the Arabs." As Monroe points out, Ibn Bassām has given us a crucially important document in support of the *muwashshaḥa*'s Romance origin and its non-classical, stress-syllabic metrics.

IBN DARRĀJ AL-QASTALLĪ

One of the most distinguished Arabic poets of al-Andalus in the Amirid and early *ṭāʾifa* period, Ibn Darrāj (958–1030) first won recognition in 992 for a panegyric to Ibn Abī ʿAmir al-Manṣūr and became court poet to him and his two successors. His panegyrics portraying Al-Manṣūr as the champion of Islam against the Christians recall those addressed by Al-Mutanabbī to Saif al-Daula, and won him acclaim as the Mutanabbī of the West. His poems treat the important political and diplomatic events of the age, including battles, thanks to the practice of bringing court poets along with the troops to record military events. Following the conquest of Santiago de Compostela in 997, he was one of the poets chosen by Al-Manṣūr to write the official communication describing the victory to the caliph. His epistle is not extant, but three of his poems commemorating the event survive, including one containing a description of the shrine.

Ibn Darrāj's position at court weakened under Al-Manṣūr's successors as the stability of the court weakened. His *dīwān* records his shifting alliances during the civil war; in general he supported the Berber party. In 1014 he left Córdoba for Ceuta, to try to win a position as panegyrist for Alī Ibn Daūd, to whom he addressed a celebrated ode. Finding no satisfaction there, he returned to al-Andalus to seek a position in the Slav states headed by former Amirid courtiers: Almería, Valencia, Játiva, Tortosa. One of his most famous poems is a panegyric composed during this period for Khairām of Almería; but Khairā treated him so shabbily that the incident became proverbial.

In 1018 Ibn Darrāj arrived in Zaragoza and became attached to the court of Mundhir ibn Yahyā and his son Yahyā ibn Mundhir. Here he regained the stability that he had sought since leaving Córdoba, though he continued to express nostalgia for the Amirid court. For Mundhir he composed a panegyric imitating one composed by al-Mutanabbī for Saif al-Daula. He may have ended his career in Zaragoza, or perhaps (from 1028) at the court of Mujaḥhid of Denia.

Ibn Darrāj was the first Andalusian poet to be appreciated in the Muslim East, thanks to his mastery of

the neoclassical style of Arabic courtly poetry that was in vogue there. His poetry is widely quoted in both Andalusian and Eastern works, and a large *dīwān* has survived. His works consist entirely of official *qaṣīda* and completely avoid the aristocratic frivolity of the *muwashshaḥ*. In the "erotic" prelude (*nasīb*) of his panegyrics he avoids the traditional erotic themes; instead he often substitutes for the evocation of the lost beloved his longing for his wife and daughter, a most unusual personal note. He sometimes employs floral themes in the *nasīb*, prefiguring the obsession with flowers of some later Andalusian poets. He inclines to heroic portrayal of the patron, depicting him as the champion of Islam and his wars as just wars. He seems to have invented the practice of ending the poem with an envoi using parallelism, a common feature among later Hispano-Arabic poets.

IBN DAŪD, ABRAHAM

Abraham ibn Daūd, who was born in al-Andalus about 1110 or later and died (supposedly a martyr's death) possibly in 1180 at Toledo, is an important if neglected figure in the cultural history of the Jews of al-Andalus.

He was apparently the first to introduce Aristotelian philosophy to the Jews of Spain; his work is extant only in the medieval Hebrew translation, *ha-Emunah ha-ramah* (edited with German translation, 1853; there is a very poor modern English translation). In particular he utilized the philosophy of Ibn Sīnā (Avicenna), and was the first to argue for the agreement between Judaism and rational philosophical thought. Neither Jewish nor Muslim philosophers, of course, had any "double faith" or "reason versus revelation" conflict, which later plagued the Scholastics, so one should not view Ibn Daūd's effort as an attempt to convince readers that it was unnecessary to choose between religion and philosophy. Rather, somewhat like Maimonides after him, he was concerned with demonstrating the harmony between religion and reason in achieving the same truth. It was left to the far greater capacity of Maimonides to make this demonstration (which explains the lack of influence of Ibn Daūd's work on later thought).

More significantly, Ibn Daüd was first in another area: he was the first (and, in fact, the only) Jewish writer of al-Andalus to compose historical chronicles. He composed two such treatises, one of minor importance, on the history of the Second Temple and the Roman Empire, with an abridged version of the medieval Hebrew *Yossifon*, and the much more interesting and significant *Sefer ha-qabbalah* (*Book of Tradition*). Both of these works, like his philosophical work (in part), were written with a certain degree of polemical propaganda. While it is true that they were produced during the period of Almoravid dominance of al-Andalus, a time of some persecution (it is, however, scarcely true that “thousands” of Christians were “wiped out,” or that “thousands” of Jews converted, as has been claimed), these works show no evidence of anti-Muslim hostility.

On the contrary, the latter book in particular seems to have been directed primarily against the Qaraite sectarians of Judaism. It purports to be a history of the Jews from the biblical period to Ibn Daüd’s day. Much of the work is of interest only to the specialist in Jewish historiography, therefore, but the relatively small portion on Jews in medieval al-Andalus is obviously of great value, chiefly for biographical information on important scholars and other persons. Some light is also shed on historical events and on the general culture of Jews at the time.

Thus, *Sefer ha-qabbalah* served as a major source for the few later medieval Hebrew chronicles composed in Spain, and entire sections were utilized by Abraham Zacut; for example. Aside from these three or four chronicles, however, neither the author nor his work seems to have left any lasting impression on the Jews of Spain.

There is yet another aspect of Ibn Daüd’s career to mention. It has frequently been claimed (even by the editor-translator of *Sefer ha-qabbalah*) that he was the famous “Avendauth” who, with the archdeacon Domingo Gundisalvo, translated numerous Arabic philosophical and scientific treatises into Latin. In fact, this is a confusion with a Jewish philosopher (virtually unknown) by the name of Solomon ibn Daüd, who converted to Christianity and was known as Juan Hispano (*not* Johannes Hispalensis, which has caused further confusion between him and a supposed John of Seville and even a Juan who was archbishop of Toledo in 1166). In Latin this converted Jew was known as Johannes Avendaut or Avendehut. Only Albertus Magnus calls him “archbishop of Toledo,” undoubtedly confusing him with the previously mentioned Juan. Who this David Iudaeus, whom Albert says included “dicta” of several Muslim philosophers in his writing, may be is unclear; there is the possibility that this reference is to Abraham ibn Daüd.

Finally, when the fourteenth-century Jewish astronomer of Toledo, Isaac Israeli, stated that Ibn Daüd wrote a treatise on astronomy, otherwise unknown, he may very well have confused it with one of the translations done by Avendaut. More research on all of this is still needed.

IBN EZRA, ABRAHAM

Abraham ibn Ezra of Tudela (1089–1164) was a Hispano-Jewish polymath whose career spanned the transition in Jewish society and culture from Muslim al-Andalus to Christian Spain. A Hebrew grammarian, literary critic, and prolific poet of devotional and secular Hebrew verse; a Neoplatonic philosopher, astronomer, and astrologer; and above all a seminal biblical exegete, Ibn Ezra left Spain in 1140 and spent the remainder of his adult life wandering through North Africa, Italy, France, and England.

Ibn Ezra originally produced biblical commentaries on all the books of the Hebrew Bible. Some of these texts are no longer extant, whereas others have survived in more than one recension. Ibn Ezra’s witty and frequently acerbic commentaries are written in an unmistakable style. They reflect a synthesis of the diverse hermeneutical trends prevalent in the Spanish school of biblical exegesis and probably represent the way in which the Hebrew Bible was understood by Andalusian Jewish literary intellectuals. On the one hand Ibn Ezra’s commentaries focus upon the grammatical, lexical, and stylistic features of the biblical text. In this respect their aim is to clarify the “plain sense” of Scripture. On the other hand they are suffused with highly laconic and frequently enigmatic philosophical and scientific observations, and they contain obscure excursions often designed to suggest esoteric cosmological and theological doctrines (“the wise will understand”). Although he did not apply them as extremely as some other Spanish exegetes, notably Moses ibn Gikatilla and Isaac ibn Yashush, the methods Ibn Ezra typically employs are rationalistic. For instance, he is thought to be the first to ascribe the second part of the Book of Isaiah to an anonymous prophet of the Babylonian Exile. He also alludes to the likelihood of post-Mosaic interpolations in the Pentateuch.

Ibn Ezra’s verse reflects the poet’s interest in cultivating strophic forms of composition and his apparent

preference for liturgical over secular poetry. From the thematic standpoint Ibn Ezra's lyrics exhibit an openness to treating more realistic and personal motifs than those represented in the conventional matrix established by his predecessors. In terms of its language his poetry upholds the Andalusians' exclusive reliance on biblical Hebrew.

Ibn Ezra's history of the Andalusian philological and linguistic tradition and his Hebrew grammar, as well as his two commentaries on the Book of Psalms, were of great importance for the dissemination of Hispano-Hebrew poetry and poetics. These writings reveal him to be a devotee of Arabic prosody and style, as well as a passionate advocate of the divinely inspired sacred poetry of ancient Israel. Through Ibn Ezra's attempts to promulgate golden age learning and its approach to knowledge, Hispano-Hebrew culture came to exert a powerful influence over the Jews of other Mediterranean lands.

IBN EZRA, MOSES

Moses ibn Ezra (ca. 1055–1138) was the second of four sons in an influential family of Granadan Jewish patricians, and the first important Hebrew poet born during the politically turbulent but culturally productive period of the *muluk at-tawā'if* (*los reyes de taifas*, the party kings). Civil disturbances connected with the 1066 murder of Yehosef ibn Naghrila forced the family to flee to nearby Lucena, where Moses studied with Isaac ibn Ghiyath, the master rabbi associated with the famous Talmudic academy of that town. When the clan returned to Granada, Moses enjoyed the material culture and stimulating intellectual and social life characteristic of the Jewish nobility. During the years prior to 1090 he came into his own as a courtier-rabbi and won acclaim as a poet's poet.

In 1090 the Almoravid invasion broke the sociopolitical stability of Granada, whose Jewish community was devastated for the second time in twenty-five years. For reasons that are unclear, Moses did not join his brothers' exodus to Córdoba and Toledo. He remained alone in Granada, "a resident alien" in his desolate native land. Subsequently, sometime between 1090 and 1095, Ibn Ezra was mysteriously compelled to abandon his wife and children, and leave Granada for exile in Christian Spain. So began the poet's forty-

year odyssey though the towns of Castile, Navarre, and, it appears, Aragón. This tragic event proved to be the turning point in Ibn Ezra's personal, intellectual, and artistic life because he was never able to reconcile himself to an environment that he believed was socially, culturally, and intellectually inferior to that of his native Muslim Spain.

Ibn Ezra was, arguably, the most conservative of the Andalusian school of Hebrew poets. He initiated no major genres; his classicizing language and style are manifest in both his secular and his liturgical verse; he revived, in Hebrew form, the traditional structure of the neoclassical Arabic ode (*qasida*); and he was the first Hebrew poet to compose an Arabic-style book of manneristic homonym poems. Even Ibn Ezra's most identifiably personal occasional poems, the lyrical complaints in which the poet laments his exile from Granada, are stylized in form and conventional in content. It would be incorrect to conclude, however, that his poetry is lacking in either originality or self-expression. On the contrary, he achieved distinction as a poet through his creative reworking of poetic tradition and his artistic mastery of rhetorical style.

Apart from his literary conservatism, what immediately distinguishes Ibn Ezra from other poets of the school are his Judeo-Arabic prose writings on Hebrew poetry and Andalusian Jewish culture. *The Book of Discussion and Conversation*, the most complete and comprehensive work on Hebrew poetics to come down from the Middle Ages, is a prescriptive and probing treatment of the legitimacy of Arabic-style Hebrew poetry. *The Treatise of the Garden on Metaphorical and Literal Language* is a theoretical study of the nature of poetic diction as manifested in the Hebrew Bible. Along with his substantial corpus of secular and devotional Hebrew poetry, these works serve to identify Ibn Ezra as the embodiment of the traditions and ideals of Andalusian Jewish literary intellectuals of the period.

IBN GABIROL, SOLOMON

Abū Ayyūb Sulaimān (Solomon) ibn Yahyā (Judah?) was born in Málaga, though his father came from Córdoba. His last name is problematic; usually spelled

today as Ibn Gabirol, it may more correctly be Ibn Jabirol or Jabirel (referring either to a bone setter, or doctor, or to the angel Gabriel). He was born in 1021 or 1022, but the date of his death is uncertain. According to an Andalusian Muslim author who praised him highly, he died in 1056 or 1057, but in light of what Moses Ibn Ezra wrote, it may have been between 1052 and 1055. He apparently was sickly for several years (possibly suffering from tuberculosis) and did not marry.

Ibn Gabirol, like other Jews of the Muslim period, was an accomplished scholar in many fields. He remains famous primarily as a poet, having written hundreds of secular and "religious" poems, beginning at the age of sixteen. He lived also in Zaragoza, where he continued to write poetry, including a damning attack on the ignorance of the Jews there, and in Valencia. His secular verse is outstanding and uniquely individual, with an easily identifiable style. One of his main themes is the constant struggle between the desire to acquire wisdom and the temptations of worldly pleasures (wine and love, particularly). He wrote many love poems about boys, but an equal number about women. Too much has been made of this, and also of his (possible) illness, which certainly did not last all his life or prevent him from falling in love.

His religious poetry stands out among the finest of this genre, with many poems expressing a mystical longing found also in his other writings (the most famous of these poems is *Keter malkhut*, *Crown of Kingship*, a lengthy mystical poem that combines elements of philosophy and even science).

Tradition has it that Ibn Gabirol composed some twenty-one philosophical treatises, but the accuracy of this statement is perhaps debatable. In any case several important authentic works have survived, foremost among them the Arabic treatise translated into Latin as *Fons vitae* by Johannes Hispalense and Dominico Gundisalvo, which throughout the Middle Ages was thought to be by a Christian author. Second is the "Improvement of Moral Qualities," composed in Zaragoza in 1045 (Hebrew translation, Arabic original, and English translations are available). Finally, there is the *Mivhar ha-penanim* (*Choice of Pearls*, extant only in a Hebrew translation and an antiquated English one), which is an interesting collection of philosophical and moral maxims.

Ibn Gabirol's mysticism and possible relationship with the later development of *qabbalah* are other factors of importance. The *Fons vitae*, although translated into Hebrew in the medieval period, exerted no demonstrable influence on Jewish thought, although it had a strong impact upon the scholastics. Among modern

Spanish scholars Menéndez Pelayo devoted many pages to Ibn Gabirol; interest in him continues today.

IBN ḤAFṢŪN, 'UMAR

Ibn Ḥafṣūn was the most successful of many local Andalusian leaders who, during the late ninth and early tenth centuries, rebelled against the emirate and later against the caliphate of Córdoba. Like many of these rebel chieftains and their followers, he was of New Muslim ancestry (Arabic, *Muwalladūn*; Spanish, *muladí*). His grandfather Ja'far had converted to Islam, but all his earlier ancestors had been Christians, and bore Hispanic or Visigothic names. Ibn Ḥafṣūn's father was a prosperous landowner. His son had an impatient, fiery temperament, and after a violent quarrel that led to the death of a neighbor, Ibn Ḥafṣūn escaped into the mountains, then fled to Morocco, and later, fearing he would be discovered, returned to Spain (850) to become leader of a small robber band in the mountain fastness of Málaga (between Ronda and Antequera). His center of operations was Bobastro, an impregnable fortified redoubt high in the Sierra de Ronda. Ibn Ḥafṣūn's banditry, which earned him fame as a daring leader, gradually turned into a full-scale rebellion against Muslim authority. In 883 he briefly made peace with Córdoba and even joined the emir's army, but he soon became impatient with the scorn to which *muladíes* were subjected and returned to the mountains.

From Bobastro, Ibn Ḥafṣūn gradually extended his power over neighboring towns and villages, even seizing or controlling through alliances important and distant centers such as Archidona, Écija, Lucena, Priego, Baeza, and Úbeda. Córdoba, often successful in crushing local rebel leaders, could do nothing against Ibn Ḥafṣūn, who became an independent leader in his own right, even conducting correspondence with Muslim rulers in Tunis and with powerful Moroccans, whose boats from time to time brought him supplies. His activities certainly benefited the territorial aspirations of Alfonso III of Asturias (r. 866–910), though Ibn Ḥafṣūn seems never to have made contact with Christian leaders to the north of the *frontera*.

In 899 Ibn Ḥafṣūn proclaimed his conversion to the religion of his ancestors and started the construction, at Bobastro, of a small stone church whose ruins survive to this day. The conversion was a disastrous

tactical blunder; though it was enthusiastically welcomed by *mozárabes*, it lost him the support of many *muladíes*, who were sincere converts to Islam. From the moment of his accession, caliph ‘Abd al-Raḥmān III (r 912–961) vigorously and successfully undertook to suppress rebellious factions throughout his territory, reclaiming most of the fortified towns once controlled by Ibn Ḥafṣūn. But Ibn Ḥafṣūn and his fortress of Bobastro remained unvanquished. He died in September 917. His sons, though divided against one another, held out at Bobastro until 19 January 928. After the fortress surrendered, the tombs of Ibn Ḥafṣūn and his grandfather Ja‘far were opened, and their bodies were taken to Córdoba and exposed to public desecration. Ibn Ḥafṣūn’s daughter, Argentea—who had converted at the same time as her father, her mother, Columba, and her oldest brother, Ja‘far—entered a convent in Córdoba, but later chose a martyr’s death and was beheaded in 937.

IBN ḤAYYĀN

For his contemporaries, Abū Marwān ibn Ḥayyān was “the master of scholarship and of the historians in our land” (shaykh al-‘adab wa-l-mu‘arrikhīn bi-baladī-nā) and, for modern critics, he is “without doubt the greatest historian of the Middle Ages in all Spain, both Muslim and Christian”. (Only centuries later, with the *Muqaddima* of Ibn Khaldūn and the encyclopedic histories of Alfonso X, do we find anything quite comparable to the great historiographic achievements of this Córdoba scholar (ca. 987–1076), concerning whose life, however, despite his distinguished reputation, we know precious little. Ibn Ḥayyān seems to have lived in humble—even impoverished—circumstances until his appointment to the government chancellery. His writings reveal a highly critical, notably acerbic attitude toward many of his contemporaries and, very especially, his deep and bitter resentment of the political instability that wracked al-Andalus during the chaotic epoch of the Ṭā‘ifas. Ibn Ḥayyān’s writings have reached us only as mutilated, isolated fragments, pitiful vestiges of a vast and brilliantly systematic historio-

graphic enterprise. Several works—possibly seven in all—have been lost in their entirety, but some of these may only have been segments separated from Ibn Ḥayyān’s two major histories: the *Muqtabis* and the *Matīn*. His contemporaries cite and attribute to him the “great history” (*Al-ta’rīkh al-kabīr*), but it remains unclear as to which of these principal works, or their pieces and parts, such references may allude. The *Muqtabis*, in ten volumes, probably written before the *Matīn*, covered the history of Muslim Spain from the Conquest up to the author’s time. There are modern Arabic editions of three surviving parts. In the *Muqtabis*, Ibn Ḥayyān assembled a vast, critical anthology of earlier Muslim historians who wrote about al-Andalus. This work thus cannot properly be said to have been “written” by Ibn Ḥayyān. The title can be roughly translated as “a book copied from other authors.” (The verb *qabasa*, “to take, or seek to take, a brand [from someone else’s fire],” can also mean “to derive, acquire, borrow, take over.” With brilliant control and surprisingly modern editorial criteria—indicating lacunae, adding editorial notes and clarifications—Ibn Ḥayyān assembled and commented on a great number of earlier historians. The *Kitāb al-Matīn* (*The Solid Book*), in an astounding seventy volumes or parts, was something very different. Here Ibn Ḥayyān was writing about, analyzing, and criticizing the chaotic events of his own time, what he himself had witnessed, to reveal—in Dozy’s words—“a rare political understanding of events.” Thanks to his admiring disciple, Ibn Bassām, substantial portions of the *Matīn* have been preserved for us as part of the *Dhakhīra*. Had the *Muqtabis* and the *Matīn* both survived the ravages of time, they would surely have made up a “great history” indeed.

IBN ḤAZM

Abū Muhammad ‘Alī ibn Ḥazm was born in 994 at Munyat al-Mughīra, a suburb of Córdoba, and died on Mont Lishan, near Huelva, in 1063. He enjoyed the

luxury and the education of the wealthy during the last years of the last Córdoba caliph, 'Abd al-Raḥmān IV, at whose court his father was a high-ranking official. His first attempts to follow in his father's steps in political life proved unsuccessful. After the fall of Córdoba, and some years of residence in various places, in 1016 he sought refuge in Játiva, near Valencia. Between 1016 and 1023 he was minister during the short reign of the Umayyad caliph, and after the latter's assassination Ibn Ḥazm was thrown into prison. Between 1027 and 1031 he seems to have been active again in political life, from which he withdrew to turn to scholarship.

Ibn Ḥazm's education, with the best-known teachers of his time, encompassed the Qur'ān and religious sciences, theology, literature, medicine, history, and logic. He was a prolific author, with some four hundred titles attributed to him, of which only fourteen(?) are extant.

Ibn Ḥazm is especially well known in the West for his book *Tawq al-hamāma* (*The Dove's Necklace*), written during his exile in Játiva and thus a work of his youth. It is in the strictest sense a literary epistle (*risāla*), a mixture of prose and his own poetry. It offers, in thirty chapters, a rather nostalgic contemplation of the nature and experience of love, which he treats with some autobiographical references, a considerable amount of sensuality, and a great deal of sensitivity. A book on love of enduring appeal, it has been incongruently compared to Ovid's and Andreas Capellanus's somewhat similar works.

Of greater importance, yet lesser known, are his other books, works in which the image of the playful and sensitive youth dissipates, replaced by that of the pious, often rigid Muslim scholar that he was. In his *Maratib al-'ulum* (*Categories of Sciences*) he encourages the study of all sciences, but with an objective that is clearly religious, for in his opinion religion should be the aim of all learning. Less important in his view is the study of poetry, especially the lyrical (*ghazal*), which may lead to temptation, and the panegyric (*madḥ*), which tends toward deceitful exaggerations. His moral concerns are the topic of another book, the *Kitāb al-akhlāq wa'l-n-siyar* (*Book of Conduct*) consisting of twelve chapters in the form of admonishments and reflections on virtuous life.

The most important of all Ibn Ḥazm's extant works is his voluminous *Kitāb al-fisal fī'l-milal* (*Decision Among Religions*). Aiming at demonstrating the truth of Islam in comparison with all other religions, Ibn Ḥazm writes what has been considered a treatise on comparative religion. Beginning with the religious and philosophical doctrines farthest removed from the truth of Islam, such as the cynics for their rejection of any truth, and atheists, for their repudiation of the

existence of a God, he progresses to discuss the polytheists, as such Zoroastrians and Manichaeans, who recognize God but not his uniqueness. Christianity is included here because of the Trinitarian doctrine, which he understands to be a form of polytheism. Judaism is, in his view, the religion closest to Islam, except for its adulteration of the divine revelation, which he proves with reference to such Jewish sects as the Samaritans, Sadducees, and Talmudites. His analysis of the various religious doctrines is solidly based on textual references that show his vast erudition.

Dealing with Islam, Ibn Ḥazm refers to its various sects, from the Mu'tazilites to the Kharigites, which he sees to have in common their esoteric and allegorical interpretations of the Revelation. To avoid this, the true Muslim must follow the obvious (*ḡahīr*) and the literal meaning of the Qur'ān. In this way he justifies the school of the literalist Thahimites that for a time became popular in al-Andalus.

Points of great importance in Ibn Ḥazm's theology are harmony between faith and reason, divine predetermination, and free will. Possibly the most important is his effort to demonstrate the existence of God and the temporality of the world, and the necessity of divine revelation. Because of them, Ibn Ḥazm is considered a precursor of Christian scholasticism.

Ibn Ḥazm exerted a great influence, and his doctrine of literal interpretation became mainstream among the Zahīrites, and was continued by his followers, known as Hazmites. Of his direct students many are known in their own right. Well known also in the Orient, Ibn Ḥazm was praised by Al-Ghazālī, and his influence extended to the end of the sixteenth century, when it disappeared under bloody persecution. In the Maghrib the favor shown to his doctrines by the Almoravid reformer Muhammad ibn Tūmart al-Mahdī helped to enhance the political influence of his followers in North Africa and al-Andalus. Among the most famous scholars that totally or partially followed Ibn Ḥazm's doctrines are the philosopher Averroës and the mystic Ibn al-'Arabī.

IBN HŪD, MUHAMMAD IBN YŪSUF

Ibn Hūd died in 1237, but the date of his birth is unknown. The most important of a group of independent governors and magnates to emerge in al-Andalus after the decline of Almohad power, he was a descendant of the governing Banū Hūd clan of Zaragoza that had been deposed in 1118.

Ibn Hūd filled a power vacuum in Muslim Iberia at the beginning of the thirteenth century. He began his career in the army of Murcia, but deserted and quickly dedicated himself to brigandage, acquiring wealth, followers, and a reputation in a very short time. Defender of the Islamic cause, he fought against the Christians and took Murcia in 1228, subsequently extending his power to Córdoba, Seville, Granada, Almería, Algeciras, and across the Strait of Gibraltar to Ceuta. He recognized the Abbasīd al-Mustaṣṣir as caliph, took a number of impressive titles for himself like “Prince of the Faithful,” and became the most powerful ruler in al-Andalus during the first third of the thirteenth century. Ibn Hūd’s authority was soon challenged by individuals like Zayyān ibn Mardānīsh of Valencia and Muhammad ibn Yūsuf ibn Naṣr, who in 1231 declared himself ruler of his native Arjona, and then took Jaén, Guadix, Baeza, and other districts. Ibn Mardānīsh’s actions culminated in a clash with Ibn Hūd that greatly weakened the power structures of al-Andalus. At the same time, the king of Castile, Fernando III, took advantage of the instability created by the situation among the warring Muslims and, moving south, forced Ibn Hūd to cede several strongholds to him and become his tributary.

Ibn Hūd’s influence lasted but a short time. Even during the height of his power, he was continually menaced by Castile and Aragón. By 1236, Córdoba had fallen into the hands of Fernando III, and by 1238, a year after Ibn Hūd’s death, all of al-Andalus had become an easy target of opportunism for the Christian kingdoms of Iberia.

IBN AL-KARDABŪS

Abū Marwān ‘Abd al-Malik ibn al-Kardabūs al-Tawzarī (mid-twelfth century to early thirteenth) was born in the town of Tawzar, in southwestern Tunisia, in a frontier region of Ifrīqiya, which—like its peninsular homonym—came to be known, in late North African Latin, as *Qasṭīliya*, and where, even during our au-

thor’s time—as Al-Idrīsī assures us—a now extinct northern African variety of Romance (*al-laṭīnī al-afriqī*) may still have been spoken. As his patronymic would suggest (*Kardabūs* = *Cordobés*?), the historian’s forebears, probably muwallādūn, must have emigrated to North Africa from al-Andalus. We know very little about Ibn al-Kardabūs’ life. He seems to have lived for a time in Egypt, where he studied with a famous expert on the *ḥadīth*, Abū Tāhir al-Silafī. Whether he ever traveled to al-Andalus remains in doubt. Nor do we know much of anything about the sources he used to compile his *Kitāb al-iktifā’ fī akhbār al-khulafā’* (*The Adequate Book Concerning Information about the Caliphs*). Ibn al-Kardabūs’s narrative on occasion offers surprising details: In contrast to most other sources, Tāriq’s invasion was not a surprise pushover against unsuspecting Christians. He encountered well-prepared and well-armed defenders, who repulsed his initial attack, forcing him to land with difficulty on a rocky shore, whence he was later able to outflank and defeat the Christians. Like Cortés, Tāriq burned his boats: “*Fight or die!*” he challenged his men. The *Kitāb* includes its own version of the widely known “Locked House of Toledo,” of Count Yulyān’s treason, and of Tāriq’s feigned cannibalism. The defeated Rodrigo drowns in a river. We are told of the Tā’ifa kingdoms and of ensuing Christian conquests in which Alfonso VI and Alvar Hāñez play their parts: “May God’s curse be upon them!” At Zallāqa (Sagrajas), Yūsuf ibn Tāshfīn, on seeing the Christians initially rout the Andalusians, slyly observes, “Let both groups perish, for both are enemies.” El Cid besieges and takes Valencia, but dies of sorrow when defeated by the Muslims. Yūsuf ibn Tāshfīn comes to Spain accompanied by Sīr ibn Abī Bakr, presumably the “rey Búcar” of the *Cantar de Mio Cid*. Ironically, Alvar Hāñez is killed in a battle with Christians. Always interesting, Ibn al-Kardabūs offers us a wealth of unusual or otherwise unedited material.

IBN KHALDŪN

Born 27 May 1332 and died 16 March 1406, he is regarded as one of the greatest of all historians, but especially of the Muslim world. He developed a theory, method, and philosophy of history he called

‘umrān al-basharī, or the social study of human civilization. As a result, many credit Ibn Khaldūn with the invention of sociology. Born into a distinguished family of Andalusī origins in Tunisia (they had emigrated from Seville), Ibn Khaldūn received a thorough education at home, in the mosque, and among the many Iberian Muslim intellectuals who were refugees in North Africa. In 1345, his parents died of the plague, and he found employment at the court of the Hafids. For almost thirty years thereafter, he was deeply involved in the turbulent politics of North Africa and Spain. At one point, he was imprisoned for his political activities. In 1362 he went to Granada, where he was well received by the vizier, Ibn al-Khatīb. There he was enlisted to serve on a diplomatic mission to Seville and the court of Pedro I of Castile. Disillusioned by what he found in Iberia, he returned to Tunisia, where he became *hājib*, or chamberlain to the ruler. Soon embroiled again in political intrigue, he decided on voluntary retirement to the oasis of Baskarah in what today is Algeria. Circumstances, however, compelled him to return to politics, even though he foresaw dangerous consequences. In 1375 he withdrew again from court life to a castle in Oran, where during the course of the next five years he wrote *Al-Muqaddimah*, his greatest work. Drawn back into politics in 1380, his experience proved nearly fatal and, in 1382, he left Tunis never to return. He went to Egypt, where he became a Mālikite *qāḍī*, or judge, and a prominent teacher of Islamic law at Al-Azhar University.

Ibn Khaldūn's *Muqaddimah* serves as an introduction to his *Universal History*. *Kitāb al-‘Ibar* *Kitāb al-‘Ibar* is a valuable source for the history of North Africa and Iberia, but the *Muqaddimah* is a brilliant exposition of the methodological and cultural knowledge necessary to produce a scientific understanding of the past. Ibn Khaldūn was interested primarily in the reasons for the rise and fall of human civilizations; he contended that the basic causes of historical evolution are to be sought in the economic and social structure of society. In his work, he emphasizes environment, politics, economics, and religion as the determining factors in the development of societies. He surveys the sciences, refuting some like alchemy and astrology, and reflects on the manner of acquiring and using them. History, like science, involves more than a description of events, it calls for speculation, discrimination, and an attempt to identify the true causes and origins of existing things. The historian needs to possess a clear knowledge of customs, social organization, and beliefs and use critical judgment in dealing always with all the versions of the past. As such, history merits a place in the realm of philosophy. While *Al-Muqaddimah* serves as the introduction to *Kitāb al-‘Ibar*, in the six

parts that follow *Al-Muqaddimah* he goes on to apply his ideas to the entire history of humankind. The work is, for the most part, a political history and is arranged around individuals, dynasties, rulers, and important events, but also includes striking reflections on human association as a dynamic interaction of many motives. Ibn Khaldūn's work stands as a monument to the history of history itself and remains an extremely important source of scholarship for the late medieval Maghrib and Iberia in particular.

IBN AL-KHATĪB

Known as *ā Lisān al-Dīn* (1313–1374), Ibn al-Khatīb was the greatest Muslim writer of Granada and the last great intellectual, writer, and statesman of Muslim Spain. Son of a Granadine court official, he received an excellent education. He was vizier to Yūsuf I from 1349 to 1354, and continued, with one interruption, under Yūsuf's son Muḥammad V. Among his friends and pupils was Ibn Khaldūn, who was present for a period in the court. Ibn Zamrak, the poet and secretary of Muḥammad V whose verses adorn the walls of the Alhambra, was also a pupil of Ibn al-Khatīb. In 1371 or 1372 Ibn al-Khatīb was accused of heresy, and fled to Morocco. He was imprisoned in 1374, and killed in prison by hired assassins while an investigative commission studied the charges of heresy and disloyalty to Muḥammad V. Ibn Zamrak was accused of complicity.

Ibn al-Khatīb's linguistically and stylistically sophisticated works are numerous. Remembered primarily as a historian, he wrote extensively on the history and geography of the kingdom of Granada. His *al-Ihāta fī ta'rīkn Gharnata*, an encyclopedia of Granadine history, has yet to be completely published or translated. Ibn al-Khatīb was the first Arabic historian to write on Andalusian history in its entirety, and his works are the principal sources for important periods in the history of Naṣrid Granada. He also wrote extensively on Islamic history in general, travel, government, medicine, philosophy, and mysticism, and he is the author of many *muwashshahs* and other poems. We lack an adequate understanding of the significance

of Ibn al-Khatīb, who was well known and respected, though not always liked, by his contemporaries. The extensive treatment of him by Al-Maqqarī in *Nafh al-Tīb* has not been translated. Much of Ibn al-Khatīb's writing remains unpublished. The Escorial has an important collection of his manuscripts.

IBN MASARRA, MOHAMMED

Little is known of Moḥammed ibn Masarra's life. His father 'Abdalla, a merchant, had studied theology in Baṣrah, where he became attracted to the movement of rational theology known as the *mu'tazila*. Some years after his return to al-Andalus, and possibly to avoid persecution by the conservative jurists of the Mālikī school predominant in al-Andalus, he emigrated to Mecca, where he died in 899. Ibn Masarra followed his father's inclination to the Mu'tazilites. While still a youth he began to attract disciples, with whom he moved to a house he had in the mountains near Córdoba. This isolation did not prevent his teachings from spreading nor the Mālikī jurists (*fuqahā*) from becoming suspicious of his orthodoxy. To avoid their persecution, he left for Mecca under pretense of the pilgrimage. About 912, when 'Abd al-Raḥmān III became caliph, Ibn Masarra returned to his Córdoba isolation, where, in spite of the increasing opposition by conservative jurists and theologians, he continued teaching until his death in 931.

None of the books written by Ibn Masarra has survived. His life and his doctrines are only partially known on the basis of quotations, not all authentic, attributed to him by his followers, both Andalusian (Ibn Ḥazm, Ibn Sa'īd, Ibn al-'Arabī) and Oriental, (Shahrazuri, al-Shahrastānī, Qifti). From all these sources Miguel Asín Palacios reconstructed the body of his doctrines.

Ibn Masarra is considered the initiator in al-Andalus of the study of philosophy and of its esoteric application, mysticism. It seems that he followed an eclectic array of doctrines related to the gnostic Neoplatonism then in vogue in Alexandria and wrongly attributed to the Greek philosopher Emped-

ocles. His importance rests on his having introduced into Andalusian thought the concept of a spiritual matter common to all beings, thus opening the way to a doctrine of emanation, which later theologians and mystic writers interpreted in various ways.

IBN NAGHRĪLLAH, SAMUEL

One of the most important and fascinating Jewish figures of al-Andalus was Samuel (Isma'īl in Arabic) Ibn Naghrīllah (993–1056). Having fled Córdoba around 1013, after the civil war, he entered the service of the ruler of the Granada *ṭā'ifa* first as a secretary and then rose to the dual positions of prime minister and commander of the army. Whereas other Jews also held such posts for other *ṭā'ifa* rulers, Granada was the most important of the kingdoms, and the hostility of Muslim fanatics over the appointment of a Jew to such a post led to constant warfare with Granada. For eighteen years Ibn Naghrīllah was continuously in battle with his Muslim troops against these enemies, all of whom he vanquished.

Not only was he thus the first (and only) Jewish general since the time of Cleopatra, but as prime minister he had to oversee the growth and prosperity of the kingdom. In the midst of all this he found time to compose thousands of Hebrew poems, collected by his sons into three massive volumes. To these he assigned significant symbolic titles: *Ben Tehillim* (*Son of Psalms*), *Ben Mishley* (*Son of Proverbs*) and *Ben Qohelet* (*Son of Ecclesiastes*), which reveal his desire to equate himself with the biblical and heroic traditions of David and Solomon. This is expressed also in his poetry, where he more than once compares himself to David, the warrior-king and poet. His skill in poetry was profound, and he was not only the first great Hebrew poet but remains perhaps the shining star in that heaven (to borrow Heine's famous phrase, though unfortunately he did not know Ibn Naghrīllah's poetry to compare with that of ha-Levy and Ibn Gabirol).

His poetry introduced not only many of the Arabic meters into Hebrew (to which he added numerous new ones), but also most of the themes which characterized later Hebrew verse, such as love, wine, nature, and other motifs. *Ben Tehillim* contains numerous poems concerning his battles and victories, of course, as well as touching poems addressed to his beloved young son Yūsuf, who was to succeed his father as prime-minister of Granada. The vitriolic treatment of Yūsuf in the

Arabic source is not confirmed by what we know of his actual life. However, his use of tax money to complete his own palace (very probably the Alhambra), although merely copying what the king himself did, led to a riot in which not only he but most of the Jews of the city lost their lives.

Samuel, who—as he had predicted—died peacefully in bed, was also a renowned authority on Jewish law. Only fragments of his legal work survive, but there are numerous quotations of him in later rabbinical literature. He was also engaged in a polemic with his former friend, from his youth in Córdoba, Ibn Hazm, who since had become a zealous Muslim judge. He was not, however, as modern writers continue to err in saying, the author of the well-known introduction to the Talmud.

IBN QASĪ See BANŪ QASĪM

IBN AL-QŪṬĪYYA

Abū Bakr ibn ʿUmar ibn ʿAbd al-ʿAzīz Ibn al-Qūṭīyya (d. 977), a grammarian, lexicographer, poet, and historian, was known by his *laqab* (surname or nickname), as “the son of the Gothic woman,” thus being a descendant of Visigothic nobility, since one of his ancestors was Sāra, the granddaughter of Vitiza (r. 700–10), the next-to-last Visigothic king. Ibn al-Qūṭīyya was born in Seville, where he studied under various distinguished teachers, before moving to Córdoba to teach grammar, law, and *ḥadīth* (religious traditions). The idea that he was to become a *qāḍī* (judge) in Córdoba would seem to have been suggested by an erroneous reading of a passage by the tenth- to eleventh-century biographer, Ibn al-Faraḍī, in *Kitāb Taʾrīkh ʿulāmaʾ al-Andalus* (*History of the Learned Men of al-Andalus*) Ibn al-Qūṭīyya was the author of various works, some of which have been lost. Two that survive are his *Kitāb Taṣārīf al-aḥḥāl* (*Conjugation of verbs*) and *Taʾrīkh ifti-tāh* (or *fath*) *al-Andalus* (*History of the Conquest of Spain*). The *Taʾrīkh* probably was dictated by Ibn al-Qūṭīyya and written down and edited by one of his pupils, though the possible use of additional written sources cannot be ruled out. The narrative, as if reflecting somewhat disconnected classroom notes, may have been known in various different redactions (Ibn

ʿAzzūz). Various citations attributed to Ibn al-Qūṭīyya by other tenth-century Hispano-Arabic historians are not to be found in the *Taʾrīkh*, suggesting, among other possibilities, that the surviving text may perhaps be an abbreviation (Fierro, pp. 491–92). Ibn al-Qūṭīyya was one of the earliest historians of Islamic Spain. His *History* is invaluable in preserving for us materials heard from his teachers, anecdotes, personal impressions, and commentaries, found nowhere else, and possibly also family traditions and perhaps even prose summaries from a lost Romance (Mozarabic) epic tradition. Characteristic episodes from the *Taʾrīkh* concern the defeat of King Rodrigo (r. 710–11), the treachery of Vitiza’s sons, the “Locked House of Toledo,” and the account of a revolt against Al-Ḥakam I (r. 796–822).

IBN QUZMĀN

Abū Bakr Muhammad ibn ʿIsā ibn ʿAbd al-Malik ibn Quzmān al-Asghar al-Zajjāl was born in Córdoba, probably just after the battle of Zallāqah (Sagrajas) in 1086, and died in 1160. He called himself *wazīr* (vizir), and his family had produced several such, as well as other minor dignitaries, so the title may have been authentic, though it was a debased coinage by his time. Little else of his biography is certain, even his legendary ugliness, there being much confusion in the minds of later medieval as well as modern literary historians between him and at least one of his eponymous relatives. Much of what is commonly said to be descriptive of him and his life is gained from the internal evidence of his poetry, which by definition is subject to poetic license.

What we do know with certainty is that he had as patrons some of the more important political figures of Córdoba, Seville, and Granada during the turbulent years of his lifetime, which more or less coincided with the first seventy years of Almoravid domination. He was considered to be an important literary figure

shortly after his death, and even gained some renown in the Arab East, despite the fact that his poetry was written principally in the dialect of southern al-Andalus and in a form outside the normal canon of Arabic poetry.

Our sources for Ibn Quzmān's work consist primarily of one manuscript of his *Dīwān* (collected poems), copied in Safad (Palestine) a century or so after the poet's death. This is known as the "lesser" *Dīwān* because the existence of a more complete one may be inferred from citations by anthologists and historians, who provide a number of fragmentary, and a few complete, *zajals* as well as Ibn Quzmān's surviving poems in classical Arabic, including one *muwashshaḥa*.

Ibn Quzmān considered himself to be the master of an Andalusian poetic form he did not invent, but perfected, as he immodestly claims in the prologue to the St. Petersburg manuscript of his *Dīwān*, though he does express admiration for one predecessor (Ibn Numāra, about whom next to nothing is known). The *zajal* is a strophic poem apparently derived from the *muwashshaḥ*: the rhyme scheme is similar (mostly AB-cccAB or AA cccAA or AA cccA, the latter differing slightly from the standard *muwashshaḥ* scheme AA(orAB) cccAA(or AB), but whereas the *muwashshaḥ* is not meant to exceed five to seven strophes, the *zajal* may do so. The *muwashshaḥ* is in classical Arabic, with only the final refrain (*kharja*) in colloquial Arabic, Romance, or a mixture of both, whereas the *zajal* is entirely in the Arabic dialect of Córdoba, with an occasional sprinkling of pithy Romance words and phrases. The Arabic shows occasional lapses from the colloquial, probably for metrical reasons, possibly playing on different registers or levels of style.

The meter of the *zajal*, like that of the *muwashshaḥ*, has been the subject of virulent controversy. Most scholars who have studied Ibn Quzmān since he came to light in the late nineteenth century have concluded that the metrical basis of his songs is closely related to the quantitative rhythmic patterns of classical Arabic prosody. Another group, composed mostly of Spanish scholars, argues that the *zajal* is governed by syllable count and accent, like old Spanish poetry. Given the uncertainties involved, it is doubtful that the issue will ever be proved one way or the other, certainly not to the satisfaction of all.

The literary quality of Ibn Quzmān's *zajals* has not been questioned, and if his is not a "voice in the street," it is an original and vivid one. Even the long odes to the talent, good looks, and generosity of his benefactors are not devoid of local color and vividly expressed feeling; the occasional poems can be sublime, especially the love poems such as the famous

Now do I love you, Laleima, little star (*zajal* 10, l. 1)
or
Strangeness and solitude and violent passion—
Such is my lot: I am the lonely stranger! (*zajal* 124,
ll. 1–2)

Ibn Quzmān's emotional palette ranges from pathetic, unrequited love to graphic description of love-making with a Berber girl. Wine, food, companionship in revelry, music, and money or (more often) the lack thereof, as of other refinements such as elegant clothes, are favorite themes. His poems, even at their most conventional (the long panegyrics), are well crafted, often playfully evoking the conventional loci of Arabic verse for the dramatic or lyrical purposes of his piece. He paints an irreplaceably vivid picture of twelfth-century Córdoba, a city, a civilization conscious that its glory days were past:

Where is Ibn . . . 's Lane, with its bustle?
Where is the Mosque Quarter, and its beauty?
Laden it is with more spite than it can bear—
Come close! you'll see a
Field to plough and seed;
The rest infested
Head-high with weed. (*zajal* 147, strophe 3 and refrain)

IBN RUSHD See AVERROES; PHILOSOPHY

IBN SAʿĪD, ABŪ ʿL-ḤASAN ʿALĪ B. MŪSĀ B. MUḤAMMAD B. ʿABD AL-MALIK B. SAʿĪD

Poet, traveler and adventurer, geographer, literary historian and anthologist, Ibn Saʿī (1208/13–1286) is recognized as a leading exponent of Andalusian culture of the thirteenth century. He was born into a noble family of Yemeni ancestry that, during the period of the Ṭāʾifas, came to govern a fortress at the present site of Alcalá la Real to the northwest of Granada. Ibn Saʿīd's grandfather had served as *wālī* (governor) of both Seville and Granada, and his father apparently left the family fortress definitively in 1224 to become *wālī* of Algeciras. Ibn Saʿīd spent much of his youth at Seville, the leading intellectual center of al-Andalus at the time, where he studied under the tutelage of many of the outstanding scholars of his day. His father, who loved learning and scholarship more than politics, instilled in his son the same zest for learning and inquiry, and the two traveled about al-Andalus and Morocco to seek out rare books for their literary research. Father and son left al-Andalus in 1241 at a time when their political fortunes had been reversed, declaring their intention to perform the pilgrimage, though neither ever returned to his native land. The father fell ill and died in Alexandria in 1242, and Ibn Saʿīd then proceeded to Cairo, where he found an enthusiastic reception and was admired for his scholarship and literary talents. In an age of political uncertainty, Ibn Saʿīd's scholarship coincided with the fervent desire of many scholars to preserve the legacy of Arab civilization. Ibn Saʿīd traveled extensively, and his travels took him to Arabia, Syria, Iraq, Iran, and Armenia.

Much of Ibn Saʿīd's fame rests on a multivolume work entitled *Al-Mughrib fī Ḥulā ʿl-Maghrib*, a work to which he put on the finishing touches, but which in actuality took shape gradually over a period of about eleven decades. In 1135–1136, a man of letters by the name of Al-Ḥidjārī visited the family fortress, and the great-grandfather of Ibn Saʿīd encouraged the visitor to compile an anthology of Andalusian poets. In this anthology the author arranged all the poets according to the town or district to which they belonged. Then, for over a century, the original patron, his son, his grandson, and finally his great-grandson (our Ibn Saʿīd) sought to improve upon the work and to make numerous additions. In its final form it came to deal with the literary history and geography of not only al-Andalus, but of North Africa, Sicily, and Egypt, as well. The section devoted to al-Andalus, conserved in almost its entirety, gives brief geographical descriptions of each area as well as biographical notes of important personages, seasoned with anecdotes and poetical excerpts. Aside from its literary value, this work

tells us much about the intellectual and social life of al-Andalus up until the time of the work's completion. Drawing principally on materials from this anthology, Ibn Saʿīd composed short works for patrons on given topics or themes. There have come down to us several volumes of a companion work to *Al-Mughrib* identical in format, dealing with the literary history of the Arab East, and originally conceived of by Ibn Saʿīd's father.

Though Ibn Saʿīd's *dīwān* has been lost, a number of his poems have come down to us. His poetry is conventional in many ways; nevertheless, his verses of nostalgia recalling the days of his youth in al-Andalus speak of a heartfelt yearning to return and are rich in many imaginative images often succeeding one another in an almost dizzying kaleidoscopic fashion.

Even though Ibn Saʿīd's contributions to literary history are remarkable, no less so is the geographical information he either recorded from personal observation or culled from the sources he consulted in libraries throughout the many countries he visited. Among works attributed to him are travel accounts and a number of geographical and historical treatises.

IBN SHAPRŪT, ḤASDĀI

Abū Yūsuf Ḥasdai ibn Shaprūt was a Jew born in the tenth century at Jaén who rose to great power at the court of ʿAbd al-Raḥmān III at Córdoba. Learned in medicine (though there is no evidence he ever practiced it), he discovered the proper ingredients for synthesizing the long-sought ancient Greek "miracle drug" (*Al-fārūq*). Most important, however, he assisted in the translation of the essential work on drugs of the famous Greek physician Dioscorides, a manuscript of which was sent as a gift to the caliph by the Byzantine emperor. As Ibn Juljul, the famous Muslim physician who was a contemporary of Ibn Shaprūt in Córdoba tells us, Ḥasdai was the one "most interested" in making this translation. The availability of this work, with correct translation of the names of various drugs and their preparation, was of inestimable value for medieval medicine.

On the political level Ḥasdai served as a sort of "secretary of state" for the caliph, receiving embassies (that included Jewish interpreters) from Otto I of the

Holy Roman Empire, as well as the Byzantine Empire and other lands. He also used his position to gain improved treatment of Jews in these countries, particularly in Italy. Ḥasdāi negotiated the delicate matter of a cure for the obese Sancho I, the new king of Navarre, and persuaded Sancho and his mother, Queen Toda, to come to Córdoba to be attended by physicians. These delicate diplomatic negotiations, in which Ḥasdāi played a role, also took place.

During his international negotiations, rumors reached Ḥasdāi of a Jewish kingdom in the Crimea (the Khazars). He sent a letter in Hebrew to their king, inquiring as to their history and situation, and received a reply. Thus, news of this kingdom converted to Judaism spread among the Jews of Spain and resulted ultimately in Judah ha-Levi's *Sefer ha-Kuzari*.

Ḥasdāi attained a position of leadership of the Jewish community in al-Andalus, and was responsible for the support of developing Jewish educational institutions and the financial encouragement of emerging Hebrew poets. Apparently he also had a knowledge of mathematics and astrology, for Juan Vernet believes that he and Rabīʿ ibn Zaid (Christian bishop of Córdoba, ca. 961) were responsible for the *Mathematica Alhandrei summi astrologi*.

IBN SŪSAN FAMILY

One of the most powerful Jewish families of Toledo was that of Ibn Sūsan. (The name is sometimes erroneously spelled Ibn Shoshan, and is not to be confused with another important Toledo family, Sason.) Some were local government officials in Toledo in the twelfth century, holding important offices and highly esteemed by the Christians. One of these, Joseph (d. 1205), owned vast amounts of property in and around Toledo, and built a famous synagogue in Toledo. He also was *almoxarife* of Alfonso VIII, who granted him much property, and played an important role in Jewish scholarship. His son Solomon (d. 1221) inherited his position. The Talmudic commentator Meir Abulafia was his son-in-law. Another son-in-law, Abraham ibn al-Fakhkhār, was an important diplomat and accomplished poet. Ziza, the grandson of another of Joseph's sons, was the grandfather of the important astronomer

Judah ben Solomon ha-Kohen, who wrote some of the treatises of the Alfonsine astronomical corpus.

Another member of the family, Meir ibn Sūsan, was the *almoxarife mayor* of Alfonso X, and in 1276 was sent on a diplomatic mission to Morocco. He was also a doctor and head of the Jewish community in Toledo, and a close friend of Nahmanides, the famous scholar of Barcelona. Meir's son Abraham was *arrendador* of all the taxes of the kingdom for Alfonso X for two years, and also of the *mesta* taxes. In addition he was an important scholar, cited frequently by prominent Toledo rabbis of the next generation and later. Isaac (Çag) Abenxuxen, probably of this family, was *almoxarife* of Sancho IV (1292). Members of the family continued to play prominent roles, mostly in Toledo, throughout the medieval period. In the fifteenth century Jacob ibn Sūsan was a wealthy landowner and *arrendador* of taxes in Talavera, and in 1470 was the *mayordomo* of Juan de Oviedo, royal secretary and *jurado* of Toledo. Though many Jews served in government positions, no single Jewish family in Castile was as continuously involved in government as the Ibn Sūsans.

IBN TUFAYL

Little is known about Ibn Tufayl's early life. He was born in Guadix in 1106, may have studied under Ibn Bājjah, and was a physician to the governor of Granada. Ibn Tufayl's medical fame soon spread and he was called to serve 'Abd al-Mu'min, the Almohad sultan, at Ceuta in the same capacity. Around 1163, he was named court physician and vizier to Abū Ya'qūb Yūsuf, the second sultan of the Almohads, who encouraged Ibn Tufayl to form a court circle of intellectuals that attracted the best talents of his day. Ibn Tufayl was followed as court physician by Ibn Rushd (Averroes), whom he had attracted to his circle, although he himself kept the post of vizier until his death in 1189. Ibn Tufayl's fame was such that his funeral was attended by Al-Manṣūr Yūsuf Ibn Ya'qūb, who was then Almohad sultan.

Ibn Tufayl was the author of several medical and astronomical works. However, his universal fame rests on his *Risālat Hayy ibn Yaqzīn* (*Alive, Son of the Awake*), which became a classic of Arabic literature.

In this work, Ibn Tufayl develops the idea of the solitary man, first articulated in the writings of Ibn Bājjah. *Hayy ibn Yaqzīn* tells the story of a man from birth through adulthood, characterizing each of the processes and stages of his development. Hayy Ibn Yaqzīn appears mysteriously on a deserted island. His cry attracts a gazelle who has lost her fawn and who suckles and adopts the boy. Never exposed to language, aided only by his natural reason, the youth learns what is necessary to live and to explain the cosmos and life itself. Observation, experience, and thought lead him to conclude that there is a supreme being, creator and giver of all life, to whom all owe reverence. Knowledge originates from the combined experience of the physical and metaphysical and the human soul, formed in three successive stages (the vegetative, sentient, and rational), is capable of discovering the idea of God as agent and final cause of all things. This story of autodidactic human development permits Ibn Tufayl to expatiate on his scientific theories concerning the processes involved in nature and in the development of life. Later, Hayy encounters Asāl, a man from a neighboring island, who teaches him to speak. They discover that their ideas on Creation and absolute knowledge coincide, and that Asāl's formal religious training is merely a different form of the same eternal truth. When Hayy and Asāl visit another island with the intention of teaching the ways of truth and contemplation, they find that its ignorant inhabitants will not accept the true sense of things. The two become convinced of the defect of living in society and decide to return to uncorrupted isolation and pass the rest of their lives in the contemplation of eternal truth.

Hayy ibn Yaqzīn acknowledges Islam as a valid revealed religion and as a sure path to the truth but at the same time it proposes that philosophy can achieve the same end. Knowledge, perfection, and happiness may be attained by intellectual means and in conformity with human nature. For this reason, the work was central to the revival of philosophy in al-Andalus in the twelfth century under the patronage of the Almohad sultans. Ibn Tufayl's allegory of the harmony of reason and faith must have been known in the West through contact with al-Andalus. Although no early Latin translations are known to exist, it was translated into Hebrew in 1349 by Moses of Narbonne. Moses's text was subsequently translated into Latin and edited by E. Pococke in 1671 under the title *Philosophus Autodidactus*, from where it was rendered into several European languages. Ibn Tufayl's themes are repeated in almost identical fashion by Baltasar Gracián in his *Criticón* during the seventeenth century and were taken up by Daniel Defoe with striking similarity in *Robinson Crusoe*.

IBN WAQĀR FAMILY

One law of the *Siete Partidas* that, like most of those concerning Jews, was never enforced and was never intended to be, prohibited the use of Jewish physicians. Nevertheless, like every king, Alfonso X had as his physician a Jew, named Abraham ibn Waqār, who was also a learned astronomer who wrote part of the Alfonsine astrological corpus. Juan Manuel relates that at the death of Sancho IV, present at the bedside were his physician, Abraham ibn Waqār, and Abraham's older brother don Çag, who later was Juan Manuel's own doctor; he adds that the brothers had also served Alfonso X and Juan Manuel's own father, Infante Manuel. Çag (Isaac) ibn Waqār was often highly praised by Juan Manuel, and appears to have served as a confidant regarding delicate relations with Jaime II of Aragón-Catalonia (1303). In 1303 and again in 1306, Jaime granted lands taken from Muslims in Valencia to Isaac. The service of both Abraham and Isaac to Sancho IV is confirmed by grants of money to them from that ruler. Another member of the family, also in the service of Sancho, was Mosé (Moses), who also was given gifts of clothing by Pedro III of Aragón-Catalonia, while physician to the queen.

Samuel (possibly Ibn Waqār) was supposedly the author of an Arabic work on cures (ca. 1311) for Fernando IV. Perhaps it was this same Samuel who, with a relative named Abraham, was physician to Alfonso XI and owned several houses in Toledo. In 1331 he rented the privilege of minting the new coins from the king and administered the taxes of the frontier, which aroused the jealousy of Yuçaf de Écija and led to a violation of the treaty with Granada, resulting in war.

Çag Aboacar (Ibn Waqār) of Guadalajara, possibly the son of Moses, was physician of the powerful marquis of Santillana (Íñigo López de Mendoza), and was exempted from taxes by Enrique IV in 1465 and by the Catholic Monarchs in 1488. Among the Jews expelled in 1492 who returned to be baptized and live in Spain was this Çag, who became (or already had been) the physician of Cardinal Pedro de Mendoza (1493), and was taken under his protection.

IBN ZAYDŪN

Abu' l-Walid Ahmad ibn 'Abdullah ibn Ahmad ibn Ghalib al-Makhzumi ibn Zaydūn was born in Córdoba in 1003, and died in Seville in 1071. He became famous as one of the best neoclassical poets in al-Andalus, and more specifically for his love poetry to the Umayyad princess Wallāda. The fact that three editions of his *Dīwān*, two of them also containing his letters, are available attests to his popularity among his contemporaries as well as twentieth-century Arabs who edited them.

Ibn Zaydūn was born into an illustrious family of Arab origin during a period of great cultural splendor in Muslim Spain that was also the beginning of an era of political instability. He was in a position to acquire an extensive education in literary culture, specifically classical Arabic literature, and he started writing his own verse when he was very young. He was first publicly recognized at the age of nineteen for a long elegy upon the death of one of his teachers, Ibn Dhāqwan, whom he admired very much.

After Caliph Al-Mustakfī was killed in 1025, his unconventional daughter Wallāda, herself a poet, became the center of Córdoba's literary circles, in which Ibn Zaydūn played an active part. Poems tracing the stages of his love for Wallāda dominate the greatest part of Ibn Zaydūn's ensuing literary work and also show its most original poetic aspects, though he also drew on his extensive literary training to produce erudite, beautifully crafted poems in a more traditional style, such as one *qaṣīda* against his rival Ibn Abdūs.

In his love poetry Ibn Zaydūn uses many stock themes of courtly love poetry as well as the poetic code of classical Arabic poetry, but he excels in endowing them with new suggestive power and poetic intensity. His first poems give expression to happy union, the elevation of the beloved, and the submission of the lover to the point where a glance is enough and he is even ready to die for her. Their union is threatened only by "the envious" and "slanderers." Soon, however, his poems deal with themes of separation because of her rejection and with his imprisonment, which probably had to do with his political aspirations. He fled from prison and then tried to entice Wallāda to join him.

Ibn Zaydūn's most famous poems spring from this era: the *Nūnīya* and his memories in the garden of Medīnat al-Zahrā. In the *Nūnīya*, he tries to induce his

beloved to go with him. With the repeated rhyme *na*, meaning "us," in addition to the frequent use of the sixth verbal form, suggesting mutuality, he endows language forms and the accepted poetic code (monorhyme) with the suggestive power to express his hope. Numerous other acoustic and structural patterns that are derived from the tradition of classical Arabic literature are creatively employed to support the poetic message in subtle ways. In his famous poem from *Al-Zahrā*, he uses the acoustic effects of the rhyme *aqā*, which together with frequent other guttural sounds reflects the melancholy, dark mood of yearning in a way that could not be achieved through rational verbalization alone.

Ibn Zaydūn's use of concepts goes far beyond a beautiful reworking of well-known images. Traditionally parts of nature were often compared to the beloved's beauty. Ibn Zaydūn, however, humanizes and spiritualizes nature by describing it as capable of feelings and their manifestations. For instance, the breeze becomes a friendly spirit sympathizing with the lover's sickness, and the flowers drooping under the morning dew are weeping with him.

Ibn Zaydūn also incorporates many Neoplatonic spiritual ideas into his love poetry, including love as the upsurge of the soul, love having its seat in the soul, and the purity of love, which—in its mixture with sensuality—is quite different from central European courtly love poetry.

After an extended exile Ibn Zaydūn was granted permission to return to Córdoba, where he became court poet at the age of thirty-eight. He left Córdoba again, however, and spent his last years at the court of Seville, as court adviser and poet of panegyrics. In the last year of his life, he was able to return to Córdoba in triumph because his patron, Al-Mut'amid, took over the city.

Ibn Zaydūn enriched the tradition of classical Arabic poetry with his conceptual innovativeness and his creative use of accepted acoustic and structural elements.

IBN ZUHR, ABŪ MARWĀN ʿABD AL-MĀLIK

(1092?–1161?) Called Avenzoar in Latin translations, he was one of the most important physicians in the history of al-Andalus. Born circa 1092 into an important family of physicians: his grandfather, 'Abd Al-

Mālik ibn Zuhr (d. ca. 1078) studied medicine in Cairo and, when he returned, became personal doctor to al-Mujāhid, king of the *ṭāʾifa* (free kingdom) of Denia (ca. 1010–1045). His father, Abū-l-ʿAlāʾ Zuhr, served as a physician to King al-Muʿtamid of Seville (1069–1091) and, later, to the Almoravids Yūsuf ibn Tashfīn (d. 1106) and ʿAlī ibn Yūsuf (d. 1143). Abū Marwān was born and died in Seville but after 1120 spent a good part of his life in Marrākesh, where he inherited his father's post as royal physician to ʿAlī ibn Yūsuf. Difficulties with this emir, due to obscure reasons, took him into prison (ca. 1131–ca. 1140). With the arrival of the Almohads he became, once more and until his death, personal physician to Caliph ʿAbd al-Muʿmin (1130–1163). His son, Abū Bakr (1113–1199), served in the same way to Caliph Yaʿqūb al-Manṣūr (1184–1199).

Unlike his friend, the famous philosopher and physician Ibn Rushd (Averroës), and following his family tradition, his attitude toward medicine is essentially practical and his works always contain case records and other observations drawn from his own personal experience or from that of other members of his family. Among his extant works, a few merit special attention. *Kitāb al-iqtisād fī iṣlāḥ al-anfus wa-l-ajsād* (On the Adequate Way to Treat Souls and Bodies) is a collection of texts of approximately equal length, written when the author was about thirty years old, to be read to prince Ibrahīm Ibn Yūsuf Ibn Tashfīn, Almoravid governor of Seville, to whom Abū Marwān was introduced in 1031. It deals with (*zina*) (cosmetics), i.e., the different ways to preserve and embellish the external parts of the human body, including plastic surgery and sexual hygiene, to which Abū Marwān adds a handbook on pathology that deals with the description and treatment of all known diseases classified “from head to toe.” *Kitāb al-taysīr fī-l-mudāwā wa-l-tadbīr* (Simplification of Medical Treatment with Drugs and Diet), written after 1147 as an attempt by a cultivated, mature physician to improve the quality of the purely practical therapeutical treatises known as *kunnāsh*, is an excellent handbook of pathology and therapeutics for the daily use of the practicing physician written by a man with both a long medical experience and an excellent knowledge of medical theory. *Kitāb al-jāmiʿ fī-l-ashriba wa-l-māʿ fājin* (A Comprehensive List of Syrups and Electuaries), written—like his *Kitāb al-aghḍhiya* (On Food)—for Caliph ʿAbd al-Muʿmin, it is usually considered a kind of appendix to the *Taysīr*, and both appear together in the edition by M. Khūrī (Damascus, 1983). It proves the interest Abū Marwān had in practical pharmacology: it consists of a collection of recipes for the preparation of compounded drugs (syrups, elec-

tuaries, pills, ointments, and so on). To this list one should, perhaps, add the *Al-Tadhkira fī-l-adwāʾ al-mushila wa ghayri-hā* (Memento on Laxative and Nonlaxative Drugs), a short treatise ascribed by G. S. Colin to Abū-l-ʿAlāʾ Zuhr, though Khaṭ ṭ ābī has given, recently, arguments in favor of Abū Marwān's authorship. It is a work that shows that its author had a solid knowledge in pharmaceutical theory and a very cautious attitude toward the administration of drugs to patients.

ICART (YCART), BERNARDO

Icart, a Spanish composer and theorist, was born about 1440, perhaps at Tortosa, and died after 1480, perhaps at Naples. Awarded an abbacy yielding an annual fifty gold cameral florins by Pope Sixtus IV on 27 October 1478, Icart was named a *clericus dertutensis diocesis*. In 1479 he was among the chapel singers employed at the Neapolitan court of Ferrante I (son of Alfonso V of Aragón)—his name, “Bernar Hicart,” appears immediately before that of the famous Flemish theorist Johannes Tinctoris (ca. 1435–ca. 1511) in the chapel list. On 27 October 1480, Icart received an allowance of approximately three meters of blue cloth for a choir gown. Francesco Florimo asserts that Icart rose from being a mere singer to *maestro di cappella* in the Neapolitan court.

In the *Dialogus Johannis Ottobi Anglici in arte musica* John Hothby, an English Carmelite based at Lucca after 1467, mentioned Ycart (Icart) as a composer fond of verbal canons (directions for singing) superscribed over tenors. For instance, “When he wished to have black notes sung as white notes, he wrote over them *Ethiopians have white teeth*.” Franchino Gaffurio, (1451–1522), who spent 1478–1480 at Naples, called Icart one of the *clarissimi musici* with whom he consorted, and in his first theoretical treatise exemplified a correctly used *punctus transportationis* with a nine-note excerpt from the tenor of a now lost *Missa voltate in qua* by “Bernardus Ycart.” Gaffurio also mentioned one other, now lost, Icart Mass, a *Missa de amor tu dormi*.

The *Lamentationum Jeremie prophete Liber primus*, published 8 April 1506 at Venice by Petrucci,

contains at folios 7–13 Icart's settings for the last three days of Holy Week: (1) Lamentations 1:1–3 plus the refrain "Jerusalem convertere"; (2) Lamentations 2: 1–2, 9, refrain; (3) Lamentations 5:1–8, refrain. Neither Tinctoris nor Icart, who are among the eight named composers, quote chant, except for Icart in the *Oratio Jeremiae*. Icart's six other extant sacred works are found at the Biblioteca Comunale at Faenza in codex 117 (three movements of a Mass, three even-verse Magnificats). The twenty-six-note tenor in the four-voice Kyrie, *Et in terra pax*, and *Qui tollis* movements duplicates the tenor in Icart's *Magnificat sexti toni*, thus entitling him to be called the composer of the first "parody" Magnificat. The Pixérécourt *chan-sonnier* (Paris, Bibliothèque nationale, 15123), folios 62^v–63, exhibits a picaresque four-voice item titled *Non toches a moi car son trop*, attributed to "b. ycart." The *chapurrado* text mixes a gibberish of French, Italian, and nonsense syllables, with "nichí, nichí, nioch" recurring as a refrain at the close of both the *estribillo* and the *coplas*.

ILLIBERIS See CHURCH; WITCHCRAFT

ILDEFONSUS, ST., BISHOP OF TOLEDO

Of Visigothic origin, Ildefonsus (b. ca. 607) was a monk and then abbot of the important monastery of Agali in the vicinity of Toledo, prior to succeeding Eugenius II as metropolitan bishop of the city in 657. During this time he also founded a convent for nuns from his own resources. During his episcopate (657–667), Ildefonsus wrote a continuation of Isidore's *De viris illustribus*, providing brief accounts of the lives and writings of thirteen Spanish ecclesiastics of the mid-seventh century, including Isidore himself. In due course Bishop Julian of Toledo (680–690) added to this collection a short "Eulogy" of Ildefonsus, the principal source for our knowledge of his life. Of

El Greco (1541–1614). St. Ildefonso. Copyright © Scala/ Art Resource, NY. Church of Charity, Illescas, Spain.

the writings of Ildefonsus referred to by Julian, only three are now known: two brief books of patristic excerpts on the subject of baptism and the ideal life of the baptized Christian, and his most substantial work, a defense of the perpetual virginity of the Virgin Mary. This was written in the "synonymous style" developed by Isidore, with each statement repeated as many times as there were different synonyms to employ in it. From this work grew the legend of the reward that the Virgin gave to Ildefonsus for his defense of her, which first appears in the mid-eighth-century *Life of Ildefonsus*, almost certainly written by Bishop Cixila of Toledo (744–753). The unspecified "treasure" of the *Life* was transformed into a chasuble in the later artistic depictions of the event. The *De perpetua virginitate* was dedicated to Bishop Quiricus of Barcelona, who may be the Quiricus (667–680) who succeeded Ildefonsus as bishop of Toledo.

IMPERIAL, FRANCISCO

The known historical documents concerning Micer Francisco Imperial reveal only that in 1403 he was vice admiral of Castile and that he may have died sometime before April 1409. In addition, Juan Alfonso de Baena, the first known editor of Imperial's poems, states that Imperial was born in Genoa and lived for some time in Seville. In July 1404 the admiral of Castile, Diego Hurtado de Mendoza, died. If Imperial entertained any hopes of being named admiral at that time, he must have been disappointed when on 4 April 1405, King Enrique III named Alonso Enríquez to the position. Many of Imperial's poems, including the two long poems for which he is best known, were composed after this disappointment, which probably explains why the theme of Fortune is predominant in them. The theme of Fortune is also crucial to the understanding of Baena's anthology, which features Imperial's poems and is a political document aimed at bringing the king's attention to focus on the plight of Jews and *conversos* in Spain, especially after the bloody pogroms of 1391.

Imperial is best known for two long poems, *Dezir al nacimiento del rey Don Juan* and *Dezir a las syete virtudes*. The first poem was composed shortly after the birth of the Castilian prince who later became King Juan II. It describes a vision a poet had in a *locus amoenus* where the seven planets and *Fortuna* were gathered to bestow their gifts on the infant soon to be born. *Fortuna*, who has the last word, claims that the gifts of all the other speakers are worthless without hers. After *Fortuna*'s speech the poet is afforded a glimpse of the infant and is then expelled from the setting by the gardener.

In *Dezir a las syete virtudes* the poet, with the help of a guide who carries a copy of Dante's *Commedia*, relates a vision of the Virtues and Vices as they affect Castile. Most of the fifty-eight stanzas of this poem contain references to Dante's *Commedia*. Like Dante, the poet clearly had it in mind to denounce a favorite city of Castile in the manner that Dante condemned Florence. There are also important references to the Bible, especially to Revelation (in which Babylon is condemned). The poem in this way belongs to the apocalyptic tradition of the vision granted to a virtuous individual.

All eighteen of Imperial's poems, as anthologized in the *Cancionero de Baena* (1445), were written in accordance with Provençal literary theory as explained in treatises like the *Leys d'amors*. They therefore respond to true historical events (*vertatz*), veiling them subtly under literary and theological artistic adornments. Spain's most pressing truth, at the time Imperial was writing, was the treatment of Jews and *conversos*.

INFANTE

Besides its meaning of "child," this derivative in Castilian of the Latin *infante(m)* with the same application acquired at least two other meanings of importance during the Middle Ages.

One was "legitimate child of a noble father," and the word was followed by the name of the family seat. The usage ceased to be employed in the thirteenth century, enduring thereafter only in epic and ballad (the *infantes* of Salas, the *infantes* of Carrión). The term was not restricted to unmarried children or youths; it included those who had been knighted and were married until they succeeded to their father's estate. The female equivalent of *infante* was *infantissa*.

The second meaning was "legitimate child of the king." This usage, datable to the ninth century, became the primary one in thirteenth-century Castilian, and from then on is found in Catalan and Portuguese also. In Castile the term is found in the *Espéculo* (*Fuero real*; ca. 1252/1255) and in the *Siete Partidas* (1256–1265) with reference to all the king's legitimate children; other royal Castilian documents of the period make it clear that *fijos* included royal daughters as well as sons. (The form *infanta* dates at least to the middle of the twelfth century, but appears not to have become general, at least in this type of document, before the reign of Sancho IV.)

The title *infante* occasionally has been applied to Juan Manuel, nephew of Alfonso X, but the famous politician and prose stylist himself refuted the accuracy of the application. The heir to the throne of Castile became known as the prince of Asturias at the time (1388) the future Enrique III was married to Catherine of Lancaster. Adoption of this title has been attributed to English influence.

INFANTES OF ARAGÓN

The term "*infantes* of Aragón" is frequently used to refer to the sons of Fernando I, king of Aragón (r. 1412–1416). Before his death in 1406, Enrique III of

Castile had foreseen the problem of a minority, and he left the government of the kingdom to a regency of which his brother Fernando was to be the dominant personality. He used his position to promote the interests of his family, promoting their powers in both Castile and the other Iberian kingdoms.

Two of the *infantes* of Aragón were to dominate the political scene in Castile. In 1409 Fernando obtained the mastership of the military Order of Santiago for Infante Enrique, who was to be involved in political intrigue until his death in 1445. His elder brother, Infante Juan, not only owned vast landed possessions in Castile but also became king of Navarre in 1425 and succeeded the eldest son, Alfonso V (r. 1416–1458), as ruler of the Crown of Aragón (1458–1479). Fernando's daughter, María of Aragón, was married to the young Juan II of Castile in 1418, and Juan's sister was married to Fernando's son, Alfonso. All in all, the infantes of Aragón virtually monopolized political power in Castile.

Nevertheless, Juan II of Castile, ably supported by his favorite Álvaro de Luna, launched a protracted attack on the power of the infantes of Aragón from the early 1420s on, and after a complicated series of successes and reversals, finally broke the powers of the Aragónese party in Castile at the battle of Olmedo in 1445.

At issue were two radically opposed notions about the nature of monarchy and political power in Castile. The infantes of Aragón thought in terms of a series of complicated family relationships that encompassed many of the great nobility: they were the king's natural advisers and councillors. It followed that major problems should be considered by the king in council—that is, by the king in association with the leading aristocrats, who happened to be his relatives as well—and with the help of technical experts, *letrados*, who would see that the details of routine business were implemented once the key decisions had been made. Yet the infantes of Aragón were no great lovers of constitutional restraints on the monarchy. Juan II and Álvaro de Luna were fond of stressing the king's right to decide matters on the basis of his "own will, certain knowledge, and absolute royal power." The infantes of Aragón did not wish to deny the king's right to use his absolute power; what they wanted to do was to ensure that he wielded this power on behalf of their relations and the nobility. Their concept of power was, above all, aristocratic.

INFANTES DE LA CERDA

The Infantes de la Cerda, Alfonso and Fernando, were the sons of Fernando de la Cerda, the oldest son of Alfonso X of Castile (r. 1252–1284). Fernando de la Cerda died unexpectedly in 1275 while raising an army against the Benimerines, who were invading from Morocco. Since Alfonso X was out of the country, Sancho, the next oldest son, took command of the army and successfully fought the Benimerines. At the urging of the Haro family, Sancho claimed the title of heir to the throne, but Juan Núñez de Lara, to whom Fernando had entrusted his minor children, upheld their rights. Alfonso X initially approved Sancho's claim, as did the *cortes* (parliaments) of Burgos in 1276, but when Sancho revolted against him in 1282, the king chose Alfonso de la Cerda as his heir.

The Infantes thus became the center of a succession crisis that had at its root the interpretation of Castilian law. Alfonso cited the *Siete Partidas*, based on the concepts of primogeniture and representation, to designate Alfonso de la Cerda as his rightful heir, while Sancho claim was based on customary principles of elective monarchy, as exemplified by his ratification by the cortes of Burgos. Queen Violante and Blanche of France, the grandmother and mother of the Infantes, removed them to Aragón in January 1277/1278, to the protection of their great-uncle Pedro III (r. 1276–1285), but Sancho persuaded Pedro to hold them captive. Philip III of France, persuaded by his sister Blanche, insisted on the Infantes' rights, but Sancho convinced Philip IV to abandon the Infantes. Alfonso III (r. 1285–1291) of Aragón recognized the Infantes, released them from custody, and had Alfonso proclaimed king of Castile at Jaca in 1288. The Treaty of Bayonne (1290), between France and Castile, and the death of Alfonso III of Aragón in 1291 marked the end of foreign support for the Infantes until Sancho IV's death in 1295, when Aragón and Portugal launched an unsuccessful invasion of Castile to make Alfonso de la Cerda king. The resulting peace settlement effectively eliminated the Infantes from serious contention for the throne, although Alfonso de la Cerda maintained his claim until 1331, when he pledged homage to Alfonso XI of Castile (r. 1312–1350).

INQUISITION, SPAIN AND PORTUGAL

In the Iberian Peninsula the Inquisition had two distinct phases: the medieval and the modern. The medieval Inquisition in Europe was not an institution but a special commission granted by the pope to specific persons (invariably from the Dominican order) in certain areas to investigate heresy by cooperating with the normal machinery of the bishops' courts. The first extensive use of these commissions was in southern France in the early thirteenth century, against the Albigensian movement. Because the heresies of southern France spilled over into Catalan territory, in the 1230s the see of Tarragona was asked to help in vigilance. In 1231 Pope Gregory IX established permanent local inquisitions in various territories. No commissions for inquisition were issued in Iberia except in the Crown of Aragón, where the formative steps were taken under Jaime I the Conqueror; and in 1242, under the guidance of the Catalan Dominican Ramón de Penyafort, the Inquisition in the Crown of Aragón was formally adopted when the provincial council of Tarragona laid down rules for its functioning and accepted the imposition of the death penalty for heresy. At this period the Cathars were the perceived heresy, but they were not active in Catalonia. As a result there was little active persecution, the only notable case being the condemnation of heretics at Castelló.

After the fourteenth century the inquisitorial commissions in the Crown of Aragón were dormant, intervening sporadically in cases such as the suppression of the Templars in 1312. When the Catalan Nicolau Eymerich was appointed inquisitor in 1356, he renewed the severity of earlier days, and also wrote a key guidebook, the *Manual for Inquisitors*. After his death in 1399 very few prosecutions took place. Finally, in 1483, the papal Inquisition of Aragón was replaced by the new Castilian Inquisition, which, like that of Portugal, had a long and eventful history of some three hundred years (and consequently will be outlined here only for the period up to the early sixteenth century).

In Castile there had been no medieval inquisitions and little awareness of "heresy," which was normally dealt with in episcopal courts. Social tensions in the south of Castile between the growing minority of converted Jews (*conversos*) and the majority Old Christian population led in the fifteenth century to growing concern over the orthodoxy of the *conversos*, and hence to demands for the establishment of an inquisition on

the French model. In 1478 Pope Sixtus IV granted Fernando and Isabel a bull commissioning two or three inquisitors; the appointments were not made until 1480, when two Dominicans were authorized to start proceedings. Seven more appointments, among them that of Tomás de Torquemada, were made in 1482; and from this time the Spanish Inquisition came into existence as a formal institution, a governing supreme council (or *Suprema*) being set up in 1483.

The early years of the modern Inquisition were highly conflictive. There was bitter opposition in Catalonia and Valencia to the abolition of the old papal commissions and the appointment of new Castilian inquisitors; and in Aragón opposition culminated in the murder (in 1485) of the inquisitor Pedro Arbués. The pope tried to retain authority over the inquisitors, but in 1483 gave way and conceded complete control to Fernando, who that year appointed Torquemada as inquisitor general over the inquisitions in all the Spanish realms. In Castile conflict concentrated in the south, where the arrest and execution of *conversos* (those who converted to Christianity) suspected of heresy took on Holocaust dimensions.

Also in Castile an important controversy took place—in reality the continuation of one that had begun in the 1450s—over the role of *conversos* in society, and whether force was the appropriate method for dealing with deviation in religion: Queen Isabel's secretary, Fernando de Pulgar, felt the use of the death sentence to be both cruel and unhelpful. By the end of the century a network of tribunals was established across Spain devoted primarily to investigating the orthodoxy of the Jews, who, since 1492, and the Muslims of Castile since 1500, had been forced to accept the Catholic faith. Of the sixteen permanent tribunals of peninsular Spain, eleven were founded by 1500, three between 1505 and 1526, and one (Santiago) in 1574; the last, established in 1640, was that of Madrid.

The activity of the tribunal in its first twenty-five years was directed almost exclusively against *conversos*; a contemporary estimated that in its first ten years it burned two thousand people and punished fifteen thousand others. After this period people of Jewish origin featured far less in trials. The early, savagely anti-Semitic years with their unparalleled death rate, were untypical of the rest of the three centuries of the Inquisition, and historians consequently have taken care to distinguish between the different phases in its evolution. From the early sixteenth century, converted Muslims (*Moriscos*), and later Protestants, absorbed the attention of the inquisitors.

The Inquisition's procedure, which was laid down by various *Instrucciones* from 1484 on, was based

closely on the medieval French model. Those suspected of heresy (which was treated as a capital crime) were interrogated in secret, were occasionally tortured, and had their property seized; public proceedings took the form of an auto da fe, at which Mass was said and punishments were decreed. Judicial penalties ranged from being burned alive at the stake (a sentence never carried out by the Inquisition, which as an ecclesiastical tribunal could not pass sentences of blood, but by the secular authorities, to whom the condemned person was “relaxed”), to the wearing of penitential garments called *sambenitos*. Each tribunal had two or three inquisitors, invariably from the Dominican order and trained either in theology or in law; they were assisted by a small staff including a secretary and a jailer. To help with distribution of orders and arrest of suspects, the tribunal had the aid of laymen (“familiaris”) who, contrary to popular legend, played no part in the denunciation of people. In addition, members of the local clergy were appointed as *comisarios* to help in collecting information.

Up to the mid-sixteenth century the Inquisition was financed exclusively out of confiscations and received no regular income, which may have stimulated its prosecution of propertied people. Though the medieval Inquisition had been theoretically under the control of the local bishop, the Spanish one, like the later Portuguese Inquisition, was dependent directly on the crown, and consequently was an organ of state, even though its character remained ecclesiastical.

Portugal, like Castile, had no medieval Inquisition, and attempts of the authorities to introduce one on the Castilian model foundered until the 1530s. Long before then socioreligious conflict—signaled, for instance, by the 1506 massacre of New Christians in Lisbon—had surfaced. In 1536 Pope Paul III yielded to crown pressure and sanctioned an inquisition, but reserved control over aspects of it; the new body came into existence in 1539 and held its first auto da fe in September 1540. The strong converso lobby in Portugal backed efforts to suppress it, and in 1544 the pope suspended its operations. As a result it was not until a papal bull of July 1547 (*Meditatio cordis*) that the Inquisition was fully introduced, with the same system as the Spanish. The first years, as in Spain, were harsh; but severity came mainly in the 1580s, when the integration of Portugal into the Spanish monarchy brought a corresponding rise in prosecutions.

The Iberian inquisitions enjoyed a lengthy existence at home and also were exported into the non-European empires. The inquisition of Portugal was introduced into Goa in 1560, and into Brazil later that century; in the metropolis it held its last auto da fe in 1765, and was abolished by decree in 1821. The Span-

ish Inquisition was established in Peru in 1570 and in Mexico the year after; at home it survived until the early nineteenth century, when it was finally abolished in 1834.

The polemical work of the scholars Américo Castro and Claudio Sánchez-Albornoz has suggested that the modern inquisition drew on medieval Jewish models for its philosophy, but the view is generally considered untenable. It is undeniable that relations between Christians and Jews dictated certain developments, such as the adoption by the Inquisition of *limpieza de sangre* (purity of blood) regulations, which discriminated against people of Jewish blood.

Because the Inquisition always made secrecy its rule, its role was invariably distorted, and no proper account of its activities could be written until the nineteenth century. The traditional picture of a machine of terror is justified only for the early period, when Jewish *conversos* were the victims; the Inquisition also played a key role in Jewish history by bringing about the expulsion of the Jews of Spain in 1492. Subsequently the tribunal extended its interests into a large number of areas affecting faith and morals (blasphemy, bigamy, superstition, witchcraft), and from the mid-sixteenth century began to play a role in cultural censorship through its indexes of prohibited books. It never, however, possessed the power to play the role often attributed to it—of a secret police force that determined the political and religious fate of the country—and its intervention in political matters was infrequent.

From the beginning the Inquisition was primarily an urban institution, reflecting the tensions and problems of life in cities such as Seville, Toledo, and Córdoba. Although attempts were made in later years to take it into the rural areas through the mechanism of “visitations,” the Inquisition never succeeded in establishing a convincing presence in the countryside, where most people lived.

The number of its victims in the early years was, as noted above, enormous; but the rough calculation that those two decades over three-fourths of all those who perished under the Inquisition brings home the fact that very few suffered in later periods. It has been estimated that in the sixteenth and seventeenth centuries fewer than three people a year were executed by the Inquisition in the entire Spanish monarchy.

IRANZO, MIGUEL LUCAS DE

Miguel Lucas de Iranzo was a courtier of humble *converso* (Christian convert) origins who moved in the circle of Enrique IV of Castile. An astute politician who was rumored to be Enrique IV's homosexual lover, he rose to the rank of *condestable* (constable) but when faced with opposition from Juan Pacheco, the marqués de Villena and the king's favorite, Iranzo retired to Jaén on the Granadan frontier as the *alcaide* (castellan) of the fortress there. While in Jaén between the years 1458–1471, he organized raids into Muslim territory to capture booty and slaves, greatly increasing his personal fortune. During his years at Jaén he became very influential in the region and established a dazzling provincial court that was the center of great social activity. Iranzo's absence from Fernando del Pulgar's *Claros varones de Castilla* is significant and probably the result of being considered a social climber. Iranzo was murdered by anti-converso sympathizers in the church at Jaén as he was hearing mass in 1471.

Aside from his political activities and his military exploits along the frontier, Miguel Lucas de Iranzo is best known through his association with an anonymous chronicle of his life in Jaén known as the *Hechos del Condestable Miguel Lucas de Iranzo*, attributed by some to Iranzo's secretary, Luis del Castillo, and by others to Pedro de Escavias, the governor of Andújar, and still others to Juan de Olid and Diego de Gámez. The latter work records in striking detail life at the condestable's court in Jaén on the frontier during the third quarter of the fifteenth century. The relation of the astonishingly elaborate and sumptuous feasts and tournaments, the games and pastimes of the nobility, the costly celebrations of Christmas, Carnival, Easter, and other festivals, all complemented by pageants, plays, and other theatrical performances, constitute an invaluable source for envisioning aristocratic life in Castile, and for gaining access to revealing personal anecdotes that betray much about politics in the realm during the waning of the Middle Ages.

ISA OF SEGOVIA (ʿISĀ IBN JĀBIR)

Important Mudéjar scholar from Segovia (fl. ca. 1450) whose precise name is uncertain. On the basis of extant sources we may deduce that he was perhaps called ʿIsāal-Shēdhilq. Christian contemporaries in their writings refer to him as Yça Gidelli.

In the middle of the fifteenth century Yça's life evolved around the Mudéjar community (*aljama*) of Segovia; around 1450 he probably was its *alcalde* and *alfaquí*. He was also known as a *mufti*, sometimes called "mufti of the aljama of Segovia," but also "mufti of all the Mudéjars of Castile." Apparently he enjoyed great religious prestige and was asked to give expert religious opinions.

In 1455 to 1456 Yça traveled, at the request of John of Segovia, to Savoy (France), where he did a literal (*de pe a pa*) Spanish translation of the Qu'ran for the theologian. In 1462 he wrote the *Breviario Sunni*, a work on Islamic law, accompanied by a creed comprising thirteen articles, a prayer supplicating forgiveness of sins, and a chapter dealing with the signs heralding the imminent end of time. Yça was involved in a religious polemic with the theologian Juan López de Salamanca. His works continued to influence later Mudéjar and Morisco authors, such as the enigmatic author known as El Mancebo de Arévalo, Muḥammad Rabadán, and others.

ISABEL I, QUEEN OF CASTILE See CATHOLIC MONARCHS ISABEL I OF CASTILE AND FERNANDO II OF ARAGÓN

ISIDORE OF SEVILLE, ST.

Isidore, born in the 560s, was the younger brother of Leander, bishop of Seville from 576, who met Pope Gregory I the Great at Constantinople about 580 and subsequently played a central part in the official conversion of the Visigothic state from Arianism to Catholicism (589). The southern fringe of the Iberian Peninsula was under Byzantine influence after 552, and Isidore's family, from Cartagena, may have been of Greek descent. He was probably born in Seville. There was a sister, Florentina, and an intermediate brother, Fulgentius. The Catholic conversion offered a potent prospect of achieving religious and political unity, in which Isidore was the single most influential intellectual figure. He succeeded to the bishopric about 601, and presided over the influential Second Council of Seville (619) and the seminal Fourth Council of Toledo (633), which, among other things, threatened excommunication for opponents of the king, at a time when

kings had come to feel the need for episcopal legitimization.

Isidore died on 4 April 636. His main professional aim had been to consolidate the doctrinal, political, and intellectual triumphs of Catholicism, and he succeeded in inspiring what is sometimes called the "Visigothic Renaissance"; the realm was not as united, educated, and Catholic as subsequent myth came to suggest, but it was the most educated part of western Europe, and Isidore deserves large credit for that. His personality is largely indecipherable, although Díaz y Díaz decided that he was shy, lacking in confidence, eager to please, and obsessively hardworking. Braulio of Zaragoza, his biographer, said that his eloquence would move any kind of hearer.

Isidore's intellectual education was largely in the hands of Leander, who built up the episcopal library (with the works of Augustine, Gregory, African grammarians, etc.). Isidore's 633 council required all bishops to run schools, and he felt a didactic need to raise educational levels; part of his success was that Spanish Christian education and culture remained in his tradition for another five centuries. After his death he slowly metamorphosed from intellectual into saint; his body was translated to León in 1063 as part of Fernando I's affirmation of links with the glorious Gothic past, 4 April was given a special office bearing his name, and, as "Esidre," he was invoked as a national patron (e.g., three times by Alfonso VI in the *Poema de Mío Cid*). He was named doctor of the church in 1722.

Outside the peninsula, Isidore's historical and institutional importance was rarely understood, and he became a mere name appended to influential texts. Surviving early manuscripts are from Irish, English, and Gaulish, rather than Iberian, centers. The works are listed here in tentative chronological order (the precise titles are often later inventions). The *De differentiis verborum*, on semantic distinctions, may precede his episcopacy. The *De differentiis rerum* was prepared independently. The *In libros veteris ac novi testamenti proemia* and the *De ortu et obitu patrum* are biblical and doctrinal; the *De ecclesiasticis officiis* is still a vital source of evidence on the history of the liturgy and the different roles of contemporary clerics. The *Synonyma*, an ascetic confession of and repentance for sins (ca. 610), developed the eventually fashionable style for piling up synonyms. The *De natura rerum*, commissioned by the Visigothic king Sisebut about 613, combines pagan (Lucretian) and Christian views on cosmography (and related allegory).

The *De numeris* considers the symbolism of numbers found in biblical texts. The *Allegoriae quaedam sacrae scripturae* comments on nearly three hundred

The Wheel of Seasons and Months. Isidore of Seville, *De natura rerum*. Ms.422, fol.6v. France, ninth century. Copyright © Giraudon/Art Resource, NY. Bibliotheque Municipale, Laon, France.

biblical characters; the *De haeresibus*, on eighty-four sects. The *Sententiae* is Isidore's main spiritual work, combining knowledge and personal experience into a practical guide to Christian life. The *Chronica* is a history of the world from the beginning to A.D. 615. The *De fide catholica contra Judaeos* is polemical. The *De viris illustribus* contains brief summaries of the works (rather than the lives) of thirty-three churchmen, mostly African and Spanish, of the previous two centuries. The *Historia Gothorum, Vandalorum et Sueborum* (625–626) begins with the famous *Laus Hispaniae* and suggests that the Goths, rather than the Byzantines, are the genuine inheritors of Roman culture. The *Quaestiones in vetus testamentum* consists of commentaries.

Various minor works also survive, plus the conciliar and liturgical texts Isidore helped draft, monastic rules, and brief letters (mostly to Braulio); others are forgeries or apocryphally attributed; but his fame came to rest on his main work, still unfinished at his death, which subsumed much previous study and developed from his increasing appreciation of pagan learning: the *Etymologiae*.

The *Etymologiae* is an enormous encyclopedia, of both objectively erudite and pastorally didactic intent, meant to preserve and convey an all-inclusive synthesis of all fields of knowledge available in respectably ancient texts, with added comments from Isidore's own experience to make it relevant to his readers; it is mostly, therefore, written in the present tense, referring to fifty-two classical authors and only twenty Christian ones (plus the Bible). Braulio advised readers to read it through entire, often and carefully, and then they would know everything; thus it is prepared in a simpler style than many Visigothic works. The title is explained by Isidore's persistent attempts to explain

why words have the written form they do; in modern terms, this is "popular etymology" (largely accidental word association given unconvincingly mystical explanatory force), not philology.

The *Etymologiae* was probably begun about 615, and a preliminary version of probably ten books (titled *Origines*) was circulating by 621. It is much more than a traditional glossary since, in essence, it presents an accumulation of compartmentalized detail rather than overviews, it is possible to deduce that Isidore worked with a kind of index-card system, preparing lemmas first and adding details as he found them later; this would explain both why several subheadings are left unexplained (particularly in the more technical chapters), and why the latest manuscript versions (from Spain) have additional material at the end of sections not attested in earlier versions. Even though the task covered twenty years, the amount of material is such that Isidore may have had collaborators. If we can overcome the modern scholarly obsession with sources, we can see that the didactic intention (looking to the future) often overrides the scientific (recording the ancient); to this extent the *Etymologiae* was astonishingly successful, being read, studied, and copied in European intellectual centers for another eight hundred years. Modern editions of all Isidore's texts, however, unhelpfully overclassicize the language of the early manuscripts.

J

JACOBO DE LAS LEYES

Jacobo (sometimes found as *Jacomo*) was the form of the Latin *Iacobus* used in the Iberian Peninsula at the time only by Italians. On the basis of his son's name and of a sixteenth-century document that records information related to the father's burial, his surname appears to have been *Junta*, a Hispanizing of the Italian *Giunta* (-i) or *Zonta*. *Jacobo* is thought to have studied at Bologna before arriving in Castile in the period 1250/1252. He is first documented as the principal allocator (*repartidor*) in the land distribution that followed the Christians' reconquest of Murcia (1266), a post that implies his presence in the kingdoms of Alfonso X before then. In a royal document of 1267 he is addressed as "Maestre Jacobo de las leys," and in one of 1268 as "Maestre Jacobo, nuestro juez." His residence in and association with Murcia seems certain by 1274, and he held appointments there as a royal judge and as collector of royal income or auditor of royal accounts. Among his other assignments were those of principal in the second *repartimiento* of Lorca (1268–1272); confirmer, with two others, of the *repartimiento* of the Campo de Cartagena (1269); and participant in a mission to Aragón to seek aid against the Muslims during the campaign of 1278–1279.

Works undisputably by Jacobo are the *Suma de los noue tienpos de los pleytos*, a brief compendium on phases of litigation; the *Flores de derecho*, a selection of texts of common law taken from Roman and, to a lesser extent, from canon law; and the *Dotrinal que fabla de los juyzios*, a selection of texts on trial law taken from common law. The case has been made persuasively for Jacobo as chief of the team that drew up the *Siete Partidas* (1256–1265). Earlier in the decade he may have participated in the redaction of books 4 and 5 of the *Espéculo* and of parts of the *Fuero real*, but this, and certainly his heading of these projects, remain conjectural in the absence of documentary evidence.

Jacobo's wife's name was Juana, and the couple had at least one son, for whom the judge prepared his

dotrinal. Jacobo died on 2 May 1294, and his body was interred in the cathedral church of Murcia.

JACOPO DEL HOSPITAL See ARAGÓN, LAW

JAIME (JAUME) I OF ARAGÓN-CATALONIA

Jaime (Jaume) I "the Conqueror," count-king of the realms (*regnes*) of Aragón-Catalonia (1208–1276), was the leading figure of the Reconquest in eastern Spain, founder of his realms' greatness in the western Mediterranean, and an innovative contributor to Europe's administrative, educational, legal, and literary evolution. The only son of Pedro II (Pere I of Catalonia), "the Catholic," he was born in a townsman's home at Montpellier, the principality inherited by his half-Byzantine mother, Marie. His father, hero of the battle of Las Navas (1212), which opened Almohad Islam to Jaime's later conquests, died at Muret. (1213) at battle in the Albigensian crusade in Occitania. Simon de Montfort, leader of the Albigensian crusade, kidnapped Jaime and held him at Carcassonne. Jaime was rescued by Pope Innocent III, who then placed his realms under Templar protection. The orphan Jaime—his mother had died at Rome—was brought up from his sixth to his ninth years at the Templar headquarters castle of Monzón in Aragón. By the time he was almost ten, he had begun his personal rule (1217), and had captained armies in a league for order—the beginning of his intermittent domestic wars with refractory nobles (particularly in 1227 and 1273–1275).

In 1225 Jaime led an abortive crusade against Peñíscola in Islamic Valencia. Four years later he mounted a successful amphibious invasion of Mallorca, adding Minorca in 1232 and Ibiza in 1235 as tributaries. Organizing his Balearic conquests as a separate kingdom of Mallorca, Jaime embarked on a nearly fifteen-year campaign to conquer Almohad Valencia piecemeal (1232–1245). Only three major cities fell to siege (Burriana, Valencia, Biar), with consequent expulsion of Muslims, and Játiva succumbed to a combination of siege, feint, and negotiated arrangements from 1239 to 1248 and on to 1252. One set-piece battle was fought in 1237 at Puig; and Valencia surrendered in 1238. Flanking naval power supplied Jaime's war and fended off Tunisian help. Alfonso X of Castile was conquering northward out of Murcia, and the two kings narrowly averted war over southernmost Valencia by the treaty of Almisra in 1244.

Historians have followed Jaime's own account in ending this crusade (actually a series of papal crusades) in 1245, followed by Mudéjar revolts in the 1250s, 1260s, and 1270s. It now seems clear that he patched up a truce with Al-Azraq, the last leader in the field, to take advantage of his last opportunity to recover Provence. He rushed north, personally led a raid to kidnap the heiress of Provence at Marseilles, was foiled by a counterraid by Charles of Anjou, protested noisily to the pope, and withdrew. Hailed as a hero of Christendom for his conquest of Valencia at this lowest point of Europe's crusading movement, in 1246 Jaime rashly announced a crusade to help Latin Byzantium. However, Al-Azraq plunged Valencia into a decade of counter-crusade (1247–1258), put down piecemeal again by Jaime in a new papal crusade. Jaime continually organized his Valencian realm as his original invasion progressed, down to his last years of life. Some of his massive land distribution is recorded in his detailed *Repartiment*. His Mudéjar treaties set up semi-autonomous Muslim enclaves throughout Valencia, on a scale unmatched elsewhere in Spain, forming a colonialist society with a thin grid of Christians dominating until the following century. He brought in more Muslims, and also attracted Jewish settlers from Occitania and North Africa, as part of a planned program. He set up Valencia as a separate kingdom with its own law code, money, parliament, and administration.

Meanwhile, Jaime signed away all but his coastal rights in Occitania to Louis IX of France in the treaty of Corbeil (1258). His peninsular politics, notably with Alfonso X of Castile, are only beginning to be explored in depth. Both kings were ambitious to absorb Navarre; they confronted one another as champions, respectively, of the Guelph and Ghibelline movements in the Mediterranean, especially after Jaime married his heir,

Pedro, to the Hohenstaufen heiress, Constance of Sicily. In 1265–1266 Jaime helped Alfonso recover the Murcian kingdom from Mudéjar rebellion, an adventure counted as Jaime's third conquest of an Islamic power. From that time on, the confrontational character of their mutual policies turned to friendship.

Jaime also negotiated with the Mongols, who wanted allies against Islam, in 1267. In 1269 he finally mounted his long-awaited crusade to the Holy Land, but abandoned his fleet due to storms (his own excuse) or to reluctance to leave his mistress (the charge by his enemies). After a brief estrangement from his heir, Pedro, and a bitter baronial revolt led by Jaime's bastard son Ferran Sanxis, the conqueror had a moment of triumph again on the world stage. Pope Gregory X summoned him to the Second Ecumenical Council of Lyons in 1274, particularly for his expertise in crusading; Jaime devoted twenty chapters of his autobiography to recounting his reception and activities there. In 1276 the worst of Valencia's Mudéjar revolts erupted, a sustained effort with North African and Granadan help, to recover the land. Jaime fell ill while fighting at Alcira (20 July 1276) and died at Valencia (27 July).

He abdicated on his deathbed, to take the vows and habit of a Cistercian monk, a not uncommon death-bed piety then. The Mudéjar war required his burial at Valencia; only in May 1278 could his successor inter him properly at Poblet monastery near Tarragona. When mobs sacked his tomb during the nineteenth-century Carlist wars, his body was removed to Tarragona cathedral, and only recently has been returned to Poblet. At his death the troubadour Matieu de Carsin hailed him as exalter of the cross "beyond all kings here or overseas," another Arthur of Camelot. His younger contemporary Ramón Muntaner records that people called him "the Good King"; another chronicler records his title as "James the Fortunate," founder of two thousand churches. A myth grew that he had co-founded the Mercedarian ransom order. A later movement to canonize him did not receive ecclesiastical encouragement.

Jaime had his dark side, however. He could be cruel in warfare after the manner of the times. He cut out the tongue of the bishop of Girona in 1246, for which he suffered papal thunders and public penance. And he was notoriously a womanizer. His guardians had married him in 1221 to an older woman, Leonor, the sister of Fernando III of Castile, for reasons of state. When he was able to consummate the union, Jaime produced his son and first heir, Alfonso (who died in 1260). Rome annulled the marriage in 1229, and in 1235 he married the true love of his life, Violante, the daughter of King Bela IV of Hungary, by whom he had two sons and two daughters. She died

in 1251, and in 1255 Jaime married Teresa Gil de Vidaure, by whom he had two sons. Historians often count Teresa as a mistress, but Pope Gregory X regarded the marriage as firm in his thunders against Jaime's efforts to divorce her (1274) after he had relegated her to a nunnery in Valencia. Jaime also had seven formal or contract mistresses and at least five illegitimate children. This led some moderns to dub him "the Henry VIII of Spain."

Jaime promulgated the first Romanized law code of general application, the *furs* of Valencia (1261), as well as the *fueros* of Aragón (1247), the Llérida *Costums* (1258), and the *Costums de la mar* (ca. 1240). Besides founding the papal University of Valencia (1245), he reorganized the statutes of the University of Montpellier to make it the first effective royal university in Europe. He fully supported the mendicant movement and its Arabic/Hebrew language schools, including the Dominicans' 1263 Disputation of Barcelona with the Jews. By his prodigal use of Játiva paper he elaborated the first substantial archives in Europe after the papacy's, leaving a remarkable record of life and administration in his registers. He promoted commerce in many ways, particularly by his trade monopoly at Alexandria, his tributary control of Ḥafṣid Tunis, the North Africa–Valencia–Mallorca–Occitania trade, and his monetary policy. He presided over a literary court (Bernat Desclot and the troubadour Cerverí de Girona stand out) and contributed his *Llibre dels feyts*, the only autobiography by a medieval king except for his great-great-grandson's imitation, to European letters. Done by collaborators at Játiva in 1244 (the first three hundred chapters) and at Barcelona in 1274, it is a lively personal account of himself as a military Roland or Cid. Desclot describes him as taller than most, with athletic frame and reddish-blond hair, a man cordial to everyone and adventurously bold. His skeletal remains confirm the physical details, and a portrait in Alfonso X's *Cantigas de Santa María* shows him at around sixty, majestic, with his short beard gone white.

JAIME II

Second son of Pedro III (r. 1276–1285) and Constanza de Hohenstaufen, Jaime II (1267–1327) was an amalgam of the stubborn courage of his grandfather Jaime I (1213–1276) and a keen and crafty mind that provided a clear ruling template for his grandson Pedro IV (1336–1387). With his father's acquisition of Sicily in 1283, Jaime as a teenager became a pivotal figure in central Mediterranean affairs, serving as king of Sicily from 1285 to 1291. In this post, he developed a ruling style which combined unbridled force with patient diplomacy. Holding at bay his family's archenemy, Charles of Anjou, by the development of a strong fleet, Jaime established such an efficient Sicilian government that, according to one chronicler, the island population "grew prosperous in a very short time."

With the death of his brother, the ineffectual Alfonso III (1285–1291), Jaime quickly realized that far greater power was open to him on the Iberian mainland than as Sicilian ruler. Shamefully deserting his island vassals, the new Aragónese sovereign began transforming old enemies into new friends. Making peace with Charles of Anjou and sealing the new relationship by marrying his old foe's daughter in 1295, Jaime then rapidly mended fences with Pope Boniface VIII (papacy 1294–1303), becoming the standard bearer and protector of the papacy in exchange for conquest rights to Sardinia and Corsica. The changed reality of this *realpolitik* was especially dramatic in regard to Sicily, which chose Jaime's younger brother, Fadrique, as its sovereign and then supported their new lord in a war of survival with his sibling (1296–1298) that guaranteed at least temporarily Sicilian independence.

The combination of specifically applied force and wide-ranging diplomatic activity marked all of Jaime's subsequent forays into foreign affairs. Maintaining generally peaceful relations with Castile, he used the death of his cousin, Sancho IV of Castile (1284–1296) to block the accession of the young heir, Fernando IV (1296–1312), in favor of another contender for the Castilian crown, hoping to gain the pivotal district of Murcia in the process. Though this conspiracy proved unsuccessful, Jaime persistently pressed his claim to Murcia. By 1304, the Castilians relented partially and granted Jaime the right to conquer Almería and its surroundings. Since the region was still under Muslim control, an Aragónese attack of the city brought overwhelming response from the Granada emir, Muḥammad III (1302–1309) and this effectively ended Ara-

gónese military operations in Andalusia until the era of the Catholic kings.

Despite these aftershocks of the great Reconquest, events soon convinced Jaime that much greater geopolitical prizes awaited him in the Mediterranean than on the Iberian Peninsula. When the Sicilian war ended in 1302, mercenary forces (*almogávares*) who had served Fadrique were out of a job. Accepting an offer for employment from the Byzantine emperor Michael IX (1295–1320), the company was soon thrown out of work again by a premature peace with the Ottoman Turks and then went into business for itself by ravaging much of the central Mediterranean and establishing a loose colonial structure, the Duchy of Athens, which remained in Catalan hands until 1388. Indirectly thrust into Mediterranean affairs by this “Catalan Vengeance,” Jaime bided time until 1322 when he attempted to make good his claim to Sardinia with extensive military operations that, however, never brought the island under his control and ultimately consumed the very Barcelona dynasty itself when in 1410 the last heir to the dynasty died putting down yet another Sardinian uprising. Despite this lingering Sardinian debacle, Jaime’s reign had ushered in a new economic era in the Mediterranean that made the Catalans, with bases in Athens, Sardinia, the North African littoral, and the Balearics, a strong rival to Pisa and Genoa for market dominance.

Jaime also played a significant role in domestic affairs. Trained in Sicilian politics, which gave much greater power to the sovereign, Jaime brought to eastern Spain not a revolution, but a steady manipulation of legal and constitutional norms. Under his tutelage, royal government became steadily more efficient and productive. Quickly realizing the disparate nature of his realms, the king soon moved to set up structures that firmly tied the ruling center to its many peripheries. His most far-reaching action in this regard was the Privilege of Union (1319), which affirmed “whoever was the king of Aragón would also be the king of Valencia and the count of Barcelona.” To further this unity, Jaime completely reformed royal government, dividing it into such departments as the chancellery and the treasury, and staffing these with university educated specialists such as the chancellor, treasurer, and master of accounts. From this pool of curial talent, he chose advisers who, along with trusted nobles and clergy, constituted the royal council.

The wholesale administrative changes that accompanied Jaime’s accession enraged his conservative realms of Aragón and Valencia, which had spent the last three decades in stamping out royal “innovations” and in legally subordinating the crown to baronial control. Rather than using military means to confront this

insurgency (occasionally bound together as the *Unión*), the king, in August 1301, used the very laws forced on his ancestors to charge his rebellious barons with treason and did so before the unionist functionary, the *Justicia de Aragón*. Despite this temporary triumph, Jaime knew he could not fully defeat the barons and admitted as much in the *Declaration of the General Privilege* (1325), in which he formally accepted many of the legal restrictions the *Unión* had previously imposed on the crown.

Jaime II died on 2 November 1327. He married four times: to Isabel of Castile (1291), Blanche of Anjou (1295), Maria de Lusignan (1317), and Elisenda de Montcada (1322). The most fecund of these unions was the second, which produced ten children, including the princes Jaime, Alfonso (the eventual successor), and Juan (late archbishop of Tarragona). To later historians, Jaime was known as “the Just” or “the Justiciar” because he would allow no one but himself to “render verdicts for disputes.” Despite these judicial sobriquets, his greatest accomplishment was the transformation of the Crown of Aragón from a solely Iberian to a strong Mediterranean power.

JAMES THE GREAT, ST.

James was apostle and leader of the Christian church in Jerusalem until beheaded (ca. A.D. 44) at the orders of Herod Agrippa. According to the legend received in Spain during the medieval period, he had preached in Spain, and some of his followers rescued his remains and transported them to Galicia for reburial. During the turmoil following the collapse of the Roman Empire in the West, the Germanic invasions of the Iberian Peninsula, and the Muslim conquest of the early eighth century, they were forgotten until the site was miraculously revealed to Bishop Theodemir of Iria Flavia (ca. 819–847). Beginning with Alfonso II (r. 791–842), the grave became a shrine church and St. James (Santiago) eventually became the patron saint of Spain.

Santiago de Compostela became an object of pilgrimage whose importance during the Middle Ages would be scarcely less than that of Rome in the European West from the eleventh century on. The old Roman see of Iria Flavia was transferred there in 1095 by the action of Pope Urban II in connection with the Council of Clermont. A quarter of a century later, Pope Calixtus II raised Santiago de Compostela to the dignity of an archbishopric in 1120, transferring to it the ecclesiastical province held by Mérida in antiquity, with Salamanca and Coimbra as suffragan sees. Since Iria Flavia had been a suffragan see of Braga in late antiquity, along with all of the other sees of Galicia that surround Santiago de Compostela, the papal action set off claims and counterclaims that were heard at Rome into the thirteenth century. Nevertheless, the church of Santiago became one of the five great archiepiscopal sees of the peninsula, ranking with Braga, Toledo, Seville, and Tarragona, even though it lacked their ancient prestige.

At the same time the constantly growing pilgrimage and religious prestige of Santiago made it increasingly important to the kingdom and the kings of León-Castile. While those kings still upheld the rights of the archbishops of Toledo to the primatial dignity, they did bestow the post of royal chancellor on the archbishops of Compostela, and were very generous with royal bequests to that see. As a consequence Santiago de Compostela became a center of artistic and architectural development. Its Romanesque cathedral was begun in 1076 but was still being embellished into the sixteenth century. During the latter period Fernando and Isabel underwrote construction there of a great hospital for pilgrims out of the spoils of their conquest of the Muslim kingdom of Granada in 1492.

JARCHA See MUWASHSHAḤA

JAUME II, KING OF MALLORCA

Jaume II of Mallorca, born in 1243, was the second eldest son of Jaime I of Aragón and Queen Violante of Hungary. After his half brother Alfonso died in 1260, the lands of the Crown of Aragón were divided between Jaume's brother Pedro, who was to receive

Aragón, Valencia, and Catalonia, and Jaume, who was to receive the kingdom of Mallorca (comprising Mallorca island, Ibiza, and tribute from Islamic Minorca), the counties of Roussillon and Cerdagne, and the lordship of Montpellier. Relations between Pedro and Jaume were never cordial, especially after the death of their father Jaime I of Aragón in 1276, and Jaume II was forced to pay homage for Mallorca to his brother in 1279. Jaume supported the French against Aragón during the political crusade of 1285, and after it failed Pedro announced his intention to retaliate; Pedro's subsequent heir, Alfonso of Aragón (1285–1291), conquered Mallorca in 1286. Jaume II of Mallorca retained, however, possession of his southern French holdings, and ruled for a period of time from Perpignan where he built the formidable Palace of the Kings of Mallorca. As part of the papally-inspired settlement that would eventually bring an end to the War of the Sicilian Vespers, begun in 1282, Jaime II of Aragón (1291–1327) was forced to surrender the kingdom of Mallorca to his uncle, Jaume II of Mallorca, who would nevertheless hold the kingdom as a vassal of Aragón.

It is this second period (1298–1311) of Jaume II's reign in Mallorca that inaugurated the kingdom's acknowledged prosperity during the early fourteenth century. The chronicler Ramon Muntaner, who knew most of the Mediterranean quite well, believed the Mallorcans to be among the most prosperous in the world. Jaume spent more of this second Mallorcan period resident on the island, converting the former fortress of the Almudaina into a suitable palace of ceremony; he also constructed the large, circular castle of Bellver, which dominates the port of Mallorca city and stands on a hill to the west of the city. At the same time that Jaume actively supported the expansion of overseas commerce, he laid the foundation for or reorganization of eleven new inland towns which he hoped would encourage agricultural development and also the production of raw wool for Mallorca's fledgling textile industry. It was during his reign that Mallorca began minting its own coinage; later, at Perpignan, gold coins would be minted in the Mallorcan realms. Jaume championed the usual number of charitable causes, but gave especially strong support to the Franciscans (his eldest son Jaume entered the Franciscans; his successor, Sanç, was his second son). He also gave support to Ramón Llull, especially assisting Llull and the Franciscans in the foundation of a school of Arabic studies at Miramar on the northwest coast of Mallorca; for this he appears in Llull's *Blanquerna* as "a man of noble customs" who "has much devotion as to the manner wherein Jesus Christ may be honoured by preaching among the unbelievers." Jaume is depicted in several

detailed, color miniatures in the *Códice de los Privilegios*, preserved in the archives of the kingdom of Mallorca, and is interred in a chapel, unfortunately not open to the public, in Mallorca's magnificent Gothic cathedral.

JAUME III, KING OF MALLORCA See MALLORCA, KINGDOM OF

JEROME, BISHOP OF VALENCIA

A native of Périgord in France, Jerome was one of the clerical recruits brought to the Iberian Peninsula by Archbishop Bernard of Toledo in 1096. His first post was as a canon of Bernard's church at Toledo, but in 1097/1098 he was appointed to the bishopric of Valencia, where the Cid wanted a Latin replacement for the former Mozarabic bishop. Jerome remained bishop of Valencia until that see and city were lost in the Castilian evacuation and the Almoravid occupation of 1102.

Subsequently Jerome was appointed bishop of Salamanca (1102–1120). That city was then still something of a frontier post, and Jerome seems never to have lived there but to have resided in Zamora, on the north bank of the Duero. From there he cooperated with Count Raymond of Burgundy, son-in-law of Alfonso VI of León-Castile, in the repopulation and organization of both Salamanca and Ávila. He seems also to have been the administrator of Ávila in an ecclesiastical sense, for there is no reliable record of an independent bishop of Ávila before 1121. Jerome must have been the most important figure in the direction of both of these nascent communities, for Count Raymond died in 1107, Alfonso VI died in 1109, and the reign of the latter's daughter, Urraca (1109–1126), was too troubled for that monarch to give much attention to such outlying areas. Neither are there any reliable no-

tices of secular officials in the Ávila-Salamanca region before Jerome's death. At the height of the civil war during Urraca's reign, Jerome seems to have flirted briefly with her rival and half sister, Countess Teresa of Portugal, for he confirmed the latter's charter of 1 August 1112.

After his death (ca. 1120) Jerome's long residence in Zamora encouraged the citizens to seek a bishopric of their own. Queen Urraca acquiesced in their desires, and another Frenchman and protégé of Archbishop Bernard of Toledo, Bernard of Périgord, was installed there. The creation of a new bishopric meant long border disputes with adjacent sees, and the matter had to be adjudicated by the papacy on more than one occasion.

JEROME, ORDER OF ST. See RELIGIOUS ORDERS

"JEWESS OF TOLEDO" LEGEND

Many legends and folkloristic tales concerning the Jews existed in medieval Spain and later. One of the most famous of these concerns a beautiful Jewess named Fermosa (a variant of "beauty") with whom Alfonso VIII supposedly fell in love when he arrived at Burgos to marry Eleanor of England. The *General Estoria* of Alfonso X, the first source for the legend, relates that the king, who in fact was particularly well inclined toward Jews, forgot his new wife altogether and lived "inclosed" with Fermosa for seven years, neglecting his realm and everything else. There is also a marginal note to a thirteenth-century manuscript of the *Primera crónica general* (also composed in the reign of Alfonso X, in 1289) that attributes the establishment of the famous monastery of Las Huelgas in Burgos by Alfonso VIII to his love of God, the nobility of his "body and soul," and his having "sinned against God for seven years when he lived in the *judería* of Toledo with a Jewess." (Nothing about Toledo is mentioned in the *General Estoria*, but it became universally believed that Fermosa was from Toledo.) Later, after the disaster of the battle of Alarcos, God is said to have sent an angel to tell the king of God's anger for his "sin" with the Jewess, because of which he lost the battle and his daughter would inherit his throne.

Essentially the same version appears in the *Castigos e documentos* (ca. 1350), attributed to Sancho IV. The totally fictitious nature of all this is evidenced by, among other things, the failure of Rodrigo Jiménez to even mention it.

The legend was significantly elaborated in the *Crónica general de 1344*, but the period the lovers lived together is changed from seven years to a more believable seven months. Certain nobles finally conspired to kill the Jewess. Other later versions generally follow this account. In one of these she is given the name Raquel. The fifteenth-century romantic chronicle *Victorial*, notably anti-Jewish, makes only a brief reference to the king's having done "injustice" to the nobles by the counsel of a Jew (male; possibly *judía* should be read), and thus he lost the battle of Alarcos.

Lope de Vega, a seventeenth-century poet and playwright descended from *conversos* (Jewish converts to Christianity), kept the name Raquel for his version of the legend (*Jerusalén conquistada*; 1609) and also used it in his famous comedy *Las paces de los reyes y judía de Toledo* (1617). Another converso poet, who converted back to Judaism, Miguel (Daniel Lévi) de Barrios of Amsterdam, also referred to the legend. Other authors followed throughout later centuries, so that dozens of plays, poems, operas, and even a ballet and movie version have appeared. The well-known (German) Jewish novelist Lion Feuchtwanger wrote a novel, translated into English as *Raquel, the Jewess of Toledo* (1956).

An unnoticed "source" is the seventeenth-century chronicle of Alfonso Núñez de Castro, of little value other than as a literary curiosity, which tells of the Jewess of Toledo, "a woman of the Hebrew nation, of very dangerous beauty, which the courtiers confirm, and her name was [she was known as] the beautiful Jewess." He is, apparently, the first, and perhaps the only one, to confess that he did not believe the story. This is more than can be said for such important nineteenth-century scholars of the Jews of Spain as Amador de los Ríos and Menéndez y Pelayo, who did believe it. It is not, of course, impossible to imagine a king in medieval Spain (or, for that matter, in other lands where such a thing really did happen) falling in love with a Jewish woman; but that he could have lived openly with her for seven years stretches the imagination. It should be noted that this is one of several legends concerning Jews in Toledo, as well as in Seville, many of which have to do with "beautiful women" who were in love with Christians.

JEWS

Setting aside legends that Jews arrived in Spain as early as the biblical era, the earliest evidence for their presence dates from about A.D. 300. Under the Visigoths (after their conversion to orthodox Catholicism) the Jews suffered severe persecution and various attempts at forced baptism. The notorious anti-Jewish legislation of the Toledo national councils, though it left its mark in canon law and in the early medieval *Fuero Juzgo*, nevertheless had no lasting effect on the status of Jews.

The Muslim invasion (711) brought a complete change, ushering in a long era of cooperation and general harmony in the "caliphal period" of Muslim Spain that ended in the civil war of 1013–1016. This was the period of great Jewish cultural renaissance. When Muslim Spain broke up into the independent *ṭā'ifas*, or kingdom-states, Jews continued to flourish, often rising to positions of great political power. In Granada, Seville, and elsewhere, Jews even became prime ministers.

The successive Almoravid and Almohad invasions from North Africa in the twelfth century actually changed little, although it is true that in the first years of the Almohad conquest, Jewish communities were depleted and Jews were persecuted. Nevertheless, contrary to a widely believed myth, not all Jews were forcefully converted to Islam, nor were all the Jewish communities destroyed, by any means. The Almohad rulers of al-Andalus quickly adopted the ways of the new land, and both Muslim and Jewish secular cultures were once again flourishing. The Christian Mozarabic population in cities such as Toledo and Córdoba was also an important factor, and it was precisely in this period (twelfth and early thirteenth centuries) that the Jewish community, especially in Toledo, reached new heights of economic and political power and influence. There is little evidence of tensions or hostility between the Jewish, Christian, and Muslim communities. The Arabic language was, and continued to be (at least to the end of the fourteenth century), the dominant language of Toledo's Jews, as well as that of many in al-Andalus.

Meanwhile, in Christian Spain (Old Castile, León, and what was to become the united kingdom of Aragón-Catalonia), the already significant indigenous

Jewish population was enlarged by an increasing number of immigrants from al-Andalus, France, and other lands. From the tenth and eleventh centuries, the laws were scrupulously fair in granting absolute equality to Jewish citizens. Indeed, in contrast to other European countries, Jews were recognized as citizens with full rights and protection. Jews were already playing a prominent role in government and as ambassadors and translators, from at least the twelfth century. This role increased rather than decreased in importance throughout the medieval period.

The gradual reconquest of Muslim Spain brought with it this beneficial, and even privileged, treatment of Jews in the reconquered territories. Indeed, whereas Alfonso X (who actually wrote very few, if any, of the works attributed to him) is popularly thought to be the special champion of Jews, in fact his treatment of them fluctuated according to whim and economic and political conditions. It was, rather, such rulers as Alfonso VIII and Fernando III who should be singled out for their particularly positive relations with Jews. In Aragón-Catalonia it was unquestionably Jaime I who filled that role, for during his long reign Jews flourished and reached unparalleled heights of economic development and political influence.

The ill-fated efforts, not of the church but of the Dominican and (to a lesser extent) the Franciscan orders, to impose legislative controls and even censorship had no tangible results. The *Siete Partidas*, largely the work of Ramón de Peñafort, were never enforced, nor did the censorship commission that he headed in Barcelona have a long period of success in convincing the king. The Barcelona disputations also had little impact on Jewish life. Jews settled and prospered in Valencia, Murcia, and Mallorca in this century, adding to the existing Jewish communities there.

Unrest made itself felt, particularly in laws enacted by the *cortes* (parliament) in Castile during the fourteenth century. The unfortunate long succession of minor kings, beginning with Alfonso XI, no doubt contributed to this. Erroneous theories about the supposed anti-Semitism aroused by the Black Death are totally without support, and ignore such obvious and more important factors as the infamous *Ordenamiento* of Alcalá (1348) and the social and political changes. The protracted wars with Aragón and especially the Trastámara civil war (1366) had disastrous consequences for the Jews of Castile (whereas, essentially, there was little change in the condition of Jews in Aragón-Catalonia). The most dramatic events were, however, the pogroms of 1391, when rabble stirred up by the ravings of an anti-Semitic archdeacon of Seville attacked Jewish quarters throughout the peninsula (and Mallorca) in the summer of 1391. The kings acted

promptly to punish the perpetrators and restore order, but many of the Jews converted. Far more significant was the preaching of Vicente Ferrer (1410–1411), resulting in the conversion of thousands of Jews throughout Spain. It is important to realize that these were not “forced” conversions but entirely voluntary, a new phenomenon in Jewish history.

The Jewish population was hardly “decimated,” but certainly was depleted in a significant manner. Many synagogues were converted into churches, and some communities ceased to exist entirely. Others, like the Jews of Burgos, moved to smaller villages in the area and continued to prosper. The fifteenth century, particularly in Andalusia, witnessed increasing hostility to Jews, especially from the middle classes. Contrary to another popular myth, Fernando and Isabel hardly pursued an “anti-Semitic” policy. On the contrary, they protected the Jews and were scrupulously fair in their dealings with them. Nevertheless, the twin factors of rising anti-Jewish sentiment in the cities and the false accusations of the “Judaizing heresy” of the *conversos*, leading to the establishment of the Inquisition in 1480 in Castile—combined, perhaps, with a desire for a unified “Christian Spain” after the conquest of Muslim Granada—compelled the Catholic Monarchs to expel the Jews in 1492. Most converted rather than leave their homeland.

JIMENA, WIFE OF THE CID See DÍAZ DE VIVAR, RODRIGO

JIMÉNEZ DE CISNEROS, FRANCISCO

Jiménez, the son of respectable but not affluent noble parents from Cisneros, in the region of Palencia, was born in 1436. He began his studies at Roa, moved on to the Franciscan seminary at Alcalá de Henares, and

then graduated in law at the University of Salamanca. After a stay in Rome (1459–1466), he was made archpriest of Uceda by Pope Paul II. The appointment annoyed the archbishop of Toledo, Alfonso Carrillo, who had planned to appoint one of his relatives to the benefice, and as a result Jiménez spent some time in prison. On his release he sought the protection and help of Cardinal Pedro González de Mendoza, and held office in the latter's cathedral church and bishopric of Sigüenza.

In 1484, however, Jiménez made up his mind to join the Observant Franciscans, and spent the following years, withdrawn from the world, in the strict and famous Franciscan houses of El Castañar and La Salceda. His retirement came to an end when Queen Isabel chose him as her confessor in 1492. The appointment was followed by rapid advancement within the Franciscan hierarchy, and then his promotion, backed by Isabel, to the archbishopric of Toledo in 1495. Jiménez now threw himself into the immense task of reforming both the secular and the regular clergy, concentrating particularly on his own archdiocese and on the Franciscan order.

In 1499 Jiménez took over from Archbishop Hernando de Talavera the difficult task of converting the Muslims of Granada, which had fallen in 1492. But whereas Talavera had approached this task in an evangelical spirit of remarkable tolerance, stressing gentle persuasion and religious instruction, Jiménez used threats and force, provoked serious and dangerous uprisings in Granada and the Alpujarras, and finally forced the Muslims to choose starkly between expulsion or conversion in 1502.

On the death of Queen Isabel in 1504, Jiménez supported the political claims of her husband, Fernando, against those of Felipe II the Fair of Castile, and when the latter died in 1506, he set up a regency in Fernando's absence, for which he was rewarded in 1507 with a cardinal's hat and virtual control of the Spanish Church and Inquisition. Inbued with a genuine crusading spirit, he turned his attention to North Africa, personally helped to finance the conquest of Mers-el-Kébir in 1507, and led the successful expedition against Oran in 1509.

Following the death of Fernando, Jiménez once again became regent in 1516 in the problematical absence of Carlos I (later Emperor Charles V), and astutely dealt with episodes of noble and urban unrest, principally in Valladolid, Burgos, and some Andalusian towns; intervened successfully against French intrigues in Navarre; and vainly attempted to deal with the perennial problem of Mediterranean piracy. When Carlos finally returned to Spain in September 1517,

Jiménez traveled north to meet him. He died during the journey at Roa on, 8 November.

Though he was a prominent, indeed outstanding, churchman and political personality Jiménez's fame and reputation are also intimately linked to his cultural achievements, particularly the ambitious biblical project that he initiated and that was linked to his foundation and patronage of the Trilingual College and University of Alcalá de Henares. This resulted in the publication of the six volumes of the prestigious Complutensian Polyglot Bible, a task in which Spain's leading humanist scholar, Antonio de Nebrija, was for a time involved. But Jiménez was not really a humanist, and Nebrija soon discovered that the cardinal was not genuinely interested in textual changes or even the correction of mistranslations contained in the Vulgate. Jiménez was interested in scholarship so long as it was placed at the service of God and religion and not Renaissance philology, and his religious spirit was in turn shaped by the ideals of the *Devotio Moderna*, Franciscan mysticism, and the Observant movements.

JIMÉNEZ DE RADA, RODRIGO

Jiménez was born about 1170 in Puente la Reina in Navarre, to a family of the minor nobility. His father was Jimeno Pérez de Rada, and his mother, Eva de Finojosa. His uncle, Martín, was abbot of the monastery of Santa María ais de la Huerta. Family connections probably led to a stay at the royal court of Navarre before his departure to secure a higher education at the Universities of Bologna and of Paris. The dates of his stay at those institutions are unknown, although it appears that he was in Paris in 1201. He had returned to Navarre and the court of Sancho VII well before 1207. In that year he participated in the negotiation of a peace between Sancho and Alfonso VIII of Castile. His ambition and talent must have recommended Rodrigo instantly to the latter, to whom he became a major adviser and confidant for the rest of his reign.

Their relationship had become so strong by 1208 that Jiménez, not yet an ordained priest, was nominated by Alfonso to the see of Osma, although he was never consecrated to it. Instead, further royal favor propelled him in that same year into the primatial see of Toledo. In that capacity he toured western Europe in 1211, soliciting aid for a crusade against Muslim Andalusia. In July 1212 he was present in the army of Alfonso VIII when the great victory over Muslim

forces from North Africa was won at Las Navas de Tolosa.

During the next few years the debility of the king and realm prevented any immediate exploitation of that victory, but Jiménez was active in consolidating the resultant territorial gains of the kingdom and of his see in La Mancha. He was a major political figure in the brief reign of Enrique I (1214–1217) and again during the minority of Fernando III. When the latter reached his majority, Jiménez became a royal confidant and one of the chief royal advisers as Fernando ruled Castile (1217–1252) and then León (1230–1252) after the reunion of the two realms. In those capacities he assisted the king in the campaigns that saw the definitive conquest of eastern and central Andalusia—Baeza (1225), Úbeda (1233), and Córdoba (1236)—although he did not live to see the conquest of Seville (1248).

Jiménez's tenure as archbishop also saw the territorial and juridical consolidation of the see of Toledo, whose aggrandizement was one of the great passions of his life. The other peninsular archiepiscopates—Braga, Santiago de Compostela, and Tarragona—were forced to recognize the primacy of Toledo. Bishoprics for the newly conquered cities of Baeza and Córdoba in Andalusia were made suffragans of Toledo. However, claims to Zamora and Plasencia, where sees had been created during the earlier reconquest period, were lost to Santiago de Compostela. Also, despite much acrimony, newly conquered Valencia was assigned by Rome to Tarragona rather than Toledo, and the ancient see of Oviedo in the north continued to be exempt from all metropolitan jurisdiction.

Given the conditions of the age, none of this could be carried through without the cooperation of the papacy, and Jiménez was well known at Rome. He had gone there first in 1211 to secure backing for the campaign of Alfonso VIII against the Almohads in 1212. He returned there to attend the Fourth Lateran Council in 1215. And in 1236 and 1241 he visited the pope. In 1218 he was named papal legate in the peninsula, and from 1224 was entrusted by the papacy with a contemplated creation of a diocese for North Africa in Morocco. Nevertheless, Jiménez had his problems with Rome. Often they flowed from the collection and utilization of ecclesiastical revenues for the reconquest of the south. Jiménez had helped to persuade Rome of their necessity, and was involved in their application to the benefit of the crown. Inevitably he was caught between the necessities of the crown, the reluctance of the Spanish clergy, and the suspicions of Rome.

Some of the moneys from this source certainly contributed, directly or indirectly, to the glorification

of the church at Toledo and of its archbishop. Jiménez had hardly been consecrated when he began the construction of a new archiepiscopal palace in Alcalá de Henares (ca. 1209). The present Gothic cathedral at Toledo was begun under his aegis (ca. 1221) to replace the mosque that had served as a cathedral since 1085.

Without question Jiménez was the dominant figure in the Iberian Church during the first half of the thirteenth century, and a major political and court figure as well. Even so, he found time to produce six historical works, and so became the major historian of that period. The most important of these is his *De rebus Hispaniae*, in which he carried on the tradition of the Latin chronicle from Genesis down to the recent conquest of Córdoba. In large measure he continued the work of his older contemporary, Lucas of Túy, and supplied the materials that would underpin the new vernacular history of the *Primera crónica general*, begun in the second half of the century. His *Historia Arabum*, on the other hand, had no known precursor in Christian Iberia, and few in western Europe. Beginning with the biography of Muḥammad, the work deals primarily with the Muslim conquest of Iberia down through the arrival in the peninsula of the North African Murābit (Almoravids). It demonstrates his acquaintance with both the Arabic language and some of the Muslim historians, as well as the breadth of his interests. A *Historia Romanorum* displays his classical interests, and a *Historia Ostrogothorum* and a *Historia Hunnorum, Vandalorum, Suevorum, Alanorum, et Silingorum* demonstrate his debt to the school of Iberian historians of Visigothic times, especially Isidore of Seville.

During the spring of 1247 Jiménez traveled to France to visit Pope Innocent IV at Lyons. On his return journey to Iberia he drowned in the Rhone on 10 June. His body was embalmed and returned to the monastery of Santa María de la Huerta, where it was entombed. His tomb was opened for examination as recently as 1907.

JOÃO I, KING OF PORTUGAL

João, the illegitimate son of Pedro I and Teresa Lourenço, was born probably in Lisbon on 14 August 1357 and died there on 14 August 1433. In 1363, when he was still a child, he became the master of the Order of Avis.

In normal circumstances, he would never have acceded to the throne, but the situation created in the latter years of Fernando I's reign (1367–1383) opened a crisis of succession. By his marriage to Leonor Teles in 1372, Fernando had a daughter, Beatriz (1372–ca. 1409), who married Juan I of Castile in 1383. Under Fernando, Portugal had had three wars with Castile, and this marriage was intended to settle the conflict between the two countries. The marriage contract laid down that Portugal would be ruled by the first heir born to Beatriz, and until the child reached fourteen, Queen Leonor would govern the country as regent. This marriage gave Juan I the possibility of one day sitting on the Portuguese throne. However, Queen Leonor, in collusion with her lover, João Fernandes Andeiro, kept an oligarchic rule that excluded the merchants from the privy council. These, fearing the regency by the queen, persuaded João to kill Andeiro in order to force an accommodation with her. But, following the death of Andeiro and the rising of the people against her, the queen appealed to Juan I, who invaded Portugal.

João immediately organized the defense of Lisbon, relying on the military support of Nuno Álvares Pereira (Nun' Álvares), a knight who proved to be a supreme strategist. The peasants, artisans, and merchants rallied to Dom João's cause, and the younger sons of noble families with no land of their own joined his forces. While João held Lisbon against the Castilian army, Nun' Álvares fought in the south and eventually neared Almada, close to Lisbon, wreaking havoc upon the Castilians. On 3 September 1384, Juan I, fearing the plague that had smitten his camp, lifted the siege of the city, which had lasted four months, and withdrew to Castile. *Cortes* (parliament) were convened at Coimbra to solve the problem of succession. And while João besieged the castles loyal to Beatriz, Nun' Álvares harassed the Castilian loyalists.

João and Nun' Álvares arrived in Coimbra on 3 March 1385. At the *cortes*, the lawyer João Afonso

das Regras argued João's case, showing that the other pretenders, the sons of Pedro I and Inês de Castro, were illegitimate in view of the irregular relationship between their parents. As for Juan I, his invasion of Portugal had disqualified him, because it was a breach of the treaty. Having disposed of the argument of rights by birth, João das Regras claimed that since João was the one who had taken up arms to defend the realm from the Castilian invader, he deserved to be king. By acclamation he became João I on 6 April 1385.

Yet the war with Castile was not over. Following Fernando's previous policy of getting military support from England, João I gained some assistance from the duke of Lancaster. An English contingent fought alongside the Portuguese in the battle of Aljubarrota (14 August 1385), which was a decisive victory for the Portuguese. Portugal's ties with England were strengthened by the Treaty of Windsor (9 May 1386), a military alliance between the two countries. This was followed by the marriage of João I to Philippa of Lancaster (1359–1415), daughter of John of Gaunt, duke of Lancaster, on 2 February 1387. From this marriage were born Duarte (1391), Pedro (1392), Henrique (1394, known as Prince Henry the Navigator), João (1400), and Fernando (1402). In 1415, four years after the peace treaty with Castile had been signed, João I, encouraged by his minister of the treasury, complied with the wishes of his sons and led an expedition to Ceuta in Morocco, taking the city. This initiated the period of Portuguese expansion in which all the princes were deeply involved. Between 1418 and 1427, Prince Henrique promoted the discovery of the islands of Madeira and the Azores.

João I was a popular king who listened to his subjects and tried to satisfy their demands. The dynastic crisis of 1383–1385 gave Portugal its independence and enabled the productive classes—traders, merchants, and artisans—to take a leading role in the development of the country. By relieving the people of Lisbon and Oporto from the payment of tithes and seigniorial rights, João I paved the way for a new age. He was a cultivated man and wrote a remarkable treatise on hunting (*Livro da montaria*) that reflects his views on court life and a pre-Renaissance awareness of the value of the human body.

JOÃO II, KING OF PORTUGAL

João, the legitimate son of Afonso V and Isabel la Poloma, daughter of Pedro, duke of Coimbra, was born in Lisbon on 3 March 1455. In January 1471 he married Leonor, daughter of Fernando, duke of Viseu, who was the son of King Duarte and Beatriz, granddaughter on her mother's side of Afonso, the first duke of Braganza. By Leonor, João had a son, Afonso (1475–1491), who in 1490 married Isabel, the daughter of the Catholic Monarchs of Spain. João had pinned great hopes on Afonso, whom he expected to be the ruler of an Iberian kingdom. But Afonso's untimely death in a riding accident shattered his dream. By Ana de Mendonça, João had an illegitimate son, Jorge de Lencastre (1481–1550). Between 1491 and 1494 he tried unsuccessfully to make him his heir to the throne. But in the face of strong opposition he chose Manuel, his brother-in-law, to succeed him.

João was acquainted with the affairs of state from a very early age. When his father campaigned in Morocco in 1464, he was made regent, in spite of being only nine years old. Later he fought alongside Afonso V in the conquest of Arzila (1471). He also was directly involved with the Spanish policy of Afonso V. In the succession conflict between Juana of Castile, the niece of Afonso V, and Isabel, the sister of Enrique IV, João supported his father and waged war on Castile with him. The battle of Toro (2 March 1476) was inconclusive. João's army was victorious. Convinced that he could defeat Castile only with the aid of France, Afonso V left for Paris in August 1476. He failed to make an alliance with Louis XI and returned to Portugal on 15 November 1477. In his absence João had been the regent and had defended the Portuguese borders against Castilian raids. He continued to rule in the last six years of Afonso's reign, although he was not the monarch.

João ascended the throne on 28 August 1481 and began to pursue his own policy after the *cortes* (parliaments) held at Évora (1481–1482). He realized that with constant wars in Morocco and Castile, his father had given excessive rewards of land and money to the nobility. João's intent was to centralize power in the crown, and he abolished many seigniorial privileges. The third duke of Braganza, Fernando, objected vigorously to these changes. On being informed that the duke was the leader of a plot against him, João acted

swiftly. He had the duke arrested on 28 May 1483, and after a summary trial the duke was beheaded on 20 June. The large estates of the Braganzas in northern Portugal then became crown property. In 1484 João aborted another conspiracy against him by stabbing Diogo, duke of Viseu, his cousin and brother-in-law.

Firmly established at home, João pursued the policy of exploration of the West African coast he had started in 1474. In 1482 he had the fortress of São Jorge da Mina built on the Gold Coast to protect the commercial interests of Portugal. From there Diogo Cão explored the Angolan coast, sailed up the Congo River, and brought back news of the Congo.

He was convinced after this voyage (1482–1485), that Cão had been near the Arabian Sea. When the king realized his mistake, he sent Cão on a new voyage. In 1487 João implemented a triple plan, looking south and east. He sent out Bartolomeu Dias, who discovered the Cape of Good Hope; he tried to penetrate the interior of Africa with the expedition of Gonçalo Eanes to Tombuctou; and he attempted to reach the East and Prester John (Ethiopia) by sending Afonso de Paiva and Pero da Covilhão overland as envoys. Politically, he secured the right to lands discovered and to be discovered by signing the Treaty of Tordesillas (7 June 1494) with the Catholic Monarchs. At his demand a line of demarcation was set 370 leagues beyond the Cape Verde Island, which gave Portugal a legal claim to Brazil (yet to be discovered). By this treaty, which was sanctioned by Pope Alexander VI, João introduced the principle of *mare clausum*: the seas belong to those who discover them. At the time of his death in 1495, João knew that the route to the Indian Ocean was open to Portugal.

JOGRAL See JUGLAR

JOHANNES HISPANUS DE PETESELLA (IOANNES COMPOSTELLANUS)

Originally from Santiago de Compostela, he appears in Bologna on 31 March 1223, taking part in an accord

with Tancredo of Bologna and a certain Pedro Hispano. The name Petesella that appears in the document is without doubt a corruption of Compostella. In fact, in the prologue to his *Summa super titulis decretalium* he refers to himself as “ego Ioannes Hispanus Compostellanus natione,” which he repeats in one of the codices at the end of his work. From Bologna he went to Padova, where he shows up in a 1229 record. After Padova it appears that he returned to Bologna, where he composed the *Summa super titulis decretalium* (1235–1236), dedicated to Alfonso, *infante* of León. The work is also the first known *summa* of the decrees of Pope Gregory IX promulgated in 1234. Modern research has attributed great value to this work, due to the author’s solid knowledge of civil and canon law, and to the frequent historical references the work contains. The *Summa* enjoyed a relatively wide presence in the West, and manuscripts are preserved in Leipzig, Oxford, Seo de Urgel, and the Vatican.

JOHN OF BICLARO

John, of Gothic origin, was born about 540 at Santarém in Lusitania. He spent seven years living in Constantinople, probably from about 570 to 577. Soon after his return he fell under the suspicion of King Leovigild (r. 569–586), and was sent into exile in Barcelona (about 580). According to Isidore of Seville he was harassed by the Arians for the next ten years. At some point, possibly following the death of Leovigild, he founded a monastery at Biclár, an unidentified site in Catalonia. For this he wrote a monastic rule, which has not survived. His principal literary work is his *Chronicle*, a continuation for the years 568–589 of the work of the African bishop Victor of Tununna, the text of which he brought back to Spain from Constantinople. This chronicle is the most important source for the history of the Visigothic period in the years that it covers, and was used extensively by Isidore. John’s work is also of value, despite some disorder in the present state of the text, for the history of the Eastern Roman Empire in the same period. Isidore states in the entry on John in his *De viris illustribus* that other writings by John existed but that he himself had not read them. None of these works has survived. In 590 or 591 John became bishop of Girona, and he died about 620.

JOHN OF GAUNT

John of Gaunt, duke of Lancaster, was born in 1340 at Ghent, the fourth son of Edward III of England. In 1367 he led a large retinue in the army with which his brother Edward, Prince of Wales (the Black Prince), invaded Castile in order to restore Pedro I. Lancaster was commander of the vanguard at Nájera, where the usurper Enrique of Trastámara was defeated. In 1371, in response to Enrique’s alliance with the French crown, Lancaster married Pedro’s daughter and heir Constanza; in 1372 he was recognized by his father as king of Castile in her right. Lancaster maintained a royal Castilian chancery and retained legitimist refugees. In the 1370s and early 1380s, with the English crown he sought alliances against Enrique II and his son Juan I, principally with Pedro IV of Aragón but also with Fernando I of Portugal and Carlos II of Navarre. The alliances failed principally because of Lancaster’s absorption in the war with France and in domestic problems.

The revolution of 1384–1385 in Portugal transformed Lancaster’s prospects. In 1386, with a small English army, he invaded Galicia; unopposed by Juan I, he was recognized as king in Santiago and other Galician communities. On 11 November, at Ponte do Mouro, he ratified an alliance with João I of Portugal, in accordance with whose terms João married Lancaster’s daughter Philippa in the Oporto cathedral (February 1387). Soon after João and Lancaster jointly invaded the kingdom of León. The Anglo-Portuguese campaign, a humiliating failure, led to Castilian negotiations for a settlement with Lancaster at Trancoso (June/July 1387) and his ratification of a peace treaty with Juan I at Bayonne on 8 July 1388. Lancaster and Constanza gave up their regal claims in favor of Juan and his successors, in return for a huge indemnity and annual pension, and the marriage of their sole child, Catalina, to Juan’s son and heir (the future Enrique III).

Lancaster’s subsequent attempts to persuade Juan to make peace with Richard II and jointly sponsor a conference of Spanish kings to work for the resolution of the Great Schism failed. The grant to him by Richard II of the duchy of Aquitaine in 1390 increased his familial interest in Iberian affairs, but the minority government of Enrique III determinedly excluded his influence and the Aragónese court regarded him with

suspicion. His relations with the courts of Navarre and Portugal were cordial, but his earlier policies had reinforced Francophile and Anglophobe inclinations in Spanish governing circles. Lancaster died in 1399.

JOHN OF SEVILLE

John of Seville (fl. 1133–1135) was an astrologer and translator of scientific works from Arabic into Latin. His full name appears to have been Iohannes Hispanensis et Lunensis (or Limiensis). Attempts to identify him with Avendauth, the collaborator of Dominico Gundisalvo, John David of Toledo, and other Johns are not convincing. He is known only through his translations, which include Abū Maʿshar's *Greater Introduction to Astrology* (1133), Al-Farghānī's *Rudiments of Astronomy* (1135), ʿUmar ibn al-Farrukhān's *Universal Book* (on astrology), Al-Qabīṣī's *Introduction to Astrology*, Thābit ibn Qurra's *On Talismans* (*De imaginibus*) and astrological works by Mshā'allāh and Sahl ibn Bishr. These were the most important texts on astrology in the Arabic world, and established Latin astrology on a firm scientific footing. To them, John added his own *Epitome of Astrology* or *Liber quadripartitus* (1135), which covered all the main aspects of astrology and, having four books, was clearly meant to be analogous to, and perhaps to replace, the best-known text on astrology from classical antiquity, Ptolemy's *Quadripartitum*.

John appears to have ventured also into the field of medicine, for he is credited with a translation of the medical portion of Pseudo-Aristotle's *Secret of Secrets*, *On the Regimen of Health*, and Qusta ibn Lāqā's *On the Difference between the Spirit and the Soul*. These medical texts are the only works that put their author into a historical context, since the first is dedicated to a queen of Spain with the initial T.—often identified with Tharasia, daughter of Alfonso VI of Castile and León, who married Henry of Burgundy, count of Portugal (1057–1114), and the second is dedicated to Raymond, archbishop of Toledo (1125–1152), and thereby is the earliest text to have some connection with the cathedral.

John's astrological translations are pedantically literal, suggesting that Arabic may have been his first language. The medical translations are more fluent, and the excerpt from the *Secret of Secrets* is preceded

by a preface in which the translator justifies departing from the literal sense of the original. Both the astrological and the medical texts remained popular throughout the Middle Ages and several of the astrological texts, including the *Epitome*, were printed in the Renaissance.

JUAN DE SEGOVIA

Juan de Segovia (1393–1458) was a historian, theologian, and theoretician of dialogue with Islam. Born in Castile, he attended the University of Salamanca from 1407 and taught there until 1433. Juan's earliest ecclesiastical opinions were papalist, but his arrival at the Council of Basel in 1433 to represent the university led to a change of mind. Incorporated into the council as a member of the Castilian delegation, Juan played a prominent role in the deliberations of the Faith Deputation. He adopted conciliarist views and defended the doctrine of the Immaculate Conception against the objections of the Thomists. His report on the 1434 debate concerning the presidency of the council reveals a talent for writing history.

Juan emerged as a key figure at the council during the divisive dispute over the site of a council of union with the Greeks. After failing to reconcile the council's factions, he became a spokesman for the majority. Within the assembly he was active in the debates over the definition of conciliar supremacy as a dogma and the deposition of Pope Eugenius IV. Felix V (Amadeus VIII of Savoy), Basel's choice to succeed Eugenius, named Juan a cardinal in 1440. Even before then Juan had become one of the council's chief representatives to diplomatic assemblies in France and Germany.

In 1449, after Felix and Basel gave up their efforts to gain control of the church, Eugenius's successor, Nicholas V, pensioned Juan. In 1453 he retired to Aiton in Savoy, where he continued writing on ecclesiastical themes until his death. More important, Juan completed his monumental history of the Council of Basel and began writing to Nicholas of Cusa about dialogue with Islam. Juan even planned a trilingual translation of the Qurʾān, but this project was never realized.

JUAN I, KING OF ARAGÓN

The eldest son of Pedro IV (the Ceremonious), Juan was born in 1350. His secretary, Bernat Metge, described him as in medium stature, grave of countenance, elegantly garbed, and typically surrounded by a pack of hunting dogs. Fits of epilepsy probably bred a touch of hypochondria in his makeup, which was otherwise impulsive and sentimental. While heir apparent he had three wives, all of them French. He married Jeanne de Valois in 1370, but she died before reaching Aragón, (Juan hastened incognito into France to her bedside); the second marriage, to Marthe d'Armagnac (1472), ended with her death in 1378. Then came a love match with Yolande de Bar (1379), contracted against parental wishes; it brought into Aragón a spirited, cultured woman who soon gained such an ascendancy over her easygoing husband that it set him at odds with his father in foreign and domestic affairs.

On becoming king in 1387, Juan swiftly reversed Aragónese policy to a pacific, Francophile stance. This led to friendship with Castile, peace with Granada, and recognition of the Avignon pope. At home, too, he sought a quiet life by dropping Pedro's confrontational attitude toward the nobility. His energies and resources turned instead to hunting (hence his sobriquet "El rey cazador") and, under Yolande's influence, to cultivation of the arts. In an atmosphere of courtly refinement, music and poetry found an authentic Catalan voice. Juan himself ("amador de toda gentileza") wrote verse. Nor were his endeavors restricted to an aristocratic circle, for in 1393 he established a festival of poetry (the *Jochs Florals*) in Barcelona.

For most of his subjects, however, this was a reign of darker hues. It began with a savage attack on his father's widow and counselors. There followed a confrontation with the towns at the *cortes* of Monzón over Juan's demand for larger subsidies to support a household whose composition and behavior were giving offense. Denied aid by his subjects, he turned to Italian bankers, whom he rewarded with privileges that aggravated Catalonia's commercial problems, and in turn provoked more ruthless exploitation of the *remensa* peasantry. In 1391 pogroms exterminated many Jewish communities supposedly living under royal protection.

Abroad, Juan failed to display the vigor he had urged upon his father. An invasion mounted by the count of Armagnac in 1390 penetrated as far as Girona before Juan could muster an army to repel it. The following year revolt in Sardinia threatened the total destruction of the Aragónese position there; to the dismay of his merchant subjects, Juan failed to take effective counteraction. His brother Martín, whose son (also named Martín) had married the heiress of Sicily, received inadequate support when in 1392 he attempted

to impose Aragónese authority in that island. Nor was any aid given to the Catalan duchies of Athens and Neopatras to save them from falling to a Florentine and, in 1394, to the Turks. This string of catastrophes was attributed by his subjects, not entirely justly, to regal profligacy in pursuit of pleasure.

Juan died in a hunting accident on 19 May 1395, still engaged in acrimonious dispute with Barcelona and Valencia over money for the rescue of Sardinia.

JUAN I, KING OF CASTILE

If by all accounts, contemporary or near-contemporary, Juan I was a depressive, the problems that faced him during his youth and his reign would explain his personality.

Plagued by uncertainties, he heroically triumphed over serious doubts regarding his legitimacy as king and the never-ending intrigues fomented by his adversaries about the succession to Castile.

Much of his reign and his personality can only be understood in terms of Castile's role in the Hundred Years' War, in which the kingdom of Castile, allied to France, had to face the problem of Lancastrian (or English) claims to the Castilian throne. In particular, John of Gaunt, duke of Lancaster, and the son of Edward III of England, by his marriage to Constanza, daughter of Pedro I, the defeated ex-king of Castile, claimed the throne of the kingdom and, using England's links with Portugal as well as internal dissensions in Castile, pushed England and Portugal into conflict with Castile, thus widening the spheres of Anglo-French belligerence and implanting them firmly onto Iberian soil. At issue also was the way in which Castile's formidable naval power was to be deployed, a spectacular example being the attacks launched at various points along the southern coast of England. Juan I, attempting to gain Portugal, suffered a humiliating defeat at the battle of Aljubarrota in 1385. Nevertheless, the real threat was posed by the invasion of the duke of Lancaster in 1386–1389. Juan I astutely countered this by refusing a decisive engagement, extending the enemy's lines of supply and employing a "scorched-earth" policy, thus forcing the exhausted and dis-

ease-ridden English forces to withdraw. In the negotiations that followed, a marriage between Gaunt's daughter, Catherine of Lancaster, and Juan I's heir, the future Enrique III, was arranged, the Castilians bought off Lancaster's claims to the throne, and the truces of Leulingham and Monção (1389) brought the Spanish phase of the Hundred Years' War to an end.

Yet Juan I had to pay a price for his success. John of Gaunt only finally surrendered his personal interests in Castile on payment of 100,000 pounds, an annual pension of 6,600 pounds and the marriage of his daughter to Juan I's heir. In addition the crisis had moved this introspective king to ponder on the fact that his position was due to a traditional involvement by others in the tasks of government, tasks in which the great nobility, prelates, doctors of law, and even representatives from the royal towns attending the *cortes* (parliaments) expected to participate. During precisely those years when the crises were most dangerous, the powers of the cortes grew. Juan I did not enjoy unlimited power but was bound by the laws of the kingdom. The making of law and the threats posed to the stability of the kingdom were matters that had to be dealt with by the king and *cortes* together.

Given the long years of alliance with the French, it is not surprising that Juan I's reign witnessed French influence on the development of Castilian institutions, particularly with respect to taxation and finance (the *contadurías*) and the army (the creation of the offices of marshal and constable).

An intensely religious man, Juan I even worked with his opponents to try and heal divisions in the church, particularly with respect to ending the Great Schism. The chronicler Pero López de Ayala, for example, emphasizes the bonds that grew between the king and Gaunt because of their mutual love and devotion to the Virgin Mary, a matter of universal concern at a time when the church was divided by the Great Schism. In this, Juan I was perhaps moved by a sense of family devotion: Enrique II had been particularly devoted to the Virgin.

JUAN II, KING OF ARAGÓN

Juan was born in 1398 at Medina del Campo. His father, Fernando of Antequera, having become Fernando I of Aragón (1412), Juan was betrothed to Queen Giovanna II of Naples and appointed viceroy of Sicily (1415). The marriage fell through, however, and Fer-

nando's death (1416) brought Juan back to Spain to assume control of the family's huge Castilian estates. At the court of Castile he immediately became embroiled in power struggles with Álvaro de Luna and his own brother Enrique. These came to a head in 1420 when Enrique, taking advantage of Juan's absence in Navarre (he had gone there to marry Blanche, heiress to that kingdom) staged a palace coup. There ensued years of political chaos that played into Luna's hands, provoked two invasions of Castile (1425 and 1428) by Juan's elder brother Alfonso, king of Aragón, and led to the confiscation of all Juan's Castilian estates.

Meanwhile Juan had become king of Navarre (1425), and in 1432 he gained control of Aragón as Alfonso's *locumtenens*; he used both positions as springboards to restore his Castilian fortunes. In 1434 pursuit of that obsessive design took him to Sicily, bent on securing Alfonso's participation. Instead he found himself caught up in his brother's Neapolitan schemes that led to the naval disaster at Ponza (1435) and Juan's brief captivity, first in Genoa and then in Milan.

Juan returned to Aragón charged with organizing support for Alfonso's conquest of Naples and making peace with Castile. The latter duty he undertook with extreme reluctance, for the treaty (September 1436) promised only to constitute his lost lands into a dowry for his daughter on her marriage to Infante Enrique of Castile. Redemption of honor and fortune seemingly beckoned in 1439 when the king of Castile invited Juan and his brother Enrique to return. Unhesitatingly they seized the opportunity, only to flounder in familiar intrigue until 1443, when, having in desperation laid hands on the king, they found themselves again driven from Castile. Staking everything on battle, they suffered a disastrous defeat at Olmedo (19 May 1445).

War then flared along the Castile/Aragón frontier, and in 1450 spread to Navarre, where Juan had maintained his royal title and authority since the death of his wife (1441), despite the claims of his son Carlos de Viana. Internal Navarrese factions had set father and son at odds, and now drove Carlos into the arms of Castile, thereby kindling a civil war that raged for forty years. Denied aid by Catalonia and Valencia, Juan saw King Alfonso make peace with Castile over his head (1454), a peace that definitively stripped him of the Castilian heritage he had striven so bitterly to preserve. Carlos bore the brunt of his wrath: stigmatized a traitor, he was declared to have forfeited his throne.

In 1450, still hearty though half blinded by cataracts, Juan succeeded Alfonso as king of Aragón. His long career as *locumtenens* had won him little popularity, least of all with the Catalan oligarchy, which re-

sented his championship of the popular cause in Barcelona and the *remensa* peasantry. When he seized Carlos at the *cortes* of Lérida (December 1460) on a charge of renewed plotting, the Catalans joined forces with discontented Navarrese to threaten insurrection in the name of their “liberties.” With Castile, too, hostile, Juan had no choice but to free Carlos and capitulate to Catalan demands at Vilafranca del Penedés (21 June 1461). Carlos’s sudden death (23 September 1461) might have calmed passions had not the triumphant oligarchs resolved to press their advantage against the cowed royalist elements in Catalonia, thereby igniting a decade of civil war.

Unbowed by age and with sight restored, Juan fought back mightily with the devoted support of Juana Enríquez, his second wife, whom he had married in 1447, and their son Fernando. Yet despite a steady string of military successes, victory constantly receded as one foreign power after another brought aid to the rebels. France he managed to buy off by ceding Roussillon and Cerdagne; Castile he astutely turned from foe to friend by marrying Fernando to the infanta Isabel (1469). But only death removed two other rivals called in by the Catalans—Pedro, constable of Portugal, and Jean of Anjou—and only total exhaustion and demoralization brought the hard-core Catalan resistance to surrender (October 1472) on terms that restored the status quo.

Instead of confronting the social and economic wounds left festering in Catalonia, Juan proceeded to drain his subjects’ last resources in a doomed endeavor to regain the lost Pyrenees provinces from France (1473–1475). Comparative tranquillity descended upon the last years of his life, which ended in 1479 with a chill caught while hunting in winter snow.

JUAN II, KING OF CASTILE AND LEÓN

Juan was born 6 March 1405 and died 21 July 1454. He was the son of Enrique III and Catalina de Lancaster. He acceded to throne on 25 December 1406, before his second birthday, and upon the death of his father. His mother and his uncle, Fernando (later Fernando I of Aragón), were coregents of the realm until the latter left Castile to occupy the throne of the Crown of Ara-

Siloé, Gil de. Tomb of Juan II and Isabel of Portugal. Designed in 1486, executed between 1489–1493. Copyright © Scala/Art Resource, NY. Cartuja de Milaflores, Burgos, Spain.

gón in 1412. Their coregency proved remarkably peaceful, with Fernando occupying himself with the Muslims on the Granadan frontier and Catalina with young Juan’s education. When Fernando died in 1416, he left titles and vast estates in Castile to two of his three sons, Juan and Enrique; a third son would inherit the Crown of Aragón and reign as Alfonso V. Fernando’s sons would remain thorns in the side of the Castilian monarchy for most of Juan II’s reign.

Very early in his life Juan, who would prove weak and disinterested in governing and in affairs of state and much more interested in poetry, music, and the arts, came under the influence of Álvaro de Luna, an adolescent petty noble who had been sent to court to be educated. Their lives would be inextricably intertwined and Álvaro would remain the king’s favorite until March 1453, when, at the urging of some of the magnates and his second wife, Isabel of Portugal, the king ordered Luna taken prisoner and executed at Valladolid. From the moment Juan came of age, Don Álvaro became the real governing force of the kingdom.

His influence over the monarch inspired both envy and gossip, at one point leading the nobles to denounce Luna and accuse him of having introduced abominable practices at court, alluding to a rumored homosexual relationship with the king. Led by the two sons of Fernando I, Juan and Enrique, known as the Infantes de Aragón, the nobles saw an opportunity to increase their power and privileges at the expense of Don Álvaro and the monarchy. Don Álvaro, however, remained confident of the king's support and relied heavily on the backing of others who associated the crown's interests with their own, namely the lower and middle layers of society. Luna brilliantly exploited the concerns and aspirations of the non-noble sectors of society and successfully increased his own influence and estate as he sought to centralize the power of the monarchy.

Luna's power, however, was sometimes undermined by intrigues and, through the duration of his career, he received inconsistent support from the king. On various occasions, as Juan fell under the influence of the nobles, Luna was exiled from the realm, only to have the king recall him later. Even when Juan II and Luna triumphed militarily against the nobility and the Infantes, as they did at Olmedo in 1445, victory was soon clouded by intrigues. For the entire duration of Juan II's reign the monarchy found itself at odds with the nobles and consistently in crisis.

The House of Trastámara, in order to gain the support of the nobles at the end of the civil wars of the fourteenth century, had been obliged to assign the nobility vastly increased power in the form of *mercedes*, or grants, which greatly reduced the royal treasury. The regents of the realm also paid the price of stability during Juan II's minority in a similar fashion. The burdened royal finances could not give the crown the superiority over the nobility that it needed if it was to maintain an independent policy. Taxes were raised but they never reached the treasury, and by 1442 it had become necessary to pass a law against nobles who seized royal revenues in order to ensure the grants owed them by the crown. The kings' revenues, when not seized by nobles or committed to them in advance, were insufficient for the creation of a permanent armed force to protect them. To make matters worse, the affluent, mostly rural nobility maintained their own armed forces, resulting in pitched battles and sieges against the monarchy and among themselves. The power of the cities declined from 1419–1430 as the Infantes de Aragón and Luna, in the king's name, vied for their support. Even the intellectuals were divided. On the one hand, the marqués de Santillana, one of the great humanists of his age, logically supported the nobles; on the other, Juan de Mena, the king's secretary and one of the most notable scholars of the fifteenth

century, staunchly defended the monarchy, calling upon Juan II to recognize his greatness, shake off tyranny, and restore the law to the kingdom.

After years of conflict, and shortly after Luna's execution in June 1453, a letter under the king's signature circulated in the realm. It explained Luna's downfall as the result of a joint demand of both the noble and non-noble classes. Although the letter was probably written by one of Luna's sworn enemies, Diego de Valera, and not the king, the *cortes* duly congratulated the king on seizing the reigns of government for himself. In fact, however, Juan II failed to govern up until his death a year later, turning over affairs of state to two clerics, one of whom had been Luna's ally.

When Juan II died, he left three children: Enrique, by his first wife, María de Aragón, who would succeed him as Enrique IV; and the Infantes Alfonso and Isabel by his second wife, Isabel of Portugal. His daughter Isabel would succeed her half-brother Enrique IV in 1474 and become known as Isabel the Catholic.

Despite his weak character, Juan II was a discerning, intelligent individual and a lover of the arts. During his reign poetry, music, and the arts flourished at court. He had a strong sense of the importance of literature and culture, and was himself an accomplished poet and musician. He is buried at Burgos in the Carthusian monastery of Miraflores next to his second wife, Isabel of Portugal. His magnificent tomb, sculpted by Gil de Siloé, stands as a memorial to an almost forgotten king who was a major patron of the arts.

JUAN MANUEL

Son of Alfonso X's younger brother, Manuel, and grandson of Fernando III; born in Escalona (Toledo) in 1282. From a very young age, he participated both in war (particularly in the advances on Murcia, which lasted from 1284 to 1339) and in politics, though not without differences with his council.

Along with his hectic political life during the reigns of Fernando IV (1295–1312) and Alfonso XI (1312–1350), which was largely motivated, as he himself says, by questions of *onra* [honor/reputation] and *facienda* [property/wealth], Juan Manuel displayed an encyclopedic knowledge that was indicative of his de-

sire to emulate his uncle, Alfonso X, whom he admired from an exclusively cultural (and not political) perspective. He was also a devout man, influenced by the Dominican tradition, which he followed throughout the various didactic works of his career. After retiring from active political life, Juan Manuel died in 1348; he is buried in the monastery at Peñafiel, which he founded.

In the general prologue to his works, the author expresses the philological/critical anxiety that his texts might be poorly copied, declaring that the authentic, original books, against which any potentially confusing transcripts can be compared, are in the convent at Peñafiel. Although this is essentially nothing more than a repetition of what Nicolás de Lira had already said, this disclaimer serves as a mark of authenticity for Juan Manuel's work. With this notice, the author participates in the medieval concept of an ethics of language opposing the lie, and is thus able to forestall any willful error on his part. For those inevitable involuntary errors, he resorts to the *topos* of modesty—already in use since antiquity—attributing such lapses to his lack of intelligence. Juan Manuel manipulates the vernacular language in a fresh, renewed manner, and with a wider vocabulary and a more purified syntax than Alfonso X. He is partial to concision and clarity, qualities he praises in his uncle's writing, although he does experiment with a more hermetic, obtuse style. The discovery of a skillful use of dialogue is frequently attributed to Juan Manuel, who arguably anticipates certain subtleties of the Renaissance.

A list of Juan Manuel's works appears both in the *Prólogo general* and in the prologue to *El conde Lucanor*, although there are discrepancies between the two prologues with regard to the order and number of works listed. Without the lost Peñafiel codex, what remains of the author's writings is found in various fourteenth-century manuscripts, among them Manuscript 6376 in the Biblioteca Nacional in Madrid. This manuscript lacks the *Crónica abreviada*, which in turn was found by Sánchez Alonso (in MS. F. 81 [now 1356]), also in the Biblioteca Nacional. Both have served as the basis for the edition of Juan Manuel's *Obras completas*.

Of the preserved texts one must first cite the *Libro del cavallero et del escudero*. Written before 1330, the work is one of many encyclopedic treatises of the time. Similar to Ramón Llull's *Llibre de l'ordre de cavalleria*, to which Juan Manuel seems to allude, the plot consists of the encounter between a young squire on his way to the court, and a former knight—now a hermit—who answers the young man's numerous questions. The hermit upholds knighthood as the most honorable estate in this world and indoctrinates the squire through a brief discourse on chivalry; later, the former

knight gives the young man, now a novice *caballero*, a treatise on theology, another on astrology, and several expositions on the animal, vegetable, and mineral kingdoms; finally he tells the young man about the sea and the land, ending with an exaltation of creation as "manifestación de la gloria de Dios" (manifestation of God's glory).

Libro de los estados, finished in 1330, consists of two books distributed in three parts: the first book's hundred chapters, which address different religions and the estates of the lay population; the first fifty chapters of the second book, concerning the different laws (among which only the Christian law is true) as well as the mysteries of Christ and the estates of the secular clergy; and the fifty-first chapter of the second book, dedicated to religious orders and their regulations, especially the orders of preaching friars and of lesser friars. The structure is that of a work within a work, all written using dialogue as a technique supported by the main characters: the pagan king Morobán, the *infante* Johas and his tutor/teacher Turín, and a Christian preacher named Julio. The basic framework is similar to that of *Barlaam y Josafat*. Turín, committed to avoid having to address the concept of mortality, ends his phase of the prince's education by explaining the meaning of death in front of a fortuitously discovered cadaver. Chapter 22 introduces the Castilian preacher Julio, "omne muy letrado et muy entendido" [a very educated and intelligent man] in matters of Christian doctrine. Julio claims to be tutor to Prince Juan, son of the *infante* Don Manuel, and from that moment on he will carry the burden of Prince Johas's education. The work teaches that, in order to be saved, he who did not keep the law of nature should follow Christian law, which fulfilled Old Testament designs. This law is contained in the Holy Scriptures and is preached by the church, whose accepted hierarchy, divided into "legos" [the lay population] and "eclesiásticos" [the clergy], is described in detail.

Crónica abreviada, written during the tutelage of Alfonso XI (around 1320), was thought lost until Sánchez Alonso found it in 1941. It is a summary of Alfonso X's *Estoria de España*, and though Juan Manuel claims to follow his uncle's work step by step, it is actually much more than just a faithful copy.

Libro de la caza, thought by some to be written late in the author's life, is a treatise on the art of falconry, addressing the care, training, and medication of falcons and hawks. Juan Manuel relates not only his knowledge of the hunt, but also his own personal experience, to which he alludes in the text.

Libro infnido, or *Castigos y consejos a su hijo don Fernando* (1337), is inscribed within the tradition

of the education of princes, although it also contains a strong dose of personal and autobiographical content. It refers frequently to *Libro de los estados*.

Libro de las armas, or *Libro de las tres razones*, written after 1335, addresses three issues: the meaning of the coat of arms given to Juan Manuel's father; the reason a person may knight others without having been knighted himself; and the content of Juan Manuel's conversation with King Sancho at his deathbed (1295). The author explains the symbolism of the coat of arms (especially the angelic *ala* [wing]) that appeared in his grandfather's prophetic vision while his father, Don Manuel, was in the womb. He relates various anecdotes told both to his father and to himself, among them the legend of Doña Sancha de Aragón, similar to the legend of Saint Alexis. He concludes that both his uncle, Alfonso X, and his father had wanted him to knight others during their lifetime. Finally, the author describes King Sancho's deathbed speech, in which he tells Juan Manuel of the anguish caused by his parents' misfortune, and entrusts the young man to the king's wife María and their son Fernando. This work, which has been praised by Américo Castro as "la primera página, íntima y palpitante de una confesión escrita en castellano" [the first intimate, true life confession written in the Spanish language], has recently been analyzed from a literary perspective.

Tratado de la Asunción de la Virgen María was likely the last work to leave Juan Manuel's pen. A brief theological treatise on the Christian miracle of the Virgin's Assumption, the work gives several reasons why "omne del mundo no deve dubdar que sancta María no sea en cielo" [men in this world should not doubt that Saint Mary is in heaven].

Finally, *Libro del conde Lucanor*, (or *Libro de los Enxemplos del conde Lucanor et de Patronio*), finished in 1335, has come down to the modern reader in a rather contaminated state. The preservation of five manuscripts, all from the fifteenth century, attest to its wide diffusion. The work is divided into five parts, of which the first is the most extensive, consisting of fifty-one known *exempla*. In the second part the style changes, and in its prologue the author praises the use of subtlety as a way of making the merit of his work known. Books 2, 3, and 4 are essentially one book of proverbs, and the fifth and final book is a general reflection on Christian doctrine. It is difficult to separate the didactic from the narrative; the work's rhetoric manages to overcome the dichotomy of the two elements.

The sources—especially of the *exemplos*—can be found in stories of Oriental origin that, like the *Disciplina clericalis*, were well known in the Western world through their Latin versions. It is important to

remember that in Alfonso X's day *Calila e Dinna* and *Sendebat* had already been translated into Castilian. Other works also circulated in medieval translations, including Aesop's fables, *Barlaam e Josafat*, *Sintipas*, the *Gesta romanorum*, the *Legenda aurea*, which was used by preachers who collected exempla, and contemporary works such as chronicles and bestiaries.

Some of the exempla may come from oral sources later recorded in some textual form selected by the author. Others are indications of Juan Manuel's own originality as a creator, as well as his artistic manner of reelaborating extant texts.

The purpose of the majority of Juan Manuel's writings is to teach through pleasure (*docere delectando*); in several occasions, the author expresses his goal of morally attending to his readers, orienting their conduct—including the increase of *onras* and *faciendas*—according to their estate. Consequently, and especially in *El conde Lucanor*, the author filled his *exemplos* with the most useful and entertaining stories he knew, hoping that his readers would benefit from the work's *palabras falagueras et apuestas* (delightful and elegant words), while at the same time taking in the *cosas aprovechosas* (useful things) mixed in.

Starting in the thirteenth century, the exemplum played a didactic role, offering models of behavior for its readers. With Juan Manuel, however, the exemplum becomes something much more: it is an explicitly structural, well-determined genre chosen consciously by the author. Furthermore, it allows Juan Manuel to establish a perfect accord between the duelling narrative and didactic elements, a desire already implicit in the prologue's affirmations.

JUAN, PRINCE, SON OF CATHOLIC MONARCHS SEE CATHOLIC MONARCHS

JUAN, INFANTE AND REGENT OF CASTILE

Juan (1264–1319), Infante of Castile was regent for Alfonso XI (r. 1312–1350) of Castile. Juan was a son of Alfonso X (1252–1284) and Queen Violante. During the conflict between his older brother Sancho (Sancho IV, r. 1284–1296) and Alfonso X, Juan initially sided with Sancho in 1282, but later joined his father. In his will Alfonso rewarded him with the kingdoms of Seville and Badajoz, to be held as vassal to Alfonso de la Cerda, the king's grandson and designated heir to Castile. The will was not executed because Sancho secured the entire inheritance. In 1287 Juan married María Díaz, daughter of Sancho's most powerful noble, Lope Díaz de Haro, and with the latter's support tried to gain the throne. Sancho caused the death of Lope Díaz and briefly imprisoned Juan. Juan took part in the conquest of Tarifa (1292), but after quarreling with Sancho he went to Portugal. In 1293 he joined Juan Núñez de Lara in a scheme to seek the help of Portugal in deposing Sancho, but following Juan Núñez's death the following year nothing more was done. In 1295 Juan offered his services to Abū Ya 'qūb, king of Morocco, for an attack on Tarifa. Juan led the Moroccan forces at this siege, where he killed the son of Alfonso Pérez de Guzmán, governor of Tarifa, when he refused to surrender the city.

Sancho's death in 1296 left a minor, Fernando IV (r. 1295–1312), whose technical illegitimacy provided a pretext for Juan to claim the throne of León according to Alfonso X's will. Supported by the troops of Jaime II of Aragón and Dinis of Portugal, Juan was proclaimed king in León in 1296. The Portuguese, however, signed the Treaty of Alcañices, recognizing Fernando IV as king. María de Molina, the king's mother, was able to fight off the Aragónese and to obtain papal recognition of her son's legitimacy. Without Aragónese or Portuguese backing, revolt was not feasible, so Juan cultivated Fernando IV instead. He received favorable judgment in the *cortes* of Valladolid (1307) over inheritance of the lordship of Vizcaya, a former possession of his late father-in-law. In 1309 he proposed that the crown raise money by collecting tax arrears, thus preventing the *cortes* from approving new revenues. When Fernando IV died in 1312, leaving as his heir the infant Alfonso XI, Juan was named regent with María de Molina and the Infante Pedro in the Concord of Palazuelos (1314). Juan's troublesome career came to an end on 25 June 1319 when he and his coregent, Pedro, advancing to war against the Muslims, died on the plains of Granada.

Juan's first marriage, to Margarita of Monferrat, daughter of Guillermo VII, took place in 1281 and produced one son, known as Alfonso de Castilla. His second marriage, to María Díaz de Haro, produced two

children, Juan de Castilla, ("one-eyed" because of a defective eye) called "el Tuerto" and a daughter (name unknown) who was betrothed to Juan Núñez de Lara.

JUANA, DAUGHTER OF FERNANDO AND ISABEL SEE CATHOLIC MONARCHS**JUANA, PRINCESS AND QUEEN OF CASTILE**

The exact date of Juana's birth is unknown, but she appears to have been conceived in or around April 1461. Her mother was the wife of Enrique IV, known as Juana of Portugal, queen of Castile. Whether Enrique was her father remains in dispute, hence her also often being called Juana "la Beltraneja," reflecting that her real father may have been Juan Beltrán, a high official at court reputed to have been her mother's lover.

The consequences of Juana's disputed legitimacy are important for monarchical succession in Castile during the last quarter of the fifteenth century. By 9 May 1462 the *cortes* of Castile, attended by leading churchmen and the magnates of the realm, had sworn allegiance to Juana as heir to Enrique IV. Shortly thereafter, the king instructed all jurisdictions in the kingdom to do the same. Soon, however, a campaign began among sectors of the disgruntled nobility to replace Enrique IV as king with his younger half brother, the Infante Alfonso, culminating in the so-called Farce of Avila in June of 1465, where Enrique was deposed in effigy. As part of the campaign to remove the king, especially after the mysterious death of the Infante in 1468, the allegations of Juana's illegitimacy began to circulate publically, placing her at the center of the controversy concerning Enrique's continued reign and his succession. Pressured by the nobles, who now favored the succession of Enrique's half sister, Isabel of Castile, the king disinherited Juana and recognized Isabel as his immediate heir. Some historians have generally been willing to interpret this act of Enrique IV as an implicit acknowledgment that Juana was not his daughter. However, even if she were his daughter, as she was by juridical presumption, he might have

yielded to the pressure exerted by the nobles, who sought to give the crown immediately to Isabel. It is therefore possible that Enrique may have compromised with the nobles by making Isabel his heir, as he did at Los Toros de Guisando on 19 September 1468.

On 12 December 1474, the day after the death of Enrique IV at Madrid, Isabel, who was at Segovia, had herself proclaimed queen of Castile. Juana, who had been betrothed to Afonso V of Portugal and had been reinstated as Enrique's heir when he subsequently revoked the Pact of Los Toros de Guisando and again proclaimed her successor to his dominions, sought to press her claims via an alliance with the Portuguese. The archbishop of Toledo, the marqués de Villena, and other nobles who in Enrique's lifetime had denied Juana's legitimacy now defended her claims. The conflict set off a five-year war between Castile and Portugal that ended in 1479, when Juana abandoned her case and retired to the monastery of Santa Clara of Coimbra (1480), from where she was never allowed to leave, thus opening the way for legitimizing Isabel's claim to the throne of Castile. Juana died at Coimbra in 1530.

JUDAH ḤA-LEVĪ See YEHUDAH ḤA-LEVI

JUDERÍA

In Castile-León (and to some extent elsewhere) the term *judería* refers to the Jewish quarter of a town or city. In fact, however, there was no restricted quarter where Jews were compelled to live until the fifteenth century, with rare exceptions such as Murcia (1267) and Valladolid (1351), when Pedro I agreed that in those places where priests had an agreement with Jews to live apart from Christians, this should be done. Under the influence of Vicente Ferrer, the Ordinances of Valladolid (1412) supposedly imposed a separate Jewish quarter for each town and city (in fact, this was not always done). A bull from Pope Eugenius IV (1442) also ordered that Jews live only in separate *juderías*, but again this was not actually enforced. It was not until 1480, when the Catholic Monarchs ordered the establishment of *juderías*, that some attempt was made actually to enforce this law. Even so, major cities ignored it, and as late as 1492 Toledo, for instance, still had no official *judería*.

In Aragón-Catalonia (including Valencia and Mallorca) the term *call*, derived from the Hebrew *qahal*, was used at least from 1238 to refer to the Jewish quarter. By 1290 a call was established in Mallorca. The most famous *calls* were those of Barcelona and Girona, but sources attest to the existence of the *call* everywhere in these kingdoms. In many towns in Spain today it is easy to locate these former Jewish quarters.

JUGLAR

This term has many meanings and may be understood in various ways according to place, time, and circumstance. It refers principally and broadly, however, to professional medieval entertainers or minstrels. The word *jokulare*, from which *juglar* derives, is first documented in the Iberian Peninsula in Aragónese Latin in the year 1062. Its Romance forms, *joglars* and *joglar*, are subsequently found in Gonzalo de Berceo, *Vida de Santo Domingo de Silos*, 318b y 775b. Its sense when used as an adjective is synonymous with happy (*alegre*) or jesting, jocular (*burlón*): *sermón juglar*, *lengua juglara* as nouns designate a type of speech used by someone to entertain others. Its sense is related to *jocus*, with the acception of joke (*burla*) or fun, jest (*chanza*).

Medieval Spanish legislation relative to the sphere of the court records the tradition of the Roman *mimos* and the barbarian *scopas*, actors and entertainers who provided diversions and entertainments for the nobility. In his *Siete Partidas*, Alfonso X recommends that the king, especially, should take respite from governing by means of leisure pursued publically amid the court, or *a modo palatino*, listening to and watching amusing pastimes. Diversion, especially during meals, consisted in conversation with other members of the court, in listening to stories, and, especially, in verbal games, or *jugar de palabra*. That is, cultivating double entendre, jokes, and verbal play whose object is laughter, because, as was noted “there would be no fun where no one laughs” (“non serie juego onde omne non rrye”). Play is thus associated with laughter and joy in a courtly setting. It is often produced by *juglares*, or entertainers. Playful diversions were referred to as *alegrías*, or joys provoked by *juglares*, or professional

performers, who by playing instruments and singing their own as well as songs composed by others provided amusement for the king, as recorded in the *Partida Segunda*.

The term *trobador*, often associated with *juglar*, is also first documented in the eleventh century, but with the sense of someone who verbally invents or creates song or poetry. The term *juglar* seems to have been applied to all performers who played instruments and sang. These entertainers were generally also distinguished by the type of instruments they played.

Other related terms are *remedador* and *cazurro*, who were also designated *juglares*. Guiraut Riquier laments that he, a *juglar*, was often confused with them. In 1275 Guiraut composed a *Supplica*, or petition, addressed to Alfonso X where he begs the king to define the function of *remedadores* and *cazursos* so that he will not be mistaken for one of them. Opinion is divided on whether Riquier's request was motivated by economics or by a concern for his social status. The *remedadores* and *cazursos* were *juglares* who were mimes and jesters. They imitated their social superiors and recited nonsense verses often in the streets and public places, usually in the company of puppeteers, cardsharps, saltimbanques, or animal trainers, all of whom also often went under the name of *juglar*.

Segreles, or professional entertainers of a higher class were also referred to as *juglares*. *Segreles* traveled from court to court offering their brand of more exclusive diversion for compensation in the form of gifts, shelter, or other emoluments. To be sure, some *juglares* were known to be permanently retained at certain courts, where their presence is documented in account books and lists of payments by the lord. In Alfonso X's *Partida Segunda*, as well as in the *Llibre de cavalleria* of Pedro III of Aragón, there are references to the requirement that *juglares* should not sing anything but songs of military deeds (*fechos de armas*) before an audience of knights, which indicates that, in addition to courtly entertainments, part of the repertoire of certain *juglares* consisted of epic songs, or *cantares de gesta*. These were known as *juglares de voz*. In a thirteenth-century *ensenhamen* (instruction poem of praise or blame that Guerau de Cabrera directed at a *juglar* known as Cabra, Guerau provides a list of activities he describes as Cabra's repertoire. The latter includes a broad range of lyric and narrative compositions that every *juglar* should master and perform in exercising their professional duties. Finally, there were *juglares de péñola*, or those who composed in writing for themselves.

Itinerant *juglares*, especially those who sold their services, were generally looked down upon, designated as *viles e infames*. The ones who played or amused

others for their own entertainment, however, were considered socially acceptable. During the Fourth Lateran Council (1215) the church pronounced excommunication against all *juglares* identified as viles and infames and strictly prohibited the clergy from associating with them. This legislation was subsequently incorporated by Alfonso X in the *Partida Séptima*.

JULIAN, COUNT

The reality of Count Julian's existence is open to serious doubt, and it is probable that he is no more than a literary figure created to help give a human dimension to the explanations for the rapid and triumphant Arab conquest of Spain in 711. He features in a number of Arab accounts of the invasion as the Visigothic governor of Ceuta, whose assistance to Ṭāriq ibn Ziyād was motivated by his desire for revenge against King Roderic. According to these stories, the Visigothic ruler is said to have raped or seduced the count's daughter while she was entrusted to his court in Toledo for her education. In consequence the enraged Julian provided the Arabs with the five (or seven) ships that they needed to cross the Strait of Gibraltar.

Julian does not feature in the Christian historical tradition at all, and, most significantly, there is no mention of him in the Latin *Chronicle of 754*, the only eighth-century account of the Arab conquest in any language. The story of Julian and his daughter belongs with similar tales, such as those of Roderic and the locked tower in Toledo or of Ṭāriq and the Table of Solomon. These are all part of an essentially literary elaboration of the events of the conquest by Arab authors of the tenth and eleventh centuries, and lack historical foundations. A ruined building on the banks of the Tagus in Toledo was long claimed to be the Baños de la Cava where Roderic was said first to have caught sight of Julian's daughter, but in reality this structure is the remains of a ninth-century Arab bridge.

JULIAN OF TOLEDO

Born around 640, Julian was of partly Jewish descent. Knowledge of his career comes primarily from the brief "Eulogy" of him written by Bishop Felix of Toledo (693–ca. 700). He was a pupil of Bishop Eugenius II (647–657), and subsequently became a member of the clergy of the church in Toledo while following a rigorous ascetic regime. Following the death of Bishop Quiricus (667–680) he was chosen by King Wamba to take over the see. The choice may have been influenced by Julian's eulogistic *Historia Wambae*, an account of the opening events of that king's reign. However, before the end of 680 Julian had been caught up in, or even had initiated, the chain of events leading to Wamba's enforced abdication and retirement to a monastery. With the new king, Ervig (680–687), to whom he had previously dedicated a now lost work on divine judgment, Julian seems to have cooperated closely. In 686 he dedicated to the king his most significant surviving book, *On the Proof of the Sixth Age*, a polemical reply to Jewish denials of Christ's messiahship. This work redefined the chronological framework of human history within an apocalyptic context, and was to be highly influential in Spain and western Europe throughout the Middle Ages. He died in Gao.

Other extant writings by Julian include the *Antikeimenon* and the *Prognosticum futuri saeculi*. In these, as in lost collections referred to in the "Eulogy," Julian is revealed as an assiduous reader of the works of Augustine. Like Ildefonsus, Julian is credited by Felix with the composition of verse and also of a substantial body of liturgy. The latter cannot be disentangled from the vast corpus of Mozarabic liturgical texts.

During his episcopate Julianus presided over four Councils of Toledo: the twelfth (680–681), thirteenth (683), fourteenth (684), and fifteenth (688). The first of these formalized the primacy of Toledo over all the other churches of the Visigothic kingdom. Julian himself contributed to this by his emphasis on the role of the anointing of the king in the "royal city" as a precondition for a new ruler's legitimacy.

JURA DE SANTA GADEA

Jura de Santa Gadea is an epic story preserved in traditional ballads and prosified in chronicles. Its hero, El Cid, compels his new lord, Alfonso VI, to swear three times in the church of Santa Gadea that he is innocent of the murder of his brother Sancho II. The murder is narrated in the lost *Cantar de Sancho II y cerco de Zamora*. Critics disagree as to whether the *Jura* was the final episode of this *Cantar*, or was composed later (ca. 1200) and separately for the purpose of linking the *Sancho II* epic and the *Cantar de Mío Cid* into a cyclical poetic life of the Cid, or was simply a ballad.

There are common features in all of the versions of the *Jura*: anti-Alfonsine sentiment and the presentation of the Cid as a rebellious vassal. Consequently the possibility that it was the epilogue of an anti-Leonese *Sancho II* cannot be excluded. It also may have been the beginning of a lost *Cantar del destierro del Cid*, in which the hero is presented as rebellious against his monarch. This can be observed better in the *Crónica de Castilla* (late thirteenth or early fourteenth century). It has also been suggested that the epic tradition of the Cid as a rebellious vassal (the best example being the *Mocedades de Rodrigo*, probably from the 1360s) may well have derived from the *Jura* tradition.

JUSTICE, CHRISTIAN, ISLAMIC See ADMINISTRATION, JUDICIAL

JUSTICIA OF ARAGÓN

The *justicia* of Aragón was a judicial intermediary between the Crown of Aragón and the people. Though long thought to have roots in the judiciary of Muslim Spain or in the *fueros* (civil codes) of Sobrarbe, the *justicia* has been shown to have originated from a class of officials of twelfth-century Zaragoza, most especially the *zalmedina*. His road from minor judge to true national voice was begun during the unionist revolt of 1265–1266. At the *cortes* (parliament) of Exea in 1265, the *justicia* was made judge of record in suits between the king and the Aragónese nobles. To prevent his being suborned by either side, the office was to be held only by a knight. During the revolt of the *Unión* (1283–1287), the *justicia*, in conjunction with the Ara-

gónese cortes, became a countervailing force to the crown. The power of the office escalated to such an extent that for the next century, even after the final defeat of the Union in 1348–1349, Pedro IV and his successors still retained the justicia as one of the greatest judges of Aragón who performed many of his earlier functions as advocate of the Aragóneſe people. As the supreme interpreter of Aragón’s foral law, the justicia also stood as the protector of individual litigants who could intervene in any suit in which Aragóneſe fueros (civil codes) were being violated by other royal judges. These functions of foral protection (*manifestación*) and litigant advocacy (*firma de derecho*) continued as long as the office of justicia per-

sisted. In all, fifty-nine justicias served in Aragón between 1123 and 1707, when the office was abrogated by Philip V’s *Decreto de Nueva Planta*.

KINGSHIP

The authority of the first Visigothic kings rested on their military success. Once settled in Spain, under the influence of Roman tradition they assumed much of the authority of the emperor. Leovigild (r. 568–586) adopted royal vestments and other trappings of kingship. The monarchy was elective, but by associating their sons on the throne, kings tried to transform it into a hereditary institution. The Visigoths unfortunately tended to assassinate their kings. To safeguard the monarchy the Fourth Council of Toledo in 633 established a procedure for a royal election. The newly elected king probably was raised on a shield and acclaimed by the assembly, who swore allegiance to him. Another protective device was anointing, a practice first used in Wamba's (r. 672–680) time and then copied elsewhere in Europe. Toledo was the favorite residence of the Visigothic kings. Isidore of Seville (d. 636) stressed the king's responsibility to rule justly; otherwise he would not be entitled to be called king.

The kings of Asturias-León, inspired by Visigothic tradition, claimed to continue the Visigothic monarchy. The principle of hereditary succession gradually came into operation as rulers were descended from Pelayo (r. 718–737) and his son-in-law Alfonso I (r. 739–757). There were three minorities in 966, and others in 999 and 1028. Royal anointing was employed sporadically, as in the case of Alfonso II in 791. After the acclamation of Ordoño II in 914, a diadem was placed on his head and he was anointed. The *Antiphonary of León* contains an *ordo* (procedure) for making a king. The king's authority was rather rudimentary. He was primarily a military leader responsible for defense, but by the end of the ninth century his obligation to expel the Muslims from Spain was clearly stated. In addition he maintained the peace and dispensed justice.

In response to the revival of Roman law, the recovery of Aristotle's *Politics*, and changing economic and social circumstances, the nature of kingship changed substantially from the twelfth century onward. The kingdoms of Castile, León, Portugal, Aragón-Catalonia, and Navarre were now well defined. The principle of hereditary succession and primogeniture was also established. Fathers often designated their sons as heirs to the throne. On several occasions between 1065 and 1230 Castile and León were separated to provide for more than one son. The right of minors to inherit the throne was acknowledged—for example, in the cases of Jaime I of Aragón (1213); Afonso V of Portugal (1438); and the Castilian kings Alfonso VIII (1158), Enrique I (1214), Fernando IV (1295), Alfonso XI (1312), Enrique III (1390), and Juan II (1406). The right of females to inherit was also accepted in Castile in the case of Urraca (r. 1109–1126); Berenguela, who ceded her right to her son, Fernando III (r. 1217–1252), and Isabel I the Catholic (r. 1474–1504). In Aragón the rights of Petronilla (r. 1137–1174) were recognized, as were those of Constanza, daughter of Pedro IV, in 1347, although she did not succeed him. In Castile a difficult situation arose when Alfonso X's oldest son and heir, Fernando de la Cerda, predeceased him in 1275. The king recognized his second son, Sancho, but opponents favoring the claims of Fernando's heirs, the Infantes de la Cerda, initiated a struggle that lasted until 1304. Although illegitimate children were barred from succession, Enrique II of Castile (r. 1369–1379) and João I of Portugal (r. 1385–1433) both gained power in revolutionary circumstances. In each case it was claimed that the people had the right to choose their king.

Although texts commonly speak of the king being raised to the kingship, that should be taken figuratively. There is no reason to believe that the Germanic custom of raising him on a shield persisted in medieval Spain. The new monarch was acclaimed and received a pledge of homage and allegiance from his people.

The custom of anointing and coronation seems to have fallen into desuetude except in Aragón, and was used elsewhere only when a king needed to stress his right to rule. Alfonso X may have crowned himself at Toledo in 1254; Sancho IV crowned himself there in 1284, primarily to strengthen his claims against Alfonso de la Cerda. Fernando IV apparently also was crowned there in 1295. Alfonso XI crowned himself at Las Huelgas de Burgos after being knighted by a mechanical statue of St. James. Of the succeeding kings only Juan I was crowned. Pedro II of Aragón was crowned in Rome by the pope in 1204, but later kings were crowned in Zaragoza by the archbishop of Tarragona. Pedro IV, however, crowned himself.

The concept of royal power was greatly enlarged during this time. The king was expected to do justice, but this was taken in a much more active sense. The king assumed the responsibility of amending old laws, and also of making new ones. His duty was to obey the law and to do justice to every person. In addition he claimed the right to levy extraordinary taxes to carry on his activities for the benefit of the kingdom, but he had to ask the consent of the people, which was usually given in the *cortes* (parliament). He was responsible for defense and for the prosecution of the reconquest.

From time to time kings were charged with incompetence or tyranny. Charged by the papacy in 1245 with tolerating anarchy, Sancho II of Portugal was effectively deprived of royal power as custody of the realm was entrusted to his brother Afonso III (r. 1248–1279). The accumulated grievances of the Castilians concerning Alfonso X's innovations in law and taxation, and a dispute over the succession, resulted in his being stripped of royal authority in 1282. Though he retained the royal title, his powers were transferred to his son Sancho IV. Years later Pedro I was challenged by his half brother Enrique of Trastámara, who finally murdered him in 1369. Juan II of Aragón had to contend with the revolt of the Catalans, who denounced him as an enemy of Catalonia in 1462. The Castilian nobility formally declared the deposition of Enrique IV in 1465 and vainly attempted to transfer the crown to his younger brother Alfonso of Ávila. The task of restoring the prestige and authority of monarchy fell to Fernando and Isabel at the close of the medieval era.

KUZARI

Judah ha-Levi (ca. 1075–1141) was an important Hebrew poet. Sometime prior to his ill-fated voyage to live in Palestine (he died on the way in a storm), he composed what he himself refers to as an “insignificant” little work in Arabic, known by its Hebrew translation as the *Kuzari*. It is not, as often erroneously claimed, a “philosophical” work, but rather a theological one, modeled fictitiously on a debate between the king of the Kuzars (who actually had converted to Judaism) and a Muslim, Christian, and Jewish spokesman, each setting forth the validity of his religion. Its aims were three: to assert the superiority of Judaism over Christianity and Islam, to assert the superiority of revealed religion over Aristotelian philosophy, and primarily to attack the Qaraite heresy. Most interesting are his “Zionist” ideals: the interdependence of God, the Land, and the Jewish people. Nevertheless, the work had little or no impact upon the Jews of Spain. It did, however, on Spanish literature, for it certainly influenced Juan Manuel (*Libro de los estados*) and Ramón Llull (*De el Gentil y de los tres sabios*). A medieval Spanish translation is extant (being edited) and a seventeenth-century one by a Jew of Amsterdam has been frequently published. English translations and others exist.

LAPIDARIES

Lapidaries are books that describe stones and their therapeutic virtues. Three types can be distinguished: medical-descriptive, magical, and symbolic interpretations of the twelve biblical stones.

The lapidary inserted in St. Isidore of Seville's (c. 560–636) *Etymologiae* follows Pliny the Elder's and Solinus's lapidaries. It shows Pliny's subdivision of stones, gems, and metals. Among stones, Isidore distinguishes ordinary, luxurious, and marble; his classification and terminology rely on external forms, so that variations of color gives rise to different names. Although he rejects superstitious practices, Isidore recognizes the existence of magical powers in Nature due to the relation between macrocosmos and microcosmos that the physician will use only for therapeutic purposes. The main interest of the work, which had an extraordinarily wide diffusion, is the etymological aspect.

Among Arabic lapidaries it is important to highlight the geological and chemical part of Avicenna's (980–1037) *Kn̄ab al-Shifā'*, which follows the classification of stones, sulfides, metals, and salts, and the mineralogical part of Ibn al-Baitar's (1197–1248) *Simple Treatise*. The latter contains alphabetically ordered descriptions of precious stones to be used in the Muslim pharmacopoeia.

Alfonso X (r. 1252–1284) ordered the *Lapidario*, considered to be the main work of astrological learning; derived from a Greek original transmitted in an Arabic version, it belonged to a vast body of research on the microcosmos as a whole. This work (the only one remaining in the Western world with miniatures) reflects diverse graphic sources, among them Muslim

adaptations of the Gothic style. It consists of four lapidaries. The first one is divided into twelve sections corresponding to the constellations of the zodiac; each section has thirty chapters, corresponding to thirty degrees of every sign; each chapter covers one stone and the star(s) to which it is astrologically linked. The text names it in three languages and describes its features, the lands where it can be found, and its qualities. This work has illustrations of two types: capital letters depicting the finding or obtaining of the stones by a savorant and his helper, and round medallions enclosing one of the forty-eight constellations from the *Ochava esfera*, which illustrate each stone's qualities and virtues. In all there are 360 stones, corresponding to the zodiac's 360 degrees. Each section is illustrated by a big wheel whose center features the corresponding sign of the zodiac. From each wheel thirty arms radiate, each of them bearing the constellation that influences the corresponding stone.

Juan Gil de Zamora (ca.1241–ca.1318) included a lapidary in his *Historia naturalis* (ca.1282), which reveals the influence of Pliny the Elder.

In the fifteenth century three anonymous Catalan lapidaries of an astrological-popular character were derived from one of the compilations of the *De mineralibus* of Albertus Magnus (1193–1280).

LARA FAMILY

One of Castile's great noble families, the Laras initially based their power at the village of Lara in the present-day Spanish province of Burgos. They emerged in the eleventh century as minor retainers of the first Castilian Count Fernán González. The era of clan violence and court intrigue in which the Laras began their climb to prominence can be gleaned from the Castilian epic *Infantes de Lara*. In such an atmosphere of social flux, the Laras rapidly moved to the forefront of the Castilian nobility by the twelfth century. Vying with their major early rivals in the baronage, the Castros, for control of such centers as Toledo, the Laras by the thirteenth century had become power brokers for the Castilian crown and the realm's parliament, or *cortes*. One of the greatest scions of the family, Álvaro Núñez de Lara, served as procurator for Castile after the death of Alfonso VIII in 1214. When Crown Prince Enrique I, died in 1217, as the result of an accident, Álvaro tried desperately to retain his position of power, but was finally forced to acknowledge the rule of Enrique's brother, Fernando III.

With the union of Castile and León in 1230, the Laras occupied a number of official posts, including those of *mayordomo mayor* and *adelantado mayor*. The most notable Lara in the late thirteenth century was Nuño González de Lara, who, as *adelantado* of the frontier, commanded a great Castilian army that was disastrously defeated—and he himself was killed—in July 1275 at Écija. Despite such sacrifices the Laras saw the Castilian monarchy slip under the influence of their archenemies, the Haro clan. Due to Sancho IV's weakness, a widening power base was carved out in the Castilian court by Lope Díaz de Haro. Rousing the majority of the Castilian nobility against Haro's dictatorial regime, Álvaro Núñez de Lara fomented rebellion against Haro as far afield as Portugal.

When Lara was deserted in 1287 by his Portuguese backers, notably King Dinis I, his rebellion collapsed and he died shortly afterward. Despite this set-

back the Laras retained much of their local power and gained increased influence at the Castilian court with Juan Núñez de Lara, who served as adviser to Sancho IV's son, Fernando IV. The traditional position of the Laras at the forefront of the Castilian nobility was recognized, even after the family had lost influence in the later medieval period to new noble clans through the practice of having one of its members serve as spokesman for the nobility in Castile's *cortes*.

LATERAN REFORMS

The movement of religious reform of the medieval church began under Pope Gregory VII in the eleventh century, with the intent to accomplish three things: a recovery of papal influence and power in the church, a reconquest of territory possessed by the Moslems since 640, and, most important, a rededication to the moral rectitude of the clergy. The first two aims of the movement, and to a certain extent the third, were generally quite successful in the twelfth century. By 1200, though, the process had slowed down and lost its effect: Moslems won important battles at Hattin and Alarcos, the monarchy still controlled the English and Spanish clergy, and the church faced anticlericalism, materialism, Catharist and apocalyptic propaganda, and a clergy that was still often corrupt and ignorant.

A revival of the reform movement took place in the early thirteenth century: St. Francis of Assisi emphasized preaching, missions, and charity work; Dominic organized his friars for similar purposes; schools and universities were established to train a more educated and dedicated clergy; canon law became more effectively codified. In an attempt to systematize this multifaceted movement, Pope Innocent III called a churchwide council in 1215, convening in the basilica of Saint John Lateran. Because of the location of the meeting, this council was known as the fourth Lateran Council, and the whole reforming phenomenon as the Lateran Reforms, even though many of the elements associated with ecclesiastical reform of the period were not a direct result of the Lateran councils.

The effect of the Lateran Reforms on Christian culture and literature in some regions (England, for example) has been well documented. Until Derek Lomax's important study in 1969, however, there was virtually no attention paid to their effects on Iberian society and civilization. As Lomax points out, the Spanish church leadership, headed by Rodrigo Jiménez

de Rada, archbishop of Toledo, was well represented at the Fourth Council. In other regions, the clergy held synods and issued decrees to pass on the legislation of the Fourth Lateran Council to the diocese. In Castile, the effect of the reforms is much more indirect and diffuse: bishops surely knew about the decrees, but were distracted by the reconquest of southern Spain and the overwhelming task of establishing a completely new Christian Church in those regions, and as a result they only rarely summoned diocesan councils and synods. They may, however, have put the Lateran decrees into practice without officially promulgating them, and many of the reform movement's effects—establishment of schools and universities, foundation of new religious orders, administration of the sacraments, etc.—were as evident in Castile as they were elsewhere.

The cultural fruits of the so-called Lateran Reforms can perhaps best be seen throughout the two centuries following the Fourth Lateran Council, when religious literature experiences a significant boom and a change in focus. This can be seen in the production of vernacular hagiography, the increased emphasis placed on confession (which was prescribed as an annual duty by the Fourth Lateran Council), and the valorization of moralizing literature, especially of the sermon and its source material. These didactic tools of the clergy slowly made their way into the lay population. Books of exempla, first compiled by clerics for other clerics (as in the case of *Disciplina clericalis*), were soon revised for the layman's use or produced as devotional reading (see the *Libro de los exemplos*). At the same time, authors began to use the exempla model for both didactic and entertainment purposes (the latter increasingly overshadowing the former), sometimes calling attention to the problematics of reading such works (see the *Libro de buen amor*). Finally, as the example of Juan Manuel shows, other lay authors began to employ the didacticism of the exemplum to communicate moral lessons that were sometimes nearly devoid of uniquely Christian teachings.

The presence and relevance of canon law in the literature of this period has only recently been articulated. It is clear, however, that church legislation on such matters as confession and marriage provided source material for the *Arcipreste de Talavera*, the *Libro de buen amor*, and in a more indirect manner, for vernacular short narratives, which seem to use as points of departure the cases that canon law lecturers like Bernardo de Compostela addressed in their *quaestiones*.

The reform movement of the thirteenth century clearly achieved a significant degree of success, resulting in a greater knowledge of theology and canon law

among its clergy, as well as a greater appreciation of works that satirized and parodied these subjects.

LATIN LANGUAGE AND LITERATURE

Latin literature of the Hispanic Middle Ages is brought about by the successive introduction of three factors: the Arabic invasion (early eighth century), the establishment of the Mozarabic population (tenth century, with a subsequent dispersion in the eleventh century), and the entrance of the Cluniac mission into the peninsula (eleventh century), which would put an end to the Spanish Mozarabic liturgy, but would also promote the diffusion of European culture.

From this perspective, the eighth century can be characterized on the one hand by the fact that communication and cultural activity between the Arabic and Christian parts of the Iberian Peninsula had not yet been broken; and on the other, by the influence of the Carolingian reforms of the last quarter of the century.

Within the Visigothic tradition, two famous epistolographers stand out: Ascárico (author of a cento based on the writings of Prudentius and Sedulius, and a theological epistle) and Tuseredo, an unknown individual who was the author of an surprisingly insightful epistle to Ascárico that addresses the problem of the Resurrection and the Glory. The abbot Pirminio, the founder of Reichenau and Murbach and a good example of a cleric who successfully fled the Arabic invasion, was the author of *De cunctis libris Scripturarum scarapsus*, which is a very useful example of Visigothic preaching.

Of greater interest and merit are the doctrinal and polemical works by the Adoptionist, Elipando de Toledo, an adversary of Alcuin who led the Hispanic resistance to the interests of Charlemagne. Besides several epistles, he is also the author of a *Symbolum* and an *Adversus Alcuinum*. The Adoptionism of Elipando (who never ceased to be closely observed because of the political problems posed by his opposition to French influence) was more a result of his heated debates with Alcuin and Beato de Liébana than of a sincere belief.

Beato, a northerner and a supporter of Charlemagne's expansionist campaign, was Elipando's first Spanish adversary, and won the approval of Alcuin. His work is fairly unoriginal, especially the *In Apocalypsim libri duodecim* which, nevertheless, is fundamental for the study of medieval art. The *Adversus Elipando*

dum, of a narrower diffusion, is more prophetic than theological; in this work Beato attacks the possible reconciliation with the Arabs living in traditionally Hispanic sectors. The growing hostility toward the Moors explains the appearance in the south of the *Historia de Mammeth pseudopropheta*, a compilation of the major ideas of anti-Islamic European literature.

Eighth-century historiography includes two Mozarabic chronicles written as supposed continuations of Isidore of Seville: the *Crónica de 741*, which treats foreign, Byzantine, and Arabic topics along the lines of John of Biclaro; and the *Crónica de 754* or *Chronica Mozarabica* which, with its very precise structure, deals with Hispanic, Arabic, and "Roman" matters successively.

The ninth century produced little original work, and is distinguished by the proliferation of *scriptoria*. In the Christian zone to the north, Latin literary production was limited to politically charged historiography. The first book of the *Annales Portugalenses Ueteres*, for example, deals with the historical legitimacy of the Asturian monarchy as heirs of the Visigothic monarchy. The *Crónica de Alfonso III* had a similar intention, though it is hidden among the jumble of contributing materials. In the last quarter of the century the third of the great political chronicles, the *Chronicon Albeldense*, was composed. It is a *historia mundi* in which news of the peninsula is interwoven with a clear pro-Asturian agenda.

The particular situation of the Mozarabic communities explains, in part, the successful preservation and persistence of Hispanic-Visigothic traditions. Around midcentury, a strong sentiment of religious and cultural opposition to Islamic power was unleashed in Córdoba, spawning a wave of persecutions. The first name among the Mozarabic ranks worthy of citation is that of the abbot Speraindeo, teacher and spiritual director of Eulogio and Paulo Alvarus, who were the most important figures of the time. Around 845, Eulogio, who belonged to a wealthy family, felt the need to travel to the Pyrenees, where he would have the opportunity to become acquainted with Christian Hispania and with the monastic libraries of Leire and San Zacarías; his journey provided him with a notable collection of books to take back to Córdoba. Eulogio allied himself with those that venerated the martyrs of the Islamic persecution, and as result was incarcerated; during his confinement he wrote the *Documentum martyriale*, the *Memoriale martyrum*, and the *Liber apologeticus martyrum*, and prepared a Latin prosody. He was martyred by decapitation in 859.

Paulo Alvarus, a friend, companion, and biographer of Eulogio, was a highly cultured layman who had read Vergil and Horace. His *Indiculus luminosus*

is a polemical anti-Islamic work complemented by the judgments expressed in the *Vita Eulogii*. Alvarus the theologian is revealed above all in his *Epistulae*; his fame, however, is mostly due to his poetic talents. He was the most accurate of the Mozarabic poets: he tried to reach the artistic heights of Eugenio de Toledo (his subject matter is very similar), but was not successful.

The tension provoked by the persecutions in al-Andalus gave rise to differences between the most strict Christians and those that, with their dominators, opted for compromise; the fiercest example among these conflicts was that of the steadfast Sansón of Córdoba and the inconstant Hostigesis of Málaga. Because the first is the only source of the second, the root of the conflict is not clear: needless to say, the *Apologeticus* demonstrates a vehemence not found even in the anti-Islamic literature.

The tenth century is dominated by the Mozarabic diaspora, which would bring with it a multitude of books only preserved by the Mozarabs. Apart from these, a biography of the child Pelayo by a priest named Raguel, along with the *Libellus a regula Sancti Benedicti subtractus* by Salvo de Albelda, are the only works of much importance that have reached our times. Introducing what would be a major cultural focus in the next century, Lupito de Barcelona composed a *Tractatus de astrolabio* that attained significant exposure throughout Europe.

With respect to poetry, one notable work is the *Epithalamium Leodegundiae*, probably of Navarrese origin. In the Ripoll monastery, a few compositions of certain quality were written in the Latin European style, "a la europea."

The eleventh century is the period of the great dispute between the supporters of European integration under the rule of the papacy and the supporters of the old Hispanic traditions. It is the century of the Cluniac mission in Spain, the introduction of the Roman liturgy, and the conquest of Toledo. The most original literary works come from Catalonia, and more specifically from the Ripoll region, where the production that began in the previous century continued. Among literary figures, both Olibas stand out: the first, from Vic, was abbot of Cuixá, bishop of Vic, and the son of the count of Besalú, and was an accomplished letter writer and a scholastic poet. The second, from Ripoll, was a scientific writer of mathematics, astronomy, and musicology. Homobono de Barcelona also flourished in the Catalan area—he was a cleric who summarized and updated the compilation of Visigothic law in a work named *Liber iudicum popularis*.

The question of the Roman liturgy imposed by the Cluniacs provoked a whole series of lively works both in favor and in opposition to the reform—the majority

of the works against the phenomenon have been lost. In part because of the influence of European satire in the work, and in part because of its decidedly anti-Roman atmosphere, it is probable that the composition of the *Garsuinis* or *Tractatus de reliquiis preciosorum martyrum Albini et Rufini* was connected to the antireform faction. This Hispanic work is a cruel and agile satire of simony (we are in the age of investiture) and the reprehensible life of the Roman Curia. Of a different vein, and with epic characteristics, is the *Carmen Campidoctoris* on the subject of El Cid (likely composed in Ripoll at the end of the century), written in Sapphic meter by someone that may have known the protagonist.

The overall importance of the twelfth century should be emphasized, as should the fact that this period in Spain does not exactly correspond to twelfth-century Europe; among the works of literary production, the *Gesta Roderici* stands out as a narrative without plot in which very reliable anecdotes of the Cid and his world are juxtaposed. In Iberian historiography, this work is complemented by the famous *Historia Silense*, a very polemical work by a very erudite author that never quite reached its intended chronological scope (the final years of the eleventh century), but that radiates Leonese patriotism.

The *Chronica Adefonsi Imperatoris*, written around 1148, is of interest as much for its subject matter—the reign of Alfonso VII—as for the addition at the end of an epic composition in hexameter that has been designated *Poema de Almería*, and includes an imitation of the time-honored “catalogs” of the *Iliad* or the *Aeneid*. The *Crónica Najerense* is a history *ab origine mundi* covering up to the reign of Alfonso VI that, apropos of the siege of Zamora, glosses what Entwistle considers a *Carmen de morte Sanctii regis*. Both histories pose the problem of the questionable existence of a medieval Hispanic Latin epic. The *Historia Compostellana* (ending abruptly with the year 1139) is not so much a history of that diocese as a *gesta* (chronicle of deeds) about Diego Gelmírez, its first archbishop. It displays both the verisimilitude of its contemporary setting and the drawbacks inherent in an imagined history; nevertheless, from a literary point of view these qualities make the history a key work of peninsular Latin literature.

The best known figure of the twelfth century is the Aragónese *converso* (Christian convert) Pedro Alfonso, who was the physician of Alfonso el Batallador and a prolific author. His works include a treatise, *De Astronomia*, a *Dialogus contra judaeos*, and the first European example of an apology of Oriental extraction, the *Disciplina clericalis*. The work is a series of exempla that the author, with a certain degree of

impudence, presents as a *via ad caelum* (path to heaven) for enlightened readers.

In terms of poetry, aside from the Latin compositions of epic style, almost all religious and secular literary production takes place in Ripoll or the surrounding regions, and are by anonymous authors. Among these works are the *Carmina Rivipulliensia*, twenty compositions—probably of Hispanic origin—of Goliardic nature with amorous subject matter.

With the exception of certain liturgical compositions (above all of the Ripoll and Montserrat schools) and the poem *Rithmi de Iulia Romula seu Ispalensi Urbe* by Guillermo Pérez de la Calzada (1250), all of the notable works of the thirteenth century are in prose, and most are histories. Lucas de Túy, who studied in Italy and joined the crusade against the Albigensians in France, became bishop of Túy and composed a *Chronicon mundi* inspired by Isidore of Seville and a curious hagiographic work, *De miraculis sancti Isidori liber*. More important was Rodrigo Ximénez de Rada, the archbishop of Toledo and author of the *Historia Gothica* (1243), a work that served as a basis for Alfonsine historiography and for less important histories of considerable quality and interest: *Historia Arabum*, *Historia Romanorum*, *Ostrogothorum Historia*, etc.

Juan Gil de Zamora, a collaborator of Alfonso X, wrote a *Tractatus Historiae Canonicae et Civilis*, a biographical collection with moral aims: his *De preconiis civitatis Numantinae* and *De preconiis Hispaniae* are representative of the patriotic current of the period.

Diego García “de Campos,” chancellor of Enrique I, was the author of a surprising work of scholastic content and deep erudition entitled *Planeta*, in which he shows off a unique yet overwrought style. Of a very different nature is the work by the Galician, Alvaro Pelayo, who studied in Italy and wrote an allegation in favor of papal supremacy, *De planctu ecclesiae*; a treatise of political theory for the instruction of princes, *Speculum regum*; and an exegetical work.

Rámon Llull (ca. 1235–1316), a Mallorcan of encyclopedic intellect, is a special case. He composed more than five hundred works of an essentially Platonic/Augustinian character. Despite his beatific status, the church always considered him with suspicion. His *Ars Magna*, about the organization of the universe, stands out amid his prolific production. Among his writings there are works of theology, astronomy, mathematics, medicine, and even enlightened spiritual meditation. The first formalization of the Catalan language owes itself to Llull.

LAURENTIUS HISPANUS

Laurentius Hispanus's birthplace and date are unknown; he died in 1248. He studied law at the University of Bologna, where he was a disciple of, among others, the Romanist Azzo; he also taught canon law there between 1210 and 1215. Among his likely disciples were Tancredo de Bolonia and Bartolomé de Brescia. Documentation of the Cathedral of Orense shows Laurentius as *maestrescuela* (schoolmaster) in 1214, 1215, and 1218. He was the bishop of Orense from 1218 or 1219 until 1248. Besides his activities in the Orense diocese, he was entrusted with various assignments in other dioceses by the popes Honorius III, Gregory IX, and Innocent IV in letters directed to him or mentioning him. His works, produced in Bologna before 1215, set him apart as one of the best canonists of his time. They include: (1) *Apparatus* to the *Decretum* of Gratian, preserved in a fairly inconsistent manuscript; (2) *Glossa Palatina*, which seems to represent the last phase of his *Apparatus* to the *Decretum* (many of Laurentius's glosses on the *Decretum* made their way into the celebrated *Glossa Ordinaria*; in fact, a considerable group of fourteenth-century manuscripts, known as *Laurentiustyp* (Laurentian type) explicitly attribute many glosses to Laurentius); (3) *Apparatus* to the *Tractatus de poenitentia* from the *Decretum* of Gratian; (4–5) isolated glosses on the *Compilatio prima antiqua* and the *Compilatio secunda antiqua*, written before 1210; (6) *Apparatus* to the *Compilatio tertia antiqua*; and (7) possible commentaries on the constitutions of the Fourth Lateran Council of 1215, but none of these has been found.

LAW, CANON

Each section that follows discusses the period's important texts and figures associated with canon law.

1. Roman/Visigothic Period (Fourth through Seventh Centuries)

Canon law texts of the Roman period (fourth and fifth centuries) were established by councils and various papal letters. The earliest Hispanic council was that of Elvira (ca. 295–314), followed by the first Council of Zaragoza (380), and the first Council of Toledo (400). Among the pontifical documents addressing disciplinary matters (decretals), the letter from Pope Siricius to Himerius, archbishop of Tarragona (385), stands out.

With the creation of the Visigothic kingdom in the Iberian Peninsula and the south of France, conciliar activity was reactivated, and flourished particularly during the Visigothic era (sixth and seventh centuries), with the Councils of Toledo (I–XVII), Tarragona, Girona, Barcelona (I–II), Lérida, Valencia, Braga (I–III), Narbona, Seville (I–II), Zaragoza (II–III), Huesca, and Mérida. Pontifical letters in this period were also more abundant than they were in the Roman period. The Visigothic era is divided into two clearly distinct periods: the Arian era and the Catholic era, which began with the conversion of Recared, made official in the Third Council of Toledo (589).

Several different canonical collections were formed based on the councils and the papal decretals, including the *Capitula Martini*, the Spanish *Epitome*, the collection of Novara, and other lost compilations. These canonical anthologies culminated in the *Hispana* (ca. 634), a collection that not only reveals much about the life of the Visigothic monarchy and church, but also about the Mozarabic world and the Christian culture of the Reconquest up until the mid-twelfth century.

2. Early Middle Ages (Eighth through Twelfth Centuries)

With the fall of the Iberian Peninsula to the Muslims, the Visigothic political apparatus broke down, with only faint traces apparent in the Christian kingdoms of the Reconquest. Visigothic canon law, on the other hand, which was more universal in nature, managed to survive not only in medieval Iberia, but also beyond the Pyrenees. The codices of the *Hispana* traveled with some of their owners to Merovingian and Carolingian territories, where some can still be found. In Charlemagne's time, the *Hispana* was included in the *Dacheriana*, which was the most important collection of canon texts in the Carolingian empire in the first half of the eleventh century, and continued to be influential until the end of the century. In the middle of the ninth century in the same kingdom, a series of falsified canonical texts were produced; these writings were known as pseudo-Isidorean decretals because of

the pseudonym used by the compiler. The “Hispana” appeared in a number of these spurious collections, although as a distorted and manipulated version. These false decretals exerted enormous influence in the Latin church until the mid-twelfth century.

During this period, two canon law movements from beyond the Pyrenees can be observed, both of which influence Iberian culture to a certain extent; this influence is, however, quite small, due to the consistency of Visigothic ecclesiastical law already contained in the *Hispana*. The first of these trends, which was especially strong in the Celtic and Anglo-Saxon churches, was the increasing presence of the penitential books that were well known in continental Europe. In the Iberian Peninsula, only a few *Libri Poenitentiales* are known: the *Albeldense* (976), the *Silense* (late tenth century), and the *Pseudojeronimiano* (eighth and ninth centuries). The other movement was the ecclesiastical reformation of the eleventh century that became known as the Gregorian reformation because one of its greatest proponents was Pope Gregory VII (1073–1085). In terms of its effect on legatine councils (directed by papal legates) and papal documents, this reform had a noticeable influence in the Hispanic world. On the level of canonical collections, however, its impact only reaches Catalonia, where two compilations of Gregorian tendency were created, presently known as the *Liber Tarraconensis* and the *Collectio Caesaraugustana*.

Visigothic canon law, therefore, informed the way of life of the Iberian church and society until the middle of the twelfth century, when it was replaced by medieval Roman canon law.

3. Late Middle Ages (Twelfth through Fifteenth Centuries)

Until the mid-twelfth century, canonical texts were collected successively and superimposed in countless canonical compilations. But around 1140–1150, Johannes Gratian, a Camaldolese monk, published his *Concordia discordantium canonum* (known historically as *Decretum*) at the University of Bologna. As the original title indicates, Gratian chose not to simply place the texts together in a random or chronological order, but rather to set them in opposition and compare them, thereby introducing Aristotelian logic and dialectic to the canonical text, and giving rise to a science and systematization of canon law. As mentioned, there were roughly eight hundred Visigothic canonical texts; Gratian’s new approach essentially wiped out all previously circulating canonical collections, among them the *Hispana*, whose texts,

save those that had the fortune to be incorporated into Gratian’s *Decretum*, became objects of historicization.

For the duration of the Middle Ages, the *Decretum* was the canon law text used in schools and in forums throughout the Christian Latin world. Medieval church fathers would supplement these legal texts with collections of their own decretals, giving rise to those collections making up the *Corpus iuris canonici*: the *Liber Extra* or decretals of Gregory IX (1234), the *Liber Sextus* of Boniface VIII (1298), decretals of Clement (1317), *Extravagantes* of John XXII (1325), and *Extravagantes Communes* (1500, 1503). These compilations were in use in the Roman church, including that of the Iberian Peninsula, for the rest of the Middle Ages.

Apart from these general collections of ecclesiastical law, there were various unofficial private collections of pontifical letters or decretals produced in Iberia, including the *Collectio Seguntina*, *Collectiones Dertusenses I–III*, *Collectiones Alcobacenses I–III*, and the *Collectio Romana*, compiled by Bernardus Compostelanus Antiquo in Bologna. The first three date from the late twelfth century, and the other two from the early thirteenth century. (The decretals of Gregory IX were compiled by another Iberian, San Raimundo de Peñafort.)

Among Hispanic canon law experts of this period, the group associated with the University of Bologna in the late twelfth and early thirteenth centuries is especially notable: Melendus Hispanus, Petrus Hispanus, Laurentius Hispanus, Vincentius Hispanus, Bernardus Compostelanus Antiquo, San Raimundo de Peñafort, Ioannes Hispanus de Petesella (de Compostela), João de Deus, and others. In the fourteenth century, authors such as Alvaro Pelagio and Juan de Torquemada stand out. In the fourteenth and fifteenth centuries there was a group of notable *canonistas* at the University of Salamanca, including Juan Alfonso de Benavente, Juan González, Juan de Castilla, and Gonzalo García de Villadiego.

In order to apply canon law on a local level, annual councils and synods were organized. A study and edition of these texts in medieval Iberia can be consulted in the *Synodicon hispanum*.

LAW, CIVIL

Civil law as treated here consists of certain legal traditions and of the law they informed that was made by secular authorities in the Asturian-Leonese-Castilian kingdom. This same law influenced that of other peninsular kingdoms and in time came to dominate even as regional differences continued to be valid in the postmedieval world.

The private law of the Hispano-Romans had its sources in the writings by certain lawyers of the imperial era; in collections, codices, and *novellae* published by the emperors; and in elements from indigenous customary law. The sources of public law were the dispositions known as *datae* and *dictae*, magisterial edicts, imperial constitutions, and other imperial ordinances pertaining to Hispania. Justinian's law may be presumed to have been introduced during Byzantine occupation of southern parts of the Iberian Peninsula for at least seventy-five years, beginning in the middle of the sixth century.

In the Visigothic kingdom of Toledo, which flourished in the sixth and seventh centuries, religious and cultural attitudes are cited as causes of the failure of legal compilations made during the two preceding centuries to prosper. More enduring was the seventh-century *Liber iudiciorum*, or *Lex Visigothorum*, a code of twelve books, in the revision of 681, that represented a combination of existing Visigothic law and pre-Justinian Roman law applicable territorially (that is, to all the inhabitants). Amendments, including a preliminary title on public law appended during this period, were added during the early years of the Reconquest; the result is called the *Lex Visigothorum vulgata*. The *Liber iudiciorum* has been said to have enjoyed, next to Justinian's legislation, a wider authority for a longer time than any other code of law. Apart from the royal law mentioned, popular customary legal elements sometimes entered the law, and they prevailed in areas where non-Visigothic traditions had a long history.

The period from 711 to 1248 covers the apogee of Muslim power in the peninsula and the uneven progress by the Christians that eventuated in the latter's victory. In law the period may be described as one of diversity and complexity that corresponded to the territorial fragmentation of Hispania into kingdoms whose boundaries changed frequently and whose independence at times was ephemeral. The numerous local laws that appeared were influenced to varying degrees by pre-Roman law, vulgar Roman law, Germanic cus-

tomary law (Castile), and Frankish law (Catalonia). The Roman distinction between private and public law fell into disuse. Newly created law derived from custom, royal legislation consisting of dispositions announced in the presence of the royal council for territorial application, seigneurial and conciliar (municipal) administrative standards, and sentences. The last originated in the decisions made in Germanic popular assemblies; in time they evolved into decisions made by judges acting for the whole, later into the decisions (*juicios de albedrío*) made by judges acting according to the legal merits of the case, and finally into the binding precedents known as *fazañas*.

The various sources of law may be described as general, territorial, and privilege. With both a general norm and territorial application, the *Liber iudiciorum vulgata* continued to undergo change as it became known as the *Forum iudicum*. It took root in León and Aragón but was rejected by Castilians when they established their independence from the Leonese in the middle of the tenth century. (The story of their burning all copies of the code merely symbolized local sentiment.)

Territorial law grew more slowly, contributing royal legislation, private written collections of juridical norms (unsystematic in their earliest redactions), and municipal law (notably the *fueros extensos*). In León such law included the Laws of 1017 and the Decrees of Coyanza (c. 1055) and León (1188); in Castile the *cortes* (parliament) of Nájera (1217–1218), the *Libro de los fueros de Castilla* (c. 1248), the *Fuero viejo de Castilla* (c. 1248), and the statements of enactments resulting from particular cortes (*ordenamientos de cortes*) as well as other works; in Navarre and Aragón the *Fueros de Aragón*, or *Código de Huesca* (1247) that derived from the *Fuero general de Navarra*, the *fueros* of Jaca and Tudela, and private territorial compilations; and in Catalonia the *capitulares* of Frankish kings and the collection known as the *Usatici* (*Usatges*, redactions from 1086 to 1251).

Laws of privilege may be classified according to their local application (municipal *fueros* such as those of León, Benavente, Toledo, Cuenca-Teruel, and many others, whether individual or in a series or family; *costums* in Catalonia) or to their application to a person (foundation charters for towns, privileges of one kind or another to an individual), or to a class (nobles, ecclesiastics, merchants, religious groups, foreigners). The complexity of the situation, only hinted here, is underlined by the use of different laws in appellate courts. Where laws were in conflict, the tendency was for the law of the judge's seat to prevail. When possible, local law was preferred to the law of higher or larger units.

The extensive conquests realized by the Christians at the expense of the Muslims in the first half of the thirteenth century made apparent the need for new territorial legislation. The resulting realization of plans was facilitated by contact with scholars involved in the revival of knowledge of Roman law by way of Justinian's legislation, by the preparation of a canon law for the ecclesiastical world and of a *ius commune* (made up of a mixture of Roman, canon, and feudal law) for the secular world, and by the examples provided by compilations of both canon law (*Decretals*, 1234) and secular territorial law (Valencia, 1238; Aragón, 1247).

A reversal of the previous trend toward fragmentation in the peninsula now led in the direction of integration, helped in the case of Castile and León by the final union (1230) of the two crowns and rationalized in citing the memory of legislative unity associated with the Visigothic kingdom, a situation in contrast to the confusion generated when a multiplicity of laws appeared in the same area. Early examples of the royal policy in favor of unification or standardization were the spread of the *Forum iudicum* in its Romance translation, the *Fuero juzgo* (1241), and certain municipal fueros (Toledo, Seville) that incorporated all or parts of the *Fuero juzgo* during the reigns of Fernando III and Alfonso X. Alfonso sought to strengthen the policy by using a similar system for disseminating the *Espéculo* and the *Fuero real*, but economic and political circumstances combined to thwart his efforts.

A contest arose between traditionalist elements who benefited from customary law and the royal patrons of territorialized legislation. A second contest originated when the official prohibition of legal sources from outside the realm began in the middle of the thirteenth century. The prohibition represented royal reaction against common law, but the reaction quickly weakened as both common and commercial law infiltrated the judiciary and the university-trained personnel who then propagated it. From the middle of the thirteenth century to the end of the fifteenth, the sources of created law in Castile consisted mainly of royal legislation (*Ordenamientos de Cortes*), charters of privilege, letters of various types and other documents used in government and administration, legal codes, judicial decisions, *Leyes nuevas* (a private written collection of the clarifications and interpretations of codified law, mainly Alfonsine), the *Leyes del estilo* (interpretations made in the royal tribunal), and custom (already losing importance unless it applied to the whole kingdom).

The territorial law created in the court of Alfonso X languished officially from 1272 until 1348, when Alfonso XI, in the *Ordenamiento de Alcalá*, estab-

lished the order of precedence of codes used in resolving a legal question: the *Ordenamiento* itself, active and valid municipal fueros (hence including the *Fuero real*), the *Siete Partidas*, and royal sentences. From 1433 to 1504 efforts to prepare a royally approved compilation culminated in the *Copilación de leyes* (1484) of Alonso Díaz de Montalvo.

LAW, ISLAMIC

The history of Islamic law in al-Andalus begins with the introduction of the legal school of the Syrian jurist Al-Awzā'ī (d. 774) during the reign of 'Abd al-Raḥmān I (r. 756–788). Al-Awzā'ī's system was rudimentary and relied primarily on the "living tradition," that is, the uninterrupted practice of the Muslims, as verified by the scholars, extending from the time of the Prophet through much of the Umayyad period in the East. For geopolitical reasons this Syrian legal tradition appealed to the Umayyad regime in Spain, which opposed the 'Abbāsid caliphate in Baghdad, and its simplicity and the attention it devoted to military problems were well suited to a country only recently conquered and minimally Islamized.

During the reigns of Hishām I (788–796) and Al-Ḥakam I (796–822) the school (*madhhab*) of the Medinese jurist Mālik ibn Anas (d. 796) began to supersede that of Al-Awzā'ī. It became the "official" school of law under 'Abd al-Raḥmān II (r. 822–852) and maintained its preeminence in al-Andalus until the fall of Naṣrid Granada in 1492. The promoters of this change were Andalusian jurists (*fuqahā'*) who had studied in Medina with Mālik himself or with his disciples, and who brought to Spain Mālik's great legal work *Al-Muwatta'* (The Smoothed Path). The most important among them, especially Yahyā ibn Yahyā al-Laythī (d. 848), gradually formed a school and propagated Mālikī doctrine with the support of the Umayyad emirs.

Mālikī law, like that of the other schools of Sunnī Islam, is based on the Qur'ān and the Sunna (the sayings and actions of the prophet Muḥammad and his companions conveyed in traditions, or *ḥadīths*, and established as legally binding precedents). The *Muwatta'* studied by the Andalusian jurists of the eighth and ninth centuries constituted the foundation for the further development of Mālikī jurisprudence and was, in

essence, Mālik's codification and systematization of the law in accordance with the consensus of scholarly opinion in Medina, his supreme criterion. Mālik considered and interpreted *ḥadīths* in the light of his own reasoning and the local legal tradition.

Mālikism triumphed because it responded to the needs of a rapidly changing and increasingly complex Hispano-Muslim society. Islamic law, which treats both religious and secular concerns, acted as an integrative and stabilizing force in al-Andalus by providing a common Islamic framework to an ethnically diverse Muslim population composed of Arabs, Berbers, and a growing body of New Muslims. The general adherence of Andalusian Muslims to one school of law, Mālikism, enhanced orthodoxy, particularly when that school privileged the tradition of Medina, the cradle of Islam, where the Prophet had enunciated Qur'ānic and non-Qur'ānic (contained in *ḥadīths*) legislation. Moreover, the Umayyad emirs and caliphs promoted Mālikism, and allowed the jurists influence in the government. They did so because they needed the support of the jurists, who, by virtue of their knowledge and piety, enjoyed great prestige among the urban populace, and because a rigid Mālikī orthodoxy shielded al-Andalus from external religiopolitical threats.

During the Umayyad period the Mālikī jurists largely devoted themselves to the study of the manuals of jurisprudence of Mālik and his most important disciples, the Egyptian Ibn al-Qāsim (d. 806) and Saḥnūn (d. 854) of Kairouan. In focusing exclusively on works of positive law (*furū'*)—that is, the law as practically applied in the form of the master's and his disciples' responses (*masā'il*) to specific problems—they neglected the study of the sources of the law (*uṣūl*), such as *ḥadīths*, which formed the base of Mālik's system. Typical of this mode of scholarship were the *Wāḍiḥa* of Ibn Ḥabīb (d. 845), a commentary on Mālik's *Muwatta'*, and the *Utbīya* of Al-'Utbī (d. 869), a collection of the responses of the great Mālikī jurists. Hence, Andalusian Mālikism was reduced to a strict adherence to and servile imitation of the teaching of the master (*taqlīd*). While Mālikī jurists had, to a certain degree, to take local realities into account when making legal decisions, independent interpretation (*ijtihād*) of the sources of the law was proscribed and the development of a jurisprudential method was impeded.

Still, even with the dominance of a rigid and conservative Mālikī school, Andalusian jurists were influenced by important developments in the field of law occurring in the East. Most influential were the ideas of Muḥammad ibn Idris al-Shāfi'ī (767–820), who was primarily responsible for formulating what would become the classical doctrine of Islamic jurisprudence. According to Al-Shāfi'ī, legal reasoning was to be

based on the four sources (*uṣūl*) of the law: the Qur'ān; the Sunna, now identified solely with the divinely inspired practice of the Prophet, which had to be verified through the criticism of *ḥadīths*; the consensus (*ijmā'*) of the entire Muslim community, as opposed to the more limited consensus of the scholars of Medina; and strict analogical reasoning (*qiyās*), which must have as its starting point the revealed sources (Qur'ān and Sunna).

In al-Andalus the practical result of the infiltration of Shāfi'ī ideas, which took place with the tacit approval of Emir Muḥammad I (r. 852–866), was the development of a school of *ḥadīth*. The forerunner of this school was Muḥammad ibn Waḍḍāh (d. 900); he had studied with the great traditionists in the East and he adopted al-Shāfi'ī's method of *ḥadīth* criticism. But it was Baqī ibn Makhlad (d. 901) who was the real protagonist of jurisprudential reform in al-Andalus. He, too, studied in the East, and was the first to bring works of al-Shāfi'ī into Spain. Baqī was not attached to a particular legal school, and because so many students in Córdoba were attracted to his teaching, he came into conflict with the Mālikī jurists. However, the emir protected Baqī, and as a result the solid foundations of a school of *ḥadīth* were laid. The fact that many of the followers of Ibn Waḍḍāh and Baqī ibn Makhlad were adherents of the Mālikī school allowed for some reconciliation between the students of *ḥadīth* and the conservative Mālikī jurists.

Simultaneous with the infiltration of Shāfi'ism, the Zāhirī school entered Al-Andalus. Founded in Iraq by Dāwūd ibn 'Alī (d. 883), this school expounded the principle that law should be based only on the literal and evident (*ẓāhir*) meaning of the texts of the Qur'ān and the *ḥadīths*. An Andalusian disciple of Dāwūd, 'Abd Allāh ibn Qasim, introduced Zāhirism at Córdoba during the reign of Muḥammad I. In the tenth century the most notable Zāhirī was Mundhir ibn Sa'īd al-Ballūṭī (d. 966), a jurist, theologian, and judge of Córdoba. Ultimately neither Shāfi'ism nor Zāhirism presented an effective challenge to the government supported Mālikī orthodoxy prevalent in al-Andalus. In fact, the followers of the Shāfi'ī and Zāhirī schools, when they functioned as magistrates and jurisconsults, felt compelled to conform to Mālikī doctrine in practice, as did Al-Ballūṭī. Furthermore, the study of *ḥadīths*, which had emerged with such promise in the ninth century, slowed considerably in the tenth century as the powerful caliph 'Abd al-Raḥmān III (r. 912–961) reduced the jurists to the role of government functionaries, which diverted them from more scholarly pursuits. Consequently, if the ideas of Al-Shāfi'ī and the return to the sources of the law contributed to some invigoration of

a Mālikism excessively confined by *taqlīd*, the tangible results were, by the end of the caliphal period, limited.

The political and cultural decentralization of the era of the party kings (1009–1091) provided somewhat more freedom to the adherents of the Zāhirī and Shāfiʿī schools, and at the same time were conducive to an internal renewal of Andalusian Mālikism. The great Ibn Ḥazm of Córdoba (d. 1064) abandoned the Mālikī doctrine in which he was first educated for the Shāfiʿī school and undertook a study of *ḥadīth* in Shāfiʿī fashion; his subsequent rejection of analogical reasoning, one of the foundations of Shāfiʿism, led him, finally, to become a zealous proponent of Zāhirism. Wishing to challenge the dominance of the Mālikī school, he attacked it for its *taqlīd* and its privileging of the practice and consensus of Medina. However, Ibn Ḥazm, who tried to reconstruct Islamic law as it was in the time of the Prophet and his companions by eliminating those elements he believed had been added by later jurists, has been criticized for ignoring the social and political context within which the law developed and for being, therefore, more impractical than the Mālikī jurists he criticized.

The internal renewal of Mālikism involved the study of other legal schools and their methods, at times for polemical purposes, and a far greater interest in the sources of the law and in jurisprudential methodology. Its most representative figures were Ibn ʿAbd al-Barr (d. 1070) and Al-Bājī (d. 1081). The career of Ibn ʿAbd al-Barr followed a course opposite to that of his friend Ibn Ḥazm: he first inclined toward Zāhirism, then left it for Shāfiʿism, and finally became a Mālikī judge in Lisbon, though maintaining certain Shāfiʿī tendencies. He rejected the *taqlīd* characteristic of tenth-century Mālikism and gained a reputation as the best traditionalist of his day. Al-Bājī was the great defender of Andalusian Mālikism. He debated with Ibn Ḥazm on Mallorca in 1047, and among his various works on Mālikī law were some devoted to polemics with other schools on the principles of jurisprudential method. In his acceptance of analogical reasoning, though in a manner more restricted than Al-Shāfiʿī, Al-Bājī evidences the change that Andalusian Mālikism was undergoing, for the early Mālikīs had not acknowledged this mode of legal reasoning.

Under the Almoravid regime (1090–1145), Mālikism regained an uncontested supremacy in al-Andalus. The legalism and moral austerity of the Almoravids, while resulting in a resurgence of the literature on positive law, did not mean an abandonment of the study of jurisprudential method, for the science of *uṣūl* had become well integrated into Andalusian Mālikism.

Almohad rule (1147–1232) was, from an ideological perspective, uncongenial to the Mālikī jurists, who

had been supporters of the Almoravids. The Almohads, for instance, criticized the Mālikīs for their excessive reliance on the established authorities of their school, instead of focusing more rigorously on the sources of the law. However, in practice, even though they showed favor to some Zāhirī jurists, the Almohads ultimately were forced to conciliate with the popular Mālikī jurists and to leave the existing judicial system in place. The most illustrious legal thinker of the Almohad era was Averroës (Ibn Rushd, 1126–1198). A Mālikī from a family of jurists, he served as judge of Seville and then of Córdoba. His great work of jurisprudence, the *Bidāya* (Beginning [for those attempting individual interpretation]), analyzes the differences between the diverse schools of law, especially with respect to their modes of deducing decisions from the law's sources. Yet the work is not a polemical defense of Mālikism; rather, it is marked by a spirit of objective criticism and an exacting rationality.

In the Naṣrid sultanate of Granada (1232–1492) the Mālikī jurists continued to play a preeminent role by virtue of their social prestige, influence with the sultan, and teaching in the *madrassa* (school) of Granada founded by Yūsuf I in 1349. The legal opinions (*fatwā*) of leading jurists, such as Al-Shātībī and Ibn Sirāj, show that in its final centuries Andalusian Mālikism continued to adapt to changing social and political conditions.

LAW, JEWISH

The Bible (particularly the Torah, or Pentateuch) is, of course, the foundation of Jewish law. Of primary importance, however, is the Talmud, which constitutes the rabbinical exegesis and development of that law over a period of nearly five hundred years. In Spain, from at least the tenth century, the rabbis studied and interpreted this law and added significantly to it. It was Moses b. Maimon (Maimonides) whose work laid the

most important foundation for the medieval development of Jewish law, not only in Spain but throughout the world.

Developments in Jewish law in Spain (paralleled, though in a less significant way, in other lands) consisted of commentaries on the Talmud, rabbinical responsa, and independent books of customs and laws. Jewish law covered all of life, since there is no separate concept of "religion." Indeed, what we would call "civil law" played a far more prominent role than ceremonial or cult observances. The autonomy of Jewish community control was scrupulously observed by the kings in Spain, and local Jewish courts (the *bet din*) adjudicated disputes over contracts, property rights, partnerships, marriage and divorce, and all other aspects of life. Matters that were either too complex for the local court to decide, or were only of a theoretical nature, were referred to leading rabbinical scholars for their decision (the responsa). Other important interpretations, which often became legal precedent, were set down by these same scholars in their numerous Talmudic commentaries. Many of these were cited by subsequent rabbis in their responsa, or were codified in such major legal compendia as the *Tur* (technically, *Arba'ah turim* (four rows), referring to the four divisions of laws) of Jacob ben Asher (fourteenth century). Another major independent legal codification composed in Spain was that of Isaac al-Fāṣī (twelfth century), which to an extent served as a model for Maimonides.

Independent treatises on laws and customs are almost too numerous to detail. Examples include works by Judah ben Barzilai (eleventh–twelfth centuries), Moses ben Naḥman (Nahmanides), Jonah Gerundi, and perhaps especially Abraham ben Natan's *Sēfer ha-manhig* (Book of Custom, or Practice), which, along with similar works of Menaḥem ha-Meiri of Provence, was the most important of that genre.

Spanish Jews nevertheless routinely utilized Gentile courts (Muslim and Christian), even when this clearly was against Jewish law. The kings were personally the court of last appeal (sometimes even of first resort) and were required to know Jewish law. Spanish rabbis had the greatest respect for their kings, and often referred to Spanish law in their own responsa or commentaries. A unique feature of Jewish law in Spain was the right of capital punishment, particularly for the *malshin* (informer).

LAWYERS

Despite a number of fine studies of law and judicial institutions in medieval Iberian kingdoms, no systematic research has been done on lawyers as a group in any of them. Traditional styles of scholarship on law and institutions have not provided a fertile ground for a social history of legists. Nevertheless, given the importance of jurists in the late Middle Ages, the lack of a prosopographical study of the group in any community or period is shocking, since the political and intellectual developments in the area of law were to some extent an expression of lawyers' interests and aspirations. Without this context it is hard to grasp the significance for contemporaries of the work of men of the law who served as codifiers, judges, prelates, and bureaucrats with increasing prominence.

Who were these men? Any study of lawyers will have to discover their career paths, their social and regional origins, their marriage patterns, their business activities, their opportunities for political action, their lifestyles, and their characteristic religious and social attitudes. Especially in the early period, from the late twelfth century, the legal experts were itinerant. (Their mobility will be a major hurdle for scholars, who may find it wise to work as a group using a computer-linked data bank for nominal record linkage.)

How and where were they educated? Until the late thirteenth century Bologna was the mother of jurists in the Iberian Peninsula, sending its graduates west and receiving, initially from Catalonia, Iberians among its students and teachers. In the fourteenth century the *studia* of Montpellier and Toulouse became important centers of legal training, although Bologna reasserted its role, at least for Castilians, with the establishment of the Spanish College through a bequest by Cardinal Gil Albornoz. However, as law graduates became more important to their ecclesiastical, royal, and seignorial employers, domestic institutions at Coimbra and Salamanca (among others) began to undermine the traditional internationalism of universities. Indeed, the transition from a group of itinerant, cosmopolitan internationalists and the political impact of this change would be an important part of any study of medieval Iberian lawyers.

Of course, to deal with questions like these, it will be necessary to define carefully who should be included in the study. Here it would be best to use the broad category "men of the law" so that notaries and

procurators can be included with attorneys, since all of these professionals played a role in the emergence of family dynasties of jurists. Moreover, ecclesiastical legists, especially those who belonged to the vast, unstudied group of clergy who had taken minor orders, must receive attention; they have been almost forgotten in the few references to lawyers that exist.

As the basis for research on lawyers, scholars can take advantage of ongoing work on particular jurists, such as that of Jean Roudil on Jacobo de Junta. And there are numerous fine histories of law as well as often massive studies, like that of Henrique da Gama Barros on Portugal, of the legal environment in which lawyers developed as a group.

The emergence of the lawyer's office as a public one has been best studied for Castile, where the role was defined as part of the codification work of the thirteenth century, particularly in the *Siete Partidas* (especially *Partida* 3, title 6). The Alfonsine legislation had an impact on Portugal through the circulation of translations, and the various law codes of the eastern kingdoms provided increasingly precise definitions of the lawyer and related officials. However, in the absence of a study of men of the law, it is difficult to know to what degree jurists' activities corresponded to the legislation.

While the final three medieval centuries saw a progressive increase in the prominence of lawyers, the establishment of the new Trastámara and Avis dynasties in Castile and Portugal, respectively, in the fourteenth century appears to have stimulated a dramatic increase in the reliance on legists by the crown, as well as by municipalities and magnates. The chronology is not as sharply delineated in the eastern kingdoms, but the increasing professionalism of the courts of the *justicias* of Aragón and Valencia had something of the same effect there. The role of trained jurists was already pronounced in Catalonia in the early thirteenth century as a result of the principality's closer connection to international commerce, the legal predominance of the judges of Barcelona, and the codification efforts of Ramón Berenguer IV. Everywhere the advancement of the university-trained lawyer was tied to the triumph of territorial over local law and the substitution of legal principles and procedures from Roman and canon sources for customs and *fueros*.

LEANDER OF SEVILLE

The family of Leander of Seville moved to that city from Cartagena after the Byzantine occupation of the southeastern seaboard of the Iberian Peninsula in 551. Little is known of Leander's early life beyond the statement in his brother Isidore's *De viris illustribus* that he had been a monk. The flight of monks from Africa into Spain as a result of conflict with Emperor Justinian I over his theological policies (the "Three Chapters Controversy") probably provides the context for the emergence at this time of monastic institutions in southern Spain, where there is no evidence for their previous existence.

At some point in the 570s, Leander was made bishop of Seville, which in 579 became the royal residence of Hermenegild. When the latter rebelled against his father, Leovigild, in 580, Leander was one of his partisans, and early in the 580s undertook a mission for him to Constantinople. In Constantinople, Leander became a friend of the papal envoy and future pope, Gregory I the Great (590–604). There, at Leander's request, Gregory undertook his series of homilies on Job, the *Moralia*. Hermenegild's conversion from Arianism to Catholicism, probably in 582, was attributed by Gregory in his *Dialogues* to Leander's influence, and this must have occurred after the bishop had returned from Constantinople.

The fall of Seville to Leovigild and the crushing of Hermenegild's revolt in 584 led to a period of exile for Leander, but with the accession of Reccared in 586 and the new king's determination to resolve the religious division within the kingdom, he regained a position of influence. Isidore attributes Reccared's personal decision to convert to Catholicism in 587 to the work of Leander. He was also, although not the most senior of the hierarchy by date of consecration, the most influential of the bishops at the Third Council of Toledo (589), and the text of the sermon he delivered to it has been preserved. Leander's other works have not fared so well. Of the writings against the Arians that Isidore refers to, none have survived. Leander's only extant treatise is a short work on the monastic life for women, *De institutione virginum*, which he dedicated to his sister, the nun Florentina.

After the conclusion of the First Council of Seville in 590, which was held under his direction to implement some of the decisions of the Third Council of Toledo, little is known of Leander's activities. It has been deduced that he died around 599, and was suc-

ceeded as bishop of Seville by his younger brother Isidore. Another brother, Fulgentius, became bishop of Écija by 619.

LEGISLATION, PORTUGAL See LAW; CHARTERS, FUEROS

LEODEGUNDIA

In addition to Egeria, other Iberian women were involved in literary activities in the early Middle Ages. Some wrote letters of a more or less artistic nature. Some participated, in various ways, in producing texts. Such is the case with Leodegundia of Bobadilla, a Galician nun who wrote a *Codex regularum*, a Visigothic compendium that was widely read for centuries. Her manuscript is one of the oldest versions of this work, which typically contains the teachings and lives of the holy fathers of the church.

The manuscript, which was moved from Oviedo to the Escorial (a.I.13) in the sixteenth century, includes the following colophon: "O vos omnes qui legeritis hunc codicem mementote/clientula et exigua Leodigundia qui hunc scripsi in monasterio Bobatelle regnante Adefonso principe in era 950 quisquis pro alium oraverit semetipsum deum commendat." The manuscript appears to refer to King Alfonso II and presumably was written in 850 rather than 950.

Leodegundia's calligraphy has been highly praised. However, it is logical to assume she did more than copy the manuscript. In addition to the usual teachings and lives of the holy fathers, her version of the *Codex regularum* contains St. Jerome's letters to women friends, St. Augustine's letter to his sister Marceline, St. Leander's letters to his sister Florentina, and the lives of a number of women saints. That the additions have to do with women would seem not to be a coincidence. Neither would the fact that some of the women saints are of Spanish origin, and one, St. Melanie, is believed to have made her living by writing. Rather, this collection appears to be a mirror in which its author and her audience, the nuns of her convent,

recognize themselves, a feminine adaptation of a masculine work.

LEÓN, COUNCIL OF (1090)

A council of the church and realm of León-Castile held in the royal city of León in late March. Though the *acta* of the council do not survive, the meeting is known from a variety of literary sources of the early twelfth century. The Roman Cardinal Rainerius, later Pope Paschal II (1099–1118), presided.

In one piece of business, Bishop Pedro of Santiago de Compostela was deposed and the tangled succession to that great shrine-church was deferred while the earlier bishop, Diego Peláez, deposed at the Council of Husillos in 1088, appealed his case to Rome. Pedro, bishop of Braga, unsuccessfully sought the restoration of the ancient metropolitan dignity of his see.

In affairs at once secular and ecclesiastical, Alfonso VI seized on the occasion to formally inter the body of his newly deceased younger brother, García, there. García, independent king of Galicia-Portugal, had been overthrown, seized, and imprisoned by Alfonso in 1073. The king also probably asked the council to confirm his decision to double the annual payment of 1,000 gold *dinars* made to the Burgundian abbey of Cluny since the time of his father, Fernando I. He certainly had council members confirm a great grant to the episcopal church of Palencia.

LEÓN, KINGDOM OF

The kingdom of León was the successor to the kingdom of Asturias, which it subsequently always included. The former may be said to have originated when Ordoño II (r. 910–925) moved the royal city

from Oviedo to León in 914, and raised a cathedral and a royal palace there. It was united to the kingdom of Castile under Fernando III (r. 1217–1252) following the death of Alfonso IX of León, Fernando's father, in 1230. Thereafter the history of the two kingdoms was permanently linked.

The history of the kingdom falls naturally into three major periods. During the first, between the reign

of Ordoño II and through that of Vermudo III (1028–1037), it generally existed in the shadow of the great caliphate of Córdoba and was subject to periodic raids from the Muslim south, though never seriously in danger of outright conquest from that quarter. The second period extends from the reign of Fernando I (1037–1065) through that of Alfonso VII (1126–1157) and is the period of its greatest splendor. The kingdom

Kings of León and Castile, 1214–1504

then was ordinarily the most powerful realm in the peninsula, either Christian or Muslim, and most of these paid the king of León either homage or outright tribute. The third period begins with the separation of León and Castile following the death of Alfonso VII, Castile going to Sancho III (r. 1157–1158) and León to Fernando II (r. 1157–1188). In general the terms of that division favored Castile, which heretofore had been subordinated to León, and Castilian ascendancy is marked through most of this era.

The most remarkable and important feature of the early period was the appropriation and repopulation of the *meseta* (plateau) north of the Duero River from the mountain lands north of the Cantabrians in Asturias, from northwest of the mountains of León in Galicia and the Bierzo, and from the Basque country and the Rioja in the northeast. The movement south was not absolutely new, but in contrast to the halting progress of the Asturian period, the long episodes of weakness in the history of the caliphate at Córdoba now allowed the steady seizure of the *meseta* from its heights in the country east of Burgos to the territories between the Miño and the Duero, where the latter debouches into the Atlantic at Oporto. This movement of Christians from the north onto the *meseta* was equaled in importance by a corresponding movement of Christian Mozarabs north from Islamic al-Andalus into the territories of León. The Mozarabs brought with them the superior agricultural techniques of Islam and a religious and cultural baggage that cemented the identity of the emerging north with its Visigothic and classical past.

Various attempts were made to push repopulation south of the line of the Duero, into the lands between it and the Guadarrama Mountains at points such as Sepúlveda and Salamanca, but raids from the Muslim south made life there too hazardous. Near the end of its first period, the Muslim dictator Al-Manṣūr (976–1002) and his son ‘Abd al-Mālik (1002–1008) launched a series of almost annual great raids that penetrated the Leonese kingdom and sacked such towns as Burgos, Santiago de Compostela, and León itself. Still, the Leonese appropriation of the lands north of the Duero could not be reversed.

During this era the kingdom was virtually synonymous with the dynasty that ruled it. The royal charters fail to indicate any regular administrative subdivisions, and in those documents the kings never refer to themselves as territorial rulers, but only by those patronymics on which their right to rule was based. The essential resource of the dynasty was the land of the royal fisc, and its chief agent was the *merino*, at once estate supervisor, local peace officer, dispenser of justice on crown lands, and leader of the local contingent to the royal host. The crown ruled in concert with the bishops and

abbots of the church, whom it ordinarily had appointed and who were its most valuable subordinates (and the only formally educated ones). Bishoprics were inherited from the Visigothic Church at Lugo, Santiago de Compostela, Tui, Orense, Braga, and Astorga, and the Asturian monarchy had established new ones at Oviedo and León. A powerful magnate class flourished both as castellans in royal territories and as virtual miniature monarchs within their hereditary lands. The most potent of these existed at the far extremities of the realm, in Galicia in the west and Castile in the east. Count Fernán González of Castile (923–970) achieved near independence.

The reign of Fernando I (1037–1065) marked the beginning of a new epoch in the history of the kingdom. He carried the Leonese frontier southward to Viseu, Lamego, and finally Coimbra in the Portuguese west, and expanded his Castilian kingdom to Burgo de Osma and San Esteban de Gormaz in the Sorian highlands to the east. Moreover, he forced the major *ṭāʾifas*, successor kingdoms to the caliphate, of Zaragoza, Toledo, and Badajoz into the position of tributaries, paying *parias* (annual subsidies) to León. His son, Alfonso VI (1065–1109), carried out the conquest of Toledo in 1085, projecting the frontier south of the Guadarrama and the Tago (Tagus) rivers, deep into La Mancha and the southern *meseta*. The appeal of the remaining *ṭāʾifas* to the Muslim fundamentalist and Moroccan dynasty of the Almoravids led to the invasion of Iberia by Emir Yūsuf ibn Tāshfin, who defeated Alfonso VI at Zallāqah near Badajoz, on 23 October 1086. Subsequently the Almoravids absorbed the *ṭāʾifas* and al-Andalus became a province of that Moroccan empire. Gradually the Christians were pushed back in La Mancha until the frontier became Toledo, and during the reign of Alfonso's daughter and successor, Urraca (1109–1126), it moved to the Tagus River basin.

During the rule of Urraca's son, Alfonso VII (1126–1157), a new period of advance began. Coria in the Leonese Estremadura was taken in 1142 and the south bank of the Tagus, north of the Mountains of Toledo, was consolidated. In 1146, taking advantage of the collapse of the Almoravid empire in North Africa, Alfonso swept south into Upper Andalusia, taking Baeza, Úbeda, and finally the port of Almería on the Mediterranean in 1147. In the latter he had the assistance of the Genoese, Navarrese, and Catalans. However, Upper Andalusia and Almería proved impossible to hold against the rise of the new North African empire of the Almohads, and were lost to the latter in 1157, the year of Alfonso's death.

Among the Christian kingdoms of northern Iberia, León held the preeminence, symbolized by Alfonso's

coronation as “emperor” at León on Pentecost, 26 May 1135. After his succession in 1126, the Leonese had forced his stepfather, Alfonso I of Aragón, out of Castile, and on the latter’s death in 1134 had reclaimed the Rioja, which had first been annexed by Alfonso VI of León in 1076. Yet in the three-cornered struggle that ensued, the Leonese was unable to prevent Count Ramón Berenguer IV of Barcelona from absorbing most of Aragón, including Zaragoza, for which the count did homage to him. Nor was Alfonso able to forestall the reemergence of Navarre under García V Ramírez (r. 1134–1150), although that king, too, did homage to him. Count Alphonse Jourdain of Toulouse, his cousin, also became his vassal. The situation was similar in the west, where an independent Portugal had grown under his aunt, Queen Teresa (1096–1128). After a series of struggles with his cousin Afonso Henriques (r. 1128–1185), the Leonese monarch was forced to recognize that monarchy as well, although it was subject to his suzerainty.

Internally, the paramount development in the Leonese realm was the expansion of its agricultural society with the widespread application of irrigation techniques, the increasing use of water mills, and the wider utilization of plow culture and transhumance stock raising in Asturias and Galicia. The ensuing growth of farm size, production, and population allowed the appropriation of the southern half of the Duero basin after 1076, and then of the Tagus basin and the Leonese Estremadura south and west of Salamanca after 1130. Foundations of restored bishoprics at Salamanca (1102), Burgo de Osma (ca. 1102), Segovia (1120), Ávila (1121), Zamora (1122), Sigüenza (1123), and Coria (1142), and the restoration of the archiepiscopal see at Toledo in 1086, gave a stiffening administrative structure to much of these new territories.

The structure and ideology of the monarchy also developed apace. With Alfonso VI the Leonese kings begin to style themselves “imperator totius hispaniae” in their documents, and the dating formula lists the constituent parts of the kingdom. The action of the royal chancery becomes sufficiently regular to be studied, and the title of chancellor is usual from the reign of Alfonso VII. The major court officials, *mayordomo* and *alférez*, become traceable, and it is evident that they are held by an emerging nobility that is also a court nobility in its training. Education at court and service in its offices prepared the holder for subsequent elevation to what was, ordinarily, a family countship. Regular counties are detectable in the various provinces, and fisc lands (*comitatus*) are assigned at least to their partial support. Other fisc lands (*infantaticum*) are allocated to the maintenance of junior members of

the dynasty and are administered by them. Experiments were sometimes made, as well, in providing territorial administration by such dynasts, as in Galicia (1090–1107), which was governed by Infanta Urraca and her husband, Count Raymond of Burgundy. A similar provision in the county of Portugal between 1096 and 1109 under Infanta Teresa and her husband, Count Henri of Burgundy, was to lead instead to the independence of that territory after the death of Alfonso VI.

Although the pilgrimage had some earlier history, this period saw the great flowering of the cult of Santiago. The route across the north to Santiago de Compostela became the artery of León and the avenue of European influence. The towns along it, although still diminutive, doubled their size as a result, and churches in the new Romanesque style rose in them while many developed a French “barrio” as well. Fernando I initiated a personal relationship between the dynasty and the French abbey of Cluny, while Alfonso VI and Urraca began a patronage that would establish a Cluniac Leonese province of formerly independent Iberian monasteries. Alfonso VII would do the same for the newer order of Cîteaux. Simultaneously Alfonso VI’s reign saw the initiation of regular relationships between the Iberian Church and Rome. The old Mozarabic ritual was abolished in favor of the Roman one, papal legates held councils in the peninsula, new episcopal sees were established, and bishops were installed with papal approbation. The appointment of a former Cluniac, Archbishop Bernard, at Toledo (1086–1125) opened an era in which Osma, Palencia, Sigüenza, Segovia, and Salamanca were ordinarily held by bishops with a French monastic background.

All of these developments were constrained to some degree by the division of the old kingdom after 1157. That partition was much more favorable to Castile than to León. The line ran just west of Sahagún, Medina del Campo, and Ávila, territories historically more associated with León than with Castile, and included all of the Toledan lands to the south of the Guadarrama as well. Consequently, most of the next three-quarters of a century was spent in sterile border disputes between the sister realms. This was especially true of the reign of Fernando II (1157–1188) because he was tempted additionally by the quick demise of his brother, Sancho III (1157–1158), and the ensuing minority of the latter’s son, Alfonso VIII (1158–1214). Fernando made common cause with the Castilian noble house of Castro against that of Lara in an attempt to control the regency of the three-year-old monarch. He had no more success than would his son and successor, Alfonso IX (r. 1188–1230), who continued the disputes with his now grown cousin of Castile. One abor-

tive effort at a solution was the marriage in 1197 of Alfonso IX and Berenguela, daughter of Alfonso VIII. The papacy forced a dissolution on the grounds of consanguinity in 1204 but the marriage had by then produced that child who would become king of Castile as Fernando III in 1217 and king of León as well on the death of his father in 1230, reuniting the two permanently.

Under these circumstances, and given the contemporary strength of the Almohads in Andalusia, the Reconquest progressed slowly, although Fernando II did manage to repopulate Ledesma and Ciudad Rodrigo. Such other gains as he was able to effect were lost again, but his son was able to take advantage of the virtual collapse of the Almohads after 1212. Alfonso IX took Alcántara on the line of the Tagus in 1213; Cáceres, which controlled the advance into the valley of the Guadiana, in 1227; and Mérida and Badajoz, in the middle reaches of that river, in 1230. During this process the Leonese kings founded the military orders of Santiago (1175/1175) and Alcántara (1213/1218).

The advance to the south was accompanied by continuous border disputes with the new Portuguese monarchy. Fernando struggled to maintain control in the valley of the Miño River and had to intervene to forestall a Portuguese advance into the valley of the Guadiana in 1169. Nevertheless, he helped to defeat the Almohad attack on Santarém in 1184.

Internally the major development of the period was the appearance of the *cortes* (parliament) in 1188. Threatened at his accession by the claims of a stepbrother who was supported by the queen mother, and the pretensions of his uncle, Alfonso VIII of Castile, the young Alfonso IX convened a *curia* at León to which the good men of the towns of the realm were also summoned. To secure the support of that first *cortes* of the realm, Alfonso IX pledged himself to obey the laws of the kingdom and not to make war or conclude peace without consulting it. In a subsequent *corte* at Benevente in 1202, the king promised that he would not issue a new coinage for seven years if the assembly would grant him an aid.

The growing importance of the towns had already become evident in the increased activity of his father, Fernando II, in the granting of municipal *fueros* (charters). Salamanca, Zamora, Benevente, Túa, and Lugo all experienced royal intervention to enlarge or modify preexisting *fueros* or to grant new ones. Alfonso IX himself saw the trade of ports such as La Coruña and Gijón grow remarkably, and was active in the granting of municipal charters to Oviedo, Toro, and Mansilla in the north of his realm, and to Cáceres and Alcántara in the south.

LEÓN, MOSÉS DE

Spanish cabalist. (1250–1305). *Cabala* means "receiving," referring to that which has been handed down by tradition. By the time of Mosés de León, the term was used to denote the mystic and esoteric teachings and practices of a growing body of mystical literature.

Little is known about his life; he settled in Guadalajara sometime between 1275 and 1280 and relocated to Avila sometime after 1291. Best known for his revelation of the *Zohar* (*The Book of Splendor or Enlightenment*) to fellow cabalists, he also composed twenty cabalistic works, only two of which have been printed: *Ha-Nephesh ha Hakhamah* (*The Wise Soul*) and *Shekel ha-Kodesh*. (*The Holy Shekel, or Weight*). By 1264 he undertook the study of Maimonides' Neoplatonic philosophy, a belief system that rejected a literal interpretation of Torah and sought to spiritualize its teachings.

While in Guadalajara, Mosés de León composed a mystical midrash, which he titled *Midrash ha-Ne'elam* (*Concealed, Esoteric Midrash*). A midrash is an analytical text that seeks to uncover the meaning of biblical passages, words and phrases and often employs philology, etymology, hermeneutics, homiletics, and imagination. This work represents the earliest stratum of the *Zohar* and contains commentary on parts of the Torah and the Book of Ruth. Between 1280 and 1286, he produced the main body of the *Zohar*, a mystical commentary on the Torah written in Aramaic, which is spoken by Rabbi Shim'on ben Yohai and his disciples as they ruminate over distinct passages of the Torah.

The text upon which the *Zohar* was purportedly based was said to have been sent from Israel to Catalonia, where it fell into the hands of Mosés de León of Guadalajara, who assumed the task of copying and disseminating different portions of it from the original manuscript. After the Mamluk conquest of the city of Acre (Israel) in 1291, Isaac, son of Samuel, was one of the few to escape to Spain. When he arrived in Toledo in 1305, he heard reports about the existence

of a newly discovered midrash of Rabbi Shim'on ben Yohai. Ostensibly written in Israel, the manuscript was unfamiliar to Isaac. He sought out Mosés de León, who assured him that he owned the original ancient manuscript upon which the *Zohar* was based and offered to show it to him if he came to his residence in Avila. After their separation, Moses became ill and died in Arévalo on his way home. When Isaac learned of the news, he traveled to Avila, where he was told that the wife of provincial tax-collector Joseph of Avila was living. After Mosés de León's death, Joseph de Avila's wife had made a deal in which she would offer her son's hand in marriage to the daughter of Mosés de León's widow in exchange for the ancient manuscript. During Isaac's visit, Joseph de Avila's wife denied that her late husband had ever possessed such a book, insisting instead that Mosés de León had composed it himself.

Mosés de León attributed the work to Shim'on ben Yohai, a famous teacher of the second century A.D. known for his piety and mysticism. Ben Yohai lived in Israel, where he reportedly spent twelve years in seclusion in a cave. After his death, his book was either hidden away or secretly transmitted from master to disciple. When Mosés de León began circulating booklets among his friends containing previously unknown teachings and tales, he claimed to be a mere scribe copying from an ancient book of wisdom. In addition, he distributed portions of the book rather than entire copies. No complete manuscript of the work has ever been found. When the *Zohar* was first printed in Italy in the fifteenth century, the editors combined several manuscripts to produce a complete text. Other manuscripts located later were added to an additional volume which was printed later. Today, most standard editions comprise some 1,100 leaves consisting of at least two dozen separate compositions.

The *Zohar* consists of a mystical commentary on the Pentateuch, describing how God—referred to by the cabalists as *Ein Sof* (the infinite, endless)—rules the universe through the Ten *Sefirot* (Ten Spheres). In other cabalistic texts, the sefirot are often organized in the form of a hierarchy of divine emanations from the apex of the Godhead with *Keter* or *Da'at* (the highest aspect of God) being followed by *Hokhmah* and *Binah* (divine wisdom and understanding respectively). *Ein Sof* is rarely emphasized in the *Zohar*. Instead, the work focuses on the sefirot as the manifestations of *Ein Sof*, its mystical attributes in which God thinks, feels, and responds to the human realm. The characters include Rabbi Shim'on and his comrades, biblical figures and the sefirot. At times the distinction between the latter two is ambiguous. Throughout the work, the *Zohar* never loses sight of its goal: to create a mystical

commentary on the Torah in which God is simultaneously revealed and concealed. To study Torah is to meditate on the name of God. As Daniel C. Matt explains, "*Zohar* is an adventure, a challenge to the normal workings of consciousness. It dares you to examine your usual ways of making sense, your assumptions about tradition, God, and self. Textual analysis is essential, but you must engage *Zohar* and cultivate a taste for its multiple layers of meaning. It is tempting and safe to reduce the symbols to a familiar scheme: psychological, historical, literary, or religious. But do not forfeit wonder."

The authorship of the text, its method of composition and its use of sources (contemporary or ancient) have remained polemical among scholars. Among the most representative opinions in this controversy are Jellinek, Graetz, Scholem, and Giller. Jellinek concluded that many of the passages in the *Zohar* were derived from ancient sources and that Mosés de León was at least one of the authors of the work. Graetz concurred with Jellinek on the nature of its sources, but believed that the text represented a forgery executed entirely by Mosés de León. Scholem argued that the text was purely a product of the thirteenth century and was based on medieval Jewish Neoplatonism and Gnosticism. For him, the author and the translator were one and the same. More recent scholarship in the tradition of Giller and Liebes tends to view the *Zohar* as the product of a group collaboration among thinkers who grappled with cabalistic doctrine. Mosés de León was a main figure in this group but is not the sole author.

Regarding the overall structure of the *Zohar*, there is some consensus among scholars. The work is divided into distinct sections or strata, each of which has its own literary nature and mystical doctrines which are unique to it. The *Midrash ha-Ne'elam* is the earliest and is followed by the long midrash on the Torah and another group of compositions resembling it; the *Tiqqunei ha-Zohar* (*Embellishments on the Zohar*) and the *Ra'aya Meheimna* (*The Faithful Shepherd*) constitute another stratum. The *Midrash ha-Ne'elam* establishes an organizing fulcrum for the entire work in creating a protagonist Shim'on bar Yohai who does not appear until later. Until his subsequent appearance in the text, the teachings are conveyed by other rabbis from the second century with no single dominant figure. Further, there is a pattern of development in which certain ideas and themes are developed and reach their culmination over the course of the work's composition.

The *Zohar* was not accepted immediately as an ancient work. Students of Rabbi Solomon ibn Adret of Barcelona treated it with restraint. In 1340, the philosopher and cabalist Joseph ibn Waqqar warned about the preponderance of errors in the book. Slowly, its

antiquity became accepted by cabalists, but as late as the mid-fifteenth century was not read or circulated except in small circles. It did not become the Bible of the Cabalah movement until after the Jewish expulsion from Spain in 1492. After 1530, Safed (Israel) gained importance as a meeting place for cabalists. Among them was Mosés Cordovero who wrote two systematic books based on the *Zohar*, along with an extensive commentary. Isaac Luria developed a new system based on Cabalah that relied heavily on portions of the *Zohar*. The trend of mystical-ethical literature emerging from this circle helped popularize the *Zohar*'s teachings as did the messianic fervor that encouraged the dissemination of its enigmas. If early qabbalists had drawn an analogy between spread of Cabalah and the redemption of Israel, in the sixteenth century, studying the *Zohar* became elevated to the level of a divine command, equal in importance to studying the Bible and the Talmud. Today, the *Zohar* retains its distinction as the fundamental text of cabalistic thought.

LEONOR DE GUZMÁN See ALFONSO XI

LEOVIGILD

The brother of Liuva I (r. 568–72/3), who made him coruler in 569, with responsibility for the south and center of the Iberian Peninsula, Leovigild proved to be perhaps the greatest of the kings of Visigothic Spain. Even those who opposed his religious policies, such as Isidore of Seville and John of Biclaro, admired his military capacity and achievements. At the time of his accession the kingdom was threatened by Frankish aggression from the north and Byzantine aggression in the southeast. Much of the north of the peninsula and various areas in the south, including the city of Córdoba, had broken free of royal control. An independent Suevic kingdom survived in the northwest. Leovigild's initial campaigns were directed against the Byzantine enclave, and he regained Sidonia and Málaga. In 572, he reimposed Visigothic rule on Córdoba. Following the death of his brother Liuva I, Leovigild

turned his attention northward, and in a series of campaigns between 573 and 577 made himself master of most of the north of the peninsula, from the Rioja to the frontiers of the Suevic kingdom, whose ruler Miro became tributary to him. In the peaceful years of 578 and 579, the king established the new town of Reccopolis, named after his younger son, and also set up his elder son Hermenegild in Seville as coruler with responsibility for the south. This failed when Hermenegild rebelled, at the instigation of Leovigild's second wife, Goisuintha, widow of the former Visigothic king Athanagild (r. 554–568). Initially Leovigild made no move to curtail his son's independence, and in 581 launched a campaign northward to contain the Basques. There he founded another new town, called Victoriacum (probably Olite in Navarre). Only when an alliance between Hermenegild and the Byzantines developed, symbolized by the former's conversion to Catholicism, did Leovigild act. In 583 he took Mérida and Seville, and in 584 Córdoba, where Hermenegild was captured. After the suppression of the revolt in the south, Leovigild overran the Suevic kingdom in the northwest, where the son of his former ally Miro had recently been overthrown by a usurper. With this achieved, the Basques temporarily pacified, and a Frankish invasion of the province of Narbonensis repelled in 585, Leovigild had achieved a military reunification of the Visigothic kingdom in the peninsula and Septimania. To turn this into a genuine political and cultural unification required the solution of the theological division between Arians and Catholics, which had provided a context for factionalism and local power struggles. This problem Leovigild hoped to tackle by holding a council in Toledo in 580 with the aim of modifying the theological tenets of Arianism, to make this view of the Trinity more acceptable. In the outcome, the polarization of religious and political opinion following the conversion of Hermenegild in 582 made such a compromise unworkable. The only solution was the acceptance by all of the uncompromising doctrinal stand of the Catholics. It is reported in Gregory of Tours's *histories* that Leovigild himself secretly converted prior to his death in 586, but the public resolution of the issue was left to his heir Reccared.

LETRADOS

Widely used in the scholarly literature on the late medieval and early modern periods, the term *letrados* has been a source of confusion. Its core meaning emerges from the much-cited passage, probably written in the early 1570s, of Diego Hurtado de Mendoza's *Guerra de Granada*, in which the author ties the Catholic Monarchs' political program of the recruitment of *letrados* for judicial and public administration. *Letrados* were those with university law degrees, their prominence dating from the Castilian Trastámara and Portuguese Avís dynasties, who increasingly dominated royal bureaucratic institutions and developed a group consciousness. Whether educated in canon or civil law, *letrados* had mastered a type of reasoning useful for clarifying and debating opposing viewpoints, and this training recommended them as judges and advisory officials. Self-interest and exposure to Romanist political theory made *letrados* active proponents of monarchical authority, and their influence in crown affairs opened numerous opportunities for them in urban, aristocratic, and ecclesiastical administration.

Confusion has resulted from the multiple meanings of *letrado* in the sources; the word could refer to a literate person, to someone with considerable formal education, to an individual both learned and wise, or to a university graduate (sometimes without reference to his actual degree). Historians often appear unsure whether to restrict the term to its fifteenth- or sixteenth-century usage or to add it to our modern technical jargon. When it is used in the latter manner, writers have discussed *letrados* prior to the fourteenth century or in the eastern Iberian kingdoms; they have debated whether clergymen were *letrados*; and they have included groups like notaries and fiscal agents. Some influential historians, such as S. de Moxó and A. Rucquoi, have expanded the word *letrados* to cover so many people that the individuals involved surely lacked the sense of group consciousness that J. Maravall and Pelorson have felt made the term worth including in contemporary historical discourse.

Due to such extensions to heterogeneous sets of people and to the general lack of precision in the term's use, important hypotheses about the role of *letrados* as a sociological class in cultural, commercial, and administrative developments have often been hard to evaluate. For example, this problem has troubled discussions of Nader's argument that *letrados* did not play a significant role in the development of Castilian Renaissance humanism, of Carande's contention that *letrado* public administrators had an antimerchant mentality that damaged Spanish commercial growth, and of the assertion of J. Vicens Vives that *letrado* emphasis on legal studies retarded the elaboration of adminis-

trative theory. The word is probably best avoided in English-language studies of Iberian medieval history in favor of more precise references to more clearly definable groups like law graduates, lawyers, jurists, legists, or bureaucrats.

LETTERS AND LETTER WRITING

In medieval Spain, long-distance communication by means of letters generally involved four people: the sender, the scribe, the messenger, and the recipient. A broad look at these four parties gives a good sense of the process and style of medieval letter writing.

The senders and recipients of letters were usually from the nobility and/or the church. The topics of these letters ranged widely, from mundane themes to legal documents to travel commentaries to protest petitions. Of the letters and letter collections in Spanish, some of the better known are those of Juan Manuel, Fernando and Isabel, Alfonso de Palencia, Juan Álvarez Gato, Alonso Carillo, Christopher Columbus, Enrique IV, Juan II, Francisco Jiménez de Cisneros, Pedro López de Ayala, Diego Rodríguez de Almela, and Hernando de Talavera. These are found published singly or as part of literary and historical document collections.

Senders generally dictated their correspondence, and with some exceptions the style of a letter can be attributed to the scribe and the medieval art of letter writing. A letter's style as presented by most scribes was firmly grounded in the medieval art of letter writing, the *ars dictaminis*. A letter consisted of five parts that could be elaborated or omitted at a writer's discretion: the *salutatio*, or formulaic greeting; the *captatio benevolentiae* or *exordium*, which captured the goodwill or, at least, the attention of the recipient; the *narratio*, or narration of facts; the *petitio*, which argued, pled, or simply stated the opinions, needs, and facts as they stood at the moment; and the *conclusio*, a closing phrase of a general nature or a recapitulation of essential arguments and points.

Scribes learned their craft through the Latin *artes dictandi*, rhetorical treatises on the art of letter writing,

or from collections of model letters and model letter parts. Whether or not a letter was dictated to a scribe or penned by the sender, the general format of *ars dictaminis* was followed. It was in fact pervasive, and use of proper format should not be seen as a direct link to knowledge of the *artes dictandi*.

Letters in medieval Spain were written in a variety of languages. The majority of letters from the early Middle Ages were in Latin, and Latin continued to be used for most international correspondence, particularly from the church. Both Hebrew and Arabic letters from the Middle Ages survive. Catalan was the language chosen for many challenge letters, and French was occasionally used in nobles' letters to parties outside of Spanish-speaking areas.

Delivery of the correspondence fell to the messenger. The type of messenger used depended on the sender's social rank, the nature of the message, and the distance the letter was sent. The messenger could be a trusted servant, an official envoy, a good friend, or merely a person going to the same destination as the letter. Royalty had at its disposal many trusted messengers who were used regularly and to whom additional, verbal messages were often entrusted.

In ancient civilizations the majority of long-distance communication was oral, although the evolution of the written message occurred very early as a method of jogging the messengers' memories. All through the Middle Ages and beyond, both oral and written communications continued to be employed. Certain types of letters, most notably letters of challenge, long remained fossilized in an oral tradition that had passed out of use in more everyday correspondence. The fluctuation between oral and written presentation of messages allowed letters to take on the quality of "half a conversation" as described by the *dictatores*.

The conversational and intimate aspect of letters, combined with their earlier role as legal, and therefore true, documents made letters a very appealing device to authors, who used them for short treatises, demonstrations of stylistic expertise, and literary devices within their texts. Differentiating literary letters from everyday letters is not a simple task. Their subject matter varies widely and encompasses many of the subjects treated in everyday correspondence. Certainly the authors of literary letters lavished careful attention on style and composition, but scribes, trained in the art of letter writing, employed similar standards for the letters they composed. Perhaps the best, albeit by no means conclusive, indication is that although commonly addressed to a single recipient, literary letters were written with an eye to public circulation. Composed in both prose and verse, literary letters circulated in single copies, in collections, and as parts of other

works. Public circulation and extensive copying, as well as their collection, indicate that the value of these letters extended beyond their news-bearing ability, to include interest in the artistry of their composition and the facts and opinions presented by the author. Authors of literary letters include Diego de Valera, Hernando del Pulgar, Francisco de la Torre, Íñigo de Mendoza, Alfonso de Madrigal, Gómez Manrique, Juan de Lucena, Enrique de Villena, Juan Rodríguez del Padrón, and the many authors of challenge letters.

LEVI BEN GERSHOM (GERSONIDES)

Although he was born and lived his entire life in then French Provence, Gersonides (1288–1344) was the heir of the Spanish Hebrew-Arabic medieval culture. Deeply influenced by Averroës and Maimonides in philosophy and by Abraham ibn Ezra in biblical exegesis, Gersonides not only excelled in both these areas but also made important contributions to astronomy and mathematics. Besides inventing or improving upon several astronomical observational instruments, he compiled his own astronomical tables, made many of his own observations, and engaged in a critical analysis of several of Ptolemy's hypotheses. In mathematics he wrote a commentary on parts of Euclid's *Elements* and a treatise on trigonometry.

But it was in philosophy and biblical exegesis that Gersonides was most influential. Continuing the tradition of the Córdoba philosopher Averroës, Gersonides wrote many supercommentaries on Averroës's commentaries on Aristotle, in which he exhibited a critical and independent approach to both his predecessors. But it is *The Wars of the Lord* that is his most important philosophical work. In this long treatise most of the topics of medieval philosophy and science are discussed in detail and with acuity. Some of his more novel or radical conclusions were (1) the individual human intellect is immortal (contrary to Averroës); (2) God does not have knowledge of particular future contingent events (contrary to Maimonides); (3) yet there is divine providence over deserving individuals;

(4) the universe was divinely created out of an eternal shapeless body (contrary to Averroës and Maimonides); (5) although it has a beginning, the universe is indestructible (contrary to Aristotle).

Whereas *The Wars of the Lord* elicited considerable criticism from his coreligionists, Gersonides' commentaries upon the Bible were widely studied, even among nonphilosophical Jews; his *Commentary on Job* was particularly popular. This is remarkable because in these commentaries Gersonides pulls no punches: the ideas of *The Wars of the Lord* are repeated or assumed, and there is no effort to mute their impact. He did not obey Averroës's and Maimonides' rule that the teaching of philosophy ought to be reserved for the philosophers alone. In his *Commentary on Job*, for example, he has each character represent a distinct philosophical position on the question of divine providence. These various positions are philosophically analyzed, and eventually one emerges as the true solution to Job's predicament. Thus, the Book of Job is transformed into a Platonic dialogue.

LEYES DE MOROS

Leyes de moros, the laws concerning the Muslims (Mudéjars) living in the Christian kingdoms, are found in royal and municipal law codes and in the legislation of regional *cortes* (parliaments). They constitute an elaboration upon the surrender treaties reached between the Christian kings and the conquered Muslim populations—which granted the Muslims the basic privileges of religious freedom and communal autonomy—and define the Muslims' status in a Christian society and regulate their relations with the Christian populace. Many laws intended the segregation of the Muslims in order to shield the faith and morals of Christians. For instance, Muslims were to reside in separate quarters and to wear distinctive clothing and haircuts; sexual relations between Muslims and Christians were prohibited and harshly penalized. Other laws affirmed Christianity's present domination of Islam by requiring Muslims to kneel in the presence of Christian religious processions or increasingly restricting the Islamic call to prayer.

Concomitant to such laws were those banning Christian conversion to Islam and encouraging the proper treatment of baptized Muslims. Laws also rein-

forced Christian sociopolitical power in their proscription of Muslims holding public office over Christians, employing Christian servants, or owning Christian slaves. Christians could own Muslim slaves, either Mudéjar or foreign, and laws regulated their treatment and manumission. Beyond granting Muslim judges jurisdiction over civil suits between Muslims, laws established guidelines for judicial procedure in litigations involving Muslims and Christians, which normally were adjudicated in Christian courts. The royal and seigneurial lords of Muslims, in order to protect their own economic interests, enacted laws that restricted Mudéjar emigration to Islamic lands and controlled Mudéjar movement from one lord to another. The crown, however, did not consistently enforce many of the harsher segregative provisions. Most royal measures to protect Muslim interests were of an ad hoc nature and do not appear in the law codes.

LEYES DE MOROS (II)

Leyes de moros is the title under which Pascual de Gayangos published in 1853 a Latin-character (not *aljamiado*) text of which the original had already been lost, so that exact dating is now impossible. The original may have been from as early as the thirteenth century, and is certainly earlier than the fifteenth-century *Breviario sunnī*. The *Leyes de moros*, like the not-dissimilar Catalan *Llibre de la Cuna* recently discovered and published by Barceló, provide a short Romance manual of some aspects of Islamic law (*fiqh*). The text appears to be primarily intended for the use of Christian administrators and functionaries rather than for Muslims. Although their Mudéjar status guaranteed to subject Muslims that they would be judged according to their own laws, administered by their own *qādī*, inevitably there were conflicts of jurisdiction, and sometimes Muslims, anxious to escape the rigors of the *ḥadd* obligatory capital punishment, sought to have their offense tried before a royal court. (In any case, the crown provided the ultimate court of appeal.) Christian lawyers and others needed a statement of Islamic law they were asked to apply. The *Leyes de moros* certainly did not cover the whole range of *fiqh*, but although Gayangos' description of them as a "civil code" goes

too far (no Islamic code is devoid of theological content), it is true that they avoid purely ritual issues. They are based on entirely orthodox Mālikī juridical writings in Arabic, and indeed some of the cases discussed arise from the needs of a camel-herding society, and so will have been quite irrelevant to the circumstances of the Mudéjars of the Iberian Peninsula.

LEYES DEL ESTILO

Leyes del estilo o declaración de las leyes is the title of the first printed edition (Salamanca, 1497) of a private compilation created by unknown author(s), probably during the reign of Fernando IV of Castile (1295–1312), according to some easily datable references from the period 1290–1309. The known half-dozen manuscripts, showing some variation in title, date mainly from the fourteenth century. The editions include four other confirmed incunabula of different dates, nine editions from the sixteenth century, and one edition by the Royal Academy of History published in 1836. The latter contains 252 *leyes*, units more appropriately called *chapters* because the collection was not promulgated. Like the *Leyes nuevas*, the *Leyes del estilo* were intended to fill gaps perceived in existing law, mainly in the *Fuero real*, although numerous sources in Roman, canon, customary, and Alfonsine juridical literature are cited as well.

The *Leyes* may be described generally as comprising a systematic compilation of interpretations, clarifications, explanations, and examples of carrying out the law emanating from decisions of the royal tribunal. The compilation was much cited by jurists into the sixteenth century. Eventually some of the chapters acquired legal status on being incorporated into the *Novísima recopilación* (1805). The *Libro de los juyzios*, contained in a manuscript written mainly in an early fifteenth-century hand, is related to the *Leyes del estilo* and has been called a version of it. It has been said to show even more receptiveness to the *Fuero real* than that appearing in the *Leyes*; both works are cited as showing evidence of the differences between the new law represented by the *Fuero real* and traditional law as represented by municipal *fueros* generally and by customary law.

LEYES NUEVAS

The thirteenth century was the most important throughout Spain for the codification and promulgation of laws. In the kingdom of Castile, Alfonso X especially is noted for his sponsorship (hardly “authorship”) of various legal codes. Whereas the *Siete Partidas* was intended as a theoretical codification, a kind of “encyclopedia” of civil and canon law, for use in the royal court, the king was very serious about his effort to impose the *Fuero real* as a universal code upon the municipalities of Castile and Extremadura. He reserved to himself (i.e., the royal judges) the right of appeal, as well as of the interpretation and emendation of the law.

The *Leyes nuevas* (ca. 1263) represent, in effect, a collection of such interpretation, in response to queries from judges of Burgos. These laws played an important role in later legislative developments and *fueros*.

In addition they are of particular importance for Jewish history and the issue of usury, inasmuch as the majority deal with these questions. Lengthy formulas of oaths for Christians, Muslims, and Jews in matters of debts are also prescribed. Other laws attempt to redress earlier injustices against Jews, such as the matter of “seizure” (hostage) for debt.

LIBRARIES

The earliest reference to a Spanish library is found in the verses inscribed on the walls of the library of St. Isidore of Seville (ca. 560–636), but the first one documented is that of Villeña (Santander), which received a donation of five liturgical works in 796. Those known

during the early years of the Reconquest (ninth–eleventh centuries) are primarily of the same type: small collections of liturgical works with, occasionally, some patristic texts. Larger collections, especially with secular works, are rare, although St. Eulogius of Córdoba visited the monastery of San Zacarías of Navarre in 848 and brought back to Córdoba texts of Virgil, Juvenal, and Horace. (More commonly books were brought from al-Andalus to the north as Mozarabic Christians fled increasingly severe religious persecution.) Thus a library inventory from 882 (Escorial, Ms. R.II.18, variously ascribed to Córdoba, Toledo, Oviedo, or Zaragoza) stands out for its size (forty-two books) and variety (Virgil and Juvenal; the histories of Eusebius, Paulus Orosius, and St. Isidore; Christian Latin poets like Prudentius and Sedulius Scottus; and the more common works of the church fathers).

Evidence for contemporary Islamic libraries is entirely anecdotal, since there are no extant inventories. The commonly cited figure of 400,000 volumes for the library of Al-Hakam II, caliph of Córdoba (961–976), is suspicious, since in Arabic 400,000 frequently means only “innumerable, beyond count.” Nevertheless, it is generally accepted that there were large collections not only in Córdoba but also in the successor *taʿifa* kingdoms of the eleventh century (e.g., Seville, Almería, Granada, Zaragoza, Valencia).

Documentation for the major monastic centers in Castile and León (e.g., Santo Domingo de Silos and San Pedro de Cardeña [Burgos], San Millán de la Cogolla and San Martín de Albelda [Logroño]) has not survived, but extant codices indicate that their libraries were almost exclusively religious and relatively small. By far the richest and most impressive library in Christian Spain was that of Santa María de Ripoll (Girona) in the Catalan Pyrenees. In 979 it had sixty-five books; by the time of the death of Abbot Oliba (1047), its collection of 246 books included Juvenal, Caesar, Horace, Terence, Cicero, Virgil (with the commentaries of Servius), the grammars of Donatus and Priscian, and the logical texts of Porphyry and Boethius as well as arithmetical and musical works. In contrast, more than a century and a half later, San Salvador de Oña (Burgos) had only 117 books, and somewhat later in the thirteenth century Silos had 146, almost all of them liturgical or patristic.

By the thirteenth century the cathedrals, called upon to create schools by the Third (1179) and Fourth (1215) Lateran Councils, began to build increasingly substantial libraries through purchase or legacies from canons and bishops. The collections at Toledo, Burgo de Osma, Burgos, Sigüenza, Barcelona, Valencia, Pamplona, Tortosa, and Vich can be traced to this period, and are essentially intact today. Burgo de Osma

had 149 books at the end of the thirteenth century, and Sigüenza's collection grew from twenty in 1242 to 280 in 1339. In contrast, at the end of the fourteenth century the cathedral of Oviedo had only seventy-six books; at roughly the same time there were eighty-six in Burgos. The collections themselves served as texts for the cathedral schools and as a source of income to the cathedral, since they were frequently rented out.

We may surmise the existence of royal or noble libraries during the high Middle Ages, but it is only toward the end of the thirteenth century that they are documented. Attempts to reconstruct the library of Alfonso X of Castile and León (r.1252–1284) are based on the sources used in his works as well as on documents listing books borrowed from Riojan monasteries around 1270. For the Crown of Aragón we have concrete information only from the reign of Jaime II (1291–1327) onward. In 1323 the *cámara real* contained a collection of eighty-eight books, mostly confiscated from the Knights Templars. This library did not form part of the royal patrimony, and many of its manuscripts were donated to other members of the royal family or to royal favorites.

The bibliophilia of the last kings of the Aragóense dynasty (Pedro IV [r.1336–1387] and his sons Juan I [r.1387–1395] and Martín I [r.1395–1410]) is well documented; and the inventory of the latter's collection of 349 books provides in some respects the final record of that passion. It contained texts in Latin (56 percent), Catalan (19 percent), French (14 percent), Castilian (4.6 percent), and Aragóense (3.4 percent), as well as scattered items in Provençal, Sicilian, Hebrew, and Arabic. Resolutely medieval in its outlook, it held fifty-five legal works (15 percent), fifty-five astronomical and astrological ones, and thirty-nine historical texts (11 percent), but almost no classical or humanistic materials and very little vernacular imaginative literature.

Carlos of Aragón (1421–1461), prince of Viana and son of Juan II, had a library of one hundred volumes that reflected the intellectual interests of his uncle Alfonso V the Magnanimous, whose library at Naples, with its magnificent classical and humanistic manuscripts, was one of the glories of the Italian Renaissance. We find no record of the Castilian royal library until Isabel I's was cataloged in 1503. However, from its contents and composition (199 manuscripts and only five printed books), it is plain that its nucleus dates from the reign of her father, Juan II of Castile and León (1406–1454). Almost half of its texts are in Castilian and the rest in Latin, with but a scattering in French, Catalan, and Italian. Law and religion are the most numerous subjects, and there is a good collection of vernacular Castilian literature, including such canonical texts as the *Libro de buen amor* and Juan Man-

uel's *Conde Lucanor*, but very little humanistic or classical literature. From this time on, the royal library was a possession of the crown, which explains why many of the books mentioned in the 1503 inventory eventually found their way into the Escorial, the Biblioteca Nacional, and the royal library (Biblioteca de Palacio).

During the reign of Juan II both the upper and the lower nobility began to collect books seriously. The largest noble library was probably that of Íñigo López de Mendoza (1398–1458), first marquis of Santillana; but its reconstruction is problematic, since it is based on a study of extant manuscripts. More useful as touchstones of the intellectual interests of the nobility are the libraries of Alfonso Pimentel, the third count of Benavente (1440–1461), who about 1447 owned 126 books, and of Pedro Fernández de Velasco (1400–1470), first count of Haro, who had seventy-nine in 1455. There is little imaginative literature in these libraries; legal and religious texts, histories, and didactic and exemplary works of various kinds predominate. Inventories of the libraries of a few well-known writers are still extant, such as those of Ausiàs March and Joanot Martorell in Valencia; of Alvar García de Santa María, *cronista* of Juan II of Castile; and of the poet Fernán Pérez de Guzmán. They tend to reflect the same interests as the libraries of the nobility.

University and school libraries were generally limited to textbooks: grammatical and logical texts at the lower levels, theological and legal works at the higher. In the earlier period provision of texts was in the hands of the *stationarius*, who rented out manuscripts for students to copy. In Salamanca, for example, the university library is not even documented until well into the fifteenth century, and appears not to have grown substantially until the second half of the century.

Through the end of the fourteenth century, private libraries remained small and tended to focus on their owners' professional concerns: lawyers owned legal texts; doctors, medical treatises. During the fifteenth century they became increasingly common, even before the advent of the printed book in the last quarter of the century. While the inventories of such libraries—generally compiled for testamentary purposes—are far more numerous in the Crown of Aragón than in the Crown of Castile, it is not clear whether this in fact corresponds to a real difference between the two regions or is merely a reflection of the earlier establishment of notarial archives in the eastern kingdoms, which preserved such inventories in far greater numbers than did Castile. Private libraries of all classes become more common in the fifteenth century, due to an increase in demand—a higher literacy rate with the spread of grammar schools—as well as in supply—the

increasing substitution of paper for parchment as a writing material; they increased dramatically in numbers, size, and content after the introduction of the printing press. Luis de Acuña, bishop of Burgos, possessed 363 books in 1496, and an obscure Mallorcan notary, Miquel Abeyar, owned 471 in 1493. Berger shows that in Valencia even some 10–15 percent of the manual laborers owned books, as opposed to 30 percent of the merchants and fully 75 percent of the professional classes. Library size ranged from one to two books for the first group to some thirty or forty for the last. Fewer women had libraries, and those who did generally owned no more than three or four books, regardless of social class.

LIBRO DE ALEXANDRE

The anonymous early thirteenth-century *Libro de Alexandre* narrates in verse the life of Alexander the Great, and thus represents the Spanish contribution to the widespread medieval Alexander tradition, which produced numerous retellings of the Macedonian hero's life in Latin, in Arabic, and in various European vernacular languages. To medieval Europeans, Alexander represented a classical figure worthy of imitation due to his sagacity, determination, and prowess as a warrior, yet he also came to signify the dangers of excessive ambition and unrestrained quest for fame. The Spanish poem clearly reflects this ambiguity by means of a detailed medievalization and Christianization of the story.

The 2,675 quatrains begin with the hero's birth, infancy, and tutelage by Aristotle. Alexander then takes arms in a scene that anachronistically reflects the rituals of medieval knighthood. After several preliminary military victories, Alexander's father, King Philip, dies, and the son ascends to the throne. The new king invades Asia in the hope of conquering the

Persian king Darius and liberating Greece from Persian domination. At Troy, 472 stanzas relate the story of the Trojan War, which instructs and inspires Alexander's troops. Alexander goes on to defeat Darius and to advance through Asia conquering and occupying territory. As the poem draws to a close, Alexander, "emperador del mundo," enters Babylon victorious, erects his magnificent tent, and contemplates his vast gains. Here at the pinnacle of his power, Alexander's nemesis Antipater poisons the great man's wine glass and when Alexander drinks, the poison kills him. The final stanzas of the poem meditate on the unreliability of earthly riches and glory and the need to serve and have faith in God's eternal kingdom in the afterlife.

Differences between the two extant manuscripts raise various questions regarding the original poem's composition. The language of Manuscript O (Biblioteca del Duque de Osuna) contains Leonese dialectal characteristics, and the last stanza attributes composition to Juan Lorenzo de Astorga. The language of Manuscript P (Bibliothèque Nationale, Paris) is more typical of the Aragóense dialect, and ends with an attribution to Gonzalo de Berceo. However, stanza 1548 in Manuscript O refers to a "Gonçalo," and in P the same *copla* cites "Lorente." For over one hundred years, scholars have attempted to explain these differences and contradictions, often arguing for either an Aragóense original by Gonzalo de Berceo or for Leonese composition by Juan Lorenzo. In 1979, Dana Nelson took the daring step of publishing an edition, or "reconstrucción crítica," of the *Libro de Alexandre* bearing Gonzalo de Berceo's name as author. Today the general consensus leans toward accepting the *Libro de Alexandre*'s anonymity yet recognizing the close connection between that work and the writings of Gonzalo de Berceo, perhaps due to a shared association with the University of Palencia.

The question of the *Libro de Alexandre*'s sources has been far less difficult for scholars to resolve. Two twelfth-century Alexander narratives, the Latin *Alexandreis* of Gautier de Chatillon and the French *Roman d'Alixandre*, in addition to the tenth-century Latin *Historia Proeliis* served as sources for the principal story line. Much of the Troy material comes from a first-century Latin Homeric summary, the *Ilias*. Scholars have not only identified the principal sources for both the primary narrative and the digressions, but have also studied in some detail the relationship between the Spanish poem and its roots.

Scholars consider the *Libro de Alexandre* prototypical of the thirteenth-century Spanish school of poetry known as *mester de clerecía*. In fact, nineteenth-century readers coined the term from the *Libro de Alexandre*'s second stanza, where "mester de clerecía" re-

fers to the poem's regular versification (rhymed quatrains of fourteen-syllable lines) in contrast to *joglaría*, or poetry tied more closely to the oral tradition with much looser metrics and rhyme. More recently, *mester de clerecía* has come to encompass a broader range of characteristics including content (learned material reflecting the thirteenth-century intellectual tradition of the nascent Spanish universities, such as Palencia) and purpose (the sharing of information for instruction and moral edification).

This didactic intent is most obvious in the many digressions, which include a lesson on how to hunt elephants, a catalog of the wonders of the Orient, a map of the world, and an allegory on the four seasons of the year. The moralistic orientation of many digressions is clear in, for example, the diatribe against social corruption, and a description of hell that enumerates the Seven Deadly Sins. Scholars agree that such "digressions" play an important structural role in that they reinforce the didactic and moralizing intent of the principal story line.

LIBRO DE APOLONIO

An anonymous work composed of some 650 monorhymed cuartets in the style of the so-called *Mester de clerecía* that dates from circa 1250 and comprises an imaginative portrayal of late classical antiquity. It is uniquely preserved in Escorial manuscript III-K-4. The *Libro* tells the story of Apollonius, king of Tyre, who, after many complicated trials and adventures in the eastern Mediterranean, is reunited with his lost wife, Luciana, and his daughter, Tarciana, who had nearly fallen into prostitution and become a *jongleur*. Apollonius, urbane and expert at solving riddles, is also a master of music and court entertainments who uses his skills to overcome adversity. A tale essentially of exile and return, the peripatetic adventures of the *Libro de Apolonio* follow the structure of the late Byzantine romances, with chance encounters, mistaken identities, and surprise endings. Although probably inspired by a French or Provençal model of the story, the poet was most likely also familiar with Latin versions of the tale, among them the *Historia Apolloni regis Tyri*, attributed to Symposius, the *Phanteon* of Godfrey of Viterbo, the tenth-century *Gesta Apolloni*, and the shorter version of it in the *Gesta Romanorum*.

More than entertainment, the *Libro de Apolonio* is noteworthy for its conflation of courtly attitudes, hagiographic discourse, folklore, and secular knowledge, demonstrating the desire to forge a new intellectual and social alliance between the laity, especially the aristocracy, and the world of clerical learning. Its vision of the world of prostitution and an almost primeval monarchy corrupted by incest that is revealed, and eventually overcome, by the virtuous and learned Apolonio exhibits a care for the interaction and involvement of Christian and human values in a fallen secular universe. Its exaltation of liberal learning in both the active and the contemplative life seeks to show the wisdom and efficacy of an education in coming to terms with the problems of the world.

LIBRO DE BUEN AMOR

The *Libro de buen amor* is by far the most enigmatic work in medieval Spanish literature, and probably in the literature of all medieval Europe. It is intentionally ambiguous, it is pervasively parodic, the relationship between the first-person narrator and the implied author is unusually complex, there is a kaleidoscopic interplay between the didactic message(s) and the subversive (sometimes obscene) humor, and even the genre of the book is hard to pin down.

The authorial title is given in a characteristically elusive way, and it passed unnoticed for over five hundred years (early readers knew it as *El libro del Arcipreste*, *El Arcipreste de Fita en su tractado*, *Las coplas del Arcipreste de Hita*, or *Cancionero del Arcipreste*). Yet there should be no doubt about the title: the narrator-protagonist tells us that as a tribute to one of the characters, "buen amor dixe al libro." The character in question is his go-between, the old bawd Trotaconventos, who had commanded "llamatme Buen Amor"; nevertheless, the prose prologue insists that "buen amor" means the love of God.

The *Libro de buen amor* as it has come down to us is not a unitary work: it has an extensive narrative core, into which some lyrics are firmly integrated (others, announced in the text, are missing), and around

which other lyrics and one episode have been gathered. The core is a fictional autobiography, treated in a parodic manner and centered on the protagonist's comically unsuccessful pursuit of women. The only episode in which he is unquestionably successful is that of Doña Endrina, whose seduction (with the help of Trotaconventos) follows advice from the allegorical figure of Don Amor and then from Venus; but in this sequence (which occupies 42 percent of the *Libro*) the protagonist's name changes, and there are so many anomalous features that only if we regard the whole sequence as a dream does everything fall into place. If we add associated episodes that follow soon after (the allegorical battle between Carnival and Lent, the triumphal entry of Don Amor), dream narrative rises to 56 percent of the *Libro* and an even higher percentage of the narrative core.

Sources or close analogues have been found for all the major elements of the *Libro*: for instance, the Endrina episode is a reworking of the medieval Latin comedy *Pamphilus*, Don Amor's advice adapts Ovid's *Ars amatoria*, many of the tales used by the characters as *exempla* to support their arguments come from medieval Aesopic collections, and the battle between Carnival and Lent derives from a European tradition, perhaps in its French form. The four *serrana* episodes, in which the protagonist encounters mountain women, parody the *pastorelas* of the troubadours (these episodes, like the allegorical battle that follows them, are now widely seen as evidence of a carnivalesque spirit in the *Libro*). All of the episodes and the inset tales and lyrics are firmly within the Western, Christian tradition (even the one tale that has a Moorish setting seems to derive from Arthurian literature). It is at first sight surprising, therefore, that several eminent scholars have detected an Islamic or Hebrew inspiration for the autobiographical, episodic structure and for the work's pervasive ambiguity. Recent research has, however, found, at several points in the *Libro*, convincing evidence of contact between the poet and Islamic culture. It is here that the question of literary influences connects with research on the poet's life.

The narrator-protagonist tells us that his name is Juan Ruiz and that he is archpriest of Hita; some other snippets of information are added (e.g., that he is "de Alcalá"). Until the early 1970s there was only speculation, but since then three serious hypotheses have been built on firm documentary evidence. First, that the poet is Juan Ruiz de Cisneros, born in Muslim Spain (Alcalá la Real?) to Christian parents who never married; in his early teens he went with his father to Castile, and eventually rose to prominence in the church. Secondly, that he is the Juan Ruiz mentioned in documents in the Toledo cathedral archives. Thirdly, that he is the

composer named as Johannes Roderici in a Latin musical manuscript. There are dangerous gaps in the evidence for each hypothesis, but there are attractive features in each. Moreover, they are not incompatible: any two, or even all three, could be correct. And if our poet Juan Ruiz is Johannes Roderici, the interest in music shown in the *Libro* is explained; if he is Juan Ruiz de Cisneros, he has a personal history that would generate elements of Islamic culture within a generally Western, Christian pattern of sources.

The textual history of the *Libro* is as problematic as the poet's biography. Scholars agree that some parts had an independent existence (and were probably written for public performance) before the work as a whole took shape, and that other parts were probably composed after the narrative core was constructed. Throughout most of the twentieth century the majority view was that there were two versions of the *Libro*, one completed in 1330 and represented by two of the three manuscripts (Gayoso and Toledo), the other, represented by the longer Salamanca manuscript, being an expansion dating from 1343. Majority opinion has now swung against the two-versions hypothesis, concluding that there was a single version (completed in 1343?) and that the differences between the two states of the text are the result of manuscript transmission and reception, not of authorial expansion. It may, however, be too early to dismiss the two-versions hypothesis out of hand, and in any case there is still controversy about the date: one scholar has suggested much later composition, in the 1380s. If this were true all the biographical hypotheses would collapse, and the *Libro* would no longer be innovatory in its abundant lyrics in Castilian (but the weight of the evidence is against this redating).

The poet's metrical virtuosity is impressive. Most of the *Libro* is in the *cuaderna vía* (monorhymed Alexandrine quatrains) that dominated learned poetry throughout the thirteenth century and most of the fourteenth, but the lyrics exhibit a variety of metrical forms, and the poet announces that one of his aims was "dar [a] algunos lección e muestra de metrificar e rimar e de trobar" (to provide a lesson and example for some of prosody, rhyming, and making poetry)." There is a period of influence on Castilian court poems from about 1380 to the beginning of the fifteenth century, but if the *Libro* was completed around 1343, the emergence of Castilian as the dominant vehicle for court lyric, a few decades later, may show that Juan Ruiz's example had been rapidly effective.

The Salamanca manuscript was copied in about 1415, and within twenty-five years was in the library of one of the university's colleges. It is unlikely to be mere coincidence that, after the short period of poetic

influence, the *Libro*'s presence in the fifteenth century was primarily learned (influence on *Celestina*, another product of the University of Salamanca, no longer seems improbable). The *Libro* seems to have been read in the light radical Aristotelianism, which saw love in the context of the natural impulse to reproduction, and that current of thought may well be present in the *Libro* itself (where it blends with the Ovidian attitude to love), not just in its fifteenth-century reception. That, however, is by no means the only intellectual current relevant to the work: St Augustine, especially in *De doctrina christiana* and *De magistro*, is now seen as a major influence on Juan Ruiz's ambivalent attitude to the interpretation of his work; in addition, the *Confessiones* may be a subtext of the autobiographical narrative, though this by no means excludes the formative role of the late-medieval European genre of the erotic pseudoautobiography.

Juan Ruiz insists that he aims to “dar solaz a todos” (give pleasure to all), and that his book provides “la santidad mucha” (much sanctity) but also “de juego e de burla” (jest and fun). It is generally assumed that much of the *Libro* was intended for public performance, but we have no evidence of such a performance (it would have been surprising if any record had been kept). If we knew how it had been performed, we should learn a great deal, and many of the ambiguities might be resolved (though, in this supremely ambiguous book, many would remain). It is likely that the *Libro*’s reception in the fourteenth century differed markedly from its mainly learned reception in the fifteenth. And its influence may have spread beyond Spain. Similarities between the *Libro* and *The Canterbury Tales* have often been noticed. Now it seems highly probable that Chaucer visited Spain in 1366, halfway between the completion of the *Libro* and the beginning of the *Tales*. The possibility that Juan Ruiz’s work may have inspired Chaucer needs more thorough investigation. For the present, the question remains tantalizingly open, like so much in *Libro de buen amor* studies.

LIBRO DE LOS ENGAÑOS

Libro de los Engaños (Book of the Wiles of Women) is the title of the first Spanish translation of *Sendebār*, a collection of short stories. It is supposed that, following a process similar to *Calila e Digna*, its origin goes back to India and that, via Persia, it reached the Arab world, though the lack of evidence makes this journey purely hypothetical. It was pointed out that the book was written in Persian in the sixth century, and, later, part of its narrative material migrated toward the East; on the other hand the importance of the Hebrew version, which served as a link between the Eastern and the Western version has also been shown. The Spanish translation was requested by Fadrique, brother of Alfonso X, in 1253, and was done from an Arabic original. The lack of a proper team, like the one gathered around Alfonso X, may explain its faults, with some passages not decipherable. There remains one manuscript written by the beginning of the fifteenth-century, corrected quite a few times at the end of that century or the beginning of the sixteenth. The corrections are very interesting for a linguistic study.

The work is one of the most perfect and simple narrative models. A prince is sentenced to death as a result of a false charge made by one of the king's wives. But the execution is postponed—as is the main narrative—because the royal advisers and the wife try, with their stories, to change the king's decision. Altogether there are twenty-three stories: five from the wicked wife, who tries to validate the accusation with them and save her life; thirteen from the seven advisers (there is one story missing), who ask the king to spare the prince and present misogynist arguments; and five stories in which the prince defends himself and shows the wisdom he has achieved. The main story, very similar in most of the Eastern versions, is a strange mix of traces of old initiation rites, folk motifs, and diverse literary traditions. Within the inserted stories there is a wide variety: some of them (such as 6 and 8) are hardly found in medieval literature; others are very close to classic tales (such as 12) or to *fabliaux* (such as 5, 10, and 13). Some were already known in the Iberian Peninsula, having appeared in the *Disciplina clericalis* of Petrus Alfonsi, and, due to their remarkable misogynist character, were widely disseminated. The work was well known in Spain, but in a much

more Western version, *Siete sabios de Roma*, which derives from the *Liber de septem sapientibus* (twelfth century).

LIBRO DE MISERIA D'OMNE

The *Libro de miseria d'omne*, a poetic adaptation of the *De miseria condicionis humanae* by Pope Innocent III, is a *cuaderna vía* piece copied in prose form and consisting of 502 strophes cast in sixteen-syllable verse. In his paleographic edition of the poem, Miguel Artigas, pointing to the eight-510 syllable hemistiches, imperfect rhyme, and poetic ineptness, classified it as a representation of the decline of the Alexandrine and dated its composition at the end of the fourteenth century. Agreeing with this assessment, subsequent scholars held the poem in low esteem, categorizing it as an uninspired translation and an example of the degeneration of *cuaderna vía* (quatrains). Recent studies have, however, shown the need to reevaluate the position and importance of the poem.

In her study of the *Miseria* Jane E. Connolly rejects the classification of the poem as a translation, arguing that the Spanish poet transforms rather than translates his source: he amplifies, abbreviates, or reorders the Latin material in order to emphasize clarity and coherence; he replaces the elevated rhetoric of Innocent with imaginative and descriptive language; he eliminates unsuitable topics while adding sections containing sharp social criticism and fundamental church doctrine; and he recasts the treatise in the more popular *cuaderna vía*. In adapting and re-creating the Latin treatise to meet his own artistic and personal designs, the attitude of the Spanish poet toward his source resembles that of Gonzalo de Berceo or the authors of the *Roman d'Alexandre* and *Libro de Apolonio*.

John K. Walsh and Connolly suggest an early date of composition for the poem: in their view the poet clearly expected his work to be understood within the context of the thirteenth-century *clerecía* texts, an intention reinforced by the inclusion of strophe 4, which is a deliberate echo of the prologue of the *Libro de Alexandre*. Connolly attributes many of the imperfections in the only extant version of the poem to errors of the prosifying copyist, and she reconstructs the poem, showing that the meter, rhyme, and formulas tie it to the practices of the thirteenth-century *cuaderna vía* poets. Walsh and Connolly situate the *Miseria* in the

homiletic literature of the late thirteenth century, pointing to the numerous thematic similarities with the *Castigos de Catón* and especially the *Proverbios de Salomón*. Connolly supports this claim by citing historical documents of the period, which reveal that the social criticism in the *Miseria* reflects the general sense of malaise at the turn of the century.

The *Miseria* belongs to the cycle of late thirteenth-century didactic poetry and may have influenced later cuaderna vía works. Indeed, Walsh argues that Juan Ruíz parodied the *Miseria* in his *Libro de buen amor*, and Connolly suggests that the author of the *Alhómba arimada* was familiar with it.

LIBRO DEL CAVALLERO ZIFAR

The *Libro del cavallero Zifar* (also written *Cifar* and *Çifar*) is an anonymous fourteenth-century prose romance that is divided into three main parts, two sets of adventures and a long moralizing discourse. The first section contains the life history of the knight Zifar, who rises from poverty to wealth; the second presents a series of lectures that Zifar delivers to his two sons on how to rule; and the third narrates the adventures of Zifar's son Roboán, who begins his quest as an obscure figure and ends it with fame and fortune. The journeys of both men are filled with numerous digressions, including two in fantasy worlds that provide variety and humor to the basic narrative.

The extensive and complex adventures of Zifar are best understood if they are separated into three phases: the first, in which the family is together; the second, dealing with the life of Zifar after the separation of the family; and the third, depicting circumstances in Mentón, where the family is reunited. The romance begins in a land of uncertain location called "las Yndias," where Zifar, the son of a noble, wealthy, and distinguished family, is living with his wife, Grima, and two young sons, Garfín and Roboán. Despite his noble birth and talent as a knight, Zifar's life is plagued with obstacles caused by a curse placed on him by an evil ancestor.

Because of the malediction Zifar's horses die every ten days, a phenomenon that has far-reaching consequences. Although the details are not totally

clear, the main impact of the curse is economic, because the high cost of replacing the animals has made it impossible for the family to live with the comforts normally available to aristocrats. It is also evident that the curse undermines Zifar's authority and effectiveness as a knight, for when his horses collapse and expire in the middle of a major conflict, his role as a leader is inhibited until the animal has been replaced.

Tired of living in poverty and unable to overcome its cause, Zifar and his wife decide to leave the area, hoping that a change in location will enable them to regain wealth and prestige. After packing their belongings, the family departs and eventually reaches the kingdom of Galapia, where Zifar is instrumental in settling a dispute between the woman ruler of Galapia and a king who controls the adjacent land. The two figures end their conflict by marrying; after the wedding Zifar and his family continue their journey and almost immediately become separated due to circumstances beyond their control: Garfín is kidnapped by a lioness, Grima is abducted by some sailors and carried on a magic ship to a distant land, and Roboán becomes lost while searching for his mother.

With the separation of the family, Zifar enters a new phase of his life. He travels alone until he unexpectedly comes upon a hermit. After the two men share a meal, the hermit has a vision in which he miraculously foresees Zifar's future life. Later the hermit introduces Zifar to a squire; Zifar and the squire leave the area and embark on a series of adventures that end in the land of Mentón.

In this final phase of his journey, Zifar's economic and political status begins to change dramatically, for he meets and marries the king's daughter, thereby placing himself in a position to inherit the throne. When in the course of time his father-in-law does die, Zifar automatically succeeds him as king. Now that he holds the highest position in the kingdom, he has attained the wealth and prestige that he had previously been denied.

Until Zifar reaches Mentón, the fate of his first wife and sons is a mystery. After he becomes king, however, their whereabouts is unexpectedly clarified, for one day Grima, Garfín, and Roboán all appear. This pleasant surprise creates a major problem for Zifar, who is now married to another woman. The dilemma is miraculously settled, however, when his second wife suddenly becomes ill and dies, thereby leaving him free to reunite with Grima.

Zifar's central portion is devoted to a series of lectures on how to rule wisely that Zifar delivers to his sons. Most of the discussion is an elaboration of the meaning and importance of concepts considered significant in the medieval period: humility, meekness,

chastity, charity, temperance, and diligence. In one part, however, Zifar abandons this highly idealistic view and discloses unexpected prejudices: he issues a very stern warning about the disastrous consequences of accepting advice from Jews.

The final section of the romance is dedicated to Roboán, who leaves Mentón in search of his own set of adventures. Shortly after beginning the journey he meets Seringa, the woman who will eventually become his wife. At this stage of his career, however, he decides to postpone marriage and to continue his journey. During his expedition he slowly acquires prominence and eventually becomes emperor. Now, as principal ruler of the land, he needs an heir to the throne, a problem that his advisers resolve by recommending matrimony. He returns to visit Seringa, whom he marries, and after the birth of their first child, Roboán and his wife return to Mentón for a reunion with his family.

For many years scholars believed that the three major parts of the romance were almost totally unrelated. The adventures of Roboán were considered to be dissociated from those of his father, and the series of lectures comprising the central, moral section were normally disregarded as insignificant and unrelated to the activities of Zifar and Roboán. In recent years, however, scholars have reversed their position, since strong similarities have been found between the lives of father and son. Furthermore, the topics stressed in Zifar's lectures have been identified as those most elaborated in the two sets of adventures.

One of the most complex and inconclusive topics concerning the *Zifar* is its sources. Investigation has concentrated primarily on three main areas of the romance: the two otherworld episodes, the adventures of Zifar, and the advice Zifar gives to his sons. Studies analyzing the two otherworld adventures have produced the least conclusive results, since sources from both Arabic and Celtic material have been found. In one of these episodes a passing reference to King Arthur led some scholars to suspect that the entire work may have derived from the Arthurian material, but a closer examination revealed few similarities with either the Vulgate or the post-Vulgate cycle.

The adventures of Zifar have revealed similarities with three sources: the eastern and western branches of the legend of St. Eustachius, formerly a Roman general named Placidus; "The Tale of the King Who Lost Kingdom and Wife and Wealth and Allah Restored Them to Him" in the *Thousand and One Nights*; and the French epic *Chanson de Floovant*, which is directly related to the legend of Octavian. Despite the strong parallels that may be drawn between the *Zifar* and all of these works, however, major differences also exist.

The main source of the second section of the romance is far easier to document, although care needs to be taken not to oversimplify an intricate situation. The point of departure for these lectures is almost certainly the Arabic treatise *Flores de filosofía*, but since the *Zifar* author has greatly expanded and rearranged the original, he may also have taken material from other sources. It is also important to point out that the *Flores* is closely related to such other thirteenth- and fourteenth-century didactic works as *Bocados de oro*, *Poridat de las poridades*, *Castigos e documentos del rey don Sancho*, and the *Siete Partidas* of Alfonso X, all of which draw on Semitic originals.

The question of sources is complicated even further when one takes into consideration a statement in the prologue indicating that the work is a translation. This comment is frequently disregarded because authors have been known to make similar assertions even though their work may not have been translated. However, since other Hispanic books produced in the fourteenth century state that they are translated, and historical evidence proves this to be true, many scholars suspect that the *Zifar* may also have been a translation.

If one does accept the possibility that the *Zifar* was translated, the second question to be addressed concerns the meaning of "Chaldean," the original language from which it reportedly was translated. The term normally designates Syriac, a dialect of Aramaic, but some Hispanists have found evidence that leads them to believe that *caldeo* may also have referred to Arabic.

Little is known about the date of the *Zifar*, although most scholars agree that the romance was composed during the first half of the fourteenth century. Since the Jubilee of 1300 is mentioned in the prologue, this year is considered the earliest possible date of composition, although it should be taken into consideration that prologues were normally written after a work had been finished. We also may confirm that the work was terminated by 27 October 1361, for on this day Pedro IV of Aragón wrote a letter in which he requests a copy of the *Siffar*. Within these broad limits, however, opinion varies, and definitive conclusions have yet to be reached.

The question of authorship is also complex, especially if the work is a translation, for we do not know the role of the person or the people who had a part in translating, copying, expanding, or editing the material. Whatever the process might have been, however, we may affirm that the author of the first Spanish version is unknown, although some attempts have been made to attribute the romance to Archdeacon Ferrand Martínez. This idea was first suggested by Menéndez y Pelayo, and it has been supported primarily on the

basis that the archdeacon is mentioned in the prologue, that he lived during the first years of the fourteenth century, and that he had the preparation and knowledge necessary to compose the work. Although some Hispanists continue to favor this theory, most now agree that the evidence available at this time is still inconclusive.

LIBRO DEL PASSO HONROSO

In the summer of 1434, the Castilian knight Suero de Quiñones, together with nine other friends, celebrated a pass of arms on the Órbigo River bridge near Astorga (León), on the pilgrimage road to Santiago de Compostela.

From 12 July until 9 August the ten defenders and the sixty-three challengers broke a total of 180 lances, considerably less than the 300 that had been agreed in the chapters publicized in the various courts of the Iberian Peninsula and elsewhere in Europe.

A detailed account of the events at the bridge by Pero Rodríguez de Lena is preserved in the El Escorial Library (Ms. f.II.19); two partial manuscripts are in the Biblioteca Menéndez Pelayo, (Ms. 75) and the Real Academia de la Historia, Madrid (Ms. B-104); and there is an abbreviated version by Juan de Pineda (Salamanca, 1558), that contains material not found in the Escorial manuscript or either of the two partial manuscripts.

The events of July and August 1434 had implications beyond the purely anecdotal: a knight who wants to free himself of a vow, or a number of knights engaged in re-creating literary interpretations of a bygone chivalric age. Riquer has proven convincingly that the *Passo honroso* was the answer of Álvaro de Luna and members of his house to the *Passo de la fuerte ventura*,

organized by Enrique of Aragón, which had surpassed a previous pass of arms organized by Álvaro de Luna. The clear interest of some Aragónese challengers in tarnishing Suero's pass—the letters exchanged between them and the Castilians, and the fact that there were several scribes present, one of them Juan de Mena, with the explicit purpose of keeping King Juan II informed of the daily events—clearly indicates that the *Passo honroso* was part, albeit a small one, of the political intrigues of the fifteenth century.

LINGUISTIC STANDARDIZATION

Linguistic standardization is an artificial phenomenon; languages only acquire "standards" if there has been a conscious decision as to which forms belong to the canon. In their natural state languages have stylistic, sociolinguistic, and geographical variation. Standardization is usually part of a wider process of the establishment of literacy. Standard written Latin in the early Middle Ages, in the Iberian Peninsula as elsewhere, was based on the *Ars Minor* (fourth century A.D.) of Aelius Donatus and his commentators. All grammars of the age focused on writing, and took the form of a limitation of the linguistic options found in speech. These *artes* concentrated especially on correct written morphology, which apparently came to be thought of as a branch of orthography as much as of syntax; Romance speakers were taught and expected to write their own language by following standard spellings plus the rules of Donatus concerning word endings.

In Muslim Spain this system never changed, although from the late ninth century the many Arabic-Romance bilinguals seem to have confined their literacy to Arabic, already essentially standardized. In the north, however, polishing texts to conform to Donatus became increasingly arduous; in the *Chronica* said to be by Alfonso III, for example, surviving versions attest to differing stages of the polishing process, but the lawyers who drew up bills of sale and other practical documents had less leisure. Yet their nonstandard morphosyntax and orthography is not merely whimsical; we see occasional glimpses of pragmatic accommodations according to less rigid standards (in the tenth and early eleventh centuries), wherein vernacular noun and

verb morphology is accepted in writing, and several orthographic approximations, both logographically for whole words and morphemes and phonographically for sounds, seem to have been taught and learned. These documents are not easy to study; Menéndez Pidal's pioneering analysis implied in many cases that the scribes operated a phonetic script, but the existence of partial alternative localized unofficial standards seems more plausible.

The problems came to a head in ninth-century France, where scholars established for the first time a standard spoken form in church contexts, based not only on the ancient morphosyntax prescribed by Donatus but also on the artificial spelling-pronunciation techniques already used as standard by Germanic speakers, where every written letter had a specified sound (as we still read Latin today). Thus for the first time written texts became generally unintelligible when read aloud. This system, reinforced by newly fashionable respect for Priscian's *Institutionis grammaticae*, led to an otherwise unnecessary conceptual break between Latin and Romance, eventually seen (in educated circles) as being two different languages. This gave rise to a need for a separate written standard for any text desired to be read aloud intelligibly to a nonclerical audience; in this, spoken morphosyntax could be allied to an orthography that used the letter-sound correspondences of the new Latin pronunciation in reverse to produce new standard spellings different from the Latin forms of the same words. Even in orthography, however, this "Old French" standardization was never as rigid as that of Latin. The new medieval Latin standard came to Catalonia in the late ninth century, but to the rest of the Iberian Peninsula only in the Twelfth-century Renaissance, when many French and French-trained scholars worked there. There then arose similar consequential needs for vernacular standards.

Techniques using roughly the same principles as in France were elaborated experimentally (as we see first now in the famous eleventh-century Riojan glosses). Different scribal centers experimented along different lines; Vairão, in Portugal, for example, seems to have had its own enterprising ideas. In due course, different political units tended to want different new standards as symbols of their own separately affirmed identities (as in the modern Spanish *autonomías*). Thus the Catalans chose to standardize a separate written system only after, and perhaps as an indirect consequence of, the battle of Muret (1213), whereas Catalan speakers had previously followed the Provençal standard. In both León and Castile the first important document written in Romance is the Treaty of Cabreros (1206). Some details suggest that already the chanceries had standardized the written forms of several words

and morphemes, often differently in the two kingdoms, but the scribes had difficulty in abandoning entirely their old "correct" instincts. The conceptual splitting of Romance into separate standard languages was thus a direct consequence of the Latin-Romance split, both processes unnecessary in the previous increasingly logographic culture but precipitated (in Romance Europe) by the heightened consciousness of the grapheme-phoneme anisomorphism and a perceived need for new local standardizations.

Later in the thirteenth century, the Castilian court worked out a kingdom-wide norm for many features of written Castilian, as used in the later Alfonsine chronicles, probably based on a selection of features from different areas (as in modern standard written Galego) rather than choosing one complete local linguistic system to be the general standard (as in modern standard written Basque). There seems to have been no general medieval Aragónese standard at all; Basque, being still unwritten, did not need one. The creators of standard written Portuguese deliberately accentuated its individuality by choosing some southern French rather than Castilian and Galician sound-letter correspondences (*nh* and *ñ* represent the same sound, for example), with the same "*diferencialismo*" that characterizes those modern *autonomías* that spell [k] with *k*. The Romance standardizations are thus both symptoms and catalysts of nationalism, of a decrease in international cultural relations, and an increase in internal social divisions, so it was as well that there was no rigid or dogmatic standardization of Castilian language (or even texts) before the founding of the Real Academia (1713). Even then it hardly affected speech at all; medieval standardization only really affected Latin (and Arabic), a fact that largely caused the general but erroneous view that vernaculars had no grammar.

LISBON, CITY

Capital of Portugal. Lisbon was already an important trading center for Africa and a large part of Europe before Afonso Henriques, king of the Portuguese, captured it from the Moors in 1147. He did not have the

resources or the men to assault it, but when a fleet carrying an expeditionary force of the Second Crusade put in at Oporto, the bishop of the city negotiated with the crusaders for their participation in the king's plan to take Lisbon. They agreed and sailed up the Tagus River on 28 June 1147. The siege, a joint operation that involved Portuguese, Flemings, Germans, Normans, and English lasted seventeen weeks. Weakened by war, hunger, and pestilence, the Moors surrendered after putting up a ferocious resistance.

In Christian hands, Lisbon became no less a coveted prey for marauders and invaders in view of its wealth and geographical position. Portuguese kings were eager to develop Lisbon as a maritime and commercial center. Afonso III (r. 1248–1279) made Lisbon the capital of the kingdom. He promoted a large market of stall-holders, renting booths that rendered good profits to the crown. Lisbon grew in prosperity and soon its merchants were trading with the main ports of Europe. King Fernando (1367–1383), after successive and unsuccessful sieges of the city by the Castilians, had its walls rebuilt between 1373 and 1376. It was behind these walls that the people of Lisbon fought off a nine-month Castilian siege in 1384. With the voyages of discovery, Lisbon became an international emporium, being one of the most beautiful cities in Europe.

LISBON, CONQUEST OF

Afonso Henriques, king of Portugal, accompanied by a large force of crusaders recruited by St. Bernard for the Second Crusade, took the city after a lengthy siege on 24 October 1147. The feat is described by a crusader known only as R. in a letter to Osbert of Bawdsey, *De Expugnatione Lyxbonensi*.

Lisbon had formed part of the Berber state of Badajoz, whose ruler had offered it to Alfonso VI of León in return for protection from the Almoravids, who, however, seized Badajoz. Alfonso could not hold Lisbon: Santarém and the Tagus River valley were also lost to the Christians in 1111. On becoming king, Alfonso Henriques made a first unsuccessful attempt to

conquer Lisbon in 1142–1143. In March 1147 he took Santarém by a surprise attack. St. Bernard had launched the Second Crusade, for which men from England, the Low Countries, and southern Germany gathered at Dartmouth in 164 ships. On their putting in at Oporto, Bishop John Peculiar persuaded them to join Afonso before Lisbon, which held out unrelieved for nearly four months. The crusaders went on to Palestine in the spring, but some remained to settle, and an English priest, Gilbert of Hastings, became bishop of the new see. R.'s letter shows the part played by Herve de Glanvill, constable for the East Anglian contingent, in this.

The feat assured the continuity of the Portuguese monarchy, greatly increased the authority of Afonso Henriques, and almost doubled the territory of Portugal, which until then consisted of the old county and that of Coimbra, annexed in 1064. It provided Portugal with the physical base for the fourteenth-century enterprise of the voyages of discovery. The taking of Lisbon was followed at once by the annexation of Sintra and Palmela. R.'s letter survives in the unique copy at Corpus Christi College, Cambridge, and was first edited by Herculano in *Portugaliae Monumenta Historica* (1861).

LITERACY

Western Christendom has been literate, in the sense of depending upon written records for the essential transactions of its civil and religious life, without interruption since Roman times. But in the Middle Ages the dissemination of literacy rested on radically different postulates from those that obtained in antiquity, or in early modern Europe: training and skill in letters (*grammatica*) was the highly specialized professional preserve of a unique social group known as the clergy, whose distinctive function was "scripture"—the guardianship of the written religious law and liturgy. This intimate connection between literacy and scripture was also fundamental to the culture and education of the Jewish and (after 711) Muslim communities of Iberia; what made the Christian case unique was its restriction (probably deriving from primitive Germanic notions of the sacral power of runes and spells, and from a caste system that separated bards from warriors) to a closed community of celibate males who, from early puberty, wore distinctive haircuts and vest-

ments and used a special hieratic language, Latin. Consequently the word *litteratus* itself, and its Romance derivatives *letrado* and *letrado*, meant not “literate” but “Latinate.” Reading was taught exclusively through the medium of Latin, using as a primer (*cartilla*) the *common prayers*, Ten Commandments, and catechism, and the aim was to train clerics to recite aloud the Latin liturgy (*psalterium discere*). At seven, the canonical age of discretion, boys memorized the alphabet with simple phonic exercises and then proceeded directly to reading aloud from the primer (which need not be understood, only accurately recited). Explicit Spanish testimony of this process is given by a vernacular annotation in a fifteenth-century grammar book and glossary (Madrid, BPal MS 1344, fol. 116^v): “*Item nota el orden que has de tener en enseñar a ler; lo primero enséñale la señal de la crux e los X mandamientos en romance . . . ; lo segundo IV oraçiones dominicales Ave Maria, Patemoster, Credo, Salve Regina* vulgarmente [in the vernacular], porque todo fiel christiano siete años pasados es obligado . . . ; lo terçero el ABC, conoçer las letras así vocales como consonantes e juntar e por síllabas deletrear, scilicet *ba be bi bo bu*, e las IV oraçiones sobredichas *en Latino sermone*” (*Item*: Note the order in which you should teach reading; first teach the sign of the cross and the Ten Commandments in Romance; second, the four Sunday prayers, *Ave Maria, Paternoster, Credo, Salve Regina* in the vernacular because every faithful Christian above the age of seven is obliged to know them; third, the ABC, to know the letters and the vowels and consonants and to join and spell by syllables, namely *ba be bi bo bu*.) Training in the skill of writing was a separate process, undertaken later by professional scribes who had to learn not only the Gothic scripts and their complex systems of abbreviation but also the various technicalities of penmanship, ink manufacture, and preparation of manuscript codices. More competent students might proceed to study ecclesiastical Latin grammar and composition, but this remained a subsidiary requirement; throughout the Middle Ages the proof of literacy that conferred benefit of clergy (exemption from secular legal jurisdiction) remained, not the ability to construe the Sacred Page, but the ability to read out a Latin passage (in England the “neck-versel,” Ps. 51:1; in Spain more often the Creed or Paternoster). The history of medieval literacy therefore concerns the processes that loosened the clergy’s stranglehold on literate skills, and then opened reading and writing to lay society in general. Among these processes two stand out: the rise of vernacular literature, and the growing prestige and professionalism of lawyers and bureaucrats.

Early Middle Ages (to 1080)

Visigothic Spain in the age of Isidore (bishop of Seville, 602–636) had the most sophisticated literary culture in the Latin West. Clerical monopolization of literacy, however, had taken place; the teaching of reading was entirely in the hands of the church and the aristocracy were, in our modern sense, illiterate. It is clear from the abundant liturgical texts of this period, and from Isidore’s own voluminous lexicographical works, that the vulgar Latin spoken by the Goths (who were Romanized before they conquered the Iberian Peninsula in 589) had evolved many Romance features not reflected in orthography; writing and reading were moving inexorably away from the spoken language, although it is doubtful whether even Isidore was yet aware of the conceptual distinction. After the Muslim conquest in 711, this separation advanced further: the daily languages of Christians were Arabic and Mozarabic Romance, while formal Latin remained as a liturgical *Schriftsprache*, preserved (along with the Visigothic rite and script) with fervid but inefficacious zeal by the clergy. Even in the most accomplished literary circle of this period, which the caliphs tolerated to gather round Eulogius in ninth-century Córdoba, Paulus Alvarus complained that his Christian flock were better versed in Arabic poetry and rhetoric than in Latin letters (*Indiculus luminosus*, c. 850). In the Christian petty kingdoms of Asturias, León, Navarre, and the Frankish March, literacy was confined to the monasteries, where the influence of French Benedictinism produced flourishing schools, first in Catalonia (at Ripoll, ninth–tenth centuries), and then in La Rioja (in the abbeys of Albelda and San Millán de la Cogolla, late tenth century). An important development occurred when monastic manuscripts began to be furnished with interlinear Romance glosses, marking a recognition of the distinction between “literate” and spoken forms; the most celebrated example, a ninth-century sermonary from San Millán de la Cogolla, includes among its glosses (inserted around 1020–1045) a transcription of the doxology commonly cited as the first extant example of Spanish prose: “Cono ajutorio de nuestro dueno, dueno Christo, dueno Salbatore, qual dueno get ena honore e qual duenno tienet ela mandatione cono Patre cono Spiritu Sancto enos sieculos de losieculos, facanos Deus omnipotes tal serbitio fere ke denante ela sua face guadoso segamus, Amen” (With help from our lord, lord Christ, lord Savior, Who is honored and shares dominion with the Father and the Holy Ghost for ever and ever, give us omnipotent God the gift that we may be before your face and share joy among us.) (Madrid, RAH Ms. 60, fol. 72). Glosses such as *ibi: obe* or *sicitates: seketates, saltare: sotare*

(the latter from an eleventh-century manuscript from Santo Domingo de Silos, London BL Add. 25,600) show that their purpose was not to help monkish readers construe the text, but to facilitate oral delivery for the benefit of the laity. The other significant development in these northern kingdoms occurred, however, not in the monastic *scholae* but in the field of civil law, where the remarkable preservation of the Visigothic *Forum iudicum* (the basis of judicial process down to the thirteenth century), brought literacy into everyday life; for although lawsuits were still conducted by the Germanic procedures of oral testimony, oath-helping, and ordeal, the *Forum* attached fundamental importance to written title, records, and codified enactments. Everyday disputes thus generated a copious documentation of charters, formally subscribed to by witnesses; the instruments themselves were redacted by professional notaries, and although we have no evidence of how these men were taught, their orthography and language, heavily Romance in phonology, phrasing, and vocabulary, was clearly designed, despite its Latin formulae, to be intelligible when read aloud to the litigants—evidence of a training in functional literacy quite distinct from the clerical literacy of the monasteries.

Central Middle Ages (1080–1300)

At the Council of Burgos (1080), King Alfonso VI of Castile abolished the Visigothic liturgy in favor of the Roman (similar measures had been taken in Aragón in 1474 and Navarre in 1076). According to the chronicles the king also banned Visigothic script (*Toletana littera*, supposedly invented by Ulfilas) and enjoined the use of Carolingian minuscule (*Gallica littera*, from which modern roman scripts are derived). Although the definitive abandonment of the Visigothic heritage took time (so that a Leonese charter as late as 1155 might be written in Visigothic script with a conversion table of Carolingian letter-forms at the foot, and the recopying of San Millán de la Cogolla's Visigothic manuscripts into the new script did not take place until around 1200), 1080 marked a watershed in the history of Iberian literacy. The direct effect was to provoke a reform of Latinity in favor of more classical orthography and accidence; the indirect consequence was to clarify the conceptual distinction between this reformed ecclesiastical Latin and the Romance of everyday speech. Before long, therefore, we find texts consciously transcribed in the vernacular. In Catalonia *Homilies d'Organyà* and a version of *Forum iudicum* (both twelfth century) and in Navarre *Fueros of Novenera* (c. 1170) and *Corónicas navarras* (co. 1206), show that scribes turned to Provençal for inspiration in

adapting orthography and script to the vernacular; the first datable documents in undisguised Portuguese are the charters of Vairão (1192) and Galician-Portuguese *cancioneiro* lyrics were perhaps written down as early as the reign of Sancho I (1185–1211). In Castile the decade around 1200 marks the full recognition of the written vernacular not only by the crown (Treaty of Cabreros, 1206), but also in literature (*Auto de los reyes magos*, *Cantar de Mio Cid*, *Libro de Alexandre*, followed in 1220–1245 by the works of Gonzalo de Berceo). The chief motor for the spread of vernacular writing was the official adoption of the national languages by royal chanceries, a process that reached its culmination in the reigns of Alfonso X of Castile and Jaime I of Aragón; the Castilian and Catalan orthographies designed at this period have lasted, with only superficial changes, to modern times. By 1300, therefore, while the clergy still retained their monopoly on Latin literacy (now highly technical, and taught not in monastic or episcopal schools but in the new universities), there had grown up a parallel group of court bureaucrats who were no less skilled, trained in Roman as well as foral law, but whose literacy was firmly vernacular.

The Late Middle Ages, 1300–1450

The inevitable next stage was the spread of literacy skills among the amateur laity. Non-professional literacy, however, could mean anything from the mere ability to spell one's name to deep book-learning, with wide discrepancies in distribution between regions, classes, town, and country. In the fourteenth century the normal method of diffusion remained oral, by social reading: The *Libro de buen amor*, for example, contains frequent addresses to an audience that included *dueñas*, and there are abundant testimonies reaching the fifteenth century of texts being read aloud to groups of nobles (as Cervantes was later to portray the romances of chivalry being read to harvesters in the *posadas* of La Mancha). Likewise, when a non-professional engaged in literary composition he dictated the text to professional amanuenses, as the Infante Juan Manuel, for example, states at the end of each *exemplum* in his *Libro del conde Lucanor*—although autograph documents show that he himself could write. But as increasing prosperity, leisure, and new forms of privacy in the architecture of private houses provided the conditions for lay study, these oral substitutes for reading and writing began slowly to co-exist, for the first time since antiquity, with the novel practice of private (silent) reading. By 1440 inventories of private libraries, evidence of lay patronage and authorship, and a large increase in the range of works

available in the vernacular, as well the growing number of manuscript copies, indicate the rise of what we may properly call a lay reading public. Literacy, even in theory, was no longer thought of as the preserve of the *clerici*; a Jewish writer, R. Moshe Arragel of Guadalajara, noted in the 1430s that “la sciencia e lengua latina” was so widespread that even “cavalleros e escuderos e çibdadanos han dexado el puro castellano e con ello han mixto mucho latino” (*Biblia de Alba*, Prólogo, V), while the Salamanca-trained canonist and bishop of Burgos Alfonso de Cartagena, in a Latin epistle to the count of Haro around 1441, enthusiastically argued for the desirability of noblemen learning “the language of literacy which we call grammatical [that is, Latin] speech” (*idioma litterale quod grammatice locutionem uocamus*—Haro himself, he informs us, learned Latin in a school at the court of John II). Cartagena mentioned as a matter of course that most knights possessed “an abundant store of books”; his only concern was that their “unbridled passion for reading [made them] rush to read and hear any book, without discrimination of subject-matter.” Cartagena’s solution was to propose a discreet form of censorship; growing ecclesiastical opposition to lay literacy was to become a feature of the age, beginning in 1434 with the cause célèbre of the burning of the *libros vedados* (chiefly of Arabic science and supposed “black arts”) in the private library of the most learned man in Castile, the nobleman Enrique de Villena, and culminating in attempts to suppress the vernacular versions of the Scriptures that had hitherto flourished in Iberia (despite the ban on Bibles in *Romancio* imposed by the Fourth Lateran Council, 1215). But this belated clerical backlash in defense of their monopoly of literacy was swept away by the last development in medieval literacy, the invention of the serially printed book. The first native Iberian presses date from the early 1470s, and they issued nearly a thousand incunable editions, almost all in the vernaculars and frequently in runs of four hundred or more copies. By 1500 the archival evidence from wills of book ownership and the statistics of the book trade show that literacy (defined simply as the ability to read and write) was general among the upper aristocracy and urban patriciate (men and women), common in the merchant classes of large cities, by no means unknown among humble artisans, and even occasionally found among rural hidalgos and parish priests. This gradual permeation of society by book-culture through printing meant the end of the medieval clerical monopoly. Iberia, like the rest of preindustrial Europe, reached by 1520 the overall rate of literacy (perhaps 30 to 40 percent) that was to obtain, more or less unchanged, until the educational revolution of the industrial nineteenth century.

LITERARY THEORY AND POETICS

In the romance vernaculars of Iberia, the composition of poetic treatises began around 1200 with the desire to codify and transmit the literary practices of the earlier Occitan troubadours for the benefit of courtiers in the kingdom of Aragón. Of the first group of six treatises, the three most significant are Raimon Vidal’s *Razos de trobar* (c. 1200) Jofre de Foixà’s *Regles de trobar* (c. 1286–1291), and Berenguer d’Anoya’s *Mirall de trobar* (early fourteenth century). Though they differed in scope and emphasis, taken together these treatises offered grammatical instruction in Occitan (which was the poetic language of Aragón until the later Middle Ages), and explained the form and function of the most authoritative fixed verse forms, illustrated by examples from classical troubadours. There are also scattered remarks on the nature of poetry itself; for example, both Vidal and Foixà claim the universality of poetry as a defining human activity (an idea that would resurface in Santillana’s writings, see below). However, the primary theoretical underpinning of these treatises is that poetry is a rhetorical display of courtliness.

Similar concerns are a feature of the fourteenth-century treatises, associated with the “Poetic consistories” of Toulouse (1323 onward), Lérida ([Lleida], 1338) and Barcelona (1394 onward). These consistories were competitive assemblies designed to conserve and regulate the traditions of Occitan troubadour verse within an orthodox moral and religious framework. The need to award prizes objectively generated poetic treatises that defined linguistic and metrical standards. The largest, and most popular, of these was Guilhem Molinier’s vast grammatical *Leys d’amors*, which exists in three redactions (1328–1355), and among texts were a rhyming dictionary by Jacme March (1371), and the *Torcimany* (*The Interpreter*) by Lluís d’Averçó (c. 1400), which, drawing on Molinier’s *Leys* and Johan de Castelnou’s *Compendi*, combines grammatical and metrical instruction with a rhyme dictionary.

Sponsored by the Aragónese monarchs Pedro the Ceremonious, Juan I, and Martín the Humane, the Catalan consistories enabled the urban oligarchies to acquire the pedigree of courtliness offered by what was called “la gaya sciència de trobar” (the delightful science of poetry).

The social premises of this “gay science” were definitely passed down to fifteenth-century Castile through the ideas of Enrique de Villena and Juan Alfonso de Baena (see below), but it is possible that the ideals of the Catalan-Occitan school may have been popularized earlier in the fourteenth by the Castilian magnate Juan Manuel, who had close contacts with the kingdom of Aragón. Among his numerous treatises on the education, pastimes, and social duties of the nobility, is a lost *ars poetica*, the *Libro de las reglas de cómo se debe trobar*. However, in the early fourteenth century Castilians were also familiar with lyric written in Galician-Portuguese. And for this school, we possess a two-hundred-line fragment of an *Arte de trovar* (ca. 1340) copied out at the start of the *Cancioneiro da Biblioteca Nacional*. Its six sections are irregularly subdivided, and the extant fragment deals primarily with poetic forms, versification, rhyme and the consistent use of tenses (an instance of the author’s interest in the proper harmony between the parts of a poem). As far as one can tell, this treatise, like Raimon Vidal’s *Razos de trobar*, was conceived as a practical guide in poetic taste and composition, although no poetic examples are cited. Its survey of accepted aesthetic practice generally refrains from the technical grammatical explanations of the contemporary *Leys d’amors*, except for the two most common errors, hiatus and *caçafaton* (lexical vulgarity).

In Castilian, the first significant work is the *Cancionero* compiled around 1430 by Juan Alfonso de Baena. This anthology contains numerous debates over the nature of *la gaya ciencia* (the term betrays a debt to the Catalan tradition), in particular over divine inspiration, the relationship between natural talent and craftsmanship, wit and decorum. These debates, between such poets as Alfonso Álvarez de Villasandino and Ferrán Manuel de Lando, are symptoms of the changing status and intellectual range of poetry within an expanding and increasingly literate courtier caste. Their social and esthetic ideals also figure in Baena’s critical rubrics, as well as in his two prose prefaces, which are not only the first of several literary-theoretical prologues in fifteenth-century Castile, but also the first critical introduction to any European verse anthology. Acting as arbiter of literary taste for the court of Juan II, Baena offers a defense of letters (mostly cribbed from Alfonso X), and consolidates the status of poetry as a noble court pastime, of intellectual and

therapeutic significance. The prologue ends with a sketch of the ideal poet, who, among other virtues, is divinely inspired, widely read and travelled, eloquent and witty, and, above all, a lover, because love is the source of all worthy doctrine.

More ambitious are the claims made in Enrique de Villena’s *Arte de trovar* (1433), which survives only in excerpts made by the sixteenth-century humanist Alvar Gómez de Castro. Most of the extant text was probably extracted from the original work’s prologue, which describes Villena’s role in the Barcelona Poetic Consistory and surveys earlier poetic treatises such as those by Raimon Vidal, Jofre de Foixà, Berenguer de Noya, and Guilhem Molinier. Although what survives of the treatise itself deals with orthography, punctuation, and euphony, overall the work is infused with the civic concerns of the Catalan school, though perhaps also modulated by Italian civic humanism: as the effective communication of thought, poetry benefits “la vida civil,” and enables the intellectual elite to stand out from the ranks of the “ediotas” and to take a leading role in society. Villena argues that poetry should possess the dignity of a *scientia*, a fully fledged branch of knowledge, with its immutable and divinely ordained laws, and that by the process of *translatio studii*, this poetic knowledge has now passed to the new poetic language of Castilian. This concern to ennoble poetry, and to set it within a historical framework, was inherited by the dedicatee of the treatise, the marqués de Santillana, Íñigo López de Mendoza.

Santillana epitomized the union of arms and letters, which was a central ideal of early modern vernacular humanism. Although several prologues and epistles bear witness to his interest in literary theory and history, the most significant is his *Proemio e carta al condestable don Pedro de Portugal* (1445–1449). On a theoretical level, this treatise is notable less for the originality of its ideas than for its impressive cultural framework, conceptual scope, and rhetorical elegance. Many issues—formal, philosophical, and historical—are addressed in the course of the prologue: in essence, however, Santillana claims that poetry combines allegory, metrical and rhetorical perfection, and music in a creative act that is characteristically human, and is mankind’s mark of divine favor. Santillana’s sources include Boccaccio, Isidore, Dante commentaries, and, indirectly Horace and Cicero: but by and large his ideas stem from the common stock of medieval and early renaissance poetic and rhetorical theory. It is Santillana’s historical survey of poetry, however, that sets this prologue apart from its European counterparts. Drawing on the ample resources of his own library, Santillana traces the history of poetry from its biblical origins, through classical antiquity, Italy,

France, and the various schools of the Iberian Peninsula. This eulogy of poetry, with its striking historical emphasis, is part of a large and complex cultural shift: as modern Castilian poets strove to emulate the classical *auctores*, to confer dignity upon vernacular letters, and to justify them as an essential ingredient of true nobility, they laid the basis for modern notions of "literature."

This trend is also apparent in the widespread application to vernacular texts of the academic terminology of the *accessus ad auctores* (a formalized scholastic prologue used in grammatical study), and in the popularity of commentaries and glosses attached to translations of the classics, Dante, and to contemporary Castilian texts. Villena's commentary to his translation of the *Aeneid* (which contains a fervent defense of allegorical poetry as a central component in the education of an aristocratic elite), Juan de Mena's self-exegesis of his *Coronación*, Santillana's own historical glosses to his *Proverbios*, and Alfonso de Madrigal's commentary on Eusebius are among the major examples before the close of the fifteenth century.

Although there are other instances of literary theorizing and poetics (e.g., a rhyming dictionary in the Occitan-Catalan tradition, *La gaya sciencia*, by Pero Guillén de Segovia [1475], a lost poetics attributed to Juan de Mena, and a treatise on the reading matter appropriate for the noble layman, Alonso de Cartagena's Latin epistle to the count of Haro, ca. 1440), the remaining works of significance were the product of the humanist movement of the final decade of the century.

Antonio de Nebrija not only wrote commentaries on the Christian poets Sedulius, Prudentius, and Persius, but also included a brief metrical treatise within his famous *Gramática de la lengua castellana* (1492). Nebrija examines the principles of Castilian meter, surveys the most authoritative rhyme forms, defines the function of the stanza, and illustrates his points with examples drawn from modern authorities, principally Juan de Mena (for whose "vulgar latinity" he reserves some withering criticism). Although Nebrija expresses reservations about the *mendacia poetarum*, compares Castilian practice negatively with the classical quantitative system, and castigates his contemporaries for being overly fond of rhyme (in this he anticipates the esthetic prejudices of the Renaissance poets Garcilaso and Boscán), his treatment nonetheless acknowledges the elevated cultural status that vernacular poetry had acquired over the previous half century.

Prefixed as a prologue to the first printed edition of his work (1496), Juan del Encina's *Arte de poesía castellana* is made up of nine chapters, divided more or less equally between a eulogy of poetry (especially

Castilian verse), and a prescriptive treatment of various aspects of composition. Although many of Encina's ideas (e.g., about the biblical origins of verse, or the philosophical poet) had been anticipated by Santillana, he draws directly upon the newly accessible Renaissance authorities Horace and Cicero. Like his mentor Nebrija, Encina was motivated by an incipient Castilian cultural nationalism as well as by the desire for self-publicity (as examples of fine verse, he quotes not only Mena but also himself). Unlike Nebrija, Encina—who was after all a musician as well as a poet—displays a keen sense of the semantic possibilities and the musicality of Castilian meter and rhyme.

The gradual elevation in cultural status of vernacular poetry culminated in the publication, in 1499, of the first critical edition of Juan de Mena's *Laberinto de Fortuna*, compiled by the classical scholar Hernán Núñez de Toledo. Núñez endowed the poem with a long and erudite commentary, which he revised in a second edition (1505) that was to become a sixteenth-century "best-seller," and which consolidated Mena as a modern Spanish classic. The edition and commentary is a prime example of early modern textual criticism in its attempt to "purge" the text (sometimes rather arbitrarily by modern standards) of the errors of scribes and compositors. Although there is little evaluative commentary upon the poem, Núñez consistently praises the work's eloquence, all-embracing wisdom, abundant aphorisms, and wealth of myths and legends, all of which demonstrated the educational value of poetry (which elsewhere he claims on the authority of the Greek geographer Strabo). Apart from his handling of a complex structure, Mena is also praised for the power of his similes and his ability to represent a scene with poetic force (what classical and renaissance theorists called *energeia*). Núñez also undertakes an exhaustive study of Mena's sources (Lucan, Ovid, Virgil), historical references, and vocabulary; and his glosses have been mercilessly plundered by modern scholars. He cannot display unqualified admiration for Mena, however; as a professional humanist, he scorns Mena's reliance on corrupt manuscripts and discredited authorities (e.g., pseudo-Anselm), which led to the poem's various factual blunders in cosmological and other matters. In short, the edition and commentary are a celebration not only of a national classic, but also of a new philological approach to the vernacular that, albeit in different modes, survives to this day.

LITERATURE, ARABIC

Even before Islam was born in the sixth century of our era, the Arabs had a deeply rooted, well-developed, and powerful poetic tradition that had produced masterpieces in the form of monorhyme odes with a limited number of quantitative meters, embodying mainly the ethos of desert life. The Islamic dogma that then made Arabic the only true language of revelation and deemed the eloquence of the Qur'ān to be the prophet Muḥammad's sole authenticating miracle further strengthened the hold of the inherited corpus of poetry, pagan though it was, as an embodiment of the purest form of the language.

The creation of a vast empire incorporating diverse lands, inhabited by races that were heirs to different cultures, soon generated ways of life far removed from that of the desert. Inevitably, modes of expression changed, but not as radically as they might have done with a different tradition. The old poetry remained normative for many centuries, conventional forms and motifs holding pride of place. The most obvious modification was a growing taste for verbal ornaments, chief among which were the paronomasia and the double entendre, but with the addition of ever more ingenious devices to which the phonemes of Arabic and even its script can lend themselves.

Local and everyday concerns, however, appear to have found an outlet in regional folk literatures; but if only because these were couched in colloquial forms of the language regarded as corruptions, they have been largely ignored if not despised by the scholars. They are, therefore, almost entirely undocumented, their early existence attested only by casual, and often derogatory, references. Only exceptionally have some features of them passed into the canon, usually when a learned writer deigned to recast them in the idiom of the "high" literature.

Al-Andalus—as Arabs and Arabists call those parts of Iberia that came under Muslim sway—is of absorbing interest in this context. It was geographically remote from the Islamic heartlands, and politically separate. Among the so-called Moors of Spain, only a small minority was of Arab stock. Far more significantly—for many of the giants of Arabic culture were not ethnically Arab—the region was never thoroughly Islamized or Arabized. For nearly eight centuries, Muslims, Christians, and Jews, speakers of Arabic and of Romance, lived side by side. Converts were not totally estranged from kinsmen who remained attached to the older faith—indeed, calendars were adjusted to enable some Muslim and Christian festivals to coincide. Soldiers of fortune such as El Cid served masters with different religious labels. There were mixed marriages between princely families and between itinerant singers alike. Al-Andalus was thus a supreme testing ground both for the homogeneity of the "high" Arabic literature and for the vitality of its folk arts.

That the initial impulse was imported is self-evident. The attachment of the newcomers to their roots is well exemplified by the founder of the first independent dynasty in Córdoba, a scion of the dispossessed Umayyads of Damascus, who retained a lifelong nostalgia for his Syrian home. Andalusians took to heart the Prophet's injunction to travel far and wide in search of knowledge, and willingly sat at the feet of masters in the heartlands. Conversely, scholarly émigrés from the east were welcome in al-Andalus. Such was the musician Ziryāb (d. 852) who not only trained singing girls but seems also to have been accepted as an arbiter of good manners. Such also was Abū Alī al-Kālī (d. 867), whose comments—mainly philological, but often implying literary judgments—were collected under the appropriate title of *Amālī* (*Dictations*).

Eventually—and not least after the breakdown of central authority had resulted in a multiplicity of city-states whose courts vied with one another in the patronage of men of letters—al-Andalus produced its own masters of the monorhyme ode, ranging from Ibn Hānī (d. 973) with his grandiloquent panegyrics and celebrations of the great events of his day, to Ibn Zamrak (1333–1393), whose verses in praise of his princely patrons are inscribed on the walls of the Alhambra much as royal portraits are hung in European palaces.

Understandably, specialists in this field have dwelled on what is distinctive of Andalusian poetry, and especially on features of Arabic literature that bring it close to European practice and taste. Much has been made of the Andalusians' delight in the beauties of a bountiful and sympathetic nature. And indeed, descriptions of flowers and of gardens abound, notably in the poetry of Ibn Khafāja (1050–1139), and the

compiler of one of our main sources for the study of this literature, the North African Al-Maqqarī (1591/2–1632), observed that in their love poems the Andalusians “fashioned cheeks out of roses, eyes out of narcissi, ears out of lilies, breasts out of quinces, waists out of sugar cane, lips out of almond kernels or apple dimples, and saliva out of the daughter of the vine.”¹ Some have also stressed the tenderness of an Ibn Zaydūn (1003–1070), a midness of disposition and an attitude to women that Pèrès² is tempted to characterize as Christian, perhaps even a greater consistency in imagery than is found in the East. Yet these are, at most, differences of degree. The poetry of the heartlands, not least that of the immensely talented al-Mutanabbī never ceased to be admired and imitated in al-Andalus, the eminence of several of its poets being marked by dubbing each of them “the Mutanabbī of the West.”

It is in the creation of two radically new verse forms that Andalusian originality is unquestionable. These are the *muwashshaha* and the *zajal*.

A *muwashshaha* consists of a number of strophes, usually five, with an intricate pattern of rhymes maintained in each, but also with a binding rhyme that may be established in an opening Arabic literature couplet and may then be used as a refrain, but will also be echoed at the close of each strophe, so that a common arrangement (capable of further elaboration) may be schematized as:

AA bcbcbcAA(AA) dededeAA(AA)

Of particular importance is the final couplet known as the *Kharja*³ which may be borrowed from another composition and may be in a mixture of the local vernacular and of Romance, in which case it usually takes the form of a provocative statement made by a woman.⁴

Most of the *muwashshahs* that have come down to us conform with classical Arabic meters, but the testimony of Ibn Sanā' al-Mulk (ca.1155–1211), who wrote the first treatise on the subject is that by far the larger number known to him did not. This indicates that the scholarly compilers filtered out compositions that they found difficult to reconcile with the norms they had inherited, yet the multiplicity of rhymes was not only in itself a striking departure from poetic tradition; it also made the strophe rather than the line the basic unit of the poem, and lent itself to a lyricism exploited with skill and often with great charm by Andalusians, mainly in love poems, though they also used the new metrical form in panegyrics and in expressions of asceticism. Other subtleties can be detected in the *muwashshaha*. Some at least have a “ring structure” with the pith of the poet’s concern in the central strophe. And a case can be made for considering the bilin-

gual *muwashshah* as a separate subgenre with a stronger feminine element and a somewhat different range of images and characters from those found in the monolingual ones.

The *zajal* is clearly a related genre, for it has a similar strophic structure, though usually with a simpler rhyme scheme. It differs from the *muwashshah* principally in that it is entirely in the colloquial Arabic of the region. It gained distinction at the hands of Ibn Quzmān, known in Spanish as Abenguzmán (d. 1160/1169). Although he himself names a long list of predecessors, to the *zajal*, its late appearance has led to the assumption, especially among Arab writers, that it was an offshoot of the *muwashshah*. Yet there are musical and prosodic indications—mainly that the trend in parallel developments has been toward the elaboration of rhyme schemes, not their simplification—either that the reverse is true or that both branched out of a common stem.⁵ Incomplete though the documentation is, to al-Andalus and its mixed population belongs the distinction of first giving a measure of recognition to an Arabic folk art.

Unlike poetry, fine prose flourished in early Arabia only in the form of oratory. Its tradition grew later, mainly out of the activities of court secretaries, who took pride in the elegance of their correspondence, and who readily adopted the poets’ taste for linguistic purity and rhetorical artifice. Belles-lettres therefore took the form of epistles, of a kind of essay that grew out of such epistles in which, for example, spring and summer flowers were compared, of *analecta* and literary curiosities, the enormous *adab* books that eventually appeared being essentially collections of such short pieces.

Mere storytelling was considered unworthy of serious men of letters, and was left to folk literature. Anonymous tales and legends, some originating as far away as in India, gained currency in al-Andalus; their status and their public may be inferred from the fact that they have sometimes been preserved only in Romance translations. The only narrative genre to secure a foothold within the canon was the *maqāma*, the story of a petty fraud perpetrated by an amiable rogue, with no greater prize in view than a free meal or some meager booty. The folk origin of such anecdotes is patent, but they gained acceptance in the East when Badī' al-Zamān al-Hamadhānī (969–1009) clothed them in the high style of which he was a celebrated master. Within a century, the genre had been brought to a peak of stylistic virtuosity by Al-Harīrī of Basra (1051–1122), who reduced the narrative element to a mere framework within which his antihero reached his ends almost invariably by a dazzling display of verbal acrobatics.

The Andalusians did not lag behind their Eastern models in producing an elegant prose in which rhyme was only one of many rhetorical embellishments, and which almost always was studded with gemlike verses. Several of them are known to have heard the *maqāmas* of Al-Harīrī expounded by the author himself, and the standard commentary on them was written by Al-Sharīshī of Xeres (d. 1222). Of his imitators, the most celebrated was the versatile Lisān al-Dīn ibn al-Khatīb (1313–1374). Yet it seems that it was the style that impressed itself on Andalusians as the supreme feature, for among them many a piece of finely wrought prose was labeled a *maqāma*, even if it contained no narrative element at all.

It follows from the primacy given to such genres that, until modern times, Arabic literature produced only a handful of books of unified conception and sustained invention, and these were due to the creativity of individuals who left no direct line of succession. It is noteworthy that three of the most original of these works saw the light of day in al-Andalus.

The first is the *Risālat al-Tawābi' wa al-Zawābi'*⁶ by the poet Ibn Shuhaid (992–1035). In this—possibly following a lead from one of the *maqāmas* of Al-Hamadhānī—he seized upon the pre-Islamic belief that each poet had a familiar spirit and imagined a series of encounters with such spirits as well as with other genii and even some articulate animals in their realm, more often than not to compare the styles of his predecessors with his own or to discuss issues of literary interest. Although sparked off by a desire to answer some detractors, it works well as a fanciful way of presenting literary criticism.

Even more substantial is a treatise on love by the jurist Ibn Ḥazm (994–1064).⁷ Rooted in Platonic thought and kept in strict conformity with Islamic law, it is also informed by his own experiences and those of individuals well known to him, and it is abundantly illustrated with verses, mostly by himself. It treats the attraction between individuals of opposite sexes or of the same sex with equal delicacy, always extolling spiritual rather than physical union. It also has revealing sidelights on the refinement of high Córdoba society in his day.

Finally, drawing on a folktale and borrowing the names of his characters from some of the writings of Avicenna, Ibn Tufayl (d. 1185) elaborated on both in the remarkably cogent philosophical romance of *Hayy ibn Yaqzan*. In it the hero, whose name means “Alive, son of the Awake,” drifts while yet a child on to an uninhabited island where he is nurtured by a gazelle. There, by the exercise of his human faculties alone, he masters not only the means of survival, but also the principles of natural philosophy, and eventually, by

dint of mystic contemplation not divorced from reason, he comes to a knowledge of God. When he makes contact with the inhabitants of another island who have had the benefit of revelation, he finds himself at one with the thoughtful and subtle Asāl, but less so with the literal-minded Salamān, and not at all with the masses, who are ruled by gross appetites.

The place of Islamic thought, including Ibn Tufayl's, in world culture has been much studied; but the literary crosscurrents generated by the meeting of cultures in al-Andalus are more problematic. On the whole, the “high” literature of Islamic Spain bears witness above all to the homogeneity and persistence of the Arab literary tradition; but that the nonclassical forms grew out of an intimate blending of local and imported elements is both likely and supported by at least fragmentary evidence.

Conversely, classical Arabic was embraced by the Jews of Spain with such enthusiasm and thoroughness that some, like the great Maimonides, wrote their own works in the borrowed language, and translations and imitations of Arabic poems and *maqāmas* loomed large in the Hebrew literature of the thirteenth and fourteenth centuries.

Few Christians, however, were inclined to emulate the Jews, so that once again it is at the popular level that fruitful contacts were made. If Dante needed the stimulation of an Arabic extraterrestrial adventure to inspire his *Divine Comedy*, it came more probably from a popular account of the prophet Muḥammad's ascent to the heavens than from either Al-Ma'arrī in the east or Ibn Shuhaid in al-Andalus.⁹ Similarities in strophic structure and in the stock characters of love poetry suggest at least short-lived Arabic influences on the Provençal troubadours, but the subject requires a mastery of two specialized fields, at which A.R. Nykl made a brave but not altogether convincing attempt.¹⁰ As for the possibility of a direct line of descent from the Andalusian *maqāma* to the Spanish picaresque novel of the sixteenth and seventeenth centuries, it must be deemed less than likely when one considers the lapse of time and the fact that the Muslims of Spain downplayed the narrative character of the genre.

Unfortunately, these issues have too often been approached in a contentious and immoderate spirit,¹¹ as if the acceptance of a literary model were demeaning, whereas cross-fertilization is a process in which admiration passes imperceptibly into imitation, emulation, adaptation, and a new creativity. Of this there is no clearer example than that the very Hebrew poets who closely imitated individual Arabic muwashshaḥs also adapted the form to liturgical uses, which it never had in an Islamic environment. Reaching out for the

best that is known, thought, or practiced anywhere is less a debt than an enrichment.

LITERATURE, BASQUE

Basque literature possesses a series of specific characteristics that complicate any comparison. In the first place, the great periods that make up the history of the major Western literatures do not apply to their Basque counterparts. Secondly, Basque literature has been basically a servant of linguistic necessities. The primary protagonist of this literature has been *Euskara*, or the Basque language. It has been accepted as an axiom that the Basques have no literature, but Basque popular and oral literature is very rich, especially in its poetry.

Although the Basque language was not used for literary purposes in the Middle Ages, it exists in in-

scriptions, sentences, and short texts. The oldest sentences that we know about are called "Glosas Emilianenses" of the tenth century, which are in San Millán de la Cogolla. The most ancient testimonies of popular Basque literature date from the fourteenth century and are evidence of the medieval Basque language.

Poetical texts were kept by the oral tradition and were recorded in writing by some Basque historians (like Garibay, Zaldibia, in the sixteenth and seventeenth centuries). These texts of medieval poetry are fragmentary except for some ballads, including "Song of Berreterretxe," "Ballad of Urtsua," and "Lady of Urruty."

The themes of this epical and familial poetry are of two types and are constantly repeated. On one side are the family wars, bloody fights that destroyed all the Basque country, as much in the north (Agramonteses and Beamonteses) as in the south (Oacinos and Gamboinos), especially in the fifteenth century. Specifically, these poetical themes were related to the death of the chief and the defeat of the enemies. On the other hand there exists the theme of love and familial problems, as typified by the "Song of Berreterretxe." This fifteenth-century song, a poem by an anonymous writer, deals with a murder that shocked and angered the Basque people of Zuberoa. The facts narrated in its fifteen stanzas can be presented in four sections: (1) the indignation and pain of the poet; (2) the arrest of Berreterretxe; (3) the anxious search of Marisantz, his mother; and (4) the horror of the young Berreterretxe's murder at the hands of the soldiers of the count of Lerín.

The rich oral Basque literature—including its *bertsolaria*k, or troubadors; the pastorales; the *chiarivaria*k, or carnivals; ballads, proverbs; and masquerades—is a very unique patrimony of this small nation whose origins still remain unknown.

LITERATURE, CATALAN

The Late Middle Ages produced the best of Catalan literature, which, after a period of decline, underwent a strong renewal during the nineteenth century and flourished again in the twentieth. Medieval Catalan writers were subjects of the Crown of Aragón (Aragón, Catalonia, the Balearic Islands, Valencia), a Spanish kingdom that reached its period of greatest power in

the second half of the thirteenth century. The Crown of Aragón actually existed until 1714, although after the beginning of the sixteenth century it was absorbed by the new kingdom of Spain. Throughout the thirteenth and fourteenth centuries the Aragónese monarchs, although ruling a plurilingual country, showed a clear preference for the Catalan sector of their possessions; Catalan medieval literature is consistently linked to the royal house. Thus, the first significant Catalan literary texts are four chronicles of contemporary events endowed with epic inspiration. Two of them are written in the form of a royal autobiography: the *Llibre dels feits*, narrating the life of King Jaime I the Conqueror (1208–1276), the true founder of Aragón; and the *Crònica* of Pedro III (1336–1386). The latter work is a political tract written by officers of the chancellery and supervised personally by the king; we presume that Jaime I used a similar method. The other two Catalan chronicles were the work of Bernat Desclot and Ramon Muntaner. The first mainly narrated the life of Pedro II the Great (1276–1285), who conquered Sicily and turned back a French invasion. Muntaner compiled a very colorful narrative of events from the reigns of all the monarchs he had personally known (Jaime I, Pedro II, Alfonso II, and Jaime II). The most powerfully original writer of the Catalan Middle Ages was Ramon Llull (1232–1316), who left the king's court in Mallorca to become a Christian apologist and missionary. He wrote more than 260 works in every discipline and literary genre, and he was the first in Europe to use a vernacular language for philosophical subjects. His *Art* is a complex system designed as a weapon of controversy against unbelievers, one that attempts to explain logically the truths of Christian dogma. Llull also wrote didactic novels that describe the contemporary world (*Blaquerna*, *Fèlix o Llibre de Meravelles*), poetry (*Desconhort*, *Plany de la Verge*, *Cant de Ramon*), and other mystical, apologetic, and didactic works (*Llibre de contemplació en Déu*, *Llibre del Gentil e dels tres savis*, *Llibre d'amic e Amat*, *Llibre de santa Maria*, *Arbre de Ciència*). Moreover, Llull wrote Catalan verse for moral purposes at a time when nobody was doing so in the Catalan-speaking regions. Catalan poetry, in fact, was born as a local branch of the troubadour lyric. Guillem de Berguedà and Guillem de Cabestany in the twelfth century and Cerverí de Girona in the thirteenth had strong personalities and produced very good poems, but wrote them in Occitanian. The Occitanian of the troubadours, with a gradual admixing of Catalan, remained the linguistic vehicle of Catalan poets until the emergence of the Valencian Ausiàs March (ca. 1425). The annual poetry competition of Toulouse, the Jocs Florals (begun in 1324), and the poetical treatise *Las leis d'amors*, con-

ceived as a tool for writing verse, had a long success in the Crown of Aragón to the extent that in 1393 King Juan I instituted Jocs Florals in Barcelona. Thus Andreu Febrer, Gilabert de Pròixita, Pere March, Jaume March, Jordi de Sant Jordi, and other minor poets, whose poems are collected in the Catalan *Cançoners*, attempted to follow the troubadours' path. The Occitanian-Catalan hybrid language they used was also the vehicle for anonymous religious poetry (the oldest metrical Catalan text is the vernacular *Planctus Mariae*, in the early thirteenth century), as well as of narrative verse. Borrowing from Occitanian and French literature the idea of the *roman courtois*, Catalan writers produced a certain number of minor fourteenth-century novels in verse, dealing with courtly and allegorical subjects; the best are the anonymous *Fraire de Joi* and *Sor de Plaser* (a literary version of the "Sleeping Beauty" folktale), the *Faula* of Guillem de Torroella (in which King Arthur is located in a sort of earthly paradise) and the also anonymous *Salut d'amor*. In 1460 the Valencian doctor Jaume Roig produced a long misogynous treatise written in quadrisyllabic verse, containing an interesting pseudo-autobiography of the author, *l'Espill* or *El llibre de les dones*, the last narrative poem of the Catalan Middle Ages. The greatest medieval Catalan poet, Ausiàs March, possessed an enormously tortured lyric temperament. He not only wrote in a pure Catalan of Valencia, but also fashioned his own new poetry, both metrically and rhetorically, from the troubadour tradition even though he was in a continuous ideological struggle against it. Ausiàs March died in 1459 and most of the minor poets of the second half of the century modeled their verse on his.

Around 1380, Italian cultural developments began to change the Catalan literary scene. Dante, Petrarch, and Boccaccio were read and admired, and a local tradition of intellectuals at the service of the royal chancellery (scribes, notaries, secretaries, lawyers) learned a new elegant and refined prose style. Bernat Metge (1324–1413) was a very talented, if not very honest, servant of the crown who produced a masterpiece of artistic prose, *Lo Somni* (1398). In it, Metge compiled a brilliant self-apology, borrowing from Cicero, Ovid, Boccaccio, Petrarch, and the Church Fathers. This work, a fictitious dialogue between the author and three dead men who come to him while he is asleep in prison, contains solemn and elegant pages mixed with others that are coarse and very funny. Translation from Latin and Italian was the actual source of the new Catalan artistic prose: Antoni Canals, a severe Dominican inquisitor, produced some versions of Seneca, Valerius Maximus, and Petrarch for moral purposes. Other translators were interested in history (the

Decades of Livy, the *Historia Troiana* of Guido delle Colonne), or in literature (the *Divina Commedia* of Dante, the *Decameron* of Boccaccio). The two long chivalric novels of the fifteenth century, the *Tirant lo Blanch* of Joanot Martorell (1460, printed 1490) and the anonymous *Curial and Güelfa*, benefited from this artistic prose writing. Although the authors of both books borrowed from the romance narrative tradition (the French prose *roman*, the troubadours, Dante), as well from that of Catalonia itself (Ramon Llull, the chroniclers Desclot and Muntaner, verse narrative novels), they created quite a new narrative pattern, with no exact parallels in their age.

Some outstanding Catalan writers of the late Middle Ages, however, ignored and even opposed this learned fashion. They were intellectuals of the Mendicant orders, devoted to their pastoral concerns. Thus Francesc Eiximenis, a Franciscan vernacular encyclopedist, and Vicent Ferrer, a Dominican popular preacher, found their literary way through scholasticism and the mendicant homiletic tradition. The same is true of the only woman writer of the Catalan Middle Ages, the abbess Isabel de Villena, who wrote a *Life of Christ* in a beautiful colloquial Catalan. Anselm Turmeda, a Franciscan friar converted to Islam, wrote very successful moral poetry and prose; the knight Ramon de Perellós narrated in colloquial prose his travel to the Purgatory of Saint Patrick in Ireland. The last great Catalan writer was a Valencian theologian and preacher, Joan Roís de Corella. He translated devotional works into Catalan and used printing to disseminate some of his writings. He was also a lyric poet, and in a rhetorical narrative tradition deeply indebted to Boccaccio, he produced some retellings of Ovid's tragic stories.

The extant texts of medieval Catalan theater belong to the Easter and Christmas cycles, or develop themes from the Old Testament. A liturgical drama on the Assumption of Mary (the *Misteri d'Elx*), which originated in the fifteenth century, is still performed each year in the city of that name.

LITERATURE, LOST

The farther we go back in time, the greater the proportion of written literature that is lost (oral literature—works composed and transmitted orally—has always had a very high rate of loss, regardless of its age). Yet lost works often leave traces, and it is important for us to know as much as we can about what has been lost. If we do not—if we attend only to the texts that have survived—our picture of the literature of the past will not only be incomplete, it may be seriously misleading. This is especially true of genres where the rate of loss is above average: the medieval epic, for example.

Tomás Antonio Sánchez, in the preface to his great collection of medieval Spanish texts, wrote, “Siempre he creído que un gran caudal de nuestra lengua, de nuestra historia, de nuestras costumbres y literatura antigua, yacía como mudo entre las tinieblas del más profundo olvido y abandono.” (I have always believed that a great wealth of our language our history, our customs and ancient literature lay silent, Forgotten, and abandoned amid the darkness). That was in 1779, and it remains true today. The fact that so many works survive today in a single, and sometimes incomplete, manuscript or copy of an incunable (the *Cantar de Mio Cid*, the *Libro de Apolonio*, the *Vida de Santa María Egipcíaca*, for instance) shows how easily a work could disappear from view. Sánchez mentioned “el tiempo, los incendios, la polilla” (time, fire, and vermin) as the main causes of loss; the causes are numerous, and may be classified as follows:

1. Fires in libraries and archives: more than four-thousand manuscripts were destroyed in the fire in the Escorial Library (1671), a loss perhaps even greater than that of the most disastrous English equivalent, the Cotton Library fire of 1731.
2. War and revolution: the library of one of Spain's greatest scholar-bibliophiles, Bartolomé Gallardo, was sacked in the Seville riots of 1823.
3. The dissolution of the monasteries in 1835–1836.
4. Theft of manuscripts and incunables by readers—and also by underpaid librarians. The Biblioteca Colombina in Seville, founded by Hernando

Colón in the early sixteenth century, now has only a fraction of its former holdings.

5. Bad conditions in libraries: damp, rodents, worms. These, however, usually damage books rather than destroying them totally.
6. Loss of leaves or of whole gatherings from intensively used books (the first and last leaves are especially vulnerable).
7. Political, religious, or moral censorship. When Enrique de Trastámara murdered his half-brother and seized the throne in 1369, the new dynasty was eager to suppress any evidence that cast doubt on its claim to legitimacy. It was dangerous to be caught in possession of ballads attacking Enrique and his followers, or of chronicles that gave a different version of the events.
8. Those who inherited great private libraries and archives might lack interest in them and sell them off cheaply—even to a wastepaper merchant (the Duque de Sessa, 1869). In extreme cases, manuscripts might be used as toilet paper, or to light the fire.
9. Manuscripts and incunables might be broken up to serve as pastedowns in the binding of other, newer books. This was the fate of the unique manuscript of the *Roncesvalles* epic.
10. A manuscript or incunable misplaced in a library, or sold to a secretive collector, may disappear from view for decades—sometimes, one assumes, for centuries.
11. Responsible for far more losses than any of these is that many medieval works lived only in oral tradition, and very soon changed drastically or died out altogether.

How can we learn something of what has been lost? The difficulty is greatest in the case of oral works, though even here something may be retrieved: some were written down, some survived in the oral tradition for centuries (notably, the ballads preserved in the Sephardic communities), and even though both kinds of preservation imply major changes, we can glimpse something, especially if the same work was written down by a literate poet and also preserved by singers. If a fragment survives (the single leaf of *Roncesvalles*, the fragment of the first version of *Amadís de Gaula*), we not only have incontrovertible evidence that the work once existed, but can form an idea of its characteristics. An author will sometimes refer, in an extant work, to one that is now lost. Juan Manuel is the most prolific source of such information: he carefully listed his works, five of which do not correspond to any that we have (the titles usually give a fairly clear indication of the content). Three titles of lost works emerge from

a shorter list by Alfonso de Palencia (though in his case it is less certain that the books were completed). And the preface to the second version of Diego Enríquez del Castillo's *Crónica de Enrique IV* gives a graphic account of the way in which the unfinished first version and its documentary sources were lost. References by other authors may also give us the title of a lost work, and occasionally may give us much more. The extreme case is Hernando de Talavera's *Católica impugnación*, which goes into such detail about a pamphlet, called by him the *Herético libelo*, that we are able to reconstruct its structure and much of its content; had he stayed his hand, the pamphlet to which he objects so strongly would be unknown to us. Some *cancionero* poems are largely composed of quotations from others; some of these other poems are extant, but some are known only through the quotations. A translation may survive when the original is lost: we have a Latin translation of one lost work from the circle of Alfonso X, and a French translation of another. A great deal of information comes from library catalogues, inventories attached to wills, and inventories of donations, though the information is of uneven quality: sometimes we have an identifiable title, sometimes not. A more precise, though much less frequent, source of information is the table of contents of a manuscript containing a number of works, from which leaves are missing; in this way, we can be sure that a Salamanca University Library manuscript once included the *Libro del arra del ánima*. An unlikely, but occasionally fruitful, source is an account book: one from Toledo cathedral gives us the titles of fourteen otherwise unknown plays from the end of the fifteenth century and the beginning of the sixteenth. The writings of bibliophiles, from the sixteenth century onward, can supplement the other sources, and may even put us on the track of a lost work recorded nowhere else. Finally, the content of lost oral epics is sometimes preserved in chronicle prosifications. This information needs to be assessed with greater care than has sometimes been used, but it is thanks to such prosifications that we know about the *Siete infantes de Lara*, the *Cantar de Sancho II*, and the *Romanz del Infant García*; whether the differences between chronicles reflect the existence of more than one version of the epic, or whether they are due to the initiative of the chroniclers, is a question now being vigorously debated.

Not every loss is irretrievable. In the past half-century, several lost *cancioneros* have been located (usually thanks to the extraordinary efforts of Brian Dutton). The *Triunfo de Amor* of Juan de Flores, dismissed for over a hundred years as a bibliographical ghost, is now known in two manuscripts. Perhaps more surprisingly, some works that had left no trace at all

have been discovered: *Ay Jherusalem!* in the 1950s, the *Fazienda de Ultra Mar* in the 1960s, the *Auto de la Pasión* and the *Coronación de la señora Gracisla* in the 1970s, and the *Devocionario* of doña Constanza in the 1980s. The likelihood of further discoveries and rediscoveries must diminish as the search goes on, but it would be rash to assert that we have reached the end of the process. And each discovery of a hitherto lost work, each reassessment of the evidence for works that are still lost, redraws to a greater or lesser extent the map of medieval Spanish literature.

LITERATURE, ORAL AND WRITTEN

As with other literatures of medieval Europe, that of Spain composed between the twelfth and fifteenth centuries reflects the transition of a culture from a predominantly oral state to an increasingly literate one, with the result that a determined literary work (e.g., the *Poema de Mio Cid*), may contain traces of primary orality (repetition and formulaic phrases; see the classic 1960 study by Lord) as well as certain learned features (diplomatic and accounting references). This convergence of oral and written elements can be studied in genres as diverse as lyric and epic poetry, the *romancero*, and even prose works (notably the folktale and the proverb) with respect to their sources, composition, and diffusion.

One of the goals of the medieval narrator was to captivate his audience and to convince it of the importance and veracity of his work: the author/poet's personal word was his "bond" with that group. Written documents were often suspect, having a connotation in the epic, for example, of privilege and secrecy, the

insidious commands that they contain often backfiring or ridiculing the executors of the documents (Montgomery studies the issue for the *Poema de Mio Cid*, the *Siete infantes de Lara*, the *Mocedades de Rodrigo*, and other works). Thus it behooved the narrator to personalize his text in an ingratiating, often "chatty" manner (although chroniclers citing time-honored written *auctoritates* as an integral part of their own narratives usually dispensed with this nicety). A poet would write down his lines, imagining himself declaiming them to an audience (real or fictional; see the 1965 study by Gybbon-Monypenny on the works of Gonzalo de Berceo and the *Libro de Alexandre*); and prose texts as diverse as *Calila e Dimna* (ca. 1250) and some *exempla* of Juan Manuel's *Conde Lucanor* (1335), would present narratives in a scholastic objection-and-response form so that the reader can imagine himself involved in an oral disputation, that is, in the form of a "frame story" that allows him the fiction of becoming part of the listening company. In offering several theorems of literary history, Ong comments on the "intriguing" nature of medieval literature, given the influence on it of a "strange new mixture of orality (disputations) and textuality (commentaries on written works) in medieval academia," observing too that "probably most medieval writers across Europe continued the classical practice of writing their literary works to be read aloud. . . . This helped determine the always rhetorical style as well as the nature of plot and characterization." This oral delivery is most evident, according to Crosby in "the use of direct address not to the reader, but to those listeners who are present at the recitation," and results in the presence of epideictic 'demonstrative' locutions ("afevos aqui," "ya oyestes") in works as diverse as poetic hagiographic texts (e.g., the thirteenth-century *Vida de Santa María Egipciaca*; early chivalresque prose romances (e.g., the *Libro del cavallero Zifar*, ca. 1300) and prose histories (e.g., the fifteenth-century *Crónica de Juan II*) and scientific treatises (e.g., Bernardo Gordonio's *Lilio de medicina*, 1495. Formulaic phrases typical of minstrel epic poetry may also be found in prose chronicles and chivalresque romances (see the studies by Gómez Redondo and Walker. As well, many belletristic texts like the *Libro de buen amor* (1330, 1343) and the *Arcipreste de Talavera o Corbacho* (1438) were probably first diffused orally for their sermonic value or for clerical instruction, being read silently only thereafter.

A useful evaluation of medieval Spanish literature in terms of *diglossia*, or coexistence of two oral and written linguistic systems (e.g., Latin and Spanish)—now popular, now learned—in a specific environment was made in 1989 by Seniff; the same work offers a series of tests under the categories "Aspectos

orales" and "Aspectos textuales [= escritos]" for examining the literary production of Alfonso X, Juan Manuel, Alfonso Martínez de Toledo, Diego de San Pedro, and Fernando de Rojas. The work of each author is shown to describe some degree of convergence of orality (now spontaneous, now elaborately rhetorical) and writing with respect to their sources, composition, and—perhaps most commonly—diffusion. A cultural milestone is attained in the case of the last two authors: the popularity of San Pedro's *Cárcel de Amor* (1492) and Rojas' *Celestina* (ca. 1499, 1502), which appeared shortly after the advent of the printing press and were doubtless read aloud to small groups as well as in silence by individuals, may qualify them as the first "best-sellers" in Spanish literature. Yet of all genres described above, the ballad remains as Spain's great living contribution to international oral literature, and is currently the object of intense fieldwork by researchers throughout the Hispanic world.

LIVESTOCK

Given the pervasive impact of pastoralism and of livestock upon the formative medieval centuries of the Iberian economic, social, and military structures, it is unfortunate that so little scholarly work has been done on the subject, despite abundant data in royal law codes and charters, the municipal *fueros* or *forais*, and in private documentation such as deeds of purchase and wills. Spanish and Portuguese linguistic usage subdivides livestock and its raising (*ganadería*; Portuguese *pastoreio*) into two principal categories: *ganado mayor* (Portuguese *gado grosso*), including such larger animals as horses, camels, cattle, mules, and donkeys; and *ganado menor* (*gado miúdo*), chiefly sheep, goats, and pigs. Other articles here deal with sheep and cattle; this one will devote itself largely to horses, with briefer comment on other domesticated species.

So far as the horse is concerned, major attention has customarily been paid to the effects of the centuries-long importation of peerless Arabian and Barb (that is, Berber) stock all through the Hispano-Islamic Middle Ages. A hardly less pressing, if neglected, question has to do with the indigenous breeds carried over from the Roman and Visigothic epochs into the life and warfare of the Asturo-Leonese and Navarrese monarchies and the Arago-Catalan counties of the early Reconquest. That such native strains bore any marked resemblance to the still surviving Sorraia breed of primitive Tarpan-like ponies seems unlikely; but how far the handsome Andalusian equine of the south, often styled the "Spanish horse" par excellence, depends upon its classification as either a purely Iberian Barb or a cross of indigenous and African Barb strains. Centers of horse breeding tended to lie off the *meseta* (plateau) in the Middle Ages: in Andalusia, for both Muslims and Christians; in Catalonia all the way from around Vic and Girona to the lower Ebro River; in Portugal, near the coast and perhaps in Ribatejo.

In medieval Iberia the dominant function of the horse was military; travel and carriage uses were distinctly secondary and employment for plowing, as in ultra-Pyrenean manorial Europe, completely undocumented. The physiography of the *meseta*, the extensive tracts of *despoblado* (wasteland), and the Arabo-Berber fondness for mobile warfare combined to stress mounted combat for both sides during the Reconquest and this directly affected the need for, and breeding

of, horses. The armored knight astride a sturdy charger was, of course, a familiar figure below the Pyrenees among aristocratic *afrancesados* (Frenchified people); but far more typical, and constituting a much larger market for horses, were the urban militias of the towns and comparable bodies of lightly armed troopers that required swift steeds of spirit and endurance for long raids or intricate battle tactics. It was upon such horses, as upon donkeys and mules, that the local and regional livestock fairs depended so heavily, supporting an as yet poorly known class of professional livestock traders.

Occupation of the southern meseta by the Christian kingdoms from around 1200 on led to increasing adoption of the donkey or burro, and the mule, widespread in al-Andalus, whether for travel, carriage, or farming. This was, in effect, the taking over of Mediterranean livestock patterns. The mule, however, stronger than the donkey and faster than the ox (although because it required grain supplement to its feeding, more expensive), gained popularity all over the later medieval peninsula for riding, draft, and agricultural purposes. In view of its importance before and after 1500 in Iberia and the Americas, the mule merits investigation of the foral and charter references.

Goats readily adapted to dry regions and were valued for their milk and mohair. They appear in the sources but were apparently less numerous throughout the Middle Ages than afterward. Rather more is known of pigs, found everywhere in Christian Iberia, but raised in the largest numbers in Galicia, in southern León—where the transhumant porkers of Salamanca are driven south each fall to gorge on the acorn mast of the Extremaduran oak forests was regulated in that town's *fuero*—and in Extremadura itself, already famous for its succulent hams. Much further research on these animals, their economic and human connections, as well as on medieval Iberian livestock in general is imperative.

LLIBRE DEL CONSOLAT DE MAR

The *Llibre del consolat de mar* (LCM) was the most systematic and widely used compilation of maritime law in the medieval Mediterranean. The code served

to expedite disputes heard in various "consulates of the sea" (*consolats de mar*), the maritime guild courts. First established in Italy, maritime consulates spread to eastern Iberia in the thirteenth century. In 1258, King Jaime I authorized the "notables of the shore district" (*prohoms de la ribera*) of Barcelona to supervise the port area, shipping, and naval defense. This first attempt to establish an independent maritime institution proved ephemeral and was superseded by a consulate of the sea. Similar institutions were later established in Valencia (1283–1284), Mallorca (1326), and other important ports in the Crown of Aragón.

The compilation known as the LCM grew in stages corresponding to the development of the principal maritime consulates. Its primitive nucleus, probably redacted in Latin at Barcelona between 1266 and 1271, drew upon two different sources: One, possibly oral, dealt with questions of commercial navigation, including obligations among captains, shipowners, sailors, passengers, and merchants; the other, an older set of regulations, was devoted to armament, seizures, and raids. The growth of maritime trade led to the inclusion of new chapters both practical and moral in nature, first at Valencia, where a Catalan version existed, after the establishment of its consulate and then at Mallorca. With the inclusion of new ordinances promulgated by Pedro IV the Ceremonious, by 1353 the LCM attained its final form at Barcelona. This version came into general use in the consulates of the Crown of Aragón and throughout the Mediterranean. Although influenced by Roman law, the LCM draws most heavily on the practical experience of Catalan merchants and sailors. Gradually formed in the three major ports of the crown, the LCM stands as a monument to the cohesiveness and sophistication of Catalan maritime civilization.

LLIBRE DELS FEYTS See JAIME I, KING OF ARAGÓN; AUTOBIOGRAPHY

LLIBRE VERMELL

Known as the "Red Book" (Biblot. Mont. ms. 1), this most revered manuscript, containing ascetic treatises, together with the music and texts of twelve pilgrim songs, belongs to the Benedictine Monastery at Mont-

serrat. It was completed in 1399 and had for long remained obscure until it was discovered by the Dominican monk Jaime Villanueva, who mentioned it in the seventh volume of his *Viage literario a las iglesias de España* (Valencia, 1821). Fortunately the manuscript was among the few items that survived a fire in the monastery's scriptorium in 1811 during the Napoleonic War. It takes its name from the red velvet binding in which 137 of its original 172 folios are preserved.

The monastery, situated about fifty kilometers northwest of Barcelona, was founded in 1027 by the abbot Oliba of Ripoll and is considered to be Catalonia's most famous religious shrine, honoring the Virgin of Montserrat. According to legend, the black image of the Virgin that was carved by St. Luke, who brought it there from the Galilee, "was hidden on the mountain at the time of the Moorish invasion and miraculously revealed to the shepherds in the 10th century." Montserrat was also purported to be the site of the Holy Grail, which inspired Richard Wagner's *Parsifal*.

The pilgrim songs (*Els cants dels romeus*), listed according to their order in the *Llibre*, are: (1) *O virgo splendens* (fol. 21^v–22); (2) *Stella splendens in monte* (fol. 22^v); (3a) *Laudemus virginem* (fol. 23); (3b) *Plangamus scelera*; (4a) *Splendens ceptigera*; (4b) *Tundentes pectora*; (5) *Los set goyts recomptarem*, with the Latin refrain, *Ave Maria, gratia plena* (fol. 23^v); (6) *Cuncti simus concanentes* (fol. 24^r); (7) *Polorum regina* (fol. 24^v); (8) *Mariam matrem virginem/Mariam/Mariam* (fol. 25); (9) *Imperayritz de la ciutat ioyosa/Verges ses par misericordiosa* (fol. 25^v); and (10) *Ad mortem festinamus* (fol. 26^v). It should be pointed out that the respective texts of the pairs 3a–b and 4a–b share the same music.

As for language, all the songs are in Latin, except numbers 5 and 9, which are in Catalan. Regarding the settings, five (numbers 1, 3a–b, 4a–b, and 8) were written for three voices, the latter for voice and instruments; two were written for two voices (numbers 2 and 9); and the remaining are monophonic. As for notation, all but the first (in square notation) were notated in the mensural notation of the French Ars Nova. Noting the forms, an antiphon (number 1, with its corresponding *versillo* and *oración*), may be considered the earliest canon discovered on the Iberian Peninsula; there exist also examples of the *virelai* (numbers 2, 6, 7, 8, and 10), a precursor of the Spanish *villancico* (the melody and text of an additional *virelai*, *Rosa placent*, was lost among the missing folios); the canon or round (*caça* in Catalan) for two or three voices (numbers 1, 3a–b, 4a–b); the *canción a dos voces vocales* (number 5), whose two distinct texts, according to Anglés, were

not sung simultaneously (that is, the former text was sung before the latter, or each of their respective six strophes were sung one after the other); and the motet, in the French style (number 9), alternating between two and three voices. Numbers 2, 5, 6, 7, and 10 are also responsorial dance songs, of the circle type (*a ball rendon*), which were unique among medieval dances. Authorized by the clergy to be danced during vigils or during the daytime hours in the open squares adjoining the shrine, this Catalan creation, whose purpose was both recreational and devotional, may be considered a precursor of the *sardana*. In noting meter, number 1, predating the other examples by its square notation, comprises the only nonmeasured example. Seven are in the predominating duple meter (numbers 2, 3a–b, 4a–b, 5, and 9, the latter in compound duple 6/4), while the remaining three are in triple (numbers 6, 7, and 10).

Ad mortem festinamus appears to have been the oldest surviving music for a "dance of death." Three of its nine stanzas were found in an earlier *Contemptus mundi* of 1267. Moreover, both its text and that of *Plangamus scelera* are penitential. It should also be noted that the tune for *Polorum regina* reappeared two centuries later in Francisco de Salinas's *Libri septem de musica* (Salamanca, 1577).

LLULL, RAMÓN

Catalan lay missionary, philosopher, mystic, poet, and novelist, Ramón Llull (1232/3–1316) was one of the creators of literary Catalan; the first European to write philosophy and theology in a vernacular tongue; the first to write prose novels on contemporary themes; and the founder of a combinatory "art" that was a distant forerunner of computer science. He wrote some 265 works in Catalan, Latin, Arabic (none of these last have been preserved), and perhaps Provençal. In addition we have medieval translations of his works into Spanish, French, and Italian.

Life

Born on the island of Mallorca (modern-day Majorca), which had only recently been reconquered (at the end of 1229), and brought up in a wealthy family in a colonial situation, amid a still considerable Muslim population (perhaps a third of the entire population of the island), Llull's youth was that of a courtier who dabbled in troubadour verse. He married, had two children, and was appointed seneschal to the future Jaume II of Mallorca. Then, in 1263, repeated visions of the Crucifixion made him decide to dedicate his life to the service of Christ, and specifically to carrying out three aims: to try to convert Muslims even if it meant risking his life; to "write a book, the best in the world, against the errors of unbelievers"; and to found monasteries for the teaching of languages to missionaries. Llull bought a Muslim slave in order to learn Arabic and began nine years of study not only of that language, but also of Latin, philosophy, theology, and logic, as well as a certain amount of law, medicine (surely in Montpellier), and astronomy. At the end of this period he wrote a compendium of Al-Ghazālī's logic and the *Llibre de contemplació en Déu* (Book of Contemplation), a vast work combining semi-mystic effusions with the germs of most of his later thought. The changing methodological tactics of the work, however, were finally resolved on Mount Randa in Mallorca, where, after a week's meditation, "The Lord suddenly illuminated his mind, giving him the form and method for writing the aforementioned book against the errors of the unbelievers." (See below for *Contemporary Life* from which this and other passages are quoted.) This "form and method" was the art, of which he now wrote the first work (*Ars compendiosa inveniendi veritatem*, c. 1274), thereby fulfilling the second of his three aims. The third was soon (1276) to be fulfilled with the founding of the monastery of Miramar on the north-west coast of Mallorca for the teaching of Arabic to thirteen Franciscan missionaries.

From this point on, apart from his feverish literary activity, Llull's life became one of ceaseless travel in an attempt to interest the world in his missionary projects. Using Montpellier as a base (it then formed part of the kingdom of Mallorca), he visited Paris four times, where he lectured at the university and had audiences with the king (Philippe IV the Fair, nephew of his patron, Jaume II of Mallorca); he traveled to Italy some six times (to Genoa, where he was in contact with rich merchants, to Pisa, to Rome, where he had audiences with at least three popes, to Naples, and near the end of his life to Sicily); he went three times to North Africa (Tunis and Bougie [modern-day Bejaïa]), thereby fulfilling the first of his three proselytizing

aims; and once to Cyprus (from where he visited the Turkish port of Ayas, and perhaps Jerusalem). Llull's lack of success was typical for an idealist approaching practical politicians with schemes for the betterment of mankind. As he himself admitted in a work of the same title, he was everywhere treated as a *phantasticus*, or as he put it in earlier works, "Ramon lo Foll." And in a touching passage from the poem *Desconhort* (1295), he complained that people read his art "like a cat passing rapidly over hot coals." But these epithets and complaints must not make us forget that he did manage to have the ear of kings and popes, that he presented them with political tracts that recent research has shown to have been far more realistic than was formerly believed. Nor must we forget that on his last trip to Paris, overcoming at last the incomprehensions attendant on his former attempts to teach his peculiar system there, Llull received (1310–1311) letters of commendation from Philippe IV and the chancellor of the university, as well as a document in which forty masters and bachelors in arts and medicine approved of Llull's lectures in *Ars brevis*. The Council of Vienne (1311–1312) subsequently endorsed his proposal for the founding of schools of Oriental languages.

After Llull's discovery of the methodology of the art, his literary and philosophical production can be divided into three periods.

The Quaternary Phase (ca. 1274–1289). This was so called because the basic components of the art (divine attributes, relative principles, and elements) appear in multiples of four. The first work of the art, *Ars compendiosa inveniendi veritatem*, was rapidly accompanied by a series of satellite works explaining it and showing the other fields to which it could be applied. Among these, the most important was *Llibre del gentil e dels tres savis* (Book of the Gentile and the Three Wise Men), Llull's principal apologetic work. It was also around this same time that Llull wrote a pedagogical tract for his son, *Doctrina pueril*, and a manual of knighthood, the *Llibre de l'orde de cavalleria* (*Book of the Order of Chivalry*), destined to become popular in its French translation, and later translated into English by William Caxton. It was also during this time (1283) that he wrote his first didactic novel, *Blaquerna* (this seems to have been the original form of the name, and not the later *Blanquerna*), which included his most famous mystic work, the *Llibre d'amic e amat* (*Book of the Lover and the Beloved*).

In the same year of 1283, Llull decided to refashion many minor aspects of his system in a new version called *Ars demonstrativa*, around which he wrote a new cycle of explicative and satellite works. It was during this period that he wrote his second didactic

novel, *Félix o El libre de meravelles* (Felix, or the Book of Wonders), which includes the political animal fable, *Llibre de les baèsties* (*Book of the Beasts*).

The Ternary Phase (1290–1308). In this phase the principles of the art appear in multiples of three (and the four elements disappear as one of its foundations). Because of “the weakness of human intellect” that Llull encountered on his first trip to Paris, he reduced the number of figures with which his system invariably began from twelve (or sixteen) to four, and he removed all algebraic notation from the actual discourse of the art. This phase begins not with a single work surrounded by satellites, but with twin works: *Ars inventiva veritatis* which, as Llull says, treats *ciència* or knowledge, and *Ars amativa* which treats *amància* or love of God; it ends with the final formulation of his system in *Ars generalis ultima* (1305–1308), and in shorter form in *Ars brevis* (1308). This period is rich in important works, among which one might mention the immense encyclopedia, *Arbre de ciència* (Tree of Science, 1295–1296), as well as his principal work on logic, epistemology, and politics, *Logica nova* (1303), *Liber de ascensu et descensu intellectus* (1305), and *Liber de fine* (also 1305).

The Postart Phase (1308–1315). With the definitive formulation of his system now out of the way, Llull is free to concentrate on specific logical and epistemological topics, many directed toward his campaign against the Parisian “Averroists” while on his last trip there (1309–1311). It was at the end of this stay that he dictated what has come to be known in its English translation as *Contemporary Life*. He also became more and more involved in the art of preaching, writing a vast *Summa sermonum* in Mallorca (1312–1313).

Llull’s last works are dated from Tunis, December 1315, after which he disappears from history. He probably died early the following year, either there on the ship returning to his native Mallorca, or on the island itself, where he is buried. The story of his martyrdom (he was stoned to death) is a legend bolstered by pious falsifications in the early seventeenth century, in which an earlier (1307) stoning in Bejaia was transposed and made into the cause of his death.

Thought and Influence

The unusual nature of Llull’s system and of his thought in general is due to his insistence that any apologetic system that hoped to persuade Muslims and Jews would have to abandon the use of Scripture, which only caused endless discussions over validity and interpretation, and try to prove the articles of the

Christian faith, above all those of the Trinity and Incarnation that Muslims and Jews found most difficult to accept. The first consideration forced Llull to forge an abstract system that could stand completely by itself. This was the art, each work of which begins with a series of concepts distributed amid geometric figures, and then proceeds to describe the correct method of combining these concepts. The point was to display the basic structure of reality, which, noted Llull, begins with the attributes of God, goodness, greatness, eternity, and so forth, which are not static but unfold into three correlatives of action. Thus *bonitas* (goodness) unfolds into an agent (*bonificativum*) and a patient (*bonificabile*), and the act joining them (*bonificare*). Their necessary activity *ad intra* produces the Trinity, and their contingent activity *ad extra* the act of creation. Moreover, this triad of action is then reproduced at every level of creation, so that, for instance, man’s intellect is composed of *intellectivum*, *intelligibile*, and *intelligere*, and fire of *ignificativum*, *ignificabile*, and *ignificare*.

This metaphysics of action exerted a strong influence on Nicholas of Cusa, as did the combinatorial art on Giordano Bruno and Gottfried Wilhelm Leibniz. But at the same time, Llull’s system was taken over by alchemists, and eventually over one hundred such works were falsely attributed to him. This, plus his self-image as a *phantasticus*, the unusual nature of his system, and the fact that his attempts to prove the articles of the faith made him suspect to the Inquisition, helped propagate the image of a peculiar, countercultural figure.

Llull’s influence in the Iberian Peninsula was less heterodox and countercultural than in the rest of Europe. Aside from the fifteenth-century Lullist schools of Mallorca and Barcelona, there were a certain number of Castilian translations of his works done in the later Middle Ages, although interest in him seems to have been of a dispersed, sporadic nature, at least until the beginning of the sixteenth century. Then we find a Lullist school at Valencia (where some of his works were published), the chief figure of which was the humanist Alonso de Proaza. He in turn was in contact with Cardinal Francisco Jiménez de Cisneros, who in his foundation in 1508 of the University of Alcalá de Henares, instated a chair of Lullian philosophy and theology. Later in the century, Felipe II was an admirer of Llull, as was his chief architect, Juan de Herrera, who not only wrote a *Tratado del cuerpo cúbico* based on Llull’s art, but in 1582 founded a mathematical-philosophical academy in Madrid in whose program the art was to have a prominent place.

Literary Works

Llull's most unusual literary feature is that he dared to modify the conventional genres of contemporary romance tradition to fit his own didactic needs. Llull first attempted the novel, in the *Libre de Evast e Blaqueria* (Book of Evast and Blaqueria, 1283), and *Félix o El libre de meravelles* (Felix, or the Book of Wonders, 1288) he recounted stories morally useful to his readers. He similarly adjusted the narrative wrapping of an early apologetical work, the *Llibre del gentil e dels tres savis* (Book of the Gentile and the Three Wise Men), in which an unbeliever struggles to find the truth and finally embraces the faith.

The plot of *Blaqueria* follows the outline of a hero's biography; the main character is endowed with the mental strength permitting him to overcome the obstacles in the way of his becoming a contemplative hermit. These "obstacles" are the ties that link a man to society: a family, a religious order, a diocese, and the whole of Christianity ruled by the pope. Blaqueria abandons his parents, Evast and Aloma, and convinces his bride, Natana, to become an exemplary nun, whereupon he enters a monastery and becomes a reforming abbot who is then elected bishop. Blaqueria improves the spiritual life of his diocese and as a result is elected pope; from Rome Blaqueria manages to reorganize the world and to change the moral attitudes of people. Finally he renounces the papacy and becomes the perfect hermit, which permits him to write *Llibre d'amic e amat* (Book of the Lover and the Beloved), a collection of short mystical proverbs lyrically embellished and artistically constructed.

The *Book of Wonders* follows the spiritual journey of Felix through events that cause him "wonder" because they seem to be contrary to God's will, and that allow various hermits and philosophers to explain the fundamental points of Christian knowledge about God, angels, the heavens, the elements, plants, minerals, animals, man, paradise, and hell. Like *Blaqueria*, this novel offers plenty of morally meaningful exempla, but unlike the earlier work, it betrays considerable pessimism about the capacity of mankind to better its moral behavior. One chapter of *Félix* has become particularly famous: *Llibre de les bèsties* (Book of the Beasts), a Llullian adaptation of the old Iranian *Book of Kalila and Dimna* with some references to the French *Roman de Renard*.

In search of a literary vehicle for his message, Llull attempted autobiography, so *Desconhort* (1295) and *Cant de Ramon* (1300), two splendid lyric poems, explain from a personal point of view the disappointments and failures of his career. In the process Llull himself becomes a new literary character: a poor, old,

and despised man who has devoted his life to revealing a treasury of knowledge, an art given to him by God. A short late prose work, *Phantasticus* (1311), offers the most complete picture of this personage, whom, as was noted above, he sometimes called "Ramon lo Foll."

Plant de la Verge and *Llibre de Santa Maria*, both probably written between 1290 and 1293, are two pieces of devotional literature: the former, in verse, is a moving description of Christ's Passion, the latter, in prose, an unusual application of the Llullian art to a prayer to the Virgin Mary. Another treatise with rich literary contents is the *Arbre de filosofia d'amor* (Tree of Philosophy of Love, 1289), which encloses a short, touching mystical novel.

In his immense encyclopedia of 1295–1296, the (*Arbre de ciència*) (Tree of Science) Llull included a little *Arbre exemplifical* (Tree of Examples), in which a preacher could find the way to "translate science into exemplary literature." This work is the first of Llull's contributions to homiletics, a trend that later developed both into theoretical treatises—*Rhetorica nova* (1302), *Liber de praedicatione* (1304), *Ars brevis predicationis* (1313)—and sermon writing. Llull in later years, in fact, put aside romance literary genres and devoted himself to sermon collections; the most important being *Summa sermonum* of 1312–1313, which offers an unusual model for preaching, since Llull wanted to persuade lay audiences intellectually rather than to touch their hearts with moving anecdotes.

LOPES, FERNÃO

The date of Lopes' birth is unknown but he was said to be quite old when he died in 1459. He was the most significant Portuguese chronicler of the Middle Ages, and flourished during the reign of Duarte and the regency of the Infante Pedro. Lopes seems to have fallen from favor after the accession of Afonso V (1448), when Gomes Eanes de Zurara began to be active. By

1454 Lopes had been replaced as custodian of the Torre do Tombo, the royal archive he directed from 1418 on. Lopes's historical accounts cover the period from 1357–1433. They are based on documentary investigations carried out by him in the Torre do Tombo and on earlier, now lost, narratives. Lopes's historical writing was probably initiated at the instance of the Infante Dom Duarte, who by 1419 was responsible for overseeing the reaction of chronicles dealing with the first Portuguese kings. Dom Duarte's interest in history continued after he became king in 1434. Duarte officially commissioned Lopes to continue chronicling Portuguese history from the reign of Dom João I forward. Lopes's historical accounts are often compared favorably with those of Jean Froissart and Pero López de Ayala, both of whom chronicled many of the same events of the effects of the Hundred Years' War in the Iberian Peninsula.

Fernão Lopes's chronicles are distinguished for their realistic portraits of individuals and for their portrayal and basic analysis of motivational factors in historical events. Lopes's *Crónica de D. João I* is perhaps his best known work for its heroic portrait and close scrutiny of Nuno Alvares Pereira, *condestavel* (Constable) of the realm during the reign of João I.

LÓPEZ DE AYALA, PERO

Pero López de Ayala (1332–1407) was a chronicler, poet, and statesman who lived in a period that spanned the reigns of five Castilian kings. He was born into a wealthy, noble family in the northern province of Álava. Although not a great deal is known of his youth, Ayala's knowledge of Latin and French, plus his interest in the Bible and other religious writings may have come from early ecclesiastical training by his uncle, Cardinal Pedro Gómez Barroso, who raised and educated him. Much of what is known of Ayala's activities is derived from the chronicles he wrote describing the reigns of Pedro I (1350–1369), Enrique II (1369–1379), Juan I (1379–1390), and Enrique III (1390–1406). Beginning with his first appearance in the *Crónicas des los reyes de Castilla: don Pedro* (Chronicle of the Kings of Castile: Peter I) in 1353 as

a page selected to carry the king's banner, Ayala served Pedro in various capacities for over a dozen years. By 1367, however, he had joined Enrique of Trastámara, Pedro's illegitimate half-brother and rival for the throne. Shortly afterward, Ayala was taken prisoner by the English at the battle of Nájera.

During the reign of Enrique II, Ayala received many royal favors, including territorial possessions and political posts. His political activity greatly increased during the reign of Juan I, when he served as royal counselor and as ambassador to France. Although he opposed the plan of Juan I to assume the Portuguese throne and thereby unite the two kingdoms, Ayala participated in the disastrous battle of Aljubarrota, where he was captured by the Portuguese and imprisoned for two years. It is probable that some of his writings were done during this period, especially the *Libro de la caza de las aves* and some poetic works. Ayala's importance and influence continued to grow during the reign of Enrique III. He was a member of the Council of Regents during the king's minority and served as a negotiator in the peace talks with Portugal. In the mid-1390s, Ayala spent several years in semiretirement at his estate in Álava and at the adjacent Hieronymite monastery. It is believed that he wrote his chronicles and *Libro del linaje de Ayala* during this time. In 1399, he was appointed grand chancellor of Castile.

In addition to being an impressive political and military leader who was personally acquainted with popes and kings, Ayala must also be acknowledged as one of the three major literary figures of his century. Juan Ruiz, Juan Manuel, and Pero López de Ayala all in their own way reflect the social, economic, and political milieu in which they lived as well as their own personal reactions to their circumstances. Although a self-consciousness as literary creators is apparent in the work of each of these authors, their primary purpose remains didactic—ranging from the jocular tongue-in-cheek admonitions of Ruiz to the chivalric preoccupations and moralizing of Manuel to the almost ascetic severity of Ayala. As the most important writer of the last half of the fourteenth century, Ayala's prose and poetic works are significant for a number of reasons. Linguistically, they comprise an extensive and reliable source of late-fourteenth- and early-fifteenth-century Spanish. His chronicles are of great historical value as they are a major source of information concerning events in Spain from 1350 to 1396. The epoch that Ayala chronicles is a period of crisis and of such peninsular and international conflicts as civil and religious wars in Spain, the Hundred Years' War, the Black Death, and the schism in the Catholic Church. An eyewitness to many of these events, Ayala identifies him-

self with the purpose and norms of ancient chroniclers, explaining in his preface that the purpose of knowing about events in the past is to serve as a guide for present actions. He further comments that his sole intention is to tell the truth based on what he himself observed and from testimony of trustworthy persons. Nevertheless, the chronicler's impartiality, and at times even his veracity, has been questioned because he reports so many barbarous acts, and because he views Pedro I primarily as a negative example. Ayala's support of the Trastámaran pretender and his later involvement in the royal court further clouds the picture. The two manuscript traditions *abreviada* and *vulgar* suggest a process of revision that served to soften the condemnation of Pedro I after the reconciliation of the two dynastic lines, with the marriage of the grandchildren of the two contenders.

The literary nature of these narratives and the chronicler's acute awareness of literary style must also be taken into account. Among the variety of literary devices used in the chronicles, Ayala includes the skillful arrangement of all the contributing elements to form an organic unity: tense choice, paired words or doublets, alternation, contrast, parallelism, repetition, and portraiture. The author's skill in the use of direct address such as dialogues, one-liners, discourses, letters, and sayings enliven narrative passages and reveal the dramatic nature of the events. The dramatic structure of the death scenes is also evident in other episodes; for example, the farewell scene between Leonor de Guzmán and her son Fadrique, the confrontation with the Queen Mother at Toro, the departure of Pedro I from Burgos, and the papal election that began the schism. Ayala must be recognized as a talented prose stylist as he relates events more varied and fascinating than many fictional sagas, consisting of wars, fratricides, marriages, mistresses, international intrigues, and power struggles at the highest levels of government.

Ayala's long poetic work *Rimado de Palacio*, completed in 1404, is a highly personal and creative expression of the author's moral and philosophical preoccupations. Most of its 2,168 stanzas (totalling more than 8,000 lines) are written in the verse form *cuaderna vía*, characterized by four-line stanzas, each fourteen-syllable line divided by a caesura after the seventh syllable and ending in uniform consonantal rhyme. In spite of being the last of the *cuaderna vía* poets, Ayala demonstrates poetic innovations that include increased use of the eight-syllable line and the introduction of *arte mayor*, both most apparent in the *Cancionero* portion, stanzas 732–919. At the center of *Cancionero*, the poet again reveals his concern for the Church in a long allegory in which the ship of St. Peter

is being torn apart by the destructive storm of the Great Schism.

The *Rimado* consists of a large number of poems of varied content and structure whose composition undoubtedly spans decades and whose impetus springs from the experiences of a long, adventurous life as well as from periods of reading and meditation. To say that it is a didactic-moral work or a long confessional poem is true. Nonetheless, this would slight the literary value and variety of Ayala's forcefully sober verse. Ayala's fine, satirically traced pictures of medieval society have, above all else, attracted readers to *Rimado*. These vigorous scenes of contemporary society and court life are found in the first part of the book, along with other poems that arise from the chancellor's personal experiences and his reflections. The poet's description of personages in the royal courts, the almost caricaturelike presentation of merchants and lawyers, prefigure later satirical works that culminate in the mordant sarcasm and ridicule of Francisco Quevedo, as well as in subsequent vignettes of manners and customs.

The more extensive final part of the work provides a focus on doctrine rather than experience. Ayala demonstrates originality in combining confessional and doctrinal themes and materials based on the Bible and the *Morals* of St. Gregory in order to produce a didactic exposition in verse. Many of the themes of the fifteenth-century rhymed confessions undoubtedly received some impetus from the meditations on life, death, original sin, and the brief duration of worldly gains portrayed in *Rimado*. In addition to influencing the verse forms, topics, and themes of later poets, Ayala's devout and moving poems dedicated to the Virgin had an impact on religious lyrical poetry of the fifteenth century. Ayala also made an important contribution to Castilian intellectual life through his translations of works of Livy, Gregory, Isidore, and Boethius.

LÓPEZ DE CÓRDOBA, LEONOR

Born in 1362, Leonor López de Córdoba composed one of the most singular chronicles of the late Middle Ages in Castile. Her *Memorias*, which were dictated

to a scribe around the beginning of the fifteenth century, are a personal testimony of a society ravaged by civil war, pestilence, and class upheaval.

Due to the dramatic circumstances of the narrator's life, the *Memorias* present a point of view that is rare in the historiography of this period. Leonor López was the sole survivor of a family destroyed because of its allegiance to Pedro I, the legitimate king of Castile, during the dynastic struggle he waged against his half-brother, Enrique de Trastámara. The social climate of the decades following this civil war was dominated by the usurper's followers, who spread propaganda alluding to the brutality of Pedro "the Cruel," and the low social class of his supporters, as a means of justifying their overthrow of the rightful monarch. In an effort to repudiate such rumors in her *Memorias*, Leonor López described in detail the nobility of her lineage, the bravery of her father in defense of the loyalist cause, and the atrocities that Enrique de Trastámara himself inflicted upon her family. Her work is a historical curiosity, both as a document of a dispossessed class, and as a feat of honor performed verbally by a woman.

Memorias also merits attention for its literary significance as one of the earliest examples of autobiographical expression produced in medieval Spain. In order to exonerate herself, Leonor López elaborated a self-portrait that exemplified the conduct deemed appropriate for a noble lady. Her persuasive manipulation of language is particularly evident in her use of motifs derived from pious literature to associate herself with a popular ideal of Christian virtue.

Despite their limitations as a historical record and artistic work, the *Memorias* of Leonor López are notable as a re-creation of the past that preserves a uniquely feminine interpretation of the values of medieval Castilian society.

LÓPEZ DE CÓRDOBA, MARTÍN

The Castilian official most identified with the last stages of Pedro I's reign, Martín López (ca. 1315-1371) remained loyal to the king's cause even after Pedro's death in 1369. A knight of relatively humble origins, he first came to Pedro's attention as a subaltern of his *canciller mayor* (senior chancellor) Juan

Fernández de Henestrosa. His first known important function was as *comendador* (commander) of the houses of Seville of the Military Order of Calatrava. López de Córdoba rose rapidly in the royal service, entrenched himself at court, and occupied a series of increasingly important posts from *camarero mayor* (senior steward) in 1359 to *repostero mayor* (senior butler) the following year. In 1365 he was elected master of the Order of Alcántara and appointed *adelantado mayor* (senior governor) of Murcia. Before 1367 he was elected master of the Order of Calatrava, and was sent by Pedro as his ambassador to the English court. Pedro López de Ayala, the chronicler of Pedro's reign, asserts that Pedro entrusted Martín López with the delicate task of eliminating some of his enemies, and that the master's success in carrying out the task accounted for his rapid ascent.

Martín López did not accompany Pedro on his fateful march northward from Seville to meet the armies of his challenger Enrique de Trastámara in the early spring of 1369. When Enrique's superior army and clever strategy forced Pedro to seek refuge at a nearby fortress following the battle of Montiel on 14 March 1369, López de Córdoba attempted to reach the fortress to relieve the king. But before he arrived, Pedro had been killed by Enrique. López de Córdoba then turned around and returned to Andalusia where he tried unsuccessfully to raise a large army to march against Enrique. As not much support materialized, he took his own family, some of Pedro's illegitimate children, an armed contingent of eight hundred knights, and what remained of the king's treasury and set up residence behind the walls of the fortress of Carmona, outside Seville, a splendidly located strategic site that had been provisioned to withstand a long siege.

After holding out for two years, and giving up hope of reinforcements from the outside, Martín López entered into negotiations with Enrique, who appeared disposed to offer the rebels reasonable terms, promising a safe-conduct abroad in exchange for their surrender and the return of what was left of Pedro's treasury. On 10 May 1371, when the gates of Carmona opened, Enrique reneged. He had many of the notables, including Pedro's children, bound in chains and carted off to prison in Seville.

López de Córdoba and the other principal defender of Carmona, Mateo Fernández, were paraded through the streets of the town, taken to a public square, and mutilated and burned to death. Before his execution, Martín López is reported to have said to Bertrand du Guesclin, the French mercenary in Enrique's employ whose betrayal of Pedro had led to the

king's death: "It is better to die a loyalist, as I do, than to live as a traitor, as you do."

It was Martín López de Córdoba's loyalty to Pedro, more than any other quality, that defined his relationship to the king during the last years of the reign. This was a period plagued by political instability, the defection from the royal cause of important individuals, and the violent response of the king to adverse circumstances. Martín López defied the trend and was rewarded for it with Pedro's trust and the prestige and rents of high office.

Martín López's death effectively marked the end of internal opposition to the Trastámaran usurpation. Martín López's daughter, Leonor López de Córdoba, a prisoner in Seville following the surrender of Carmona, left a set of memoirs recollecting the fate of the prisoners after the death of her father. She eventually became an important figure in the Castilian court of Catherine of Lancaster, wife of Enrique III and granddaughter of Pedro I.

LÓPEZ DE MENDOZA, IÑIGO

Born in 1398, Íñigo López de Mendoza (first marqués de Santillana, and señor de Hita and Buitrago) was the son of Diego Hurtado de Mendoza, the influential admiral of Castile. His uncle was Pero López de Ayala, poet, statesman, military figure, and the commanding chancellor of Castile during the last quarter of the fourteenth century. During the reign of Juan II of Castile, López de Mendoza was head of the powerful Mendoza clan, which was connected through marriage to many of the most influential families of the kingdom.

López de Mendoza is one of the major cultural and political figures of the fifteenth century. He spent a part of his youth in Aragón, where he became friends and shared intellectual pursuits with Enrique de Villena, one of the great learned men of his time. López de Mendoza distinguished himself both militarily and literarily on the Granadan frontier, at Ágreda in 1429 and again at Jaén in 1438. Although he fought alongside Juan II and his confidant Álvaro de Luna, Constable of Castile, at the battle of Olmedo in 1445 defending the interests of the monarchy against the challenges of the Infantes de Aragón, López de Mendoza quickly became don Álvaro's sworn enemy.

Along with other powerful nobles, López de Mendoza then conspired to topple Luna from power and went on to write admonitory poetry about the example of Luna's life and execution in 1453.

The Marqués, as López de Mendoza was referred to simply in his time, surrounded himself in Guadalajara with artists, writers, and thinkers like Nuño de Guzmán, Pero Díaz de Toledo, and Martín González de Lucena, and was perhaps the greatest single cultural and artistic force of his time. As both intellectual and patron, López de Mendoza was the single most important figure in the propagation of humanistic knowledge in Castile during the first half of the fifteenth century. In addition to having gathered in Guadalajara the most significant library of humanistic works in lay hands and patronized the translation of Homer's *Iliad*, Plato, Ovid, Cicero, Seneca, Dante, and Boccaccio into Castilian, López de Mendoza was in his own right a celebrated poet, literary critic, and theoretician. Although he collected Latin manuscripts, he could not read Latin, but he read several vernaculars fluently and was aware of contemporary developments in European poetry, especially in France and Italy. His *Carta e prohemio al Condestable de Portugal*, which draws heavily on classical and patristic writers as well as Boccaccio's *De genealogia deorum*, is considered the first concerted work of literary theory and criticism in Castilian. Its novelty lies in its historical descriptions of different genres and the catalogue of works that it contains, just as it offers an evaluation of the qualities and defects of the poets he mentions. In addition, his *Sonetos fechos al itálico modo* (1438), which follow the example of Dante and Petrarch, mark the first coherent attempt to cultivate the sonnet form in Castilian. Besides these two works and his patronage, López de Mendoza was a prolific writer responsible for a vast body of work in both prose and verse that deals with moral, religious, political, and sentimental themes, all of which contributed to his vast fame during his lifetime. Among the best known of his lyrical works are his *serranillas*, or pastourelles, that tell of rural love encounters between knights and rustic shepherdesses. His ambitious narrative and allegorical poems, known as *decires* (*Bías contra Fortuna*, *Doctrinal de Privados*, *Comedieta de Ponza*), are replete with mythological, biblical, and other learned themes that attest to his humanistic knowledge and intellectual aspirations. The *Comedieta* (1436), a patriotic composition that exalts the Aragónese in their Italian campaign at the naval battle of Ponza, represents the culmination of López de Mendoza's allegorical works. It is built upon a complicated image pattern developed through the use of highly learned language and allusion. *Bías contra*

Fortuna, written in 1448 as a consolation to mark the political imprisonment of a cousin by don Álvaro de Luna, marks the climax of the theme of Fortune in his work. In contradistinction to the difficult allegory of the *Comedieta*, Bías, the Greek philosopher who is the spokesperson for Santillana, makes his views on Fortune and the world clearly known. The *Doctrinal* reveals a final vindictive side of López de Mendoza's character, in which he employs Fortune and confession to make Álvaro de Luna, his dead enemy, denounce his own transgressions.

When López de Mendoza died in 1458, the event inspired his contemporaries to write a number of elegies and other literary compositions to mourn his passing.

LUCAS OF TÚY

Lucas of Túy (fl. thirteenth century) was the bishop of the small see of Túy in Galicia on the Portuguese frontier between 1239 and 1249 where he had also been *magister scholarum* and canon just previously. His episcopate was not particularly significant and he is known to us chiefly as an author. Lucas was likely a native rather of the city of León or its environs and, before he came to Túy, had been a canon and deacon of the cathedral of León. While in that position, he had written a *translatio* detailing the movement in the eleventh-century of the relics of St. Isidore of Seville from that city to the great shrine church built for them in León. There as well he also wrote an apologetic tract against the Albigensian heresy.

These works may have brought him to the attention of the Queen Mother Berenguela, former wife of Alfonso IX of León, who asked him to compile a history of the realm. The result was his most famous work, *Chronicon Mundi*, composed before 1238. A world chronicle in form, the work largely follows Isidore of Seville for the earlier period and only with the fourth book, which covers the time from the Muslim invasion of 711 down to the recapture of Córdoba by Fernando III in 1236, is it of independent interest. Lucas excerpted freely from the chronicles of the Alfonso III cycle, from *Historia Silense*, and from *Crónica del obispo Don Pelayo*. It is possible, as well, that he used

Crónica Nájerense and *Crónica latina de los reyes de Castilla*. However, for his twelfth and thirteen-century narrative he employed sources now apparently lost. He does not utilize *Historia Compostelana* or *Chronica Adefonsi Imperatoris*.

In addition to earlier but lost chronicles as such, he also freely employed epic materials. That of Bernardo del Carpio first appears in Lucas's text. He also incorporates epic materials dealing with the reigns of Sancho II of Castile (r. 1065–1072) and Alfonso VI of León and Castile (r. 1065–1109). There are also minor tales, including that of the pilgrimage of Louis VII of France to Santiago de Compostela in 1154. Writing slightly later, Rodrigo Jiménez de Rada incorporated these materials almost verbatim into his *De rebus Hispaniae* and from there they became the common property of subsequent historians.

LUCIDARIO

The Latin *Elucidarium*, composed around 1095 by Anselm of Canterbury's disciple Honorius Augustodunensis (c. 1075–c. 1156), was a highly popular work translated soon after its creation into every major European language. The Castilian version, the *Lucidario*, was commissioned by Sancho IV (r. 1284–1295) around 1293 and forms a complement to the other minor encyclopedic works from the reign of the second son of Alfonso el Sabio: the *Castigos e documentos* and a translation of Brunetto Latini's *Li Livres dou trésor*. *Lucidario* is extant in five manuscript copies ranging from the late fourteenth or early fifteenth to the early sixteenth centuries. Like the original *Elucidarium* and its vernacular congeners, the Castilian rendition is couched in the form of a dialogue between a master and his pupil wherein the student poses a question to which the master duly responds with a conventional answer based on the interplay between the fundamental medieval doctrines of *lex naturalis* or laws of nature and *lex theologiae* or laws of God. In this respect, the work was a highly successful attempt to reconcile the pagan Aristotelian scientific corpus with the essential canons of Christian dogma. As such, the Castilian *Lucidario* became a standard text of Christian orthodoxy at the level of the cathedral schools where

it was utilized as a most effective if rather limited and rudimentary mode of instructing Christian cosmogony and cosmography. In the process of reproducing and translating the primitive text of the *Elucidarium*, scribes frequently incorporated additional questions and answers which were then suitably accommodated and passed on as if they had been part of the original work, thus accounting for the variety of contents found in the extant Castilian codices of the *Lucidario*, which range from 59 to 113 chapters. The title *Lucidario* eventually came to be used as a generic term for a variety of encyclopedic works cast in the master-disciple format of question and answer. Today its value resides precisely in that aspect of the text that made it so popular during the Middle Ages: the certainty that it accurately reflects the orthodox Christian views of the average Spaniard between the thirteenth century and the demise of Aristotelianism some four hundred years later when, in testament to the esteem it continued to enjoy, an abbreviated Latin translation based on the Castilian version was made by Padre Juan Eusebio Nieremberg (1595–1658).

LUNA, ÁLVARO DE

Don Álvaro, as he is commonly referred to, was the illegitimate son of a minor noble of Aragónese origin by the same name. He was born in Castile at Cañete in 1388, and his mother was from that village. When his father died in 1395, Álvaro was taken in by his uncle, Juan Martínez de Luna. In 1408 Álvaro de Luna was sent to court to further his education. There he was known for his elegance and wit, and quickly became the friend, companion, and favorite of Prince Juan, the considerably younger boy who had inherited the throne during infancy and would become Juan II, king of Castile. From their earliest days together, Luna and the king were constant companions and confidantes. Fearing the worst of the association, the young prince's mother, the Queen Regent Catalina de Lancaster, arranged to have Luna removed from court in 1415. Juan was miserable without his friend's company, and Luna was quickly recalled. By 1418, when Catalina had died, Luna and the king's relationship had grown to the point that it inspired both public gossip and private envy among many of the nobles, who sought influ-

ence to augment their power at the expense of the crown. (In later years the king would be confronted by the nobles with rumors of their homosexual relationship). Luna, however, remained confident of the king's support and relied heavily on the backing of others who associated the crown's interests with their own, namely the lower and middle layers of society. Luna brilliantly exploited the concerns and aspirations of the non-noble sectors of society and, at the same time, sought to increase his own influence as well as centralize the power of the monarchy. As a result, he undermined the power of the *cortes* (parliament) and the local municipalities, as he gathered more and more power for the crown and for himself. The king, who remained largely disinterested in affairs of state, became a virtual pawn of the ambitious Luna.

In 1420 Luna, who had been elevated to count and been given large estates, rescued the king from the Infantes de Aragón, who had seized the monarch and taken him to Talavera de la Reina. The Infantes, brothers of Alfonso V of Aragón, were closely allied with the Castilian nobles who sought to curb the power of the monarchy in the kingdom. Both had regal ambitions themselves and looked to protect their family's enormous interests in Castile. Luna was made the constable of Castile in 1423, a step which greatly increased his power and influence by making them official. The move provoked the nobles and the Infantes to multiply their efforts against him, which met with success in 1427, when they and the other nobles forced the king to exile Luna. Neither the king nor the nobles, however, were capable of governing Castile without Luna, whose talents had ensured his indispensability. As a result, he was quickly recalled and fully reinstated. The Castilian victory in the war against Aragón (1429) not only restored but amplified Luna's power and influence.

Luna seemed unstoppable. At one point, the mastery of the military Order of Santiago was conferred upon him after it had been stripped from the Infante Enrique, heir to the throne. With this new power in hand, Luna began to campaign against the Muslim south and led the Castilians to an important victory at the battle of La Higuera in 1431. The nobles, presided over by the Manrique and Enríquez clans, continued to resist Luna and plot against him at court. Although their efforts led to a second exile in 1438, by 1445 Luna had been restored to favor and had handed the nobles a resounding defeat at the battle of Olmedo. Only King Juan's second wife, Isabel of Portugal, managed to rid the kingdom of Luna. With the collaboration of the nobles, especially the conde de Haro and the marqués de Santillana, she persuaded the king to arrest Luna and condemn him to death. He was taken

prisoner at Easter, 1453, and publically beheaded at Valladolid on 22 June of that year.

As he went to his death, Luna, whose bravery was legendary, calmly requested that his executioner not tie his hands with the customary rope but with the silk cord he had brought for that purpose. Luna's spectacular rise and dramatic fall would continue to haunt the Castilian imagination for the next several centuries as an example of the whims of Fortune, inspiring many literary works that commemorated it. He is buried in the cathedral at Toledo. Juan II died the year after Luna's execution, overcome by personal grief and remorse.

Álvaro de Luna's diplomatic and military skills rank him among the most influential Iberian political leaders of the fifteenth century. Committed to a powerful monarchy and centralized authority based on broad popular support, his vision was only betrayed by an indecisive king and his own venality.

LUNA, MARÍA DE

The first wife of Martín I, "the Humane," king of Sicily (1409–1410) and king of the Crown of Aragón (1395–1410), María de Luna was born in 1357. The daughter of the powerful Lope, count of Luna, María was betrothed to Martín at the age of four. The couple married in 1372 and had four children, although only one, Martín the younger, born in 1376, survived to adulthood.

In 1395 King Juan I, Martín's brother, died without a male heir. Martín was proclaimed king but because he was in Sicily, María stepped in as regent until her husband's return in 1397. The new queen demonstrated prudence and strength during this difficult regency. She first had to contend with a threat to the legitimacy of her husband's royal inheritance from Juan's widow, Yolanda, who claimed to be pregnant. Then, in October 1396, she successfully warded off an invasion by the count of Foix who sought to recover lands in Aragón for his wife, Juana, daughter of King Juan.

María remained active in government even after Martín's return. She worked toward the pacification of feuding factions in Valencia and Aragón, but the peace accords were not effective until 1407. One of her most enduring accomplishments was her intervention in 1402 on behalf of the *remensa* peasants of Catalonia. María appealed to her kinsman, the antipope

Benedict XIII, for a formal admonition of the harsh treatment of the peasants by the ecclesiastical lords. María's actions served as precedent for later settlements in the 1460s and 1480s. Deeply religious and an active proponent of arts and culture, María died in 1406 in Villareal (Castellón).

LUNA, PEDRO DE

Antipope under the name of Benedict XIII, born Illueca, Aragón, 1328; died at Peñíscola, Spain, either 29 November 1422 or 23 May 1423. He was elected pope 28 September 1394 and deposed at the Council of Constance 26 July 1417. He belonged to the de Luna family and was distantly related to Álvaro de Luna, constable of Castile. He studied law at Montpellier, where he obtained a doctor's degree and later taught canon law. On 30 December 1375, Gregory XI made him cardinal deacon of S. Maria in Cosmedin. As cardinal he returned to Rome with Gregory XI, after whose death in 1378 he took part in the conclave that elected Urban VI, for whom he voted. The conclave was attacked by the citizens of Rome. Later, he joined the other non-Italian cardinals at Anagni, where he became convinced of the invalidity of the vote for Urban VI. Pedro de Luna took part in the election of Robert of Geneva (Clement VII) at Fondi on 20 September 1378, and became one of his adherents, energetically defending his legality. When Clement VII died, Pedro de Luna was unanimously chosen on 28 September 1394 to succeed him. The choice of Cardinal de Luna was welcomed by the French court. His desire to put an end to the schism in the church, even if he had to renounce the papacy, was a strong inducement for the cardinals obedient to Avignon to vote in his favor. As he was only a deacon at the time of his election, he was made a priest, consecrated bishop, and enthroned as pope under the name Benedict XIII. Benedict XIII was highly esteemed because of his austere lifestyle and personal ability.

In 1396 an embassy, headed by three of the most powerful French princes, brought a resolution to Benedict that both he and Boniface IX, the Roman pope, abdicate. Benedict obstinately opposed the proposal, despite the fact that the cardinals at Avignon sided with the embassy. He insisted that personal negotiations between both popes was the only course to pursue

and clung tenaciously to his opinion. Like Benedict, Boniface IX, refused to hear of resigning, remaining as firmly convinced as Benedict that he was the legitimate pope. The schism in the church remained, while general discontent reigned in all Christian countries.

In 1398 Geoffroy Boucicout occupied Avignon and besieged the pope in his palace, but failed to take the papal fortress. Benedict was, however, obliged to deal with his enemies; in an understanding with his cardinals he pledged to renounce the papacy if the Roman pope would do the same. Nevertheless, on 9 May 1399, the pope protested that these stipulations were obtained by force. Benedict ensured that long negotiations ensued as to who would be the custodian of the pope in the palace at Avignon. On 12 March 1403, Benedict took flight from Avignon and reached safe territory. Avignon immediately submitted again to him and the cardinals likewise recognized him. His obedience was reestablished in all of France.

Benedict XIII pursued negotiations with the Roman pope, and in 1404 suggested to Boniface IX that they and both colleges of cardinals should meet at a mutually agreeable place to put an end to the schism. Boniface would have nothing of it. After the latter's death (1 October 1404), Benedict's envoys continued to negotiate with the Roman cardinals. These however elected Innocent VII on 17 October, who also refused all negotiations. When Innocent VII died in Rome on 6 November 1406, Gregory XII was chosen on 30 November as his successor. The latter wrote immediately to Benedict and announced that he was ready to abdicate on condition that Benedict would do likewise, and that afterward the cardinals of Avignon would unite with those of Rome for a unanimous papal election. Benedict replied 31 January 1407, accepting the proposition.

A meeting at Savona was planned for this purpose but never took place. Benedict went to Savona. Gregory failed to appear. Benedict's position worsened; on 23 November 1407, his principal protector in France,

Louis of Orléans, was murdered. Benedict no longer received revenues from French benefices, and when he wrote a threatening letter to King Charles VI, the latter tore it up. On 25 May 1408, the king declared France's neutrality toward both papal pretenders.

A number of cardinals belonging to both sides met at Pisa for the purpose of convening a universal council. Benedict XIII fled to Roussillon and called a council at Perpignan, which opened on 21 November 1408. Both popes were deposed at the Council of Pisa. The delegation that Benedict sent there arrived too late. In spite of this, the Avignon pope was still recognized by Scotland, Aragón, Castile, and the island of Sicily. Avignon was seized in 1411 for the Pisan pope (Alexander V).

Emperor Sigismund went to Perpignan on 19 September 1415, as a delegate of the Council of Constance, to urge Benedict to abdicate, but to no avail. A conference was held at Narbonne in December 1415, between the representatives of those countries who acknowledged Benedict. The conferees withdrew their obedience to Benedict on account of his obstinacy. Benedict retired to his family's castle at Peñíscola, near Valencia. An embassy from the Council of Constance failed to convince him to abdicate, and he was deposed by the council 27 July 1417. He never submitted, continuing to consider himself the only legitimate pope. He died at Peñíscola either 29 November 1422 or 23 May 1423. His remaining adherents elected a successor, Muñoz, who for a time continued the schism.

LYRIC See POETRY, LYRIC

M

MACÍAS

Macías is one of the earliest known *cancionero* poets of the late Middle Ages. As such, he wrote still very much in the vein of the Galaico-Portuguese lyric of the middle of the fourteenth century. Little of any certainty is known about him, although he appears to have been from Galicia in the northwest of the Iberian Peninsula and to have flourished between 1340–1370. His poetry, which received wide circulation through *cancioneros* especially in Castile during the fifteenth century, is dominated by themes of catastrophic love and sacrificial desire. As in the case of many of the earlier Provençal troubadours, the tragic incidents to which his poems refer led to the creation of a legend around Macías as a martyr to love. Don Pedro, Condestable de Portugal, Juan Rodríguez del Padrón, Hernán Núñez, and much later Argote de Molina, all recall dramatic anecdotes about him. These tell how Macías was slain by a jealous husband, who discovered the poet's love for his wife. Macías's fame as a martyr of romantic love extended itself into literature well beyond the fifteenth century. In both the early modern theater and nineteenth-century literature the legendary figure of Macías became synonymous with paradigmatic tragic lover. Lope de Vega made Macías the protagonist of his drama *Porfiar hasta morir*, and Mariano José de Larra was inspired to write a play titled *Macías* and a novel called *El doncel de don Enrique el Doliente* based on his celebrated exploits.

MADEIRA See EXPLORATIONS, PORTUGAL

MADĪNAT AL-ZAHRĀ

Madīnat al-Zahrā was founded in 936 by the Umayyad caliph ʿAbd al-Raḥmān III al-Naṣir (r. 912–961) approximately five kilometers east of Córdoba. It became the caliph's personal residence where he entertained a brilliant court of scholars and artists from al-Andalus and abroad. Built after he declared himself caliph in 929, the palace-city was larger and more magnificent than any of the earlier palaces in the environs of Córdoba. It was a huge complex with double-enclosure walls and extended across three stepped terraces carved from the foot of a gently sloping hill.

Of the four gates described by historians, the only one extant is the Bāb al-Sudda (reconstructed), located at the entrance to the Dār al-Jund (reconstructed), the military headquarters. With stabling for horses and a hall giving onto the corral, this quarter was a protective intermediary between the lower levels of the city and the upper level of reception halls and elite residences. Among the latter, a residence with rich stucco wall decoration has been identified as the Dar al-Mulk, or caliphal quarters; another elegant residence was distinguished by columned porticos facing a small garden with a pool and water channels.

The Salón Rico (reconstructed) was a handsomely decorated reception hall of three naves that looked out through a screen of marble columns to a large quadripartite garden (the first in western Islam) with paved walkways, pools, and a small pavilion. To one side were baths; on the other were service rooms and a ramp leading down to a second quadripartite garden on the lower level. Excavations and inscriptions indi-

cate that the Salón Rico was built in 953–957 and replaced older buildings. Near it was the congregational mosque (finished 940–941), distinguished by its square minaret placed to one side of the axis leading to the *mihrab*, its double *qibla* wall, and its prayer hall of five aisles separated by marble columns bearing arches. A second mosque in the southwest corner of the city (unexcavated but evident in aerial photographs) probably served the soldiers of the barracks there. A mint, zoo, aviary, fish ponds, prison, and factories are mentioned in medieval histories. The histories' detailed accounts of the materials used, numbers of workers and occupations, and their salaries provide an extraordinary glimpse into the organization of a medieval Islamic construction site.

The palace-city was continually built during the reign of ʿAbd al-Raḥmān III and the reign of his son and successor, Al-Ḥakam II (961–976). Subsequent revisions during the reign of Hishām II (976–1009 and 1010–1013) were, it seems, not for expansion but to confine the young ruler when his regent, Al-Manṣūr (Muḥammad ibn Abī ʿAmir, also known as Al-Manṣūr) seized control. When Al-Manṣūr built his own palace-city, Madīnat al-Zāhira, west of Córdoba, the political importance of Madīnat al-Zahrā waned. During the civil war of 1010–1011, both palaces were sacked and destroyed, and ultimately their whereabouts forgotten. Nonetheless, Madinat al-Zahrā retained its reputation as an splendid architectural ideal and, despite its short life, was the progenitor of subsequent palaces such as the Alhambra.

Madīnat al-Zahrā was rediscovered in the mid-nineteenth century; excavations began in 1910; today about 10 percent of the buildings have been unearthed.

MADRID

The name Madrid derives from the Celtiberian word *Mageterito-Vadaluengo* meaning long ford. In heraldry from the twelfth to the end of the fifteenth century, it was represented as a she-bear on all fours, and from the end of the fifteenth to the beginning of the sixteenth century as a standing she-bear leaning against the right side of a tree.

Initially a modest village in New Castile, Madrid is centrally located and well situated on a steep slope

of the Manzanares River with a healthy climate. In medieval times there was abundant water, forests for hunting major game, olive groves, and vineyards. The economy was rural and artisan; it obtained in 1447 two annual fairs, and in 1463, a free market and three regular ones. The population in the fifteenth century was approximately 2,500. Moors had fewer rights than Christians but they coexisted peacefully. The same was true for the Jews, except in 1392, when serious confrontations took place with Christians. The Jews were eventually expelled in 1492.

Madrid has many paleolithic remains, but there is little evidence of the Romans and Visigoths. It gained strategic importance (defending Toledo) with the coming of the Arabs; but was reconquered by Alfonso VI in 1085–1095. Madrid grew out from around its castle, which was destroyed in 1724, into two areas with walls in the ninth and eleventh centuries (there are some remains): the citadel proper (eight hectares) and the town (twenty-six hectares). In the fifteenth century, areas outside the walls were incorporated, and this doubled the expansion. Madrid has several gates: Santa María, Albega, De Moros, Cerrada, De Guadalajara, and De Balnadú, as well as narrow and winding streets. In medieval times the housing was generally poorly constructed. The principal monasteries were San Francisco, Santo Domingo, San Martín, and San Jerónimo. There are remains of Mudéjar culture in the towers of San Nicolás (twelfth century) and San Pedro (fourteenth century), as well as late Gothic remains in San Jerónimo, the front of the Hospital of La Latina, and buildings in La Plaza de la Villa.

The town's grammar school was founded by Alfonso XI in 13–16. The works of the writers Alvarez Gato and Ruy González de Clavijo (fifteenth century) were well known. There was a special devotion to Santa María of Atocha and to Isidro Labrador (canonized in 1622). During the civil wars, Madrid supported Pedro I and Enrique IV; it delayed in recognizing Isabel I the Catholic as queen; and it was the meeting place of the *cortes* (parliaments) in 1309, 1339, 1391, 1393, and 1433. It continued to litigate with the municipality of Segovia and with the church hierarchy in Toledo.

Administratively, Madrid was organized as "la Villa" and its "tierra" (outlying territory). The villa was divided into ten districts: Santa María, San Andrés, San Pedro, San Miguel de los Octoes, San Justo, San Salvador, San Nicolás, San Juan, San Jacobo, and San Miguel de la Sagra. The outlying territory (almost the size of the current province) was organized into three large districts called *sexmos*: Vallecas, Villaverde, and Aravaca. They belonged to the crown except for a short period (1383–1393) when they were under the feudal authority of Leon V of Armenia, who was living in

exile in Castile. It was governed by a *fuero* (municipal code, established in 1202) and its corresponding *Carta de Otorgamiento* (1219). In total, there were 110 precepts on criminal law, legal procedure, and municipal law (the codex still exists, in thirty-two folios). Alfonso X gave Madrid (1262) a *fuero real*. In 1346 Alfonso XI named a fixed number (twelve) of town council members. In 1480 Madrid was influenced by legislation approved by the Cortes of Toledo, whose intention was to strengthen municipalities.

MADRIGAL, ALFONSO FERNÁNDEZ DE

Eminent theologian, canonist, and philosopher known also as *El Tostado*. He was born in Madrigal de las Altas Torres around 1410 and died at Bonilla de la Sierra, Avila, on 3 September 1455. Madrigal was educated at the Colegio de San Bartolomé of the University of Salamanca, of which he later became rector. He studied Greek, Latin, and Hebrew from an early age. Madrigal received the title of *maestro* in 1432 and then studied theology from 1432–1441, when he was conferred the title of master of theology. Madrigal occupied the chair in poetry in the faculty of arts at Salamanca and, most probably, the one in moral philosophy as well. In addition, he held the chair in biblical studies in the faculty of theology. During his career, he was also canon of the cathedral and finally chancellor of the university.

By the time Madrigal was twenty-five he had acquired the reputation of a polymath and sage. He wrote commentaries on Aristotle and Thomas Aquinas and, at one point, fell under the influence of Scotus in theology later to return almost entirely to Aquinas. On the whole, his work was notable for its originality and independence of thought. He was invited to participate in the Council of Basel but failed to do so. Rather, he went to Siena and presented twenty-one propositions to Pope Eugene IV, three of which displeased the pontiff greatly. The latter dealt with absolution of sin and the date of Jesus' death and were censured by the bishops of Reggio and Ancona. Eugene IV ordered Cardinal Juan de Torquemada, an eminent Castilian theologian, to challenge Madrigal on these points. Madrigal responded to Torquemada with his *Defensorium trium propositionum*, made public after Madrigal's death.

Disillusioned by his experience at the curia, Madrigal returned to the Carthusian monastery of Scala Dei in Catalonia with the desire to become a monk. He became a novitiate there on 16 January 1444 and stayed only until 11 April of that year, when Juan II called him to Castile to serve as a counselor at court. After his return to Castile, Madrigal, who was the author of numerous vernacular works, wrote several opuscles like the *Tratado por el qual prueva como al home es necesario amar*, which became influential in the debates centering on Aristotelian naturalism and love carried out among the intellectual circles associated with the University of Salamanca during the second half of the fifteenth century. These debates had a profound influence on the evolution of vernacular imaginative literature during that period.

When Madrigal returned to Castile and established himself at court, Juan II appealed to the pope that he name Madrigal bishop of Avila, which he did on 11 February 1445. Madrigal's elaborately sculpted tomb, with its inscription referring to him as *stupor mundi* (marvel of the world), is in the cathedral of Avila.

MAHOMAT EL XARTOSSE

The heading to the only poem by Mahomat el Xartosse to have survived (*Cancionero de Baena* no. 522, "Preguntador de cara pregunta") describes him as a Moor (that is, Muslim), formerly physician to Diego Hurtado de Mendoza, the admiral of Castile (d. 1405), and as being from Guadalajara (one of the few places in Castilian territory at that time where Arabic medical science continued to be transmitted in Arabic). His 168-line *respuesta*, one of seven to a *pregunta* by Ferrán Sánchez Calavera (or Talavera) was criticized by Juan Alfonso de Baena for its failure to respect the rhyme scheme of the *pregunta*. (It is only fair to add that of the six others to participate in this literary debate, only three poets did manage to adhere to the rules, among them the great Pero López de Ayala; three did not, among them Francisco Imperial.) Mahomat's handling of the subject, free will versus determinism, is praised by Baena as "very subtle." In such distinguished liter-

ary company, Mahomat acquits himself well, but the poem is an isolated curiosity from which it would be unwise to draw general conclusions.

MAGIC See WITCHCRAFT

MAIMONIDES

Likened by more than one medieval Jewish writer to the prophet Moses (“From Moses to Moses there was none like Moses”), Moses ben Maimon (correctly, Maimūn) was born in Córdoba not in 1135, as is usually assumed (and so the 850th anniversary was universally celebrated in 1985) but in 1138, where he was educated and began writing his first works.

His father, Maimūn, was a *dayan* (religious judge) of the Jewish community of Córdoba, and a student of the great Joseph ibn Megash, and himself author of some responsa and “Letters of Consolation” meant to strengthen the Jews in the face of the Almohad persecution. It was due to this that the family left Spain around 1160, settling first in Fez, Morocco, and then briefly in Palestine. From there they went to Egypt and settled at Fustat, a suburb of Cairo, where Jews were allowed to live. The twin tragedies of the death of his father and then his brother David devastated the young scholar, who had to support himself and his family by becoming a doctor and court physician to the *wazīr* (prime minister) and his son. Never did he convert, or even appear outwardly to do so, to Islam, as a long-discredited legend maintains.

Within a few years he had become by reputation the most famous physician of the Muslim world. At the same time, his reputation in Jewish learning, established already by his brilliant commentary on the Mishnah, was growing. Questions poured in from all parts of the world. Working almost entirely from memory, and under the most difficult conditions imposed upon him by the demands of his medical practice, he composed in clear and simple Hebrew the *Mishneh Torah*, a work in fourteen volumes that encompasses the whole of Jewish law. This work quickly became the

accepted authority for Jewish law, the only such composition ever written by someone who was not a rabbi.

Nevertheless, there were critics. First, he had not cited his sources, and although sources have been found for virtually every statement, lesser scholars had difficulty in accepting some of his rulings. Second, there were disagreements in some cases as to the rulings themselves. Finally, certain religious zealots who lacked training in philosophy objected strenuously to his philosophical notions, contained both in his commentary on the Mishnah and in the legal code. The situation worsened when he wrote his great philosophical work, *Dalālat al-bā’irīn* (*Guide for the Perplexed*). Clearly intended only for those with the necessary preliminary background of rigorous study, the book was translated twice from Judeo-Arabic into Hebrew and thus soon fell into the hands of those without such background. Its clear denial of such fundamental popular beliefs as miracles, creation in time, resurrection, and so forth combined with allegorizing of many biblical and rabbinic statements, gave rise to charges of heresy. The result was a controversy that lasted in Spain and Provence for hundreds of years, and actually led to Jewish-inspired condemnation and burning of the book at Montpellier around 1232.

In spite of the philosophical controversy, Maimonides continued to be revered as a legal authority throughout the Middle Ages in Spain and elsewhere. Even those who disagreed with him, such as Nahmanides and Ibn Adret, cite him constantly and respectfully. Communities, such as Tudela, enacted decrees according to which only his rulings were to be followed; similar decisions were made throughout North Africa and Yemen.

No less important was his impact on Christians in Spain. In Aragón-Catalonia, various kings ordered translations of the *Guide* and even of the *Mishneh Torah*. Philosophers in Spain (and, of course, the scholastics in general) who were influenced by him include Poncio Carbonell (fourteenth century) and, more important, Alfonso de la Torre (fifteenth century). Sancho, son of Jaime I, archbishop of Toledo (1266–1275), and Archbishop Gonzalo García Gudiel (1280–1299) both possessed copies of his work. In the fifteenth century, Pedro Díaz de Toledo, possibly a *converso* (Jewish convert to Christianity), made a Spanish translation of the *Guide*.

Maimonides died in 1204, and tradition maintains that his grave is near Tiberias.

MĀLIKITES

The administration of justice in Muslim society was originally in the hands of the rulers and was often delegated to warriors and politicians. As the new Muslim society acquired a more permanent and more complex status, and as new laws (and reinterpretation of old ones) became necessary, the duties were increasingly delegated to others, who in this way became a special class—the jurists (*fuqahā'*) of Islamic law.

Already under the Umayyads there was a preoccupation with maintaining the revealed law. Under the 'Abbasids, and coinciding with the study of its theological and philosophical aspects, the study of revealed law also began to shape its technical interpretation. The result was four main schools of legal thought: Hanīfite, Mālikite, Shāfi'ite, and Hanbalite, thus named by their founders. Each became predominant in various parts of the Islamic empire for social as well as political reasons. In their scope, the schools extended beyond the legal interpretation of Muslim law to encompass liturgical and even social behavior. The interpretations of law could also have had political implications, so the *fuqahā'* achieved at times extraordinary power.

Although other schools had their followers, in al-Andalus, Mālikism achieved such an importance, and often even official endorsement by the rulers, that it is generally identified with Andalusian Islam, and more concretely as a sign of Andalusian traditional conservatism. A major factor in this acceptance, however, was also political, most specifically the victory of the 'Abbasids in the east over the Umayyads in Syria, and the enduring animosity that Andalusian Umayyads felt toward the 'Abbasids.

Against the philosophical principles—analogy (*qiyās*) and preference (*ijtihād*)—introduced in the interpretation of law by the school of Abū Hanīfa, which was favored in the east, Al-Awzā'i (d. 795), a Syrian, defended more traditional interpretations. From this conflict a new school grew formed by Mālik ibn Anas (ca. 715–795), who insisted on a strict adherence to the Qur'ān and the traditions (*ḥadīth*, *sunna*), with the help of the principles, general consensus (*ijmā'*) and communal interest (*istislah*).

Andalusian Umayyads, suspicious of the the 'Abbasids, preferred the more conservative Syrian interpretation. The introduction of Mālik's doctrine in al-Andalus is attributed by some Arab historians to the time of Emir 'Abd al-Raḥmān I (756–788). It became predominant during the reign of Hishām I (788–796)

because of the favored position he granted to Yaḥyā ibn Yaḥyā al-Laiyṭhi, one of Mālik's students.

During the Almoravid period, Mālikism tended to include more than just legal scholarship. The school's most eminent scholars were Ibn Ḥazm and Abū al-Walīd Muḥammad ibn Rushd, grandfather of the philosopher Averroës.

As the threat from the Almohads began to appear in Africa from about 1125 onward, the Mālikites supporting the Almoravids felt compelled to attack their leader, Ibn Tūmart. The Almohads tried at first to do without the Mālikites, who, for a time, lost most of the political favor they had previously enjoyed. However, the new lords soon recognized that they needed the Mālikite jurists and the population they represented.

Andalusian Mālikism did not help the formation of a real school of legal thought in al-Andalus. Rather, Andalusian jurists preferred to follow the solutions already provided by noted Mālikite scholars in their manuals, to the point of a narrow-minded exclusivism. With them, an excessive reliance on the school tradition was established by the great jurists that took precedent over the study of the Qur'ān and the *sunna*, *ḥadīth* tradition as Mālik had established it. As a consequence, this school became repetitive and ritualistic even to the point of neglect of direct study of the texts.

MALLORCA, CONSTANZA DE

An early fifteenth-century manuscript (Biblioteca de Catalunya, *Cançoners Vega-Aguiló*, 7) includes a poem attributed to the queen of Mallorca (modern-day Majorca). The poet is believed to be Jaime III's first wife, Constanza, daughter of Alfonso IV of Aragón. Her family was very literary: her great-grandfather, Pedro III of Aragón, her grandfather, Jaime II of Aragón, and her brother, Pedro IV of Aragón, wrote poems in Provençal, as did Constanza herself. Constanza was born in 1313, married in 1325, and died in 1346, two years after her husband lost his kingdom to her brother.

Her poem begins with a declaration of her lover's perfection and her total devotion for him. She then expresses her desperation at his being away in France: "I fear the yearning and great desire I have for you will kill me, my sweet dear lord, and I may soon die

for you, whom I love and want so much, if I do not see you return to me soon, for I miss the embraces, the talk and all.” She sounds like a woman addressing her lover, but at the end says: “Grace, my husband, that I spend my time enduring the suffering you have given me, you should return, for no treasure is worth a heart dying for you in loving thought.”

It has been considered surprising that Constança does not seem to follow the conventions of courtly love. However, most women writers knew better than to imagine they were the dominant parties in their love relationships with men and did not show themselves in that light, particularly if they were married. In addition, an entire genre, the earlier Galician *cantigas de amigo*, concerns women who lament the absence of their lovers. In a limited way, Galician poetry became known in fourteenth-century Aragón, and this poem is a *cantiga de amigo* of sorts. Thus, a woman at the crossroads of regional traditions, the queen of Mallorca composed a poem in Provençal with a Galician topic, appropriate to the circumstances of a lonely wife. Her rather original work must have become known to some extent, since the first part of it was reproduced with modifications in a 1429 Catalan translation of the *Decamerone*.

MALLORCA, KINGDOM OF

The Balearic and Pitiusan Islands in the western Mediterranean include Mallorca (3,640 square kilometers), Minorca (702 sq. kms.), Ibiza (541 sq. kms.), Formentera (82 sq. kms.), and assorted other islets. In the Middle Ages these islands were the commercial and to some degree cultural crossroads of the western Mediterranean, and, whether under Muslim or Christian domination, were coveted by the Catalans, French and southern French, Italians, and various North Africans. Conquered by the Muslims in the year 902—the same year Sicily was conquered by Muslims from Tunis—when troops of the emir (later caliph) of Córdoba invaded the islands, Mallorca was, after the collapse of the caliphate, joined to a peninsular landmass which included Denia, Alicante, Cartagena, and Murcia. For a brief period (1075–1115) Mallorca constituted an independent Islamic state, but this independence fell to a combined Pisan and Catalan crusade led by Ramón

Moorish art, 1229 A.D., from the Palacio Berenguer de Aguilar, Spain. Fresco: The Conquest of Mallorca—detail showing city fortifications. Copyright © Werner Forman/Art Resource, NY. Museu d'Art de Catalunya, Barcelona, Spain.

Berenguer III. Unable to sustain a serious effort at colonization, the Pisans and Catalans departed, and the island was peaceably reconstituted in 1116 under the Muslim control of the Banu Ghaniyah who ruled in the name of the Almoravids. The Ghaniyah resisted the Almohads, even attacking and capturing Bougie and Algiers in 1185, but the Almohads nevertheless prevailed and conquered Mallorca in 1203. The final years of Muslim domination of the island were under a *wālī* (governor) appointed from Marrakesh.

The kingdom of Mallorca was founded by Jaime I, king of Aragón, who led a fleet of 150 ships and 1,300 knights on an official crusade, accompanied by the papal legate Cardinal Jean d'Abbeville, to the island in 1229. Victories were won by the Christians on 12 and 13 September, and by 15 September the city of Mallorca (Present day Palma) was under siege by land and sea. On 31 December, as retold in the king's own autobiography, the crusaders successfully stormed the walls in a bloody assault that led to widespread slaughter and enslavement of Muslims. By the spring of 1230 the eastern sections of the island had been overrun, and in 1231 and 1232 Jaime returned to the island for final operations in the more mountainous northern and western sections of the island. In 1231 Jaime successfully negotiated tribute and homage from the Muslims of neighboring Minorca. Jaime sold the right to conquer Ibiza to Nunyo Sanç, lord of Roussillon and Cerdagne, and to a Prince Pedro of Portugal; he later reallocated this right to Guillem de Montgrí, sacristan of Girona cathedral and archbishop-elect of Tarragona; the three completed the conquest in the summer of 1235.

Jaime's first and most lasting act as king of Mallorca was to oversee the land division. By right of conquest the king received half of the land of the island, principally Montuiri in the southeast, Sineu-Petra in the center, Artà in the northeast, and Inca, Muntanyes and Pollença in the north, and half of the houses, workshops, ovens, and baths in Mallorca City. The *repartiment* or land division that survives describes the subdivision and distribution of this royal half. The major beneficiaries of royal largesse were nobles such as Ramon Alemany, Ramon de Plegaman, Guillem de Claramunt, and members of the Montcada family; various religious orders, especially the Knights Templar, who were endowed with land in Mallorca City and in Inca and Pollença; and a very large number of small proprietors from Barcelona, Marseilles, Tarragona, Lérída, and Montpellier. Little is yet known about the subdivision of the seignorial lands that comprised the other half of the island, but Nunyo Sanç controlled Bunyola and Valldemossa, the count of Ampurias controlled Muro and Sóller, the bishop of Barcelona Andratx, and the viscount of Béarn controlled Canarossa in the center of the island, including the key castle of Alaró. Jaime specifically constituted Mallorca as its own kingdom; despite his enormous pride in the conquest and his new kingdom, he subsequently returned there only once, briefly in 1269 while planning a crusade to the Holy Land, before his death in 1276.

When Jaime's only heir from his first marriage died in 1260, the royal patrimony was divided in two: his eldest surviving son Pere was to receive Valencia, Aragón, and Catalonia, while his son Jaume was to receive the Balearics, Roussillon, Cerdagne, and Montpellier. Jaume II of Mallorca ascended the throne in 1276, though he was forced to pay homage to his brother in 1279. The kingdom of Mallorca (or, occasionally the "Mallorcas," or the Balearics) refers only to the Mediterranean islands and not to mainland holdings; Jaume II was king of Mallorca, count of Roussillon and Cerdagne, and lord of Montpellier, and the three disparate entities, correctly identified as the Crown of Mallorca or the lands of the Crown of Mallorca, were only linked via the monarchy. After Jaume sided with the invading French against his brother in the political crusade of 1285, Pere vowed to conquer the Balearics in retaliation, but fell ill and died shortly after setting out from Barcelona in November 1285. His heir Alfonso III of Aragón continued the expedition, recapturing Mallorca and Ibiza for the Aragónese crown; in January of 1287 Alfonso conquered Minorca, whose Muslims had supposedly advised coreligionists in North Africa of Aragónese troop movements on the eve of the War of the Sicilian Vespers. In 1298 Jaime II of Aragón, successor to Alfonso III

after 1291, returned at papal insistence the Balearics to his uncle Jaume II of Mallorca, who had held on to his southern French lands and ruled from the royal palace of the kings of Mallorca at Perpignan, as a part of the agreement that would eventually bring the War of the Sicilian Vespers to a close.

Mallorca's greatest period of prosperity dates from this second and final period of its independence: the years when the kingdom was ruled by Jaume II for a second time (1298–1311), by Sanç of Mallorca (1311–1324), and by Jaume III of Mallorca (1324–1343). In 1343 Pedro IV of Aragón permanently reincorporated the Balearics into his crown, and Jaume III died in 1349 on the battlefield at Lluçmajor in an attempt to reclaim his patrimony. Jaume III's son Jaume IV married Joana of Naples, invaded Roussillon in 1374, and died in 1375. If the royal house of Mallorca reached a sad and dismal ending with the deaths of Jaume III and Jaume IV, and the subsequent pretensions of Jaume IV's sister Isabel, the separately constituted kingdom of Mallorca, with its own laws and customs, and even its own coinage, would endure well beyond the end of the Middle Ages. The elaborately illuminated codex of *Palatine Laws*, now housed in the Royal Library of Brussels, gives a detailed glimpse of the Mallorcan royal household and administration during the reign of Jaume III; the *Ordenacions* of Pedro IV of Aragón are a Catalan collection closely modeled on this earlier Mallorcan antecedent.

Mallorca's strategic position in the Mediterranean made it of great significance in the commercial networks of Catalan and Italian merchants. The Balearics are almost equidistant between Barcelona and Algeria, and Catalan trade with Bougie and Tunis blossomed after the conquest. The Genoese had signed treaties with Islamic Mallorca in 1181 and 1188, and they were quick to work out agreements with the new Christian rulers of Mallorca after the conquest. Pisans and later the Florentines maintained active interests in Mallorca, and like the Genoese occasionally became permanent residents; Francesco Datini, the celebrated merchant of Prato, had notable ties with Mallorca in the years around 1400. Mallorcan port registers show 617 foreign ships visiting the island in 1340, and Mallorcan merchants themselves were as active and acquisitive as the foreign merchants who visited the kingdom. Some 261 Mallorcan merchants are documented as trading with North Africa in the years 1308 to 1331; in addition to Mallorcan consulates being located in ten North African ports, they are found in the early fourteenth century in Seville, Málaga, Granada, Naples, Pisa, Genoa, Constantinople, and Bruges. Figs, raisins, honey, almonds, and olive oil were exported from Mallorca, as was cheese from Minorca and salt

from Ibiza. Slaves were both imported and exported from the Balearics in large numbers throughout the Middle Ages.

Mallorca's main cultural contributions are intimately linked to its Jewish and Muslim minorities. The city of Mallorca, and later Inca, in the center of the island, possessed sizable Jewish populations; these included Arabic-speaking Jews who the Christian conquerors found upon their arrival, and both Arabic-speaking Jews fleeing Almohad persecution and Romance-speaking Jews from French and Catalan lands who were actively encouraged to settle on the island. Numerous royal charters to Mallorca's Jews have survived; they confirmed their right to buy and sell land, property, and slaves, to engage in a wide variety of trades, to establish separate court systems and a communal system of tax collection, and to freely practice their religion. The fate of the Muslim population of Mallorca island after the conquest is unknown; it seems likely, however, that many were enslaved, the wealthy perhaps purchasing their freedom and right of emigration to North Africa. Many Muslims remained as semifree tenant farmers, but records indicate that many of these accepted baptism and became Christians. Although there was not only a sizable Muslim slave population but also a population of free and foreign Muslims on the island, there is no record of Muslim communal organization or judicial or religious officials.

The post-mystic and missionary-philosopher Ramon Llull was born on Mallorca around 1232, learned Arabic from one of his Muslim slaves, and, despite a peripatetic existence, wrote many of his several hundred Catalan works while resident on the island. Llull assisted, with the support of Jaume II of Mallorca, the Franciscans in founding at Miramar on the northwest coast of Mallorca a school of Arabic studies—similar to Dominican establishments at Játiva, Tunis, and elsewhere—for the training of missionaries. The school did not, however, survive into the fourteenth century. Mallorca city was also the site in 1286 of a disputation between Mallorcan Jews and a Genoese merchant by the name of Inghetto Contardo. The Latin transcript of this disputation survives in two editions printed in Venice in 1524 and 1627 and at least seventeen manuscript copies, but only recently has it received a critical edition and scholarly attention. One of the more enigmatic Catalan writers of the late fourteenth and early fifteenth centuries is Anselm of Turmeda, a Franciscan on Mallorca, who as a result of a spiritual crisis moved to Tunis and converted to Islam. Mallorcan cartographers in the fourteenth century were among the best in Europe, and some of these were Mallorcan Jews, such as Abraham Crescas,

whose celebrated Catalan Atlas of the World (1375) is in Paris, or *conversos*, converts to Christianity, such as Abraham's son Jahuda or Jafuda Crescas, later known as Master Jaume of Mallorca.

There is a tendency in Mallorcan historiography to attribute its comparative decline in the late fourteenth century and throughout the fifteenth centuries to its return to the Crown of Aragón. The case may be overstated in some of the historiography, especially of a local variety, and the causality certainly unproven, but the correlation between Aragónese governance and decline would appear to be empirical. Mallorca was hit hard by the Black Death of 1348–1351, suffered recurring demographic setbacks, including a further visit from the plague in 1440, and did not recover its 1329 population until 1573. Although the city of Mallorca built a beautiful new *lonja*, or trading exchange, between the years 1426 and 1456, Mallorcan shipbuilding and merchant enterprise were becoming eclipsed by activity in Barcelona and Valencia. The endless Catalan and Genoese naval war of the fourteenth century exacted a toll, and Muslim piracy and its threat would plague the Balearics well into the early modern era. Some wounds were self-inflicted. Mallorca city was one of several Iberian cities that witnessed violent pogroms against Jews in 1391, yet Mallorca's Jews played a far greater role in trade and the Mallorcan economy than Jews did in many of the other cities. Although several hundred Portuguese Jews settled on the island in the 1390s and some Mallorcan Jews returned from North Africa following 1391, the entire Jewish community was converted en masse in 1435. Soon after the creation of the Spanish Inquisition a tribunal was established in Mallorca. Civic conflicts between the elite who controlled Mallorca city and the smaller towns of the island were constant throughout the fifteenth century and erupted into a civil war in the years 1450–1453.

MANRIQUE, GÓMEZ

The fifth child of the *adelantado* (governor) of León, Pedro Manrique, and Leonor of Castile, Gómez Manrique was born in Amusco (Palencia) around 1412. (He was probably named to honor the memory of his uncle who died late in 1411.) He tells us in his *cancionero* that his formative years were spent in the household of his older brother Rodrigo for whom he had deep affection and respect and with whom he engaged in several military campaigns. Caught up politically in the tumultuous years of the reigns of Juan II (1406–1454) and Enrique IV (1425–1474), Manrique sided with his brothers and their extended families, ultimately supporting Enrique's brother Alfonso, and then his sister Isabel, as legitimate heirs to the throne. His active support of the marriage of Fernando and Isabel, and thus of the alliance of Castile and Aragón, was clearly instrumental in his being appointed *corregidor* (magistrate) of Toledo, a post he held for some fourteen years until his death in November 1490.

Gómez Manrique's fame is usually based more on his reputation as a man of letters than as a politician. After the deaths of Juan de Mena (1411–1456) and of Manrique's uncle, Íñigo López de Mendoza, the Marqués de Santillana (1398–1458), Manrique gained a lasting reputation as one of Castile's most respected poets by completing Mena's already lengthy but unfinished *Contra los pecados mortales*. And in Manrique's elegy on the death of Santillana—the man in his words who first “congregó la ciencia con la cauallería, e la loriga con la toga” (joined science with chivalry, and the lorica with the toga.) (*El planto de las virtudes*)—he sets himself up as the messenger through whom poetry will lament the loss of his friend and relative whose poetic talent excels even that of Dante. Although Manrique's efforts to assume the mantle passed on by Mena and Santillana is articulated through his references to his own unworthiness, his goal is unequivocal even as he tries to pass off this grave responsibility to the oldest and most famous writer of the time, Fernán Pérez de Guzmán.

Manrique's poetry can be roughly divided into work composed before and after the deaths of Mena and Santillana. His early poems are almost indistinguishable from those of his contemporaries: *canciones*, *cartas de amores*, *apartamientos*, *preguntas y respuestas*, *estrenas*, *quejas y comparaciones*, and *glosas*.

Often larded with courtly love imagery and themes, riddles and allegories, he characterized them late in life simply as *trobos*: “solía hazer en un día quinze o veynte trobas sin perder sueño.” (I used to compose fifteen or twenty poems in a day without losing sleep.) He came to realize that his emphasis on the technical aspects of poetry (verse form, rhyme scheme) did not make him a *poeta* as defined by Mena and Santillana; serious poetry demands transcendental themes. His production of didactic and moral works rose sharply when he began to concentrate on Christian life and death. His elegy on the death of Garci Laso de la Vega (around 1455) consoles the living by finding solutions in the afterlife: Garci Laso gains immortality because he was killed by fighting the Muslims in the service of king and God. Manrique reminded Fernando and Isabel, in his *Regimiento de príncipes* (around 1469), that political turmoil and bad government are the result of misguided kings and their counselors. Most *consejeros* “corren tras sus apetitos/con consejos lisonjeros/no buenos, mas voluntarios.” (Run after their appetites/with flattering advice/not good, but voluntary.) Only by fearing God and following Christian virtues (justice, prudence, charity, temperance, and fortitude) can kings sustain their earthly powers: “es a saber, que temáis/príncipes esclarecidos/aquel Dios por quien regnáis,/amándole, si deseáis/ser amados y temidos.” (Take note, you should fear/enlightened princes,/that God for whom you reign,/loving Him, if you wish/to be loved and feared.) Manrique's poems about consolation and civic behavior are built on examples from the past. Pagan examples are mentioned only to be discarded in favor of biblical precepts, and a poet's true reputation is based not on knowledge and book learning but rather on Christian wisdom and faith.

Manrique's moral and didactic motives reappear in his *Representación del nacimiento de nuestro señor* (1468), a liturgical play written at the request of his sister, the abbess of the convent of Calabazanos. The play opens with Joseph's suspicion and disbelief at his wife's unexpected pregnancy. His moral blindness can be healed only by divine intervention and by witnessing the faith of uneducated shepherds who come to worship the new king. The tortures through which the child will later pass as a man to death and resurrection constitute a visible portrait of the world's temporal and deceptive nature, and emphasize the certainty of life after death. Manrique's humanism, based principally on the reading of a Christianized Seneca and of biblically inspired treatises, is reflected in that poetry that constitutes his lasting reputation.

MANRIQUE, JORGE

The reputation of Jorge Manrique (ca. 1440–1479) has long rested principally upon his *Coplas por la muerte de su padre*, most familiar to English-speaking readers through Longfellow's translation. His poetic range extends, however, beyond the serious mood of the *Coplas* to a wide variety of compositions found in the late medieval and fifteenth-century *cancioneros*, in which Manrique demonstrates a fluent handling of the current

verbal and conceptual conventions of the genres and categories involved. These include personal satire and various approaches to conventional amorous themes, among them verses in which a lady's name is conveyed acrostically, and renderings of the traditional motif of love as a siege (*Escala de amor*), a castle (*Castillo de amor*), or membership of a religious order (*Profesion que hizo en la orden de amor*). Critical evaluation of Manrique's verse has concentrated primarily upon the *Coplas*, but the importance of his other writings is now generally recognized.

Jorge Manrique's life was marked by active involvement in the politics of his day and their military extension. His family was prominent in the turbulent events of the reign of Enrique IV; his father Rodrigo (1406–1476), count of Paredes and a master of the Order of Santiago, was involved in the abortive elevation of the puppet-king Alfonso against Enrique (an event alluded to in the *Coplas*). To Jorge fell the role of maintaining this involvement in the next phase of the succession dispute, and, having actively espoused the cause of Fernando and Isabel he was fatally wounded in a minor action.

The military aspect of Manrique's career fundamentally marked his poetry; his work stands comparison with that of any war poet of any period. Imagery drawn from the experience and equipment of medieval warfare abounds even in the amorous poems (it is, indeed, the very foundation of *Escala* and *Castillo*, while isolated images occur in other poems), and permeates the *Coplas*, where death is expressed in terms of an ambush and an arrow, against whose force the strongest fortifications and armies are powerless and ineffective. The tournament panoply of the warrior caste (among other dimensions of its courtly existence such as music and dancing) is richly evoked in the poet's examination of the meaning of life. For Manrique, war is a necessary element in existence: the noble's duty is to fight for his faith against its enemies (just as that of the priest is to pray), and by doing so he merits salvation. His father, Rodrigo, is praised for his effectiveness in this sphere, and his entry to paradise is, as a result, taken for granted in the idealized deathbed scene that closes the poem. But Rodrigo is also commended by the poet for his part in the civil wars in support of the legitimate candidate for the throne, and also for fighting fellow-Christians in the maintenance of his own status and domains. The political aspect of his career is thus an essential element in the poet's eulogy of his father Rodrigo's greatness. In this Jorge Manrique is merely reflecting the importance attached to *estado* (state) and to the behavior appropriate to one's rank, in contemporary thinking; beyond mere physical existence lies a further dimen-

sion of *fama*, the existence implied in one's reputation, which survives after death; this itself is, of course, a poor second to eternal life, though an essential prerequisite for it in so far as it indicates a worthy life. In addition to the doctrinal statements made and political points scored in the poem, various conscious statements of literary attitude are explicit, as in the rejection of traditional poetic invocations and classical examples in the *Ubi sunt?*, while others remain implicit. Although the *Coplas* have been widely praised, and is indubitably in many respects a masterpiece, problems have been noted in various aspects of the poem from the earliest commentators to the present. The *Coplas* make use of a wide range of traditional imagery drawn from the Bible and other sources in addition to the author's military experience, with the transience of earthly life and the inevitability of death being conveyed in a densely textured series of metaphors. The skillful updating of the topos of the *Ubi sunt?* by reference to politically prominent persons of recent memory is but one dimension of Manrique's artistry in handling traditional concepts and poetic commonplaces. The eulogy of his father (apparently controversial among early commentators, and ignored by most glossators) draws upon classical archetypes and established medieval concepts of hierarchy and makes effective use of the personification of death.

Despite the prominence traditionally assigned to the *Coplas* in Spanish literary studies, the first truly critical edition (which is likely to become the standard text) was not published until 1991; the many previous editions vary, because of problems in the complex transmission of the text, both in the number of stanzas (forty or forty-two) and in their order. The stanza that begins "Si fuesse en nuestro poder," in particular, has been variously placed as number seven or thirteen; the earlier location is undoubtedly the original. The additional two stanzas found in many early editions (and in Longfellow's translation) are problematic; they do not form a natural part of the poem. Their attribution to Manrique remains questionable; even if ultimately proven to be by his hand, they are best viewed as originally independent stanzas that later became an accretion to the *Coplas*. During the sixteenth century, the *Coplas* were frequently printed, and private manuscript copies further attest their popularity. It is clear that the poem circulated in a wide variety of forms and contexts. Important among these are the early printed editions in which the text is accompanied by a poetic gloss; the *Coplas* soon attracted the attention of glossators, the earliest of whom was Alonso de Cervantes (first printed in 1501).

MANŞÜR, AL-

Ibn 'Abī Āmir, later known as Al-Manşūr, was the last of the great rulers during the caliphate period in al-Andalus. Initially he served as vizir, virtually assuming effective control of the caliphate after the death of Al-Ḥakam II, who appointed his young son Hishām to succeed him in 976. Allegedly acting on Hishām's behalf, Al-Manşūr eliminated all who wished to compete for power, including his father-in-law Al-Ghālib, securing it all for himself. Al-Manşūr remained in power from 976 to 1002 and was feared and noted for his decisive action, vigilance, and ruthlessness; it was in 981 that he assumed the sobriquet (*laqab*) Al-Manşūr, "The Victorious."

The caliph Hishām, who was a virtual captive of Al-Manşūr, was a weak individual who allowed his weaknesses to be exploited. A brilliant politician, Al-Manşūr filled the political vacuum created by the death of Hishām's father, Al-Ḥakam II. He ruled with an iron hand, galvanizing the army and leading daring incursions into Christian territory that struck terror into the hearts of the northern populations. His name alone was enough to make them shudder with fear. As a response to the Christians who, sensing disunity among the Muslims in al-Andalus, had begun to make their first incursions into Muslim territories, Al-Manşūr led some fifty expeditions against the Christians. In 997 he struck at their very heart, taking Santiago de Compostela, the alleged burial place of the apostle James. When he entered Santiago the town was all but deserted, except for a Christian monk whom Al-Manşūr allowed to go free. Although Al-Manşūr rode his horse into the cathedral to show his contempt for Christianity, the tomb of the apostle was not disturbed. He destroyed all the surrounding buildings and took the bells of the cathedral back to Córdoba both as booty and as a sign of humiliation. He converted the bells into lamps for the mosque, where they remained until the thirteenth century. Besides warrior and statesman, Al-Manşūr was a poet and a builder,

and he expanded the Great Mosque of Córdoba. A devout religious man, he publically abjured philosophy and science by burning the books in Al-Ḥakam II's library that dealt with these subjects, and always carried with him a Qu'rān that was copied out in his own hand. Whenever the name of Allah was uttered in his presence, he never failed to repeat it. If tempted to act in an impious way, he was reputed always to have resisted temptation. Nevertheless, he was known to have enjoyed all pleasures—even wine, which he failed to renounce until two years before his death.

In 991, virtually ignoring Hishām, he made his eighteen-year-old son 'Abd al-Mālik chamberlain, and later designated 'Abd al-Mālik as his successor. Al-Manşūr died in 1002 while on an expedition against the Christians. His other son, Al-Muzaffar, succeeded him, but died six years later. Al-Muzaffar was briefly succeeded by his brother, 'Abd al-Rahmān, known as Sanchuelo, who conspired to grasp the title of caliph for himself. The death of Al-Manşūr was followed by a crisis of authority and struggles among his family; Hishām II, the grandson of 'Abd al-Rahmān III, who was incapable of ruling; and several other contenders, including Al-Mahdi, who eventually seized power. Al-Manşūr's biography, *al-Ma'āthir al-Āmiriyyah* was written by Husayn Ibn 'Āsim at the end of the eleventh century.

MANUEL I, KING OF PORTUGAL

Born at Alcochete on 31 May 1469, died in Lisbon on December 13, 1521. Manuel was the ninth child of Fernando (1433–1470), the second duke of Viseu and first duke of Beja, and Beatriz (1430–1506), the daughter of João (1400–1442), son of King João I. Manuel was the grandson of King Duarte, great-grandson of João I and the brother of Leonor (1458–1525), wife of João II. His ascent to the throne was the result of accidental circumstances. The unexpected death of Afonso, the heir of João II, created a problem of succession. João II tried hard to have Jorge de Lancastre, his illegitimate son by Dona Ana de Mendonça, accepted as his successor, but he faced vigorous opposition from the queen. In his will he left the throne to his cousin and brother-in-law. Manuel had shown total loyalty to João II and never rebuked him for the death of his brother Diogo, involved in a plot against the king.

In 1497 Manuel married Isabel, daughter of Fernando and Isabel of Spain and widow of Prince Afonso; she died in childbirth the following year. In 1500, Manuel married her sister, Maria, who gave him eight children, including the heir to the throne, João III. Widowed in 1517, he married Leonor, sister of Charles V, who had been previously promised to his son João.

When Manuel I came to power he found a centralized state that was the work of his predecessor, he had only to consolidate what had been done to achieve royal absolutism. The measures agreed to at the *cortes* (parliament) of Montemor-o-Novo, in November 1495, put public administration under the direct control of the crown. On the other hand, he invited the nobility that had sought political asylum in Spain at the time of João II to return, and changed the conditions that had kept the Jews in a state of slavery. In 1496, however, to satisfy Isabel and the Catholic Monarchs, he decreed that all Jews who refused baptism had to leave the country or lose their property and lives. Yet, before the time for their departure expired, he had them all converted by a royal decree. By the law of 4 May 1497, he forbade all enquiries into the beliefs of the converted and by the royal order of 1499 prohibited them from leaving the kingdom. Manuel I was not interested in losing the Jews but wanted them to lose their juridical identity. This identity was ignored in the *Ordenações Manuelinas*, the royal civil law code.

Manuel inherited from his predecessor all plans and preparations for overseas voyages; he had only to implement them. In 1497 he sent Vasco da Gama on a voyage to India, which he completed successfully when his ships put in at Calicut on 20 May 1498; the sea route to India had been discovered. In 1500, Manuel ordered a larger fleet, under the command of Pedro Álvares Cabral, to establish commercial relations with the East and show off the power of Portugal in view of the difficulties Vasco da Gama had encountered. Cabral followed a longer route to the southwest and discovered Brazil on 22 April 1500. He proceeded then to Calicut, but Muslim hostility made him move to Cochín, where he was allowed to establish a factory. Yet his bombardment of Calicut had stiffened Muslim resistance to the Portuguese presence in the area. The armadas of Vasco da Gama and Dom Francisco de Almeida, sent out respectively in 1502 and 1503, had the purpose of imposing Portuguese control over the Indian Ocean. But these expeditions proved costly. The problem was temporarily solved when Afonso de Albuquerque occupied key positions in the Indian subcontinent by conquering Ormuz (1507), Goa (1510), and Malacca (1511). He promoted intermarriage between the Indians and the Portuguese, laying the foundations for a durable empire. During the reign of Man-

uel I Portuguese expansion reached its peak and arts and letters flourished with the spirit of the New Age. The Manueline style in architecture, characterized by exuberant maritime motifs, produced masterpieces such as the monastery of Jerónimos in Lisbon.

MANUSCRIPT ILLUMINATION

The terms *illumination* and *miniature* are equivalent in the modern terminology of the art historian, and both refer to paintings in manuscript texts. Strictly speaking, *illumination* alludes to the use of gold leaf in the painting, and this technique is quite uncommon in the Iberian Peninsula, or at least in Castile.

The first great age of the Spanish miniature is the Mozarabic age, principally during the tenth century and the beginning of the eleventh century, and which reached a splendor with no known equivalent in the Visigothic era notwithstanding the Asturian and Isidorean cultural achievements of the period. Beginning with Gómez Moreno, the term *Mozárabe* has been applied to the manuscripts in Castile and León supposedly written and illuminated by Christians under Muslim rule. Starting with Camón Aznar, this style has also been called the “art of repopulation,” implying that its characteristics are similar not just to Muslim artistic contributions, but also to Christian art of the same period. Compared to Carolingian art, which was implicated in an extensive renovation of ancient classicism, Mozarabic art (with some exceptions) seems to be situated in the margins of older artistic legacies. There are certain undeniable Islamic traits, including the frequent use of the horseshoe arch and the existence of Abbasid imagery such as the image of the woman on horseback (with the cup of the world in her hand). Its profound originality is its most notable characteristic, and it is rooted in an aesthetic radically different from classical art, with very linear form and stylized, abstract drawings. The works display a radical bidimensionality that makes few concessions to illusionism and applies strongly contrasting and deeply expressive coloring.

The *Biblia Hispalense* (Madrid, Biblioteca Nacional, MS. Vit. 13–1.), written in Seville around 900, is the earliest Mozarabic codex. In its miniatures two styles contrast, resulting perhaps from two distinct

stages. The date cited above would apply to the atypically illusionistic paintings that accompany the canons of Luke and John (f. 278), portraying the animal heads of the two evangelists in a classic style. The images of the prophets Micah (f. 161) and Nahum (f. 162v.) were painted around 988, displaying an abstract, distorted two-dimensionality typical of the Mozarabic style.

The *Biblia del año 920* (MS. 6, now in the Cathedral of León) was prepared in a Leonese monastery under the direction of a monk named Vimara, but was written and illustrated by Iohannes. Along with smaller decorations, the work’s illustrations include full page miniatures of a fully developed Mozarabic style. In the St. Luke miniature (f. 211), for example, the evangelist appears encircled by five colored discs that frame his distorted face, which in a daring metamorphosis gradually changes into the body of a bull, St. Luke’s symbol.

The most characteristic Mozarabic miniatures are the illuminations of the *Beatos*, the name given to the manuscripts copying the “Comentarios al Apocalipsis” of Beato of Liébana. Given their importance for Spanish art throughout time and their international renown, the *Beatos* are studied separately in this encyclopedia.

Continuing in chronological order, another important manuscript is the *Moralia in Job* (Madrid, Biblioteca Nacional, MS. 80), a work of great artistic importance that sets it apart from the numerous manuscript versions of this famous text: the commentaries on the Book of Job written by Pope Gregory the Great at the request of San Leandro of Seville. The illuminator, Florentius, signs his name on a beautiful page accompanying an abstract miniature in the style of a tapestry. The “Majestas Domini” (f. 2) portrays a Christ amidst angels holding the book of life, and uses intense yellow hues that stand out from the vivid red background.

The *Biblia del año 960* (León, Colegiata de San Isidoro, MS. 2) is a magnificent work signed by two monks, Florentius and Sanctius, who appear in the miniature on the last page of the book (f. 514, marked with the Greek letter *omega*), toasting each other for having finished the work. The numerous miniatures that illustrate this work are inserted into the text in two ways. Some are displayed without a frame to separate the figures from the texts. Others, more developed, are situated within a frame that accentuates the illustration’s beauty and pictorial value.

Aside from Bibles and the *Beatos*, the most numerous and representative manuscripts, other works deserve mentioning. The *Códice Albeldense* (Escorial, MS. d.I.2.), a collection of canon law texts, was finished in 976 in the Navarrese monastery of San Martín de Albelda by a scribe named Vigila. One of its miniatures (f. 142) contains an image that alludes to the

Toledan councils: Toledo, the regal city, appears up high, and although it culminates in typical medieval battlements, the miniature lacks the horseshoe arches and the vivid color schemes associated with Mozarabic illumination. In folio 428 a miniature with nine panels displays the portraits of six important figures: three Visigothic monarchs in the top level, starting with Chindasvinto; three contemporary Navarrese kings in the middle; and the three authors of the manuscript—the scribe Vigila, his partner Sarracinus, and his disciple Garsia—at the bottom. The *Códice Emilianense* (Escorial, MS. d.I.2.) is a similar work, finished in 994.

The *Antifonario Mozárabe* (Cathedral of León, MS. 8) was written for the abbot Ikila by the copyist, abbot Totmundo—the date of the work has long been disputed, but is now considered to date from the tenth century. Its renown stems mostly from its musical notation, which has not yet been possible to transcribe, and from its extremely valuable text, containing all of the pieces of the Visigothic-Mozarabic liturgy that were sung. Its miniatures are excellent works produced by the school of the painter Magio (also the author of the *Morgan Beatus*), although they are more worthy because of their imagery and their appearance in an *antifonario* (antiphonary) than because of their pictorial quality.

A *De Virginitate Mariae* of San Ildefonso (Florence, Biblia Laureniana, MS. Ashb.17.), written in Toledo in 1067, contains only one miniature—it depicts the Annunciation and employs a style notably archaic for the late eleventh century.

In the Romanesque period, manuscripts can be divided into three chronological subdivisions. Among representative works of the early Romanesque period are two Catalan Bibles written and illuminated in Ripoll. Through a series of misadventures, these works passed through the possession of various monasteries, with one (*Biblia de Roda*, Bibl. Nationale, MS. lat. 6) eventually landing in Paris and the other (Bibl. Vaticana, MS. lat. 5728) in Rome. These works are of exceptional importance for the history of the Catalan and European miniature, despite the fact that neither has been completely preserved. There is significant iconographic similarity between the two works, implying that they both descend from a common antecedent. In terms of both imagery and stylistics, the works display traits similar to previous Carolingian manuscripts, and are quite different from other Castilian or Leonese works.

In the kingdom of León, a royal scriptorium established to serve the imperial ambitions of Fernando I and doña Sancha produced a *Diurnal* o *Libro de Oraciones* for the royal couple (Biblioteca de la Universidad

de Santiago de Compostela, MS. Res.1), as well as a *Beatos* (discussed in a separate article). Written in 1055, the *Diurnal* seems to reflect the economic glory of the kingdom after the progress of the reconquest in the south, as well as the new ties with trans-Pyrenean Europe. Folio 3 depicts the two monarchs standing beneath solemn curtainry; between them is a figure holding a book. This person has been variously interpreted as the scribe Fructuosus and as King David, the author of the Psalms that appear in the text.

In the high Romanesque period (1075–1150), the most important works are the Castilian-Leonese *Beatos*, studied in a separate article. Among other significant works is the *Biblia de 1162* at the Colegiata de San Isidoro de León (MS. 3), which is a copy of the Mozarabic Bible of 960 that is preserved in the same collegiate church. This text is one of a long series of Castilian Bibles written in Latin that reach the thirteenth century preserving Visigothic and Mozarabic traditions. Its numerous miniatures, though copied from the previous text, are adapted to the Romanesque style and display other novel qualities. In Santiago de Compostela two exceptional works were illuminated in the same period. The first is the *Tumbo A* of the cathedral of Santiago, a *cartulario* (cartulary) containing privileges granted to the cathedral between 1125 and 1255. In an early stage, the illuminator produced twenty-four images of monarchs and other royal figures. The king appears as a donor, seated on a throne with a majestic attitude, and is surely influenced by Carolingian or Ottonian models. The portrait of Fruela II (f. 11) is notable for its pliant, flexible style; Fernando II's image (f. 44v.) gives rise to a new iconographic type, with the king mounted on horseback. This miniature also occupies the whole page, the bottom of which displays a heraldic lion with the royal shield. The portrait of Fernando II belongs to the late Romanesque period (or the Romanesque in transition) and in its style a new Byzantine naturalism is apparent. The *Codex Calixtinus* is another important work produced in Santiago during the high Romanesque period. It contains beautifully decorated capital letters that are representative of one of the most creative aspects of the Romanesque. It also contains several miniatures. Its style recalls English works connected to the *Psalter of Saint Albans*.

The late Romanesque or Proto-Gothic period occurs around the year 1200, when a wave of Byzantine influence explodes in Europe, with varying intensity according to the place. In Castile and León the *Beatos* enjoy a final moment of glory, and two Bibles also stand out.

The *Biblia de Burgos* (Burgos, Biblioteca Pública del Estado), produced in the scriptorium of San Pedro de Cardeña between 1190 and 1200, is one of the most

remarkable examples of the Romanesque miniature in Spain, despite the fact that it only contains two miniatures, both of considerable size. Both the Epiphany (f.8 v.) and the Genesis cycle (f.12v.) are of great iconographic originality. The *Biblia de Avila* (Madrid, Bibl. Nac. MS. Vit.15–1) contains an initial Italian section to which was added a Spanish part. The Spanish section's miniatures are of a strong expressionism recalling the paintings of San Justo of Segovia.

The *cartularios* (cartularies) of this same period are of great aesthetic significance. The *Libro de los Testamentos* (Archivo de la Catedral de Oviedo) was commissioned by Pelayo, the bishop of Oviedo, to try to save the Oviedan diocese from considerable decadence. Its eight large paintings have been considered some of the most beautiful miniatures of the Spanish Romanesque. They were created by a visionary artist with a very personal style who used beautiful and diverse colors, creating a few figures that are completely expressionistic.

The *Libro de las Estampas* (Catedral de León, MS. 25) contains seven preserved miniatures that portray the kings who bequeathed their legacies to the cathedral. The enthroned figures are represented in a Byzantine, classicist style. The *Obras de Santo Martino* (San Isidoro de León, cod. 11) are of a similar style, with beautifully illuminated capital letters and a sizeable portrait of the author.

The *Biblia de Lérida* is a remarkable Aragónese work (Archivo de la Catedral), with handsome ornamental initials depicting battles between men, animals, and fantastic beings. The work was likely produced in a scriptorium in Calahorra. In Catalonia, two cartularios stand out: the *Liber feudorum maior* (Archivo de la Corona de Aragón, ms. 1) and the *Liber feudorum certaniae* (Archivo de la Corona de Aragón, MS. 2). The first is the masterpiece of Catalan illumination of the period, with two particularly notable miniatures: one (f.1) portrays the compiler of the documents, Raimundo de Caldes, before king Alfonso I.

In the Gothic period (1225–1500), as in the Romanesque, the miniature employs various styles.

In this encyclopedia a separate entry is dedicated to the Alfonsine miniature, given its fundamental role in Hispanic illustration in the late Middle Ages.

The kingdom of Castile achieved artistic preeminence in the thirteenth century through the works of Alfonso X, which are characterized by an authentic aesthetic experimentalism and by other exceptional qualities. In Aragón, the existent miniatures show a clear French Gothic style, especially in the backgrounds, which are dominated by golds, reds, and blues and decorated with white dots. The figures are cast in curved lines characteristic of the period. The *Vidal*

Mayor (J. Paul Getty Foundation, Malibu, California, Getty Museum, Ludwig XIV 4) seems to have been illuminated by a talented Catalan, Aragónese, or French artist at the service of King Jaime I, who appears in the first miniature of the book (f. 1), accompanied by members of his court, in the act of commissioning the compilation of the *fueros* of Aragón to Vidal de Canellas, bishop of Huesca. The most opulent miniature (f.72v.) portrays the enthroned king, with the sword of justice in hand, presiding over a group of common people and public officials. The marginalia or *drôleries* of the work are particularly remarkable, shooting off from the capitals to form sketches with elements of humor and of plant life. In Castile, marginal decorations only appear in the Alphonsine *Lapidario*, though in the same period the phenomenon is evident in the Bolognese schools and on both sides of the English Channel.

In the fourteenth century the Castilian miniature cultivated a linear Gothic style influenced by the French, except for a very few number of works that expand on the Alphonsine style. One group of texts attributed to King Alfonso XI contains two juridical manuscripts that are different versions of the same document, the *Ordenamiento de Alcalá*. Both manuscripts are decorated with elaborate miniatures: the version in the Escorial (MS. Z.III.9.) contains two full-page miniatures with marginal decoration; the other, in the Biblioteca Nacional de Madrid (MS. Res 9) is more modest, but does contain a portrait of the enthroned Alfonso XI with a scepter and a globe in each hand, both symbols of power linked together, in my opinion, in the king's concept of monarchy as a contract supported by the court. Both manuscripts were written by Nicolás González, who also produced the masterpiece of Castilian illumination of this period, the *Crónica Troyana* (Escorial, MS. h.I.6.). With more than one hundred miniatures, many of them occupying the whole page, this codex echoes the French and Italian traditions of illuminating literary texts about the Trojan War. Compared with the uniquely Castilian character of the Alphonsine miniature, both in textual and stylistic terms, the *Crónica Troyana* is a rich, sumptuous work derived from European sources. There are no allusions in its miniatures to Islamic imagery, unlike the *Cantigas* and other manuscripts of Alfonso X, and the style is linear Gothic. The history of the ancient Greeks and Trojans is interpreted by Gothic heroes in a Gothic setting, while in the Alphonsine works there was a conscientious effort to revive ancient astrological and mythological themes. The land and sea battle scenes are very decorative, as are the visions of the besieged city of Troy, depicted with brightly colored walls.

The Italo-Gothic style, influenced by *Trecento* Italian painting, is fully expressed in Catalonia, both in the miniature and in panel painting. The Maestro de los Privilegios, who worked for the monarchy in Mallorca during its brief period as an independent kingdom, was one of the most talented illustrators. His most important work is the *Llibre del Privilegis* (Archivo Histórico de Palma de Mallorca), containing a miniature in which Jaime I appears in a majestic vision surrounded by his court, receiving the crown from two angels while another two play music. The same painter illustrated the *Leyes Palatinas de Mallorca* (Brussels, Bibliothèque Royale, ms. 9169) as well as a series of works on panels. Ferrer Bassa introduced the Italian style to Catalonia; he was famous for his murals in Poblet, and recently the *Horas de María de Navarra* (Venice, Biblioteca Marciana, MS. lat.1.104/12.640) have been attributed to him, though others have suggested that they are the work of the Maestro de San Marcos (creator of a famous altarpiece) or of Arnau Bassa, Ferrer's son. The most famous work of this artistic group is the *Salterio Anglocatalán* (Paris, Bibliothèque Nationale, MS. lat.8846). Illumination of the work began in Canterbury around 1200, but it was finished in Catalonia in the fourteenth century; these two stages are evident in both the style and the iconography of the work.

In Castile the Italo-Gothic style is introduced through Gerardo Starnina, a Florentine painter who came to Toledo at the end of the fourteenth century. We know very little about the extent of this style's influence in Castile, because the contemporary manuscripts of the cathedral of Toledo remain incomplete. In the *Siete Partidas* (Bibl. Nacional, MS. 12.793), an extraordinary Last Judgment (folio 7) demonstrates a style clearly derived from the Italian *Trecento*.

Illuminated manuscripts intended for Spanish Jews, such as certain Bibles and the *Haggadot*, are studied separately in this encyclopedia along with other Jewish art.

The international Gothic style of the early fifteenth century was most successful in Aragón. In Catalonia the most eminent work is the *Breviario* of King Martín I the Humane (Paris, Bibl. Nat., MS. Rothschild 2529); the setbacks associated with the process of the work's production are well documented, and the work was completed by Martín's heir, Alfonso V the Magnanimous. The illustrations from Martín's period resemble the Parisian manuscripts of the Valois in their use of calendar iconography, but in terms of style, the work alternates between Parisian and Catalan influences. The most famous work of the international Gothic in Catalonia is the *Misal de Santa Eulalia* (Archivo de la catedral de Barcelona, cod.116), the mas-

terpiece of the painter and illuminator, Rafael Destorrents. Its Last Judgment (folio 7) expresses incredible refinement. With a rather original format, the illustration occupies every bit of the four margins, leaving the text in the center. The Glory of the upper margin is painted in luminous tones that gradually get darker and darker toward the bottom of the page, where the depths of Hell are represented. The codex also has eighteen exquisitely illuminated initials—the Annunciation stands out especially.

In Mallorca, the illuminated atlases and *portolanos* are of note, particularly the *Catalán Atlas* (Paris, Bibl. Nat., MS. Espagnol 30), produced around 1375.

The Crespí family dominated the scene in Valencia. Domingo Crespí was the author of a *Llibre del Consolat del Mar* (Archivo Municipal de Valencia). His son Leonardo produced the Valencian masterwork of the period, the *Salterio-Libro de Horas de Alfonso V el Magnánimo* (London, British Museum, MS. add.28962). This rich work contains several types of illustrations and employs original imagery, especially in the "Oficio de Difuntos" (Office of the Dead), whose central figure is Death riding an ox and shooting his arrows at the living, a fairly uncommon variation on the Dance of Death.

In Castile, the International Gothic is concentrated in two cities, Toledo and Seville. Around 1430, a Maestro de los Cipreses illuminated numerous choirbooks for the cathedral of Seville; he might be identified as a Pedro de Toledo who worked in the cathedral during those years. The beautiful miniatures of this work are characterized by their winding drawings with background landscapes of cypresses: two of the especially remarkable miniatures are the images of King David (Libro 44, f.21) and the Virgin with Child (Libro 4, f.20v.). The same artist collaborated in the illustration of a *Biblia romanceada* (Escorial, MS. I.1.3.) along with another master of inferior quality. The Maestro de los Cipreses is attributed with the representations of the death of Absalom (f.184v.) and the story of Samson (f.149v.); the other artist, who is in my opinion comparable to the master of the altarpiece of D. Sancho de Rojas (Museo del Prado), is attributed with, among other miniatures, the stories of Noah's Ark and the Sacrifice of Isaac.

The most famous Castilian work of the fifteenth century Gothic is the *Biblia de Alba* (Palacio de Liria, Madrid, MS. 399), whose fame is rooted above all in its text, translated from the Hebrew to Romance by a rabbi in Guadalajara at the request of Don Luis de Guzmán, a great *maestre* of the Order of Calatrava. It contains 334 miniatures of variable quality and of a clear Toledan style: the prologue indicates that once

the text was written, the codex was brought to Toledo to be illuminated. Gutmann believes that the Christian tradition is very strong in the miniatures, and that the work found more inspiration in Christian works than in Jewish ones, a theory opposing the thesis defended by Nordström in his monograph.

Two other works exist from the Toledo school, both written on paper instead of parchment. Despite their inferior quality, these texts contain highly original illustrations. The *Castigos del Rey Don Sancho* (Madrid, Bibl. Naci., MS. 3995) is a moralizing work whose first miniature depicts the enthroned Salomon before the kneeling King Sancho, all in a high quality chiaroscuro. The *Décadas de Tito Livio* (Madrid, Bibl. Nac., MS. Res.204) were illustrated by a naive but expressive artist who was especially adept at portraying scenes of cruelty, like that of Tulia driving her carriage over her father's body (f.16v.). Its thirteen full-page miniatures are, in my opinion, of great interest for modern aesthetics.

The Hispano-Flemish miniature (1450–1500) is still insufficiently known, but it seems that it reached considerable development in Castile. The two best-known works are of a literary nature and were produced for Enrique IV: the *Libro del caballero Zifar* and the *Libro de la montería*. The *Genealogía de los reyes de España* was likely written and illuminated for the same king. The most significant development of the period is the boom in liturgical works that were fashionable in Europe since the thirteenth century but only recently in Castile: breviaries, psalters, books of hours, missals, and choirbooks were also popular.

The *Libro del caballero Zifar* (Paris, Bibl. Nat. MS. Espagnol 36) contains 242 beautiful miniatures that are of particular interest because of the civil and military documentation they offer. The principal illuminator has been identified as Juan de Carrión, a prolific artist who signed the choirbooks of Avila and who merits more study.

The *Libro de la montería* (Madrid, Biblioteca de Palacio, MS.2105) is one of the existing copies of the famous hunting treatise by Alfonso XI, and was written and illustrated for Enrique IV, with Juan de Carrión creating the miniatures.

The *Genealogía de los reyes de España* (Madrid, Bibl. de Palacio, MS. Z-LI-2) is an elaborate work with eighty-two ink drawings that depict Spanish kings and princes from Atanórico to Enrique IV. Its precious and highly detailed style is unmatched in the field of the miniature and of painting in general.

The Catholic Monarchs promoted the production of various manuscripts that have yet to be studied sufficiently. The *Libro de Horas del Infante D. Alfonso* (New York, Pierpont Morgan, Library MS. 854) was

clearly commissioned by Isabel at the death of her brother, and though the work is not very elaborate, it applies original imagery, especially in the “Oficio de Difuntos” (f.161v.). Here, Death rides with the horseman of the Apocalypse, wounding with his arrows a cardinal, a bishop, a pope, a monk, and the already dead prince. Behind is a queen, possibly Isabel, dressed in white. The *Misal Vitrina* 8 of the Escorial has not yet been studied, and there is doubt as to whether the work is Spanish (which is Durrieu's opinion) or Flemish. Another *Misal de Isabel la Católica*, in the Capilla Real of Granada, was written in 1496 by Francisco Flórez for the queen, who appears in two portraits of the manuscript. Two breviaries are of interest: the *Breviario de Isabel la Católica* (Madrid, Bibl. Nacional, Vit.18–8), with several decorated letters; and the *Breviario del Escorial* (b.II.15), which displays the shields and emblems of the Catholic Monarchs and contains 115 miniatures. The choirbooks of the Capilla Real of Granada and of the cathedral of Badajoz also contain the shields of the Catholic monarchs. There are few illuminated works belonging to the Castilian nobility. Íñigo López de Mendoza, the Marqués de Santillana, used the painter Jorge Inglés as a miniaturist; Inglés participated in the *Conocimiento de todas las Cosas* (Madrid, Bibl. Nac., MS. 1197) and the *Fedón* (Madrid, Bibl. Nac., ms. Vit.17–4). The Zúñiga family commissioned numerous works, including Antonio de Nebrija's *Gramática latina* (Madrid, Bibl. Nac. MS. Vit.17–1).

Toledo played a significant role in the production of liturgical manuscripts—recently studied by Lynette M. F. Bosch—although the phenomenon was very closely connected to production in Avila and even Burgos. Especially notable among the monastic *scriptoria* was the monastery of Guadalupe, which specialized in the illumination of choirbooks. The majority of their fifteenth century choirbooks were sold in the sixteenth century and substituted with more modern versions.

MAQĀMA

The *maqāma* (pl. *maqāmāt*) is a classic Arabic narrative genre. The term is usually translated as “session” or “assembly.” The genre’s invention is credited to the Arabic-Persian author, Aḥmad Badī al-Zamān al-Hamadhānī (968–1008). His greatest successor, Abū Muḥammad al-Qāsim al-Harīrī al-Baṣrī (1054–1122) established the generic norm, followed—though often with radical modifications—by subsequent generations up through the nineteenth century. The *maqāma* came to be cultivated throughout the medieval Arabic

world and beyond, as a vehicle for Muslim and Christian writers alike, spreading all across North Africa, to the Maghrib and to Spain; it was also cultivated in Persian and Syriac, as well as in Hebrew by Hispano-Jewish authors. Taking Al-Hamadhānī's pathbreaking work as a model, the genre can be characterized as follows: The maqāmāt are written in rhymed and rhythmic prose, occasionally interspersed with verse. Each maqāma represents a separate episode or adventure; there is no temporal or spatial link between the different episodes; chronological sequence is unimportant; the narrative is essentially synchronic, rather than diachronic, and covers a wide variety of geographic milieus. The various maqāmāt achieve a certain unity in the usual—though not totally consistent—presence of a principal protagonist, a roguish, morally ambivalent character (Abū'l Faṭḥ al-Iskandarī), capable of unexpected and bizarre disguises and transformations, who, in one episode, may appear as aged, but subsequently be represented as youthful. The encounters with this protagonist are told by a narrator (ʿĪsā ibn Hishām). The maqāmāt are characterized by a concern with eloquence and word play, and with rare, recondite, multivalent, deceptive vocabulary; language is seen as essentially “misrepresentational.” Central to Al-Hamadhānī's narrative is the problem of deceptive appearances, the contrast between image and essence, the external and the internal; social corruption and preaching vs. practice; the problem of meaning; the world and the characters of the maqāmāt are essentially unstable. Free will vs. predestination is another basic concern (a Shīʿite vs. Sunnī polemic). Irony and parody, including parody of sermons and heroic narrative, are also crucial features. Reality in the maqāmāt is conceived as cyclical and ring composition is essential to the organization of individual episodes. Authorial intent suggests both entertainment and instruction, by combining serious and comic perspectives.

As the genre was taken up by later authors, the maqāmāt came to vary greatly in form, content, and artistic intent. The opposition between protagonist and narrator was often eliminated, the first becoming identified with the second. The maqāma sometimes came to be confused with other genres, such as the *riṣāla* (epistolary treatise) and the *ḥadīth* (multigenerational tradition of consecutive narrators). In Spain, the maqāmāt were much cultivated in both Arabic and Hebrew. The outstanding Arabic practitioner was Abū Tāhīr al-Ashtarkūwī al-Saraqustī (d. 1143), whose *Maqāmāt al-luzūmiyya* (*Double-Rhymed Maqāmāt*) is the only Hispano-Arabic example to embody the classic fifty episodes (on the model of Al-Ḥarīrī). Among important Hispano-Jewish authors are Yēhūdāh bēn Shēlō-mōh al-Ḥarīzī (1170–1235), who translated Al-Ḥarīrī

and also wrote his own *Sēfer Taḥkēmōnī* (Book of the Wise Counselor)—consisting of the traditional fifty maqa-īmāt—and Yōsēf bēn Mēʿir ibn Zabāra (ca. 1140) whose *Sēfer Shaʿāshū ʿim* (*Book of Entertainments*) is considered a masterpiece of the genre.

The putative influence of maqāmāt on Hispano-Romance literature is highly controversial. A number of parallels with Juan Ruiz's *Libro de buen amor*, perceptively pointed out by M. R. Lida de Malkiel, have, in general, not been favorably looked upon by contemporary criticism. Abundant analogies with Spanish picaresque novels may or may not reflect some genetic connection. No medieval translations of maqāmāt into Latin or Romance are known, though a thirteenth-century Arabic religious debate reveals a Christian monk well versed in the complexities of Al-Ḥarīrī's masterpiece.

MARCH, AUSIÀS

Valencian knight and poet (1397–1459). His uncle Jaume and his father Pere were both courtly poets and the latter bequeathed to Ausiàs the lordship of Beniarjó, a village next to Gandía. He attended Alfonso V the Magnanimous's court and took part in the royal expeditions to Italy as Jordi de Sant Jordi did. However, this link became gradually weaker after 1424, when he retired to manage his property. At this stage, he started writing a kind of personal poetry; Ausiàs's work consists of 128 poems (one, at least, of dubious attribution) that mostly follow the traditional verse pattern of Catalan post-troubadour lyric (stanzas of eight decasyllables), though he was the first to use a Catalan deprived of Occitan features as a poetic vehicle. This

outward ambivalence can be extended to many other aspects of Ausiàs's poetry. On one hand, there is a courtly love framework that would group a majority of his poems in cycles according to the *senhal* (*Plena de seny* and the biblical *Llir entre cards* are the earliest), although any hypothetical order is still controversial. Ausiàs, however, carries the tradition to extremes, mainly through self-awareness, and even argues against it to emphasize his ideas about honorable love. This struggle results in a range of limited situations, often expressed by means of broad analogies that draw on a variety of sources (moral literature and preaching, classical authors, Dante, and so on), so much so that, in fact, courtly commonplace turns into moral judgment of human nature and love, nearly always focusing rhetorically on the poet's unique condition. From this viewpoint the lady can either represent an ideal of wisdom or be blamed for her inability to love, and the poet, in turn, can temporarily dream of a heavenly human happiness, regret the weakness of the flesh or even reject openly any deceitful illusion (especially in the later cycle *Oh folla Amor*). Furthermore, on some occasions March explained his conceptions of love, virtue, and double human nature theoretically, via some elemental philosophical ideas of his time onto which he gradually imposed his own thoughts. In some measure, this aspect grew as he became older, and it eventually led to longer didactic verse compositions (*Cants morals*) in his last years. His splendid *Cant espiritual* and his *Cants de mort* give a complementary view of Ausiàs's tortuous thought. In the former he enacts a dramatic monologue with God to express both faith and doubt while reflecting that an interest in such theological points as predestination had arisen among learned laymen. The latter stress Ausiàs's spiritual concerns, as when he felt guilty after the death of his second wife Joana Scorna (1454). Thirteen manuscripts, five editions, and some translations into Spanish and Latin account for March's posterity. His ability to refurbish an ancient tradition and his claim for truth in poetry, both in a sentimental and moral sense, impressed his followers. Thus one should consider an early fifteenth-century Catalan Ausias Marchism different from the deeper influence he had on Castilian Golden Age poetry.

MARCH, PERE

Pere March (1336/7–1413) was a Valencian knight and poet who spent most of his life serving Pedro of Aragón, count of Empúries, and the latter's son, Alfonso, the marquis of Villena (and later the duke of Gandía). The influence of March's lineage as well as his merits as a warrior eventually brought him promotion to the post of Alfonso's general deputy (ca. 1370–1412), from which he mainly took benefit when given the lordship of Beniarjó, later inherited by his son, the great poet Ausiàs March. Much of Pere's poetry was written from 1372 on and reflects to a large extent both his responsibilities and Alfonso's interest in moral culture. In *Lo compte final*, after asking ironically for the reward he deserved, Pere reminds his lord of his father's exemplary ruling and ends by quoting a proverb of Cerverí de Girona. Like these precursors, March cast himself in the role of moral adviser and offered yet another poem in *noves rimades* to Alfonso (*L'arnès del cavaller*). This is a long didactic exegesis of the Christ-knight's *similitudo*, sometimes echoing preaching modes. Vices and virtues as well as precepts for ruling are also the subject of five of March's poems in *cobles*, in which he managed to turn moral commonplace into highly convincing verse (*Al punt c'om naix comensa de morir*). Apart from other minor poems, a second, perhaps earlier, aspect of March's work is provided by his *Plazer* and his narrative *Lo mal d'amor*. The former gives a lively outline of a range of activities in courtly life. The latter seems to be just a courtly epistle to advise a certain real lady who suffers from love, though, in fact, the framework and the poet's pretense to be an expert doctor hardly cover an adulterous act of seduction. This aspect, however, did not survive Pere as well as did the moral side, as we can see in his son Ausiàs's poetry.

MARGARIT I PAU, JOAN

Humanist historian and churchman, Margarit was born in Girona in 1422 and died in Rome in 1484. His father's family belonged to the minor nobility of the Ampurdán; his mother's family came from Roussillon, which contributed to his frontier mentality. Destined from an early age for the priesthood, he went to Bo-

logne to study law; in 1443 he got his doctorate. After five years as vicar general to his uncle Bernat de Pau, bishop of Girona, he returned to Italy and served as emissary between Alfonso V and the Vatican during the strife between Naples and Anjou. In 1453 he was nominated bishop of Elna, which he administered mainly as an absentee. From this moment his career as a politician began. On 16 October 1454, as a member of the *cortes* (parliament), he delivered his famous welcome address in Catalan to Juan II of Navarre, who was being sworn in as lieutenant general of Catalonia. Eventually he returned to the Vatican as the royal representative when Juan became king of Aragón in 1458. He delivered a public address on the arrival of the Aragónese embassy on 12 August 1459 at the Congress of Mantua to discuss the crusade against the Turks. There were few positive results for the pope, but Margarit may have met major Italian and Spanish scholars there. He returned to Catalonia to collect the tithes for Pius II's ill-fated plan of crusade and became involved in the preliminaries to the Catalan civil war. Rewarded for his services to the crown with the bishopric of Girona, he found himself defending the inner redoubt of that city, to which Queen Juana and her young son, the future Fernando the Catholic, had fled against the army of the Generalitat. They escaped, but in June 1469 the city eventually capitulated to French forces, allies of the rebel Catalans. Two years later, Margarit declared his support for the crown as Juan was advancing from the south. The king rewarded Margarit by making him chancellor, and the bishop served the king loyally until his death in 1479. Fernando reappointed him chancellor and sent him back to Italy as a roving ambassador to the Italian states, traveling between Ferrara, Venice, Naples, and Rome. During these negotiations he received his cardinal's hat at Sixtus IV's last creation; he died shortly after on 20 November 1484. Margarit was a typical product of cultural relations between Italy and Catalonia during the humanist period; he wrote normally in Latin. *Templum Domini* was a pamphlet on the relations between the church and the state, provoked by events during the civil war. He also dedicated to Fernando an educational treatise, the *Corona Regum*, structured around the names of precious stones. His best-known works are on early history, *De origine regum Hispaniae et Gothorum* and *Paralipomenon Hispaniae libri decem*. The latter was first published by Elio Antonio de Nebrija's son Sancho (Granada, 1545) and represents a significant advance in the treatment of pre-Gothic Iberian Peninsular history through an intelligent use of recently translated Greek texts. The copy of Ptolemy's *Geography* bearing his arms is preserved in the Sala-

manca University library. His own library was dispersed after his death.

MARINEO SÍCULO LUCIO

Humanist, letter-writer, historian, and grammarian, Marineo (Luca de Marinis, Lucius Marineus Sículus; ca. 1444–1533) was born near Catania, Sicily, a subject of the Crown of Aragón. He studied in Rome and Palermo, and taught in Palermo from 1479 to 1484, when Fadrique Enríquez de Cabrera, son of Almirante Alfonso Enríquez, brought him to Spain. Appointed to one of the new chairs of humanities in Salamanca in 1484, overlapping with Pedro Mártir and Elio Antonio de Nebrija, he taught poetry and oratory and attempted to revive the use of Latin. He never met Nebrija, who disliked all immigrant scholars, and eventually moved to the royal household at Toledo where he acted as tutor to young nobles, one of whom was Juan Boscán. To further his career he took holy orders and was given a benefice by Fernando V; upon the king's death he became chaplain to Carlos V. His published collection of letters (Valladolid, 1514) contains 250 of his own and 150 from his friends. It was the first of its kind in Spain and aimed at promoting a high standard of informal epistolography in Latin. These letters may have reached figures of importance, but his closest friends do not seem to have risen above the secretarial level. It is not surprising that he was sensitive about his learning, sycophantic to his superiors, and dismissive of those that did not care for his view of culture. His *De laudibus Hispaniae* (1491) was a characteristic eulogy of Spain and its most famous inhabitants, with particular reference to Salamanca. As a result he received a commission from King Fernando to write a biography of his father Juan II of Aragón at the same time that Gonzalo García de Santa María received his. The patronage of Alfonso de Aragón, archbishop of Zaragoza, and others led to a series of historical works, like *De genealogia regum* (Zaragoza, 1509) on the kings of Aragón, and an account of the reign of the Catholic Monarchs that was never published separately, but subsumed with other items in his major work, *De rebus Hispaniae memorabilibus opus libris XXII comprehensum* (Alcalá de Henares, 1530), dedicated to Carlos V. The geographical introduction was the most extensive yet for any Iberian Peninsular his-

tory, and it branched out into new topics, like the Spanish language of past and present. Marineo is not, on the whole, an impressive figure, but he is typical of the period, the expatriate scholar, living by commissions, and a contributor to the propaganda campaign supporting the achievements of the Catholic Monarchs.

MARRANOS See CONVERSOS

MARRIAGE AND DIVORCE

Marriage in the Middle Ages was a contract negotiated between two families, an institution rather than a companionship. On the average, women married at sixteen and men at nineteen years of age, though much earlier ages were legally acceptable. Many young people were bound to each other by means of a formal betrothal if they were over the age of seven. The church's sanction was not necessary at the time of the betrothal, thereby revealing the contractual nature of this step. Children could not commit themselves to matrimony without parental approval. Although free to refuse their parents' choice, they had to choose between marrying a mate chosen against their will or living life disinherited. The *Siete Partidas* recognized that a parent might be mistaken or might have delayed marriage beyond reasonable expectations and ruled that children were not deserving of such harsh treatment.

Having chosen a spouse for one's child, the father arranged the exchanges of dowry, or *arras*, which served as a guarantee that the marriage would take place. With this exchange, the bridegroom and his family assigned a part of his belongings or future inheritance to his prospective bride. In some cases, especially in the late Middle Ages, the girl would also bring her marriage portion, or *dote*, to the marriage. These possessions would be administered by the husband, but they would always legally belong to her and would be hers to use as she wished if widowed. Her widow's settlement would also include any future inheritances as well as her share of future gains made by the couple, including movable and immovable goods. The amount given as dowry varied greatly, not just between classes but also depending on where the couple lived. Already

in the *Fuero Juzgo*, just the giving of *arras* was well controlled by law: in this code, one-tenth of a man's belongings were to be exchanged. These would revert to the man or his relatives should she not produce children. Customary law dictated that in Castile, one-third of his possessions be granted to her whereas, in León, one-half was given. The legal literature is explicit, requiring different payments depending on the bride's social origins and previous marital status.

Marriage, second only to feudal loyalties, formed the cornerstone of medieval society. Great care, therefore, was dictated in the choice of a spouse. In the case of royal daughters, for example, the *Siete Partidas* emphasized four principal characteristics: lineage, beauty, comportment, and wealth. These were no doubt sought by all fathers of marriageable children. Kings could well afford to list wealth as fourth and last; other fathers probably put higher value on that attribute.

Fathers usually arranged the marriages of their children, but the decision was to be mutually pleasing to both parents. If the father had died, the mother assumed this duty. Brothers or uncles took charge of orphans. In the case of other nobility, the king or other high-ranking nobles often arranged the marriages of the children of their vassals. The church at the time was flexible regarding the marriage ceremony, which was still not solidly established as a sacrament. Clandestine marriages, to which there were no witnesses, were considered valid. As a legal obligation, established practices later were given sacramental connotations. Just as the king was consecrated and the knight initiated in a religious ceremony, so too was marriage sanctified and given spiritual value.

Most impediments to marriage grew out of established local customs. The more obvious impediments concerned the mistaken identity of people, lineage, social class, religion, and—in the case of a supposed virgin bride—previous sexual activity. Weddings performed under duress were not considered valid, nor were marriages to impotent men or to the insane. Incest was strictly forbidden as were marriages in which there existed a kinship closer than the seventh degree and, after the Fourth Lateran Council in 1215, from the fourth degree. This included relatives by marriage, as well as godparents and their children. Age, as an important consideration for procreation, could be cited as an impediment to marriage as were marriages between the infirm. Because the church approved of matrimony strictly for the purpose of procreation, these customs were incorporated into medieval Spanish law.

To love, honor, and maintain his wife were the husband's responsibilities because she reflected his honor and was the mother of his children. By doing so, he could expect in turn to be loved, honored, and

cared for by her. The wife's obligations were less self-centered, spanning both peace and wartime. Despite rulings that forbade women and children to intervene in military matters, women were not shielded from warfare. Just as in war, the law emphasized the solidarity of the family. A wife and children could be held responsible for debts incurred or crimes committed by the husband and father; even common-law wives were so bound.

Through marriage, women were given and taken by father and husband. One aim of political marriages was to enlarge boundaries and extend power. They were also used as gifts to reward deserving vassals and formed one way in which a man could improve his status. The reverse was also applicable in that one way to dishonor a rival was to kidnap his wife or daughter. Repudiation was the most favored method by which a woman could be used to shame an enemy.

Women bore many children in order to keep a few. Because of the high rate of infant mortality and the physical burden of repeated childbearing, early marriage was advised. A high rate of fertility has been documented, with an average of two years between births, yet royal couples produced only an average of 3.6 children, nobles 3.5, and other families only 2.3 who survived to adulthood. Motherhood in the Middle Ages did not greatly differ from other times. One way in which a mother did serve her offspring was to ensure their inheritance and to maintain the economic level of the family. Her children's later well-being could depend on her ability and chastity. The family was not necessarily tied to each other by emotions; it was a moral and social entity. It was a woman's duty to assure its survival from generation to generation.

Regulations regarding inheritance came into effect as soon as a couple was wed. According to the *Fuero Juzgo*, the moment a marriage was finalized, the wife could inherit half her husband's belongings. Later law codes insisted that the marriage be consummated before the wife could inherit. Daughters could inherit equally with their brothers. Recognized illegitimate children could also inherit a part of their parent's estates.

Mothers had very little decision-making power over the choice of a legal guardian for their children, should they be orphaned by their father. A woman could appoint a guardian only if she left her child an inheritance. A father's wishes were to be obeyed and only if he died intestate could the mother or grandmother automatically become the child's guardian. Women who were not mothers could not be guardians. Upon remarriage, parents were not obliged to care for the children of a previous marriage. A widower could choose between keeping the children with him or put-

ting them into the care of a guardian chosen from among his late wife's relatives. Widows did not have this choice. A woman wishing to remarry was forced to relinquish her children.

The indissolubility of the conjugal tie was proclaimed by the church and divorce was technically forbidden by the eighth century. Nevertheless, at least among the upper classes, repudiations, annulments, and separations were frequent. It was not unlikely in medieval Spain to find women who had been married and repudiated various times. Annulments could be obtained from the church for the lightest motives: consanguinity of a close or imagined degree, the minutest of physical defects, or a simple illness were given and accepted as excuses. The church accepted cruelty, adultery, and forced marriages as grounds for annulments. Other grounds were when one partner was unwilling to have children or when one partner forced the other into prostitution. Still another was religious conversion.

Wars, crusades, and pilgrimages of the Middle Ages produced many widows. Because proof of death was hard to obtain, care had to be taken to avoid bigamy. The *Fuero Juzgo* ruled that a woman who remarried could be severely punished if it later became known that her first husband was alive. Both she and her new spouse could be sold as serfs. The more liberal *Siete Partidas* absolved women from prosecution, allowing them to claim ignorance. This law code did, however, establish stringent minimum waiting periods of from five to ten years depending on where the husband was said to have died.

Certain segments of medieval Spanish society were exempted from their feudal duties and widows were included in this group. Widows were also granted extra physical and emotional protection. Most widows lived off their marriage settlements and their portion of their husband's estates. If a man died in battle, his widow was to receive compensation, the amount depending on his social class. Nevertheless, a careful reading of epic poetry shows that no mention of these pensions is made when spoils are divided. Given the state of the royal treasury through the Middle Ages in Spain, one wonders how often, if ever, these benefits were paid to deserving widows and orphans. Not a few widows entered convents.

In medieval Spain the physical security of women was assured; they could refuse to marry anyone; their dowries were safeguarded from husbands' abuse; their children's inheritances were guaranteed. As symbols of the weak and custodians of family honor, medieval Spanish women were well protected.

MARTÍ, RAMÓN

The most erudite and accomplished Arabist and Hebraist of his day, missionary to Muslims and fierce polemicist against Jews, Ramón Martí was born at Subirats near Barcelona (ca. 1210/15). He joined the Dominican mendicants at Barcelona's Santa Caterina priory by 1240, and studied at Saint-Jacques College of the University of Paris alongside Thomas Aquinas under Albert the Great (Albertus Magnus). The order sent him in 1250 to help found a missionary school of Arabic at Tunis. In 1264 King Jaime I commissioned him to censor rabbinic texts at Barcelona (but probably he had no role or presence at the Barcelona Disputations of 1263). Martí perhaps worked at the Murcia Arabicum in 1266; in 1268 he was again at Tunis. In 1269 he successfully visited Louis IX of France to urge a North African crusade; while there he probably commissioned Thomas Aquinas, for the order's master general, to write his masterwork the *Contra gentiles*. Martí spent the 1270s and 1280s at Barcelona, where he held the chair of Hebrew in 1281. His contemporary Marsili titled him "Philosophus in arabico," and "beloved intimate" not only of Jaime I and Louis IX but of "the good king of Tunis." Martí's friend Ramon Llull has an anecdote about his nearly converting that Muslim ruler. King Jaime mentions him as a friend in his own autobiography, noting his trip from Tunis to Montpellier. Arnau de Villanova was one of his students.

Martí's prolific writings are a key to the contemporary anti-Talmudism and growing animosity toward Jews. Until 1260 his main focus had been the conversion of Muslims, beginning with his *Explanatio symboli apostolorum* at Tunis in 1257. He is most probably the author of the *Vocabulista in arabico*, an Arabic word list of some 650 printed pages in Celestino Schiaparelli's edition, a missionaries' dictionary of unrivaled importance today for studying the Arabic of eastern Spain. His Islamic phase ended in 1260 with the now lost *Summa* against the Qu'ran. In 1267 came his *Cap-*

istrum iudeorum, which Aquinas seems to have used for his own *Contra gentiles*. Martí's masterwork was *Pugio fidei contra Mauros et iudeos* (*Dagger of Faith*), finished in 1281, filling over a thousand pages in its printed version, of wide influence over the next three centuries. Recent redating of Aquinas's *Contra gentiles* suggests that the hundreds of parallels between these two works show a strong dependence on Martí. With a wealth of rabbinic materials from and in Hebrew, *Pugio* is the most thorough of all the medieval anti-Judaic polemical works. Martí's writings are currently being studied intensively.

MARTIN OF BRAGA, ST.

Martin (A.D. ca. (520–ca. 579), stands forth as one of the most illustrious figures of the early Middle Ages in the Iberian Peninsula. Born in Pannonia, present-day Hungary, he ventured east to the Holy Land where he lived a monastic life. From the East he sailed westward to Galicia in the northwestern corner of the Iberian Peninsula. Martin is credited by the contemporary chroniclers, notably Gregory of Tours and Isidore of Seville, for the conversion of the Sueves to Catholicism. In Galicia, he founded churches and monasteries and successfully converted the Sueves to Catholicism. An important factor that facilitated his ministry among the Sueves was the friendly relations he maintained with the Suevic rulers. From about 550 to 579, Martin had succeeded in working with four distinct Suevic leaders: Chararic, Ariamir, Theodomir, and Miro. All came under his heavy influence. He played a pivotal role in the Galician Church to extirpate the Arian and Priscillianist heresies, including attempts to suppress paganism. Of the highlights of his ministry were the meeting of two councils at Braga held in 561 and 572. In the First Council of Braga, Martin was one of many signatories gathered; by 572 he had become the metropolitan bishop, which allowed him to preside over the Second Council. At that council Martin promulgated a collection of canons of the eastern councils called the *Capitula Martini*, which is one of the oldest canonical collections of the Iberian Church. The bishops also made the bold claim that unity of faith and orthodoxy had been firmly established in Galicia, thus contributing to the claim that Martin was the "Apostle of the Sueves." His labors in Galicia resulted in the establish-

ment of a permanent church among a people that had displayed a great deal of ambivalence in matters of religion.

Martin of Braga is also well known for his literary works, which are not abundant in number but had remarkable circulation and popularity in the Middle Ages. The most significant is *Formula vitae honestae*, based loosely on a lost work of Seneca, one that emphasized the four cardinal virtues. Of equal importance is *De correctione rusticorum*, a work intended to refute pagan practices, and one that offers us enormous insight into rural popular religion in early medieval Galicia. Other works by Martin of Braga include translations, from Greek into Latin, of *Sayings of the Egyptian Fathers* and *Questions and Answers of the Greek Fathers*, both of which made contributions to monastic life in Galicia.

MARTÍN THE HUMANE, KING OF ARAGÓN

Born in 1356, Martín was the second son of Pedro IV (1336–1387) King of Aragón and Sicily. In 1372 he married María de Luna; they had four children, although only one, Martín the Younger, survived to adulthood. Martín the Humane served his father ably as lieutenant in Valencia between 1378 and 1384 and as leader of expeditions to Sicily to secure the crown's succession there.

In 1395 his brother, King Juan I, died without a male heir. Martín was proclaimed king although the legitimacy of his right to rule was challenged by Juan's widow, Yolanda, who believed herself, erroneously, to be pregnant. Because Martín was on a military campaign in Sicily, María served as regent of the peninsular realms until her husband's return two years later; he was crowned in 1399 at Zaragoza.

On his return from Sicily in 1397, Martín stopped at Avignon to meet with the antipope Benedict XIII, his wife's kinsman. His unfaltering support for Benedict in the face of a rival pope in Rome and the powerful enemies that engendered, intensified the contentious dilemma provoked by the schism of the Western church. Their alliance, however, provided both parties with important benefits. In 1397 Martín's attacks against Berber piracy on the Valencian coast were designated a crusade by Benedict; in return Martín physi-

cally saved Benedict in 1403 from a French army that had captured Avignon.

His involvement in papal affairs marks Martín's principal foray into external politics; in fact, most of his reign was concerned with domestic matters that often brought him into conflict with powerful nobles and townspeople. In order to strengthen crown finances he struggled vigorously to recover former royal territories that had been sold off to local lords by his father and brother. His attempts to quell chronic violent factional unrest in Valencia and Aragón infuriated both the local lords and the urban oligarchies, which viewed royal intervention as a threat to traditional liberties and privileges.

Outside the Iberian Peninsula, his Mediterranean possessions remained persistent concerns. He sent troops to Sicily between 1392 and 1398 to suppress partisan opposition to Aragónese rule. Genoa continued to pose a threat to the crown territories in Sardinia and Corsica, but it was local rebellion in Sardinia that was a more intractable problem. In 1409 an exasperated king sent his son to Sardinia at the head of a large army. Although his son Martín won an important battle at Sanduri, he died of malaria a month later, leaving his father with a serious crisis of succession.

Martín's first wife, María de Luna, had died in 1406; his advisers had urged him to remarry but he resisted because he favored Federico, his illegitimate grandson. Even though Federico had been legitimized by Martín the Younger in order to grant him the lordship of Luna and the Segorbe, in the end, Martín the Humane gave in to his advisers. In 1409 he married Margarita de Prades, daughter of Pedro, the constable of Aragón, but they had no children. As he was gravely ill by this time, Martín's advisers tried in vain to get him to designate an heir.

The question of the succession was not resolved before his death on 31 May 1410; the kingdom remained in disarray for two years while four candidates claimed the throne. The contest was settled by the Compromise of Caspe, which brought a Castilian family, the Trastámaras, to rule the Crown of Aragón.

MARTÍN THE YOUNGER, KING OF SICILY

The son of the Aragóense king Martín the Humane (1376–1410) and María de Luna, Martín the Younger is noted less for his accomplishments as king of Sicily than for the serious crisis of succession provoked by his death at age thirty-four. At the head of a large army gathered in Sardinia to suppress chronic local unrest, Martín defeated a joint army of Sards, Genoese, and French at Sanduri on 25 July 1409, only to die of malaria one month later. With him died the last hope for a peaceful succession for the family that had since 1137 possessed the extraordinary good fortune of an unbroken string of male heirs to rule the Crown of Aragón. Less than a year later his father died and the kingdom suffered a contentious two-year interregnum that was settled by the Compromise of Caspe in favor of the powerful Castilian family, the Trastámaras.

The only one of the four children of Martín the Humane to survive to adulthood, Martín the Younger was born in 1376–1410. He married María of Sicily in 1390, thus securing Aragóense control of that Mediterranean kingdom. Their one son, Pedro, died in 1400.

Martín was designated heir to the Crown of Aragón in 1398 and began the traditional education of Aragóense princes as his father's lieutenant in various royal realms. Prudent, athletic, and cultivated in the arts and sciences, Martín was also a fine soldier. He was concerned mainly with the governance of the crown's Mediterranean possessions—Sardinia, Corsica, and above all, Sicily. Sardinia, with its combination of external threats from the Genoese that harassed Catalan shipping and internal rebellion against Aragóense rule, proved to be the most vexing problem. The tense situation there necessitated continued military intervention. By contrast, a more peaceful atmosphere prevailed in Sicily after the campaigns of the early 1490s. In fact, Martín the Younger's claim to rule Sicily was not challenged when his wife died in 1401. He remained in charge as his father's heir and viceroy, and on his death he left Sicily to his father.

In 1402 he married Blanche of Navarre; they had one son, Martín, who died in 1407. He had an illegitimate son, Federico, whom he later legitimized to permit him to inherit the counties of Luna and the Segorbe. On the death of Martín the Humane in 1410, Federico was a principal claimant in the four-way succession dispute that he lost in the end to the Trastámara candidate, Fernando of Antequera (r.1412–1416).

MARTÍNEZ DE TOLEDO, ALFONSO

Fifteenth-century writer and cleric from Toledo (1398–1460). He held the title of bachiller en decretos (bachelor in decretals) and was probably educated at the University of Salamanca. Martínez de Toledo was archpriest of Talavera de la Reina, prebend of Santa María de Nieva in Segovia, and chaplain of the Capilla de don Sancho, or Reyes Viejos, in Toledo cathedral, where he was responsible for organizing short plays for the celebration of Corpus Christi. He is buried in Toledo cathedral. Martínez de Toledo traveled widely in the Iberian Peninsula during his youth, especially in the Crown of Aragón, and visited Rome. Sometime between 1438 and 1444 he received the title of royal chronicler.

Martínez de Toledo is best known for the book he named after one of his ecclesiastical benefices, *Arcipreste de Talavera* (also called *Corbacho*), composed in 1438, which survives in one manuscript, two incunabula, and several later editions. The latter is a tract directed against misguided love that takes up the tradition of the complaint against women (*demanda de las mugeres*). Derived from diverse sources (principally book 3 of Andreas Capellanus' *De Amore*, the *Secreta secretorum pseudo-Aristotelis*, and Boccaccio's *De casibus virorum illustrium*) it is central to the understanding of the pro- and antifeminist debate in Castile and Aragón during the fifteenth century. Although much of this work derives from bookish sources, Martínez de Toledo's elaboration of them points to contemporary cultural tensions produced by evolving sentimental attitudes at court and society at large. Part sermon, part essay, and part fiction, the tract, which is divided into four parts and composed in both high and low styles, is often punctuated by amusing or shocking illustrative exempla that reveal this author's ability to capture colloquial language and create impressive scenes of imaginative prose.

Martínez de Toledo was also author of the *Atalaya de las crónicas* (begun in 1443), an important digest of medieval Castilian chronicles critical for the understanding of the evolution of historiography in fifteenth-century Castile, and two hagiographies from 1444, the *Vida de Sant Ildefonso*, archbishop of Toledo (657–667) and the *Vida de San Isidoro*, or Saint Isidore of Seville.

MARTÍNEZ, FERNANDO (ALSO FERNÁN, FERRANT)

Martínez's, whose only claim to historical fame lies in his responsibility for sparking off the series of massacres of Jews that took place in Spain in 1391. He was archdeacon of Ecija, in the archdiocese of Seville, and hence a canon in the cathedral of Seville. Evidently he started trouble in the middle of the 1370s, preaching rabble-rousing sermons against the Jews, threatening town councils that allowed them to live in their midst, and subsequently ordering the destruction of synagogues. On 25 August 1378, King Enrique II of Castile ordered him to desist from his anti-Jewish campaign, orders that were subsequently repeated by his son and heir, Juan I (1379–1390) in 1383. These royal actions calmed matters for a time, but Martínez soon ignored them, and even began to claim that the king and queen secretly supported any attempt to kill Jews.

Martínez' opportunity came in 1390 when both Juan I of Castile and the archbishop of Seville died, and, the archbishopric, being *sede vacante*, Martínez became its administrator. As a result of the power vacuum and his demagoguery, the massacres began on 6 June 1391 in Seville and quickly spread to the other cities of Andalucía, and then to all the cities of the kingdom of Castile and the Crown of Aragón. Hardly a town escaped.

The size and wealth of the Jewish communities suffered drastically as a result of the massacres, the Jews either forsaking the towns and cities for smaller rural communities or accepting forced conversion. The pogrom of 1391 should have brought an end to the history of the Jews in Spain, but it did not. Thousands survived as New Christians or *conversos*.

MARY OF EGYPT, ST.

Fifth-century penitent who has been depicted in literature from the seventh century to the present, and in iconography from the eighth century to the present. The unique Spanish poetic text of her life exists in manuscript III-K-4 of the Biblioteca del Escorial and is of the early thirteenth century; a unique prose version is in manuscript h-I-13 of the Biblioteca del Escorial and dates from the late fourteenth century. Both prose and poetic texts are believed to have been redacted from texts in Old French and Latin. To date there exist five translations of Jacobus de Voragine's life of Mary the Egyptian in Spanish versions of his

Legenda aurea Golden (*Legend*), which probably derives from the *Speculum Historiale* of Vincent de Beauvais. There is also a fourteenth-century Spanish translation of Paul the Deacon's *Vita Sanctae Mariae Aegyptiacae* (MS. h-III-22 Escorial, and Biblioteca Nacional 780), which is based on the *Golden Legend*. A third prose Latin treatment, represented in a Portuguese translation, *Vida de Santa Maria Egipcia*, survives in two manuscripts, Alcobaça CCLXVI and CCLXX.

The original legend derives from numerous Greek sources and may be summarized as follows: The daughter of a wealthy Egyptian family engages in prostitution for personal satisfaction. After seventeen years of sinful behavior she begins her repentance when she is miraculously forbidden entry on Ascension Day to the Church of the Holy Sepulchre and hears a voice directing her to the monastery of Saint John on the banks of the Jordan. For forty-seven years she roams the desert living on seeds, nuts, water, and three loaves of bread. Her hair replaces her decayed clothing, and her physical beauty disappears as her body blackens and shrivels, while the blackness of her soul becomes purified. When she meets Zosimas, a vainglorious ascetic, she causes him to repent of his sin, and he witnesses her miracles of levitation, walking over the Jordan, and finding her deceased body intact in the desert after one year with her identity written in the sand. A tame lion assists him with her burial.

The legend of Saint Mary of Egypt clearly enjoyed great popularity in the Iberian Peninsula. In Granada there was a convent dedicated to her, and iconography depicting her miracles can be found in the Church of San Juan Bautista in that city, as well as in the Museo del Prado.

MASLAMA DE MADRID

Abū-l-Qāsim Maslama ibn Aḥmad al-Majrīṭī, (d. 1007), Andalusian astronomer and mathematician, was born in Majrīṭ (Madrid). He studied in Córdoba and practiced astrology: interested by the Saturn-Jupiter conjunction that took place in 1007, he predicted a series of catastrophes usually associated with the fall of the caliphate and the period of civil wars (*fitna*, 1009–1031). He is the author of the first documented astronomical observation in al-Andalus (the longitude

of *Qalb al-Asad*, Regulus, $135^{\circ} 40'$ in 977 or 979). He wrote a set of notes on the only trigonometrical tool used in antiquity, Menelaos' theorem (*al-shakl al-qattā'*), as well as a commentary, with frequent original digressions, on Ptolemy's *Planisphaerium*, which is the first of the studies dedicated by Andalusian astronomers to the astrolabe: its influence is clear in the thirteen-century Latin compilation on the instrument ascribed to Messahalla (Māshā'allāh, fl. Baṣra, 762–809) the echoes of which reach the treatises on the astrolabe written by the collaborators of Alfonso X and by Geoffrey Chaucer (ca. 1340–1400). He is the creator of an important school of mathematicians and astronomers, and two of his disciples (Aḥmad ibn al-Ṣaffār and Abū-l-Qāsim Aṣḥab ibn al-Samḥ) collaborated with him in his revision of the *Sindhind zīj* (astronomical handbook with tables) of Al-Khwārizmī (fl. 800–847), a work having an Indian pre-Ptolemaic origin, probably known in Al-Andalus since ca. 850. This revision, extant in a Latin translation by Adelard of Bath (fl. 1116–1142), adapted certain tables to the geographical coordinates of Córdoba, changed the Persian calendar used in the original for the Hijra calendar, introduced Hispanic and, possibly, Ptolemaic materials and added a considerable amount of new astrological tables (about one-fifth of the extant set of numerical tables), which improve considerably the techniques used by Al-Khwārizmī himself. He also introduced Ptolemaic astronomy in al-Andalus: he studied the *Almagest* and wrote astrological additions for the Ptolemaic *zīj* of Al-Battānī (d. 929).

MASS See MOZARABIC RITE

MATHEMATICS, MUSLIM

Andalusian mathematics did not have the same importance as did astronomy. Very little is known about its origins apart from the existence, in the tenth century, of a practical handbook on land surveying (*taksīr*) by Ibn 'Abdūn al-Jabalī as well as treatises on commercial arithmetic (*mu'āmalāt*) written by members of the school of Maslama ibn Aḥmad al-Majrīṭī (d. 1007). An idea of their contents can be obtained through the *Liber mahameleth*, a Latin translation ascribed to John of Seville of an Andalusian treatise on the same subject. Arithmetic and geometry were cultivated by Abū-l-Qāsim Aḥmad ibn al-Samḥ (d. 1035) but his works on these subjects seem to be lost. Nothing is known, on the other hand, on the development of algebra in Al-Andalus until the Naṣrid period (1232–1492) toward the end of which flourished Abū-l-Ḥasan 'Alī ibn Muḥammad al-Baṣṭī al-Qalaṣādī (ca. 1412–1486 or 1506), who wrote extensively on it as well as on arithmetic, algebra and *parā'id* (the partition of inheritances). Strongly influenced by the Moroccan mathematician Ibn al-Bannā' al-Marrākushī (1256–1321), his originality has been exaggerated by modern scholarship. Thus, in spite of the fact that he made interesting improvements to the method of successive approximations of imperfect square roots, the way he dealt with summations of series of squares and cubes and used algebraical symbolism merely followed the lead of many predecessors both in eastern and western Islam.

Geometry and spherical trigonometry had, however, important developments in the eleventh century. Abū 'Amir Yūsuf ibn Aḥmad al-Mu'taman, king of the *ṭā'ifa* of Zaragoza (1081–1085) wrote an important geometrical treatise called *Al-Istikmāl (Perfection)* of which four incomplete manuscripts have been recently discovered. They deal with number theory, plane geometry, the study of the concepts of ratio and proportion (following Books 5 and 6 of Euclid's *Elements*), geometry of the sphere and of other solid bodies and conic sections, and they prove that the royal library in Zaragoza contained the best books—both Greek, in Arabic translation, and Arabic—available at the time for the study of higher mathematics. Al-Mu'taman did not limit himself to a reproduction of his sources but offered often original solutions that prove that he was an excellent geometer. Geometrical research was also developed by Abū Zayd 'Abd al-Raḥmān ibn Sayyid (fl. Valencia 1063–1096) the master of Ibn Bājja (Avempace, 1070?–1138), who wrote on arithmetical series and conic sections, and by the *qāḍī* of Jaén Abū 'Abd Allāh Muḥammad ibn Mu'ādh al-Jayyānī (d. 1093), whose *Maqāla fī sharḥ al-nisba (Commentary on the Concept of Ratio)* seems to be the first known instance of an adequate comprehension of the Eu-

clidean conception of ratio (*Elements* V, def. 5) before the seventeenth century. On the other hand, his *Kitāb majhūlāt qisī al-kura* (*Unknown Arcs of the Sphere*) is the first treatise on spherical trigonometry compiled in western Islam as well as the first known instance in which this mathematical discipline becomes independent from astronomy. It introduces six new trigonometrical theorems discovered in eastern Islam toward the end of the tenth and beginning of the eleventh centuries that allow the solution of spherical triangles in a way that is far more simple than that used in classical antiquity, in which the only known trigonometrical tool was the so-called Menelaos' theorem (*shakl al-qattā'* in Arabic). He was the first, in the West, to use a method of quadratic interpolation and to compute a tangent table for $r = 1$. It is difficult to establish up to what extent there is some originality in this work but it seems, for example, that his use of a polar triangle is independent from that of his Eastern predecessor Abū Naṣr Maṣṣūr ibn 'Irāq (d. e. (–ca. 1036). Ibn Mu'ādh's book was not translated into Latin and its influence in medieval Europe was exerted indirectly, through the *Iṣlāḥ al-Majistī* written by Abū Muḥammad Jābir ibn Aflaḥ toward the middle of the twelfth century, a work translated both into Latin and into Hebrew, in which four of Ibn Mu'ādh's trigonometrical theorems appear.

MAURICIO, BISHOP OF BURGOS

Mauricio's origins have been a topic of discussion among those researchers who believe that he was born in Medina de Pomar (Burgos) at the end of the twelfth

century, but to an English or Gascon family stationed in Castile. He appears to have studied law in Paris, and in 1209 he was the archdeacon of Toledo, where he displayed his juridical instincts, intervening as ecclesiastical judge in several matters of the archbishopric of Toledo and the bishopric of Burgos because of his reputation as a jurist before the Holy See. In August of 1213, he was elected the bishop of Burgos, backed by the archbishop of Toledo, Rodrigo Jiménez de Rada. He was consecrated in 1215, and in September of the same year traveled to Rome to attend the Fourth Lateran Council, whose regulations he tried to put into practice in Burgos. His good relationships with royalty, especially with Doña Berenguela, led him to participate actively in national politics. He helped put Fernando III on the throne, and in 1219, under the guidance of the queen, traveled to Germany to meet Beatriz de Swabia, Fernando's future wife, and accompany her back to Castile: Mauricio performed their marriage on 30 November 1219 in the Romanesque cathedral, having knighted the king earlier in the monastery de Las Huelgas.

Mauricio filled an important spiritual role in the diocese. He promoted its statutes in an effort to reform his chapter, establishing the so-called *Concordia mauriciana*. He attended the Valladolid Councils in 1228 and the Tarazona Council in 1229. During his term as bishop he authorized the foundation of several different religious orders: the Franciscans in 1214, the Trinitarians in 1221, and the Dominicans in 1227, as well as the orders of Saint Clare and of Calatrava. He also approved the establishment of the Cistercian nuns in Vileña and in Villamayor de los Montes. Mauricio died on 12 October 1238 and was buried in the presbytery of the same Gothic cathedral for which he and the monarchy had earlier laid the first stone on 20 July 1221.

Mauricio dedicated himself passionately to gathering sufficient resources to build the magnificent cathedral. In 1230 worship services were first held in the new building, which was definitively consecrated in 1260. Its stylistic elements, both architectural and sculptural, reveal its dependence on French Gothic art, and several artists from France worked on the cathedral. The bishop left an extraordinary mark on all of the arts, including funerary monuments: the recumbent statue portraying the bishop is considered by specialists to be an exceptional work in terms of the material and techniques applied. It is made of wood coated with gold-plated copper and decorated with *champlevée* enamel, a technique frequently employed in the Limoges workshops. This has led specialists to conclude that this interesting work of the mid-thirteenth century was a French product.

MAYORAZGO (PRIMOGENITURE/ INHERITANCE)

In Castile and León, more so than in other medieval kingdoms, laws protected the hereditary transferral of property within the family, and permitted a sole heir to inherit a large part of the estate, thereby favoring aristocratic practices that tended to keep most of the wealth together instead of splitting it up. The *Liber iudiciorum* (ca. 654) combined the freedom of the testator with the concept of the obligatory heir (*herederos forzosos*). Four-fifths of the estate (*reserva*) was set apart for these compulsory beneficiaries, who were primarily legitimate children of the testator, though in some cases they were more distant relatives, sometimes up to the seventh degree. Only the other fifth of the estate (*quinto*) was allowed to be freely distributed by the testator. The *reserva* could be divided equally among all of the obligatory heirs; alternatively, a third of the *reserva* (*mejora del tercio*) could instead be set apart for one specific heir, with the rest distributed equally among remaining heirs. Despite negative reactions, these regulations were ratified in medieval Castilian law and included in the *Fuero Juzgo*, *Fuero Real*, *Leyes del Estilo*, and *Leyes de Toro*.

Added to this system, which was the most common, was the establishment of primogeniture (*mayorazgo*), which was the transferral of a mass of wealth following habitual lines of succession and favoring one sole heir. The first examples date from the latter part of the twelfth century, but the practice didn't become common among the high nobility until 1369, when royal gifts of seigniorial lands and property increased and when the monarchy permitted inheritance through illegitimate children when there were no legitimate heirs. To establish or increase a *mayorazgo* required royal authorization, as did the severance or disassociation of the wealth entailed in primogeniture. However, the *Leyes de Toro* (1505) allowed the formation of *mayorazgos cortos*, dictating the bestowal of the *mejora de tercio* or the *quinto*, without previous authorization. The lower nobility, as well as those of non-noble rank, established many of these smaller *mayorazgos* beginning in the sixteenth century.

The *mayorazgo* was formulated through public documents that detailed the property linked to the inheritance. Even if it did not bestow any property, this system complied with the principle of primogeniture and of succession to the throne described in the *Siete*

Partidas, and included the so-called *derecho de representación* (right to representation).

In summary, *mayorazgo* and the stable transmission of estate and of aristocratic power in the noble family were inseparable realities: the system of primogeniture consolidated and stabilized the nobiliary structure of Castilian society between the fourteenth and eighteenth centuries.

MEDICAL TREATISES

During the Visigothic period (sixth century) St. Isidore of Seville dedicated the whole of book 4 of his *Etymologies* to medicine.

Apart from St. Isidore, the most important treatises may be divided into four groups: those written in Arabic by Spanish doctors; translations from Arabic into Latin; translations from Latin and Arabic into Castilian; and finally, works composed in Latin or Castilian by Spanish authors.

Group 1 includes: *The Book of Generations of Doctors* by Ibn Juljul of Córdoba, (tenth century), which discusses Dioscorides, *Materia medica* and tells how to identify and locate the simples described there. The *Kitāb al-Tasrif* or *Book of Surgery* by Abūal-Qāsim Khalaf al-Zahrāwī, known as Albucasis (ninth century), was still being printed in Latin in the sixteenth-century. The *Kitāb al-kulliyāt fī-l-tibb* by the Córdoban Abūal-Walīd Muḥammad ibn Aḥmad ibn Rushd or Averroës (1126–1198), was translated into Latin as *Colliget*. The *Amal mān tābba li-man habbā* or *Treatise on General and Special Pathology* by Muḥammad ibn ‘Abd Allāh ibn al-Khatīb (1313–1374) from Granada.

Group 2 includes translations into Latin by Gerard of Cremona of the *Kitāb al-hawī fī-l-tibb*, known as *Continens*, by the Persian Abū Bakr Muḥammad ibn Zakarīyā al-Rāzī, known as Rhazes (865–925), an extensive work that includes all Greek and Eastern medicine, plus the latest developments. A more compact and hence more widely used work is the *Kitāb al-Manṣūri fī-l-tibb* or *Liber Medicinae ad almansorem*, studied and imitated for centuries by Western doctors.

Special mention must be made of *Qanun fī-l-tibb* by Abū ‘Alī al-Husayn ibn Sīnā, known as Avicenna (980–1037), known in Latin as his *Canon*. The work

covers the entire field of medicine as then known in five books. A shorter version of this work was widely known in the West as the *Canticas*, being a summary in verse of the pathology contained in the *Canon*. The aim of this work was to impart the most essential knowledge, and the verse was meant as a memory aid.

Group 3 includes translations into Castilian of Latin works by medical professors from northern Italian and French universities. The *Lilium medicinae* or *Lilio de medicina* (1305) by Bernard of Gordon is a general pathology that follows closely Arabized Galenism, but one colored by the personal experiences of the author. The *Compendio de la salud humana* by John of Ketham is a schematic but poorly systematized summary in six chapters of the commonest pathology of the period.

Kitāb al-hummayāt or *Treatise on Fevers* by Isaac ben Solomon Israeli, translated into Latin by Constantine the African, from Latin into Hebrew in the twelfth century and into Castilian in the fifteenth, is a monograph on the diagnosis and treatment of fevers, based in the traditional authorities. Three books on surgery exist by Theodoric of Lucca (1206–1298), Guy Lanfranchi of Milan (d. 1305), and Guy de Chauliac, originally from Bologna (ca.1300–1368). All three were internationally famous university professors and their works were translated into several European languages.

Group 4 has original works including an anonymous treatise on pathology in an acephalous and defective manuscript of the late fourteenth century. It is not very original since it follows very closely an Arabic manual, to the point that many technical terms are mere transliterations of the Arabic. *El menor daño de la medicina* by Alonso de Chirino (1428) contains two basic treatises, one on hygiene and one on pathology, that are more concerned with prevention than cures. The *Tratado de apostemas* by Diego del Covo contains a part of his lost *Cirurgía rimada*, composed in 1412. The surviving fragment was copied in 1493. *Sevillana medicina* by Jean de Avignon, composed in the early years of the fifteenth century, survives in an edition by Monardes of the year 1545. It is one of the first European medical topographies, but from the indications in the prologue, the edition appears to be incomplete. The *Sumario de la medicina con un tratado sobre las pestíferas bubas* (1498) was written in verse by Francisco López de Villalobos, then a student in Salamanca, following Avicenna's *Cantica* very closely. The rhymes were meant to help the reader memorize, and while the aim was divulgation, it retains technical medical terminology and Arabisms. The *Suma de de la flor de cirugía* by Alonso de Córdoba survives only in a very incomplete and corrupt copy.

MEDICINE

Roman domination of the Iberian Peninsula and the Romanized Christianity that later flourished there led to the widespread practice of medical doctrines inherited from Greece by the empire. The outstanding Greek authority was Galen of Pergamum (ca.130–ca.200), who strove to systematize Hypocratic medical teaching and theory to link them with practical medicine, thus becoming the creator of rational scientific approaches through the study of animal anatomy and experimental vivisection. His basic concept of man as the creation of a Supreme Being, the body being merely the vessel of the soul, won ecclesiastical approval and resulted in the universal acceptance of Galenic medicine in the West until the seventeenth century. Galen took up residence in Rome when he was thirty-three and began to practice, treating the ailments of emperors and aristocrats, but also teaching medicine and writing manuals that covered all aspects of the science: anatomy, pathology, hygiene, pharmacology, and so on. Galenic medicine, as part of Greek science transmitted to the Latins, was based on a rational knowledge of the human body, of diseases, and of methods of treatment, reached the Iberian Peninsula, but did not supplant popular empirical or magical medicine, which had a fundamentally different view of illness. If the harm to an organism was due to external causes such as wounds, bites, fractures, and so forth, time-proven remedies were applied. On the other hand, if the cause was some moral transgression that provoked divine punishment, then the gods had to be appeased with religious or magic rites and formulas capable of restoring the broken bond.

From the fifth century onward, barbarian invasions fragmented the western Roman Empire, impeding communications between the various imperial provinces, whose isolation led to cultural decline. The resultant economic collapse and general insecurity produced a flight from the cities to the countryside, which was under stress from the large numbers seeking refuge there. The outcome was a severe decline in those cultural contacts that had been natural to city life. Medi-

cine continued to be practiced, but there was a lack of development and advances, and a reliance solely on what had survived of the Graeco-Roman science transmitted by personal instruction, usually through direct experience in medical practice from those who continued the profession.

In general terms, culture took refuge in the episcopal schools, and only the aristocracy and the clergy could take advantage of it. Hence we find the lay doctor alongside the priest doctor from the secular clergy or, with the rise of the monasteries, among the monks. The most outstanding figure of the period is St. Isidore of Seville (560?–636). Book 7 of his *Etymologiae* deals with the scientific medical terminology most commonly in use in his time. Chapter 13 explains that medicine cannot be included among the other liberal arts because they deal with individual areas of study under the general heading of philosophy, whereas medicine too must cover them all. For this reason, he states that it must be considered a “second philosophy,” since it claims for itself the entire man, and “if the first heals the soul, then this second philosophy cures the body.” St. Isidore’s encyclopedia was known and used far beyond the confines of the Visigothic kingdom in Spain, influencing European culture generally. In the court of Charlemagne (742–814), the erudite philosopher Alcuin knew and admired this Spanish author, but Charlemagne’s general prohibition of the use of superstitious practices, favoring a more technical approach to medicine, itself indicates that in spite of his prohibition, magical arts continued to hold sway in his kingdom, not only in the Spanish Marches, but well beyond them.

The Arab invasion of 711 and their conquest of Iberia produced a radical change in science in general and medicine in particular. The recovery of many of the lost Greek medical manuals came about as a result of Arabic translations, refined and expanded in the Muslim East, that reached the peninsula after the establishment of the caliphate of Córdoba. However, the first century of the Arab conquest is culturally quite poor, owing to the massive time and effort needed to establish the understructures for security and political government. Hence Visigothic culture survived and continued, and St. Isidore remained the supreme authority.

During the tenth century a cultural awakening is perceptible. In various regions groups of scholars undertook translations from Arabic into Latin of the most important scientific works that had come from the East. The monastery of Ripoll in Catalonia is one of these centers, where the translation of medical texts in summary or abstracts strove to disseminate this knowledge, without showing any concern for the original author-

ship or the name of the translator in almost all cases. This activity, combined with the large numbers of Mozarabs who fled from Muslim domination to find refuge there, made Ripoll an extremely important cultural center.

In the eleventh century, as political factors brought about a cultural decline in the Middle East, Arab culture flourished in the conquered territories of the West that were now independent. In Spain, the sovereign caliphate favored this cultural growth. Ibn Wāfīd (1007–1074) wrote *On Simple Medicines* and *The Bed-side Book* in Toledo, his treatises *On Agriculture* and *On Bath Treatments* were translated into Latin. In the early years of the twelfth century Ibn Rushd (Averroës; 1126–1198) composed in Córdoba his medical encyclopedia *Coliget*. In the middle of the twelfth century Archbishop Raymond de Sauvetot (1125–1151) formed a school of translators in Toledo who made available in Latin numerous Arabic treatises on a wide variety of subjects. Among the most outstanding translators was Gerard of Cremona (1114–1187), who practically headed a team of Arabs, Jews, and Spaniards that was to put the latest medical science of the Arab world within the reach of Western scholars. Among the most important authors translated into Latin was Hunayn ibn Ishāq al-Ibādī (809–873), known in the West as Johannitius, who during his lifetime had translated from Greek into Arabic 129 treatises by Galen, as well as the *Alexandrian Summaries*, while his own compilation *Kitābal-mudjal* or *Isagoge ad tegni Galeni* is a faithful reflection of Galenic medicine that does not lose sight of the contributions of the Alexandrian school. His work, while not original, was concise and orderly. It became widely known in medieval universities, thus renewing and invigorating European knowledge of Galen. Editions of Johannitius’s works were in print constantly from the fifteenth to the seventeenth centuries.

Also of extraordinary importance for medieval medicine were the translations of works by Abū Bakr Muḥammad ibn Zakarīyā al-Rāzī (865–925), known as Rhazes. His *Continens* is an treatise that incorporates into an organic whole Greek and Indian medicine, and the new Arab discoveries. A shorter work was his ten-volume *Kitāb al-Manṣūri fī-l-tibb*, known as the *Liber medicinae ad almansorem*, equally divided between theory and practice. Being less extensive than *Continens*, and hence more manageable, it became indispensable for medical practitioners. Equally important for its effects on later development was the *Canon* by Avicenna (980–1037), which gives complete coverage of the medical science of the age; it was translated several times into Latin and in use in numerous editions for centuries. We know that even in the seven-

teenth century it was still a required text for medical students at the University of Salamanca.

As for surgery, mention must be made of the translation done by Gerard of Cremona of the *Book of Surgery* by the Córdoba Abū al-Qāsim Khālaf al-Zahrāwī (ninth century), known as Abulcasis, in which we have the first known descriptions of hemophilia and leprosy. Abulcasis not only covered in detail previous surgical knowledge, but also introduced several advances and new methods, such as sutures and cauteries. Thanks to the Latin translation, this work could be studied by the top surgeons of the fourteenth and fifteenth centuries, who, using this firm basis, vigorously developed the new science.

During the following centuries radical changes came about in the structure of society that gradually left behind the feudal world and opened out into a more bourgeois social system in the cities and towns, offering greater freedom and requiring different modes of social behavior. Concomitant changes in medical practice were soon felt. Ecclesiastical medicine gradually disappeared (except in rural areas, where the monasteries continued to function as clinics until the nineteenth century) and medicine was quite definitely separated from the church, becoming progressively more rationalized and demanding its proper place, like any other human endeavor. In this new social order, the transmission of knowledge also underwent important changes. The cathedral schools were replaced by or developed into the new *studium generale* or university, but as these studies began to set themselves within the framework of the universities, medicine tended to be left behind, and we know that it was only through the agency of Alfonso X the Wise (1252–1284) that the *studium generale* of Castile created chairs of medicine. This coincides with attempts to regulate the practice of medicine. Medical professionals would have to complete special studies and obtain an official license to practice. We know that, following Eastern custom, Muslim Spain did not have such a general system until the thirteenth century, which was gradually consolidated in the fourteenth. For a very long period doctors with a degree coexisted with those who simply practiced medicine after having learned it by working with an experienced physician.

The new medical studies in the universities went no further than teaching the Arabized Galenism contained in the Latin translations of Arab authorities, to which Scholastic methods were applied to a greater or lesser degree, as the all-embracing source of all knowledge: philosophy. Medical education was based on a theoretical view, based solidly on the authorities, without any experimental approach that might have led to systematic constructive criticism, and hence effective

advances. However, the authorities as a basic foundation did not prevent practical nonacademic criticism that gradually modified criteria as a result of daily contact with patients whose individual clinical record in terms of climate and social and physical factors differed from what the books indicated and made the doctor depart from the authorities and change his approach, leading to different and new treatments.

As it had for centuries, Latin continued to be the language used in this science and also in the new medical education programs, although Castilian in the Alfonsine schools has already managed to achieve the level of a scientific language quite capable of expressing Graeco-Roman knowledge as transmitted in Arabic. However, although Alfonso the Wise ordered that the scientific writings created by his school be written in the vernacular, no purely medical works were produced, although several medical topics appear in others.

Medical treatises written in Castilian in the fourteenth and fifteenth centuries may be divided into two quite distinct groups. There are a large number of translations of the most important Western medical books written by doctors, usually university professors who, for teaching purposes, composed manuals, summaries, and monographs that are little more than compilations of existing knowledge, to which they added those advances acquired through their medical practice. On the other hand, we have works or fragments of works in Castilian, often anonymous through the loss of initial folios or because the copy derives from such a fragment. These are sometimes partial translations from Latin or Arabic, summaries compiled as a handbook for personal reference. These two groups have distinct characteristics. The first shows us the state of the art in the late Middle Ages as an outcome of the systematization of the *materia medica*. The second group introduces us to a more popular type of medicine, quite alien to Latin and often not deriving from theoretical studies. The texts preserved are not treatises but compendia or monographs whose aim is to teach in the shortest possible time all that the professional would need to know. However, in both groups the contents derive from Arabic sources, to differing degrees reworked, adapted, and modified by practical knowledge acquired in general practice.

During this period we have Castilian translations of important and extensive medical works in Latin, as well as compendia and monographs written in the general area of northern Italian and southern French universities. One such work is *Lilium medicinae* or *Lily of Medicine*, 1305 by Bernard of Gordon. Three treatises on surgery were also translated, those by Theodoric of Lucca (1206–1298), Guy Lanfranchi of

Milan (d. 1305) and Guy de Chauliac from Bologna (1300–1368). All three were designed to aid in the study of medicine in their respective universities, but their fame and prestige carried them far and wide and they were quickly translated into many languages. The surgery inherited from the ancients as transmitted by the works of Abulcasis did not cease to advance, thanks in great part to the dissection of cadavers, which increased anatomical knowledge considerably, and also to the fine education and great ingenuity of these three great surgeons.

Within the second group, works written in Castilian, we have compendia and monographs, always with didactic aims in mind, or as in the case of *El menor daño de la medicina* or Lesser Harm of Medicine (1428) by Alonso de Chirino, a warning to healers or those who might suffer the consequences of treatment by poorly trained doctors. In this group we have only one extensive work, a treatise on pathology in an anonymous manuscript, whose beginning is lost, that is also defective and mutilated. Its formal structure and content are not original. It must have been put together following very closely some Arabic treatise, since its terminology often derives from a mere transliteration of the Arabic terms.

Medical theory and practice in the Middle Ages were, in general terms, the continuation of Arabized Galenism, transmitted in Arabic versions and commentaries, translated into Latin, reworked and adapted to the methodology of Scholasticism. However, direct contact with reality and with patients gradually altered medical practice, which bit by bit changed theory as a result of experimental proof of hypotheses, modifying practice (albeit slowly), rationalizing it, and making it more technical, marking a slow but steady progress in this incipient new science. There always existed alongside, however, a more or less magico-religious medicine that at times affects the more rational arts of healing.

To sum up, the content of this new science is as follows: In anatomy it distinguished two main constituents of the human body, the extremities and the main cavities, cephalic, thoracic, and abdominal. These cavities are occupied by the organs, which are nurtured by the veins, a term that also includes what we now know as nerves, tendons, and so on—in general the vessels through which the humors and spirits that sustain the organism circulate. Physiology is governed by four humors: blood, phlegm, bile, and melancholy (black bile), the predominance of any of which gives rise to four human biological types: sanguine, phlegmatic, choleric, and melancholic. The balance among these humors favors health and well-being. The movers that drive life are the spirits that set in motion the

powers needed to maintain the vital functions. The body is healthy if the humors are in balance, that is, if they are mixed in due proportion and circulate freely through the vessels. Good health is lost if this balance is altered or the circulation of the humors is hampered by obstruction of the vessels or excessive density or fluidity of the liquids and gasses necessary for life. The causes of the anomalies may be internal, such as an excess or lack of some humor that upsets the conditions for the sound functioning of the organism, or external, such as disorders caused by poisons, wounds, or a bad lifestyle. Health is reestablished by restoring the humoral or organic balance, if the cause is internal; if it is external, by correcting the agencies that cause harm, for example by purifying corrupted air in plagues or using surgical methods for wounds, fractures, or abscesses. To this end, medicaments are applied, either simple or compound. Any substance capable of modifying the functions of the organism can constitute a remedy—that is, a means of healing. The vegetable, animal, and mineral worlds, above all the first, are the basis for the pharmaceuticals used directly as simple medicaments or combined with other elements to form the composites.

The philosophy underlying all healing relied on the use of opposites. If the cause of the illness is cold, then remedies of a warm type are applied, and vice versa. The degree of effectiveness of each pharmaceutical also needs to be known—whence came the development achieved by pharmacology. The general manuals in Arabic devoted a great deal of space to the discussion of medicines, and they were followed by the doctors. Galen had already indicated the possibility of determining the degrees in the qualities of medicines, that is, warm, cold, dry, and humid, and basing themselves on this, Arab and Western doctors developed a scale of degrees in all natural elements of which medicines are composed, and thus devised a suitable therapy in each case. The starting point for this pharmacological system was the *Materia medica* of Dioscorides (first century), which the Arabs modified and expanded with a large number of new simples and composites, many of which were widely used in the Middle Ages and even in later centuries. Dioscorides' work was still used in the sixteenth century when Laguna translated it into Castilian, adding learned commentaries, thanks to which we can know the previous fundamentals of pharmacology and the continued use of the old medicaments in later centuries. The evolution of medicine was to rely on a praxis that would gradually modify the old conception, interpreting and rationalizing the new discoveries, but still, in the sixteenth century and the beginning of the seventeenth,

we see theories and fundamental concepts completely rooted in medieval ideas.

Veterinary Medicine

The Greeks tell us that the origin of veterinary medicine is to be found in the centaur Chiron. Virgil mentions him, and St. Isidore, in book 9 of his *Etymologiae* stated, "Animal medicine was created by a Greek named Chiron, who is portrayed as half man and half horse." However, in the Iberian Peninsula veterinary medicine originated with shepherds tending their flocks, who followed a lore acquired from direct experience and family traditions, but we have no systemized doctrine for this knowledge. Generally, animal pathology followed human pathology, growing out of the shepherds' folk medicine into the clinical veterinary. The care of stock, and above all horses as a necessary factor in warfare and the rise of knighthood as a social class in the Middle Ages, led to a special concern for its welfare and to great advances in the knowledge of its anatomy, hygiene, and pathology. Several surviving manuscripts reveal this interest, among them an anonymous thirteenth-century *Book of the Horse* and *Book of Hunting*, or the treatise composed by Theodorico of Lucca on equine pathology. Falconry produced similar results in avian medicine. This new science, however, may be viewed as really beginning its true development with the creation at the close of the fourteenth century of the Royal Tribunal for Animal Medicine, charged with the examination and certification of future veterinaries.

MEDINA SIDONIA, HOUSE OF

In the late thirteenth century, under Sancho IV and Fernando IV, Alfonso Pérez de Guzmán the Good married María Alonso Coronel in Seville, and thus acquired significant property in the area to begin his family's progression toward Castilian upper nobility. Between 1282 and 1303, Alfonso gained control of lands that appeared to be of little importance at the time, but were to form the basis of a huge territorial empire in southwestern Spain. As with so many other grandee noble houses in the later Middle Ages, the big opportunity for Guzmán came with the Trastámaran victory in the Castilian civil war of 1366–1369. Juan Alfonso de Guzmán fought for the victorious Enrique II, and was awarded not only the hand of the new king's niece, Juana de Castilla, but also the extremely valuable county of Niebla. Juan and his successors steadily accumulated lordships and other properties in western Andalusia until, in 1445, a later count, Juan Alfonso, was granted the duchy of Medina Sidonia. Both the new duke and his tardily legitimized heir Enrique took full advantage of the political difficulties of Juan II and Enrique IV. Not only did they succeed in greatly expanding their seigniorial possessions, mainly in the modern provinces of Huelva, Seville, and Cádiz, but they also intervened increasingly in the government of the growing port of Seville itself. This was despite the fact that the city's council was supposedly directly subject to the crown.

The influence and wealth thus gained by Duke Juan Alfonso was greatly added to by his son, in the last years of Enrique IV's reign, between 1468 and 1474. In this period, Duke Enrique gained virtually complete control of Seville, in the process driving out the rival Ponce de León family, lords of Arcos and Marchena, and their supporters. The height of the political power of the house of Medina was in the 1470s, when Duke Enrique was chief magistrate (*alcalde mayor*) of Seville and also held various other significant and lucrative offices. Although Fernando and Isabel came to the region in 1477–1478 to curb the power of magnates such as these, their success was limited. Duke Enrique was suspended from his Seville magistracy, but the Granada war assisted his rehabilitation, and in 1488, Isabel made him marquis of Gibraltar. Only in 1502 did she succeed in regaining this jurisdiction, but even so, when the Guzmán entail (*mayorazgo*) was put together in 1503, it was still possible to travel across western Andalusia without ever leaving Medina Sidonia land. The ducal accounts of 1509 indicate the vast range of the family's interests, equivalent to those of a holding company of the present day. In that year, apart from the rents and dues from their numerous urban houses and rural estates, they also gained income

from taxes and duties on trade through their various seaports, and from the proceeds of fisheries, salt pans, butcheries, tanneries, banks, and brothels, as well as royal taxation revenue of various kinds that had been diverted legally into the ducal coffers. It was not surprising that Charles V declared the dukes of Medina Sidonia grandees of Spain.

MEDINACELI, HOUSE OF

The De la Cerda family, counts of Medinaceli and marquises of Cogolludo (Guadalajara) were descended from an illegitimate branch of the house of Béarn, in the Pyrenees. Bernard de Foix, known as the Bastard of Béarn, married into the De la Cerda branch of the family of Alfonso X. They became naturalized Castilians in the early fourteenth century, with seignorial jurisdiction over Medinaceli (Soria) and Arcos, near the Aragónese border. Their rise predated the development of a new upper nobility in the late fourteenth and early fifteenth centuries, as the victorious Trastámaran kings granted increased resources to their noble supporters in the Castilian civil war of 1366–1369. Thus it was not until the reigns of Fernando and Isabel that the De la Cerda made further advances, but by then Fernando del Pulgar, in his *Libro de los claros varones de Castilla*, had left a vivid description of Count Gastón de la Cerda, whom he portrays as having been loyal to Enrique IV, in contrast to his father Count Luis, though he was also said to have been "ome vencido del amor de las mugeres, e él fue amado dellas!" (a man conquered by the love of women, and beloved by them)

Whatever the truth of this, it is undeniable that the De la Cerda family gained greatly from having supported Isabel and Fernando in their conflict with Juana la Beltraneja and Afonso V of Portugal. In 1476, they received from the crown a massive grant of 406,000 *maravedís* a year, while in 1479, the county of Medinaceli was upgraded to a duchy. Thus they became part of the elite nobility of the Catholic kings, and grandees under Carlos V. More significantly in some respects, the De la Cerda family also received in 1479 the county of Puerto de Santa María. This was a small seaport south of Cádiz that had scarcely been developed at the time. In the climate of economic optimism that had been created in Spain and Portugal by

growing trade and discoveries in the Atlantic and Africa, El Gran Puerto might have become a major center to rival not only Cádiz and the duke of Medina Sidonia's port of San Lúcar de Barrameda, but even Seville itself. In the event this did not occur, though, by his own account, the duke was asked for sponsorship by Christopher Columbus, a request that entirely accorded with his ambitions for Puerto de Santa María. He appears to have refused so as not to offend his royal mistress and master, from whom he had so recently received rewards and preferment and who were intent on clipping the wings of the main magnates of the region and developing both Cádiz and Seville under crown control.

Nevertheless, the house of Medinaceli continued to add to its Andalusian interests as the sixteenth century began, eventually acquiring by intermarriage with the Ribera family that great monument to seignorial pride and classical and Islamic culture the Casa de Pilatos in Seville.

MENA, JUAN DE

Secretary and chronicler of Juan II of Castile and one of the outstanding poets of his time. Author of two long narrative poems, *La coronación del marqués de Santillana* (c.1438), and his masterpiece, *El laberinto de Fortuna* (1444); an allegorical debate, *Coplas de los pecados mortales* (also known as *Debate de la Razón contra la Voluntad*), left incomplete at his death; and some fifty shorter compositions typical of the courtly verse of his day: queries and responses to other poets, occasional pieces, riddles, love poems, and satiric verse. His prose works include a prologue and commentary to his *Coronación*; *La Ilíada en romance*, a translation of the *Ilias latina*, with prologue (c.1442); *Tratado de amor* (c.1444); *Tratado del título de duque* (1445); a prologue to Alvaro de Luna's *Libro de las virtuosas e claras mugeres* (c.1446); and the fragmentary *Memorias de algunos linajes antiquas é nobles de Castilla* (1448).

Reliable data on Mena's life is sparse. He was born in late December 1411 in Córdoba, and was

named alderman (*veinticuatro*) there possibly as early as 1435. In his *Memorias* he traces the Mena lineage to the valley of Mena in La Montaña. Vatican archival documents place him in Florence in 1442–1443 at the court of Pope Eugene IV, from whom he unsuccessfully sought ecclesiastical benefices in Córdoba. He was appointed secretary for Latin and royal chronicler by King Juan II of Castile probably in the mid-1440s, although the earliest extant document which refers to him with either of these titles is his own *Memorias* (1448). He married Marina Méndez, some twenty years his junior, around 1450. Upon the death of King Juan II in 1454 he remained in the service of King Enrique IV; he died in Torrelaguna in 1456, leaving no descendants.

The poet's first editor, Hernán Núñez, supplies additional biographical data that cannot be corroborated: that he was the son of Pedrarias and of a sister of Ruy Fernández de Peñalosa, lord of Almenara and *veinticuatro* of Córdoba; that both parents died when he was very young; that he began his studies in Córdoba and continued them in Salamanca; and that he was married in Córdoba to a sister of García de Vaca and Lope de Vaca. Other early biographical accounts derive from Núñez, although they differ in some particulars.

Throughout his adult life Mena divided his time between Córdoba and the royal court. He was a loyal supporter of King Juan II and an unabashed admirer of Alvaro de Luna; at the same time, his friendship with the Marquis of Santillana transcended the political turmoil of the time and survived the Marquis's disaffection with the crown and the *condestable*.

El laberinto de Fortuna (popularly called *Las trescientas*), a narrative poem of 297 *arte mayor* stanzas, was presented to King Juan II in February 1444. The poet inveighs against capricious Fortune, and is forthwith transported in a visionary journey to her palace. There he is met by Providence, who will serve as his guide. Providence shows him the three wheels of Fortune corresponding to the past, present, and future, each with seven circles governed by the seven planets. The wheel of the unknowable future remains veiled, but the poet will be permitted to see those of the past and the present.

The main body of the poem (stanzas 61–238) recounts the histories of exemplary figures (exalted and condemned) in each of the seven circles. The first four circles (Diana, Mercury, Venus, and Phoebus) stress figures from the past and ethical concerns, while the last three (Mars, Jupiter, and Saturn) emphasize the present (and, by extension, the recent past). Here Fortune holds sway; only Alvaro de Luna has been able

to conquer her, and the king must emulate his example if he is to attain the greatness foretold for him.

The work concludes with Providence's prophecy of future glory for the king, whose fame will eclipse that of his ancestors; the vision fades, however, before the poet can inquire of his guide as to the particulars of the king's future accomplishments. His task is clear: he must put an end to civil strife ("las guerras que vimos de nuestra Castilla," 141b) and unite the warring factions in a final push to victory over the Muslims (the "virtuosa, magnífica guerra" of 152a).

Mena drew selectively and deftly from a wide variety of sources. His allegorical construct owes much to such works as *Anticlaudianus*, *Roman de la rose*, and Dante's *Divine Comedy*, though he appears to have made his own contribution to the symbology of Fortune in the concept of the three wheels. He knew and utilized Latin epic poets (Virgil, Lucan, Statius) and relied heavily on Ovid's *Metamorphoses* for Greco-Roman mythology.

The language of the *Laberinto* is a language of poetic innovation. It is characterized by an abundance of neologisms coined from Latin roots, a tendency toward Latinate morphology and syntax, and the extensive use of a wide variety of rhetorical devices. Yet the poet does not hesitate to juxtapose a vulgar, archaic vernacular word and an elegant Latinism: "*fondón del gilénico cerco segundo*" (at the deepest bottom of the second celaenic [i.e., Meraniell] circle) (92b) or "*con túrbido velo su mote cubría*" (with turbid veil covered their riddle 57d). The result is a compendium of tragic, satiric, and comedic styles consistent with principles enunciated earlier by the poet (*Coronación*, prologue).

La coronación del marqués de Santillana was composed to celebrate Santillana's victory over the Moors in the Battle of Huelma in 1438. It consists of fifty-one octosyllabic *coplas reales*, accompanied by the author's extensive prose commentary in which he explicates each stanza, clarifying classical allusions and glossing his neologisms. Mena coined the term *calamicleos* (from the Latin *calamitas* and Greek *cleos*) to describe the work, "a treatise on the misery of evildoers and the glory of the good." The poet describes his allegorical journey through the valleys of Thessaly, where he contemplates the fate of figures from antiquity such as Ninus of Babylon (armless in punishment for his failure to raise his arms in defense of his city) and Jason (afire in punishment for his lust). He then makes his way through a forest of knowledge and ascends Mt Parnassus, reaching a place reserved for those who have attained fame through their works: Solomon, David, Homer, Lucan, Virgil, Seneca, and others. Under a canopy, attended by the immortal authors and the Muses, is the Marquis of Santillana; the

poet watches as he receives the laurel crown from four maidens who represent the cardinal virtues, and exhorts the goddess Fame to spread the news of the event worldwide.

Stanza 42 and its commentary reveal that Santillana is being recognized for his diligence, loyalty, and valor in the service of the king against the Muslims rather than for his accomplishments as a writer. By implication, the poet's condemnation of those being punished for cowardice or irresponsibility could be extended to some of his contemporaries; the example of Santillana (like that of Alvaro de Luna in *Laberinto*) is worthy of emulation.

In *Coplas de los pecados mortales*, the poet invokes the Christian muse, disavowing the "dulçura enponzoñada" of his earlier works and ruing time mispent in the study of pagan antiquity. Written in octosyllabic *arte menor* stanzas and structured as an allegorical debate between Reason and the Seven Deadly Sins, represented as seven faces of Will, the work leaves off at Stanza 106, during the debate between Reason and Anger. An indication of the work's reception in its own time are the continuations of it written by Gómez Manrique, Pero Guillén de Segovia, and Fray Jerónimo de Olivares.

Mena's earliest prose work is probably his commentary to the *Coronación*. There he cultivates several styles, ranging from elaborate Latinate through simpler narrative to direct didactic. The *Ilias latina* is his translation of an abridged version of the Homeric epic in 1,070 Latin hexameters. *Tratado de amor*, in relatively straightforward didactic style, reveals some of the author's subtle humor as he concentrates on "el amor no lícito e insano" and devotes almost equal attention to that which engenders it as to that which repels it. *Tratado sobre el título de duque* purports to trace the origins, rights, privileges, insignia, and prerogatives of dukes but serves as a vehicle for the poet's praise of the duke of Medina Sidonia and count of Niebla, Juan de Guzmán, to whom it is dedicated. In his brief prologue to Alvaro de Luna's *Libro de las virtuosas e claras mugeres*, Mena renders thanks at the behest, he says, of many well-born ladies to Alvaro for his defense of their honor; finally, the fragmentary *Memorias de algunos linages antiguos é nobles de Castilla* are brief sketches of the historical and geographical origins of fourteen lineages, including his own.

Mena's works—particularly the *Laberinto*—were well known to his contemporaries and to posterity. He was cited extensively by Elio Antonio de Nebrija and Juan del Encina, annotated by Hernán Núñez and Francisco Sánchez de las Brozas, and his influence can be found throughout the sixteenth century (in Cristóbal de Castillejo and Fernando de Herrera, for exam-

ple), and into the seventeenth (Luis de Góngora). The point of departure for modern Mena scholarship is Lida de Malkiel's monumental study (1950).

MENDOZA, FRAY IÑIGO DE

Franciscan friar (c. 1424–c.1507) related to the aristocratic Mendoza family and to the Jewish convert Santa María family. He appears in Enrique IV's court and later in the court of the Catholic Monarchs, of whom he was an ardent supporter as well as Isabel's personal preacher. The first version of his major work, the *Coplas de vita Christi*, dates from 1467 to 1468, and interspersed in it are numerous extensive passages of criticism against King Enrique, his protégés, and other personalities (Pedro Girón, Juan Pacheco, Beltrán de la Cueva, Alonso Carrillo, for example), as well as Alvaro de Luna, the high constable to Juan II. Mendoza was obligated to rewrite a second version of this work excluding the personal references but he managed to maintain the same critical tone. The first edition (actually a third version of the poem) appeared in Zamora in 1482, with almost four hundred double five-line octosyllabic stanzas and one ballad (perhaps the first ever printed) with its *desfecha* (gloss). The text includes a pastoral Christmas episode with clearly theatrical connotations. Imbued with both cultured and popular styles, *Vita Christi* also conveys the typical Franciscan spirit of the time with a didactic, moralizing tone. The influence of this poem is notable in Comendador Román, Juan de Padilla, and Ambrosio Montesino, among others; important traces of the pastoral episode appear in Juan del Encina, Torres Naharro, and in other authors prior to Lope de Vega. Shortly before *Vita Christi* appeared, another poem by Mendoza was published, the popular *Coplas de Mingo Revulgo*, also directed against Enrique IV and his protégés.

Mendoza was, in addition, the author of strictly religious poems, among which *Los gozos de Nuestra Señora* and *Coplas a la Verónica* are particularly noteworthy. Two works of moral intention were reprinted frequently during the period up to 1509: *Coplas en vituperio de las malas hembras* and *Historia de la cuestión y diferencia que ay entre la Razón y la Sensualidad*; the latter follows very closely the *Debate de la Razón y la Voluntad* by Juan de Mena. During the same period a series of political works by Mendoza in defense of the Catholic monarchs enjoyed considerable fame and in them the political and military instability inherited from the previous reign was reflected. In the *Dechado* (1475–1476) addressed to Isabel, he encouraged the queen in her struggle against Juana la Beltraneja's supporters and foreign allies, and predicted her coming victory. In his *Coplas en que declara como por el aduenimiento destos muy altos señores es reparada nuestra Castilla* (composed around 1479), he prophesies an extraordinary, messianic future for Castile and its monarchs Fernando and Isabel, and recommends the relentless application of justice in dealing with rebels who challenge royal authority. It is therefore evident that Mendoza is not simply a religious poet, but rather his works, of great variety and complexity, encompass other important topics that make this author one of the most interesting writers of late-fifteenth-century Castile.

MERCEDARIANS, ORDER OF OUR LADY OF MERCY *See* CHURCH, RELIGIOUS ORDERS

MERINIDS

The Merinids, often referred to as the Benimerines, were a North African dynasty probably of Berber origin, although they claimed Arab ancestry. Essentially nomadic, they struggled with the Almohads in Morocco, and in 1145 were driven into the Sahara. In subsequent clashes with the Almohads they emerged victorious and by 1246 had taken the Almohad capital of Marrakesh, Tangiers by 1273, and Ceuta by 1275. They first appeared in Al-Andalus at the time of the Mudéjar revolts of 1264–1266, when they were welcomed by Ibn al-Aḥmar and seen as the instruments for frustrating Christian gains in the south. On several

occasions, they came to the aid of Granada against the encroachments of Alfonso X and Sancho IV. After the disintegration of Almohad power in Al-Andalus, the Merinids by the fourteenth century had hoped to build an empire that could counter the influence of Castile and Aragón in Iberia. Their attempts, however, failed and they were compelled to return to Morocco after a resounding defeat at the battle of the Río Salado in 1340.

Contrary to the Almoravids and the Almohads, the Merinids had no sectarian or ideological foundation for their authority. Their power had been won by means of tribal conquest and established by force rather than through religious reform. Despite the secular origins of their dominance, they perceived themselves as the heirs and successors of the Almohads and sought to intervene in Al-Andalus on the basis of protecting the Muslim faith and their coreligionists there. Their leadership in campaigns against Iberian Christians not only signaled their political initiative but their sponsorship of *jihād* and, therefore, their right to ascendancy. The Merinid armies were highly mobile, composed of light cavalry, reflecting their desert origins and ties to the Zanāta Berbers. With this type of force they were successful in raiding and claiming booty, but not in retaining territory or carrying out successful sieges of cities and fortresses.

The Merinid interest in Al-Andalus led to Merinid involvement in the internal affairs of the Iberian Muslims, especially in Granada. Their presence contributed greatly to the deterioration of relations between Iberian Muslims and Christians and led the latter to introduce oppressive measures against Muslims living in their territories. Merinid intercession in Al-Andalus proved almost as dangerous for the Muslims of Iberia as had the intervention of the Almoravids and the Almohads, plus any alliance that had been wrought with the Christians.

MERINO

The *maiorinus* in the Astur-Leonese kingdom was the administrative official named by a count or *tenente* to collect payments, especially those judicial in origin, in a given district. In the tenth century the term generally replaced the earlier *vilico* as the king appointed a no-

bleman to function at court as an assistant *mayordomo* or to take charge of a jurisdiction. Analogously, lay and ecclesiastical lords began to appoint *merinos* in lands under their authority. In the eleventh century public administration acquired a more civil character as the king gradually replaced counts and tenentes with *merinos* (whose names were listed in royal documents) and the former counties with *merindades* that might or might not have the same boundaries as their predecessors. The merino also came to be entrusted with the tenancy of castles and towers, thus gaining responsibility for keeping local peace and order. At the same time, the rise of towns as corporate authorities with their own *fueros* (municipal charters) resulted in the appearance of *merinos concejiles* who eventually functioned under the authority of the municipal judges (*alcaldes, jueces*). Concomitant with the legal organization of municipal corporations was the limit thus placed on the authority of seigneurial or ecclesiastical *merinos*, although not on that of royal judges or judges from the same town. As early as the end of the twelfth century some *concejos* began to participate in choosing their merino, hitherto appointed by the king or lord. By the thirteenth century the merino in Castile and León—whether royal, seigneurial (either lay or ecclesiastical), or municipal, and whether located at the seat of highest authority or in an inferior jurisdiction—can be described generally as fulfilling fiscal responsibilities, exercising judicial power as the logical extension of delegated authority, carrying out judicial decisions, and recruiting and leading soldiers in maintaining public order.

At the beginning of the reign of Alfonso X (1252) there were four *merindades mayores*: Galicia, León, Castile, and Murcia. The Alfonsine *Espéculo* describes the *merino mayor* only in terms of his executive authority; he was the superior officer in charge of meting out justice and carrying out the law, and he oversaw the *merinos menores* of the lesser territorial jurisdictions within his region. (In the *Segunda Partida* the *merinos menores* could also be appointed by an *adelantado* [governor] and the merino's powers were specified.) In 1258 Alfonso suppressed the *merindades mayores* in Castile and Murcia, replacing them with *adelantamientos* (governorships). Later he also suppressed the *adelantamientos* without appointing new *merinos*, the latter action no doubt in response to the specific demand made by the nobles in the *cortes* (parliament) of Burgos (1272). The *merinos mayores* in Galicia, León, and Castile reappeared early in the reign of Sancho IV, but by the end of the reign were replaced by *adelantados mayores*. In the *Ordenamiento de Alcalá* (1348) Alfonso XI referred to *merinos mayores* for Castile, León, and Galicia, *adelantados mayores* for Andalusia

and Murcia, and *merinos* for Guipúzcoa, Alava, and Asturias. Enrique II created (1371) the *audiencia* to serve under the chancery and over the *merinos mayores*, but from the middle of the century the merino already had begun to lose ordinary judicial authority to a new official, the *corregidor*. By 1500 Castilian territory had been divided into sixty-five *corregimientos*.

MESTA

A specifically Castilian term, derived from the Berber *meshtā*, meaning the annual winter encampment of migratory shepherds, denotes in common usage the great royal-chartered corporation of sheepmen in medieval and modern Castile alternatively known as the *Mesta Real* or *Honrado Concejo de la Mesta de los Pastores del Reino*. But it can also apply to a comparable body based on a single municipality or district, and, in its original sense as a seasonal meeting of sheepowners and herdsmen to redistribute stray animals (*mesteñas*), settle disputes, and enforce pastoral law.

The two and one-half centuries of medieval *mesta* history from around 1260 to 1500 have tended to be overshadowed by a traditional focus on the modern period, and by the hostile polemical literature of Spanish agrarian reformers from the eighteenth century on, charging the Mesta with having ruined the nation's agriculture and peasantry. In consequence, much remains to be learned regarding the Mesta's genesis, structure, membership, and operation in the Middle Ages when it almost certainly played a beneficent role in society and agropecuarian economy.

The Mesta's obscure origins in the second half of the thirteenth century are irrefutably linked to that dynamic extension of long-distance transhumance across the Iberian *meseta* (plateau) made possible by the major Reconquest advances of Alfonso VI and his successors. These opened up to entrepreneurial sheepraisers—nobles, monasteries, churches, military orders, and, above all, townsmen—vast new areas ideal for winter grazing grounds (*invernaderos*) in Extremadura, New Castile, Murcia, and Andalusia. Out of the network of sheepwalks linking these southern regions with the older summer pastures (*agostaderos*) in Galicia, León, Old Castile, the Rioja, the central Sierras, and Serranía de Cuenca, emerge the four great north-

south sheep highways (*cañadas*)—the Leonesa, Segoviana, Soriana, and Cuenca—upon which the Mesta will center its activities. It is probably from associations (*cuadrillas* of herdsmen banding together on each *cañada* to elect their own *alcaldes* [judges] and handle mutual problems) that arose, no doubt under royal pressure, and not from the often alleged merger of mythical local *mestas*. Contrary also to the frequent affirmation of 1273 as its date of establishment, the Mesta's existence can unquestionably be carried back to Alfonso X's first set of Mesta charters, around 1260. These charters, four in number, recognized the Mesta as a legal corporation, conceded it pasturage privileges in the royal domain (*realengo*), and defined various protective rights. At the same time, the king moved to ensure crown control by assigning the Mesta on each *cañada* itinerant royal justices (*alcaldes entregadores*) for adjudicating the Mesta's claims to its stray sheep, its rights of pasturage access, and protection against excessive tolls and rents imposed by *concejos* or military orders; and by imposing upon it royal taxes of passage and pasturage (the *servicio y montazgo*) to be collected at toll stations strategically located along the *cañadas*.

It should be kept in mind that the Mesta of the Middle Ages was not, as it later became, an oligarchical body of high nobles and large ecclesiastical corporations, but an organization whose membership was largely of the urban and rural middle classes. Whether these holders of relatively modest flocks actually controlled elections of *alcaldes de cuadrilla* who made up the governing board that presided at the supreme annual juntas held at Montemolín in Extremadura and elsewhere, and whether in consequence Mesta government was democratic, continues to be a subject of debate. There is the problem also of when and how speedily the Mesta came to convert its flocks to the high-quality, fine-wooled sheep of the celebrated Merino breed. Vicens Vives has argued that the Merino's introduction into the Iberian Peninsula before 1200 resulted in a "wool revolution" that in turn led to the creation of the Mesta; but all our documentary evidence indicates that the advent of the new breed from North Africa did not much predate 1350, a century after the Mesta's foundation.

Other questions revolve, on the internal side, around the little known prosopography of the actual Mesta membership and their alignments during the political disturbances of late medieval Castile; around the power and familial appropriation of the top royal judicial office, that of the *alcalde entregador mayor*; and how far the Mesta's difficulties with agrarian and other opponents of its sweeping privileges actually

constituted, as has been often supposed, a struggle between farmer and pastoralist.

What is certain is that whatever the magnitude of the profits and losses, the members of the Mesta experienced in the fourteenth and fifteenth centuries due to wool price fluctuations or the semianarchy of the Castilian kingdom, the *honrado concejo* (honorable council) comes over basically unscathed into the reign of the Catholic Monarchs (1474–1516) as a major producer of national wealth, fielding some two million animals for its annual clip; receiving now from the centralizing monarchy a president, henceforth taken from the senior members of the royal council; and embarking upon its greatest age of importance in the sixteenth century as an ever greater supplier of prime Merino wools to the bustling clothmaking centers of western Europe from the Low Countries to Italy.

MESTER DE CLERECÍA

In accord with the derivation of *mester* from the Latin *ministerium* ("profession"), in its broader sense *mester de clerecía* refers to the profession of the clerk, but its connection with the verse form known as *cuaderna vía* was established in the second stanza of the *Libro de Alexandre*, so that *mester de clerecía* now refers to a monorhyme tetrastrophe of Alexandrine lines (fourteen syllables per line, divided into two equal hemistichs).

The form first appeared toward the middle of the thirteenth century: the most important examples are the *Libro de Alexandre*, the works of Gonzalo de Berceo, and the *Libro de Apolonio*; near the end of its popularity in the middle of the fourteenth century, the *cuaderna vía* still predominates in the *Libro de buen amor* and the *Rimado de palacio*.

It has long been held that the works were composed in regular fourteen-syllable lines; however, the manuscript witness reveals many irregular lines, and in the case of the *Libro de Alexandre* the fourteen-syllable line represents only 70 to 75 percent of the total. A majority of scholars also concur in the uniform observance of hiatus between contiguous vowels in adjacent words; some proponents even attribute to

obligatory hiatus a certain esthetic status, in that the poet dignifies the language by preserving the integrity of the vowel locutions, in imitation of the vowel autonomy of Latin poetry. On the other hand, complete elimination of vowels through the widespread apheresis, syncope, and elision is a salient characteristic of the Castilian language in the thirteenth century, and is reflected in the manuscripts themselves, especially those of the *Libro de Alexandre*.

METALINGUISTICS

The language spoken by non-Basque inhabitants of the Iberian Peninsula continued to be called *lingua latina* after the end of the Western Roman Empire. St Isidore referred to the Latin of his own time (seventh century) as being *mixta*, translating the Greek κοινῇ: "id est mixta, sive communis quam omnes utuntur." (It is mixed in the common way men are). Isidore had a concern for careful usage, but saw his society as essentially monolingual. This perspective probably survived for another four hundred years. Our own data for the language of the period preceding the general use of reformed written Romance comes from two sources: reconstruction on the basis of later Romance evidence, and the texts of the time. Their evidence appears to conflict, so some modern scholars have visualized those centuries as being bilingual (or diglossic), Latin and Romance; Menéndez Pidal postulated a third intermediate language (Leonese Vulgar Latin). The speakers of the time seems to have made no such metalinguistic distinctions, not even the erudite stylists in Muslim Spain; they distinguished Arabic, Hebrew, and undifferentiated Latin/Romance. Their own speech, now called *Mozárabe* (Mozarabic), was neither distinguished nor probably distinguishable from that farther north. Historians suggest now that in these centuries the majority of the population were not, as used to be thought, cut off from literate culture and a society whose functioning was still based on documentation; a few could write, many more could read, and virtually everybody (then as now) could usually understand written texts read aloud to them (orders, letters, sermons, the details of legal documents, saints lives, even histories). This fits a metalinguistic perspective of sociolinguistically complex monolingualism, with wide social and stylistic variation (as is normal everywhere)

and a gap between most people's active and passive competence, but not the postulated rigid divide between the language of the literate (supposedly attested by texts) and the illiterate (attested through reconstruction); older and newer grammatical and morphological features coexisted, and everyone's pronunciation was evolved. Learning to write was thus as complicated then as it is in the modern English-speaking world. Nor do we have in these early centuries any sign of geographically based metalinguistic distinctions; such words as *Galleco* seem to have merely geographical reference. Spatial variations existed, naturally, but were still perceived as language-internal.

The metalinguistic situation changed drastically between 1080 and 1300. Catalonia, being Frankish, may have seen a conscious Latin-Romance conceptual distinction in some church centers from the ninth century (when the distinction was invented by Carolingian scholars); elsewhere, such a metalinguistic distinction seems not to have occurred to Spaniards until after the French liturgy replaced the Toledan liturgy (1080), needing to be pronounced in the standard European way (producing a specified sound for every written letter) that we now call "Medieval Latin." Outside progressive church circles the distinction was probably not generally felt until the thirteenth century, and even Alfonso X el Sabio still occasionally treated them as two modes of one language. Subsequently, the distinction was clear, and people could become literate in the vernacular without necessarily first becoming literate in Latin.

This metalinguistic development probably arose parallel with new geographically based ones. Alfonso X referred to *romance*, but regularly also to *romance castellano*, distinguished in his own mind from the *romance gallego* in which he composed poetry; clear distinctions from Leonese and Aragónese were probably also invented in that century (for political reasons), even though these had no internal standardization process. Catalan, also for political reasons, acquired a separate standardized written form then to distinguish it conceptually from the written form they had used before (Provençal). The fourteenth-century conceptual erection of a Portuguese-Galician divide was similarly only thought worthwhile because of their political separation. For such diatopic distinctions are never based on a list of sufficient and necessary conditions for regarding related languages as separate; they are always political decisions, usually accompanying, or even following, the elaboration of new separate written forms. Thus before 1080 the peninsula was metalinguistically comparable to the modern English-speaking world (one language with wide variation), but by 1300 it was comparable to Spain in the late 1990s (where several

newly identified geographically based separately written languages are claimed to exist). Meanwhile, actual linguistic changes continued largely unconnected with such metalinguistic revolutions.

METGE, BERNAT (505)

Bernat Metge (1340/6–1413) was a learned Catalan writer. His stepfather, Ferrer Sayol, the principal notary of Queen Leonor of Sicily, translated into Catalan the *De re rustica* (1380–1385) of the Latin writer Palladius Rutilius, so we presume that he initiated Metge both into the field of classical letters and into the royal court. In 1371 Metge entered the service of the queen and in 1375 he was appointed scribe to her son, Metge's protector, who began to reign in 1387 as Juan I of Aragón. In 1390 Metge was promoted to the position of secretary to the king and his wife, Queen Violant, even though his honesty as a royal servant had been questioned; he was, in fact, involved in at least three lawsuits. As the records of the last of these trials (1397) have been preserved, we know exactly how serious the charges were against him. Such legal problems became the subject of very interesting literary writings that illustrate the discovery of the value of learned prose by Catalan intellectuals toward the end of the fourteenth century. In 1381, in fact, Metge wrote his first self-defense in traditional Occitanian-Catalan verse, the *Llibre de fortuna e prudència*, in which he wittily borrowed from Dante and Jean de Meun as well as from Latin writers such as Alain de Lille and Arrigo da Settimello. Metge also parodied preaching in the verses of his *Sermó*, and adapted to Catalan prose the second book of the medieval pseudo-Ovidian poem *De vetula*, which is known as *Ovidi enamorad*. From 1388 on, he began a new literary fashion with his translation of the last novella of Boccaccio's *Decameron*, the story of Walter and the patient Griselidis. Metge, who felt himself to be the first Petrarchist in Catalan vernacular literature, used the Latin version of Boccaccio's text included by Petrarch in one of his *Seniles*. His Italian masters acquainted Metge with classical Latin literature, as we can see in his unfinished *Apologia* (1395? 1408?), and in his masterpiece, *Lo somni* (1399). This work was conceived as a dialogue between the author and three dead men that come to him when he is asleep in prison. Metge tries to prove that he is innocent of

the charges of treachery and immorality that have put him in jail after the unexpected death of King Juan I in 1396, so he agrees to be converted to the "true faith" from cynic skepticism—which he calls Epicurism—and also promises that in the future he will restrain his excessive devotion to women. This part of *Lo somni*, which Metge borrowed from Cicero, Ovid, and the church Fathers and Doctors, shines with Platonic solemnity and elegance, but there is also a coarser and extremely funny part that comes straight from Boccaccio's *Corbaccio*. *Lo somni* is such a unique achievement that it does not fit into any scheme of medieval literary history. There is a scholarly tradition in modern Catalonia that makes Metge a humanist *ante litteram*, even though he is at least as medieval as his main source, Boccaccio.

MIERES, TOMÁS

Catalan jurist and counselor to King Alfonso IV, Tomás Mieres is best known for his glosses and recompositions of the constitutions of Catalonia, the acts of the Catalan courts, and the local and provincial customary law known as the *Usatges* of Barcelona. A native of Girona, born in the late fourteenth century, Mieres studied law in Italy. He worked as a lawyer and judge of the curia in Girona; later Mieres was named legal council to the Real Património by Alfonso IV and made a member of the the royal curia (court).

In 1430 Mieres began a new compilation of the customary law codes of Girona that were concerned with feudal and seignorial landholding. Due to the contradictory nature of the texts, Mieres had to reorganize thoroughly the older codes into a new compilation and concordance. This work, the *Consuetudines diocesis gerundensis*, published in 1439, provided a solid base for feudal institutions in Girona and thus became a key argument used by secular and legal lords in defense of their landholding practices in the face of demands for liberation by the *remensa* peasants.

In the same year as the publication of the *Consuetudines*, Mieres began work on a gloss on the constitutions of Catalonia and the promulgations of the *corts* of Catalonia up to 1432. Completed in 1446, the *Apparatus super constitutionum curiarum generalium Cathalonie* attempts to harmonize older native customary laws that emphasized monarchical aspirations of con-

trol with demands by the new class of bourgeoisie for greater liberty and political control.

MILLÁN DE LA COGOLLA, SAN

Millán of the Cogolla was born in 473 in Berceo, a village in the Rioja Alta, near the place today known as San Millán de la Cogolla, a name taken from the saint and from a high peak that was called, in ancient times, Cogolla (*cuculla*), according to a Latin document from 1016.

The main source of information about Millán of the Cogolla is the *Vita Beati Aemiliani* by St. Braulius, bishop of Zaragoza (631–651), who was one of the most outstanding figures of the Visigothic culture. Millán was a young shepherd in the Distercian Mountains; he then lived for a while in Bilibio (Haro?) as a disciple of the holy anchorite Felices, who taught him holy science and wisdom. After this period of learning he went back to his native land and to his family. However, he soon decided to abandon life among men and to retire into the wilderness of the Distercian Mountains, where he lived as a hermit for some forty years. Word of his virtues came to Didimus, bishop of Tarragona, who ordained him a priest and entrusted him the church at Berceo. When he was an old man, he retired again to a cave in the folds of the Distercian Mountains, where he led a community of monks and another of women who had been consecrated to God. In such a way began the cenobite cell of San Millán de Suso.

Millán died in 574, and was buried in the same cave where he had lived. In 1030 his relics were transferred to the church of San Millán de Suso and in 1067 they were transferred again to the new church, San Millán de Yuso, where they were placed in a rich casket covered with ivory panels that is still kept in an oratory.

MILITARY ORDERS

Military orders had their origin in the Crusades and were founded in Jerusalem in the twelfth century to fight against infidels. Their members had a double con-

dition: they were both monks and soldiers. In Spain, military orders were also founded to fight against the Muslims and to help the kings during the Reconquest; their organization was very similar to the international orders. When the Moors were expelled from the Iberian Peninsula, Catholic Monarchs Fernando and Isabel incorporated the Hispanic military orders into the crown in 1493.

Internationals Orders

The order of Saint John of Jerusalem (or the Hospital, known as the Hospitalers) was founded in Jerusalem in 1104 by St. Gerard of Provence to take care of the sick pilgrims and to offer help to the crusaders. Their members took the standard vows of poverty, chastity, and obedience and another vow of arms. Their habit was a black mantle with the white Hospitaler cross. This order expanded through the Western Christianity, including the Hispanic kingdoms. Hospitalers in Spain were endowed to fight against the Muslims and to encourage Christian resettlement within the peninsula. They enjoyed an exceptionally prominent position in Roussillon, Catalonia, Aragón, and Valencia. Hospitaler properties were divided in two *lenguas* or languages: Castile and Aragón. That of Aragón embraced the *Castellanía de Amposta* and the priories of Catalonia and Navarra. In Aragón there were also two convents of Hospitaler sisters: Grisén, founded in 1177, and the important monastery of Sijena, founded in 1188 by Queen Sancha, where many king's daughters and women of noble extraction professed. Hospitalers reached their highest power in the fourteenth century with such important personalities as Master Juan Fernández de Heredia and the prior of Catalonia, Guillem de Guimerà. Afterward, Hospitalers began to decline, especially as a result of the incomes produced by the sustenance of Rodas, where the master had his court.

The Order of Knights of the Temple of Solomon (known as Knights Templars) was founded in 1118 by Hugues de Payens and other French knights to defend the pilgrims who visited the Holy Land. Its expansion through Europe was rapid, and in the mid-twelfth century there were twelve provinces in the West and five in the East. The exact date of the entrance of the Templars into Spain is unknown, but it seems probable that before 1128 they were in Aragón and a bit later they arrived in Castile. There the Templars served in the fight against the Moors during the twelfth and thirteenth centuries. After the conquest of Seville, King Fernando III gave them the town of Fregenal. Like other military orders, the Templars had their properties grouped in *encomiendas* and commanded by a preceptor or *comendador*. The most important *encomiendas*

in the Crown of Aragón were Monzón, Tortosa, Gardeny, Barberà, Horta, Peñíscola, Ares, Borriana, and Miravet. Both Templars and Hospitalers gave much military service to the kings during the Reconquest and they received so many rewards that the Order of Temple acquired great financial power. This economic power worked against them and they were dissolved in 1312 by Pope Clement V. Their possessions in Catalonia, Aragón, and Mallorca passed to the Hospitalers, while the Valencian properties would endow the new national Order of Montesa founded in 1317.

Hispanic Orders

The Order of Calatrava is the oldest military order in Spain. It was founded by King Sancho III of Castile, who in 1158 committed the defense of Calatrava castle to Raimond Serrat, abbot of the Cistercian monastery of Fitero. Afterward, he clustered the defenders of Calatrava in a military order that adopted the Cistercian rule and was recognized by Pope Alexander III in 1164. This order was composed of knights and clerks. They were committed to vows of poverty, chastity, and obedience, but in 1540 Pope Paul III freed them from the vow of celibacy. The order's purpose was to defend the roads between Andalusia and Toledo against the Almohads. As a reward, Fernando III and Alfonso X gave the dominion of Jaén to the knights. There the order had got nine preceptories in the fourteenth century. Other important preceptories in Andalusia were Fuenteovejuna and Osuna. In Aragón the Calatrava Order was introduced by King Alfonso II, who gave it lands and the town of Alcáñiz, where a big preceptory was established. Calatravas helped in the reconquest of the Balearics and the Valencia kingdom. Calanda, Alcorisa, Maella, and Monroyo were important preceptories in Aragón. The master lived in Almagro.

The Order of Alcántara was at the beginning only a fraternity of knights placed in the San Julián de Pereiro Convent. It was founded in 1156 by Suero Fernández Barrientos and approved by Pope Alexander III in 1177. It followed the Cistercian rule and after 1212 the order was subjected to that of Calatrava. In 1218 King Alfonso IX of León gave the town of Alcántara to the order. Its aim was to fight against the Muslims and to defend Extremadura against the Portuguese. The Alcántara knights received as a reward the towns of La Serena, Benquerencia, Zalamea, Villanueva de la Serena, and Magacela in Extremadura, and Morón and Cote in Andalusia. Their contribution to the repopulation of much of the land was very important. Their habit was white, with a gold and green cross in the left side.

The Order of Santiago was a Christian military-religious order founded in 1171 to fight against the Muslims of the peninsula and to protect European pilgrims who were going to visit the Sepulcher at Santiago de Compostela. In 1174 King Alfonso VII of Castile gave it the town of Uclés, which became the main center of the order, where the master lived. This order grew very quickly especially in the territories of Ciudad Real, Cuenca, and Toledo, and in the fourteenth century there were five big preceptories: Portugal, León, Castile, Aragón, and Gascona, and two priories, Uclés and San Marcos of León. The first members of the order in Aragón had been there since the beginning of thirteenth century and they received the Montalbán town that became the main preceptory of Aragón. The *freires* took vows of poverty and obedience, and the clerks also took vows of chastity, because the Santiago order was the only one that allowed the knights to get married. The Santiago order also had some hospitals for the care of pilgrims (San Marcos of León), for the care of lepers (Carrión) and, especially, to redeem those Christians captured by infidels (Toledo, Cuenca, Alarcón, and Talavera).

The Order of Montesa was born as a consequence of the dissolution of the Templars, whose properties and those of the Hospitalers in Valencia—except the town of Torrente and the House of Valencia—were ascribed to the Montesa order. It was founded in 1317 by Pope John XXII, under the Cistercian rule and as filial to the Calatrava order. Its purpose was to fight against the Muslims on the Valencian frontier. King Jaime II gave them Montesa castle, where the main convent was set up. Montesa properties were subject to a master and were clustered in two *baillías*, Cervera and Montcada, and in *encomiendas*, the most important of which were Peñíscola, Culla, Benassal, Onda, Borriana, and Ademús. In 1400, the Order of San Jorge de Alfama was joined with Montesa, after which it was called the Order of Montesa and San Jorge de Alfama.

The Order of San Jorge de Alfama was a Catalan order founded in 1201 by King Pedro II to defend and repopulate the Mediterranean coast between Ampolla and Balaguer, whose wilderness provoked frequent attacks by Muslim ships. Their members had also to help the pilgrims who arrived at the Alfama castle, where their convent was. The order had properties in Catalonia; Valencia, where a priory was created; the Balearics, and Sardinia. Their members, both clerics and lay men, lived under the St. Augustine rule and wore a white habit with a red cross. The order was not approved by the pope until 1371. Poverty and a scarcity of members ended in 1400, when it was incorporated into the Order of Montesa and thereafter known as the Order of Montesa and San Jorge de Alfama.

During the Middle Ages other military groups were formed, such as the Order of Santa María de Montegaudio, with a more severe rule, founded by one of the founders of the Order of Santiago. It was then known as the Order of Monsfragüe until 1221, when it was joined with the Order of Calatrava. The Milicia de Cristo appeared in Trujillo during the reign of Alfonso IX of León, and was later joined with the Order of Calatrava by the king. In Portugal, the Order of Avis was founded in 1147 in the town of Aviz, under the rule of the Cistercians, to fight against the Muslims. In the mid-thirteenth century, King Alfonso X founded the Order of Santa María de España to defend his conquests in Andalusia. Its history was very short, because in 1280 the knights were incorporated into the Santiago order.

MIRROR OF PRINCES, THE

An ethical treatise adapted to the particular interests of rulers. Although princely concerns are discernible

in the wisdom corpus, *Calila, Zifar* and the works of Juan Manuel, the earliest vernacular example of the pure form of the genre in the Iberian Peninsular is the *Libro de los doze sabios*, probably produced at the court of Fernando III (c. 1237). A number of works emanated from the Castilian court: the Alfonsine *Setenario* (c. 1250), the *Castigos e documentos* (1293) commissioned by Sancho IV, the *Speculum regum* of the Galician Franciscan Alvarus Pelagius (Alvaro Pais, c. 1280–1349), dedicated to Alfonso XI, and the Isabelleine *Repertorio de principes*. The *De regimine principum* (1287) of Giles of Rome was translated and glossed with numerous exempla (c. 1345) by the Franciscan Juan García de Castrogeriz for Bernabé, bishop of Osma (c. 1290–1351), tutor to Pedro I when prince. In the extensive gloss the focus on statecraft is blurred, perhaps reflecting its origins on the periphery of the court rather than at its center. The gloss, which circulated separately from and in considerably more witnesses than the simple translation, is the source for the additional matter in the longer redaction of the *Castigos e documentos*. There were also Portuguese and Catalan translations of Giles, and a Castilian translation of the Dominican Thomas Aquinas's *De regimine principum ad Regem Cypri*.

In Catalonia, the theme of princely instruction is present in the works of Arnau de Vilanova, Francesc Eiximenis, and Ramón Llull (whose book of proverbs of statecraft dedicated to Jaime II is lost), and in chronicles. One monograph on the subject is the scripturally centered *Tractatus de vita moribus et regimine principum* written by infante Pere, count of Ribagorça, after entering the Franciscan Order in 1358. The presence of the preaching orders is thus striking.

The Portuguese representative of the genre, the *Leal conselheiro* of King Duarte (r. 1433–1438) is unusual in that it is a work on kingship written by a king.

The dedication of *Castigos e documentos* shows the dual nature of the genre: “ordené fazer este libro para mi fijo, e dende para todos aquellos que del algund bien quiseren tomar . . .” (I ordered this book made for my son and for all who wish to take some good from it). The mirror tends to address both the prince and the broader community. Pragmatism and piety coexist throughout the history of the genre, but the latter seems to predominate toward the end of the medieval period.

The Secret of Secrets

Straddling the wisdom genre and the mirror of princes is the *Secret of Secrets*, ostensibly a letter from Aristotle to Alexander the Great on the government of self, household, and state, including advice on diet, hygiene, and divination (this last topic is censored in

some versions). A hermetic element is present. Its ethos is generally more Machiavellian than that of the mirror.

The peninsula knew this text in translations from two redactions. The Western version, in the form of the Arabic *Sirr al-asrar*, supplied the first Hispanic translation, the Castilian *Poridat de las poridades*, known to Alfonso X. *Poridat* is to a degree implicated in the textual transmission of *Buenos proverbios*: both have material on Alexander the Great; of the six *Poridat* manuscripts, four include *Buenos proverbios*; in Catalonia, they are probably the twin sources of the *Llibre de saviesa*. The Eastern version is represented in the peninsula by the Aragónese, Castilian, Catalan, and Portuguese translations from the Latin abbreviated version of the translation of Philip of Tripoli (first half of the thirteenth century). This version seems to have been the more popular: unlike *Poridat*, it survived into the printing age.

MISA DE AMORES

Two major surviving compositions are generally given the title *Misa de amor* (or *amores*). One is attributed to Juan de Dueñas, "Beati de amores adsit" (Dutton 0369), and the other to Suero de Ribera, "Amor en nuestros trabajos" (Dutton 0034). A further fragment of a "love mass" is found in a four-line *Sanctus* to love by Juan de Tapia in the *Cancionero de Estúñiga* (Dutton 0559). The poets make use of the form of the Christian liturgy of the Mass (confession, creed, and the like) to write about love, or to address love as a god. To dismiss this as irreverent blasphemy, as some have done, is to make an inadequate critical response to the works themselves and also to late medieval religious sensibility. Evidence of censorship of such works does exist, but it looks to be the product of a later hand. The court anthologies of the fifteenth and early sixteenth centuries appear to allow for a creative juxtaposition of the sacred and the secular. At some times there is a clear parodic intent; at others the effect is less easy to categorize. This is true in the case of a third intact *Misa de amor*, which is less well known

than those mentioned above. It comes in a composition by Nicolás Núñez in the *Cancionero general* of 1511, "Estas oras rezaréys" (Dutton 6621). The poet is ostensibly directing his lady in the devotional use of her Book of Hours. Each of the liturgical hours is accorded just one stanza, except the office of Terce, where some sixteen stanzas are devoted to the lady's attendance at the mass accompanying this service. Here the poet not only employs the structural form of his source but he also appeals to its spiritual and moral content.

MOCEDADES DE RODRIGO

As one of only three epic narratives surviving in rhymed form, the *Mocedades de Rodrigo* is a document of major importance. The poem's unique, lacunous, poorly copied codex (Bib. Nat. Paris, MS. Espagnol 12), discovered in 1844, was studied and edited by A. D. Deyermond. Neotraditionalist criticism saw in the *Mocedades* only a late, aberrant, decadent epic. Deyermond has determined the poem's date (c. 1365) and has demonstrated that, in its present form, it embodies ecclesiastical propaganda in favor of the bishopric of Palencia, thus providing evidence of learned intervention in the diffusion of this late Spanish epic. However, the poem is not the only extant *Mocedades* narrative. Evidence of a *Mocedades* tradition dates from the late thirteenth century. An extensive prose rendering of similar structure and narrative content, thought to reflect an oral verse version (a lost *Gesta de las Mocedades*), was absorbed in the *Crónica de Castilla* (1300); the Portuguese *Crónica de 1344* attests to further possible evidence of the oral tradition. Vestiges of still other variants appear, after the extant *Mocedades*, in the *Bienandanzas e fortunas* (1471–1476) of Lope García Salazar, in a revision of Diego Rodríguez de Almela's *Compendio historial* (1504–1516), and in ballads from the late sixteenth century as well as in the modern oral tradition. From a neotraditionalist perspective, such texts document an epic tradition concerning El Cid's youthful deeds beginning in the late 1200s and lasting until the end of the Middle Ages and, in ballad form, until even later.

The *Mocedades de Rodrigo* will continue to be a crucial witness in the ongoing dialogue between neotraditionalist and neoindividualist critics concerning the origins and nature of the epic on the Iberian Peninsula.

MOLINA, MARÍA DE

Queen of Castile María (c. 1270–1321) was the wife of Sancho IV (r. 1284–1295) and the mother of Fernando IV (c. 1295–1312). As the daughter of Alfonso de Molina and Mayor Téllez de Meneses, she was a niece of Fernando III and a first cousin of Alfonso X. In June 1282 at Toledo she married Infante Sancho, the son and heir of Alfonso X, even though they were related within the prohibited degrees of kindred. Threatening them with excommunication and interdict, Pope Martin IV ordered them to separate in 1283, but they would not do so. Inasmuch as they lacked a papal dispensation, their enemies regarded the marriage as invalid and their children as illegitimate. María was crowned with Sancho IV at Toledo in April 1284. She seems to have been an active counselor to her husband, but her powerful presence in Castilian politics was particularly felt after his death in 1295.

As guardian of their firstborn, Fernando IV, her responsibility was to protect his person and to repel those who challenged his right to the throne. Her brother-in-law, Infante Juan, denied Fernando IV's claims on the grounds that he was illegitimate. Alfonso de la Cerda, as the son of Fernando de la Cerda, Alfonso X's eldest son, alleged that he had a better right to rule. She also had to contend with Sancho IV's uncle, Infante Enrique, who, after long years in exile in Italy, returned home and now demanded the right to act as regent for the boy king. María skillfully won over the towns of the realm, who formed their *hermandades* (military and religious fraternities) in defense of their liberties and the rights of Fernando IV. Through her impassioned appeal the *cortes* (parliament) of Valladolid in 1295 recognized him as king, giving María custody of his person and naming Enrique as guardian of the realm. In the turmoil of the next few years she succeeded in keeping her son's domestic enemies at bay and eventually made peace with his external ene-

mies, Portugal and Aragón. She then arranged his betrothal to Constanza, daughter of King Dinis of Portugal. When Fernando came of age in 1302 he wished to be free of his mother's control and so there followed a period of estrangement. Though forced to withdraw into the background, she later endeavored to induce the nobles to abandon their hostility toward her son.

After the sudden death of Fernando IV in 1312 and of Queen Constanza in 1313, María de Molina emerged once more as a central figure in Castilian politics, championing the cause of her grandson, Alfonso XI (r. 1312–1350), then an infant. Summoned to determine who should be regent, the cortes of Palencia in 1313 were unfortunately divided, some acknowledging her brother-in-law, Infante Juan, while others accepted María and her son, Infante Pedro. After a year of diplomatic, political, and military maneuvering, María took the lead in persuading the infantes to collaborate. The cortes of Burgos in 1315 acknowledged the unified regency, entrusting María with custody of the king. She successfully maintained the unity of the regency, despite the tensions between Juan and Pedro, but after both men died on the plains of Granada in 1319, her skill was tried to the utmost. Her son Felipe, Juan's son Juan, and Infante Juan Manuel, the distinguished writer, now all demanded a share in the regency. Insisting that nothing could be done without the consent of the cortes, she summoned them to Valladolid in 1321, but she fell gravely ill. After making her will on 29 June, she died the next day and was buried in the Cistercian nunnery in Valladolid. By her marriage to Sancho IV she had several children: Fernando IV, Alfonso, Enrique, Pedro, Felipe, and Beatriz. A truly remarkable woman, she deserves to be ranked among those who most effectively governed medieval Castile. In many respects both Fernando IV and Alfonso XI owed their thrones to her.

MONARCHY, PORTUGAL See KINGSHIP; QUEENSHIP

MONARCHY, SPAIN See KINGSHIP; QUEENSHIP

MONASTERIES, CROWN OF ARAGÓN

Pre-Benedictine monasticism spread from Gaul to northeastern Romano-Visigothic Spain (the Tarraco-nensis) before the time of King Leovigild (r. 569–586),

when it became more common throughout the Iberian Peninsula. Both Antonian eremitic or anchoritic, and cenobitic or communal forms existed, including double monasteries, using the guidelines from John Cassian or Caesarius of Arles, with indirect Basilian influence from the East and later that of St. Fructuosus from the West, and the old Isidorian or Mozarabic rites. The extent of continuity in monastic life at the oldest sites through the severe interruptions of the Arian controversy and Germanic invasions, is, however, debatable; and the Muslim conquest (711–718) was an even more severe interregnum. Monks who fled to mountain refuges do not seem to have retained their communities intact. Even when houses in the Hispanic March of northeastern Spain and farther west, in what would become Aragón and Navarre, trace their origins to late antique foundations either by oral tradition or because of archaeological remains, their recorded history usually begins anew in Carolingian times.

Normalized communal monastic discipline under the Rule of St. Benedict (480–543) usually dates after the promulgation in 817 of the *capitula* of Aachen and the ninth-century reforms of St. Benedict of Aniane. The general pattern was that a few houses in the Pyrenees spread their influence into mountain valleys, received patronage from local nobility, and enlarged their domains, then joined into some form of congregation for mutual support partially to ward off their patrons intervention and exploitation. These federated communities would found daughter houses in the lower piedmont country of northeastern Spain and spread monasticism farther south behind the lines of frontier action by the Catalan counts and upstart kings in Aragón who were able to encroach on Muslim territory. There is no evidence of the survival of Mozarabic monasticism in Muslim territory or the Hispanic March, which was embroiled in more than three centuries of intermittent warfare. However, the ideal of Romano-Visigothic monastic culture exemplified by the chronicler John Biclaro (d. 589), the monk-bishop of Girona, was later revived. As a learned Visigoth from Lusitania and traveler to Constantinople, he could have brought Fructuosan and Basilian monasticism to Catalonia, but the site (Vallclara?) of the monastery of Biclaro cannot even be located for certain. Medieval monasticism must be seen as a re-creation and renewal—largely spreading in a north-to-south movement with the Reconquest—that resurrected oral traditions, fostered a nostalgia for an often romanticized past, and revered places hallowed by events in pre-Muslim history.

Stronger evidence for continual monastic life after the Carolingian intervention pertains to key Pyrenean foundations such as Sant Miquel de Cuixà in the con-

flent where some Mozarabic influence can be detected. Founded in 879 by the archpriest Protasius and monks from Sant Andreu d'Eixlada, it would last until 1790. Santa Maria de Ripoll, whose church was dedicated in 888, was founded about the same time by Count Guifré and his protégé, the priest Dagui (880–902); it would continue until the exlaustration of its last eighteen monks in 1835. Ripoll had a dual house for women, Sant Joan de les Abadesses, which the count erected in 885 for his second daughter, Abbess Emma (898–942). Later (1001–1007) Sant Martí del Canigó, organized by the monk Solua (c.1004) from Ripoll, was patronized by Count Guifré II of Cerdanya (c.–1049) who would retire there. It would hold the relics of St. Guldrio, the patron of Catalan peasants. Other centers included Banyolas, Besalú, Camprodón, and revival of the old eighth-century foundation at Labaix.

Organizational reforms were directed by the famous abbot Oliba of Ripoll and Cuixà (1008–1048) who became bishop of Ausona (Vic). Oliba owed his education and inspiration to his predecessor at Cuixà, Abbot Garí (956–998), who continued the building program started by Abbot Ponç in 956, and who introduced the Cluniac (910) reform to the Pyrenean monasteries. Bishop Oliba continued building Cuixà, which is still known for its fine Romanesque architecture, and made it a center of learning with an active scriptorium that began producing chronicles in 985 and continued this tradition through the twelfth century. Ripoll likewise flourished as the pantheon of the comital house of Barcelona in its new church of Sant Pere (890) and monastic school that would later attract scholars like Gerbert (Gerbert d'Orlhac who became Pope Sylvester II) from the north to use its 121 manuscripts (catalog of 1008; 246 codices by 1046). Comital patronage of Ripoll's scriptorium, especially by counts Ramón Berenguer III and IV, resulted in numerous productions, some still extant: Bibles, the *Carmen Campidoctoris* (1098–1099) memorializing El Cid, the *Brevis historia* of Ripoll (1147), and an important version of the *Gesta comitum barcinonensium et regum Bragonum*.

In addition to Canigó, Ripoll (which numbered seventy-five monks in 1169) founded houses dedicated to St. Peter at La Portella and Casseres, and Sant Sadurní de Tavérnoles. After a feudal intervention by the counts of Besalú, the monks influenced by the Gregorian Reform sought union in 1070 with the congregation of St. Victor of Marseilles. Previous federation attempts were spread through the congregations of St. Ponce de Thomières and from La Grasse to incorporate Catalan Benedictine houses. In the 1070s many of these Benedictine monasteries became Cluniac. This pan-Pyrenean congregationalism encouraged cultural

exchange between Catalonia, Provence, and Languedoc, which in turn supported Barcelonan dynastic interests in southern France. Filial priories were established by Ripoll at Cervera, Meia, Banyeres in the upper Penedés, Mediona, and Urgellet. Other important houses included Santa Maria de Amer and Santa Maria de O. The most important of these sub-Pyrenean monasteries, however, was Sant Cugat del Vallés, founded around 870 on first-century Roman ruins to commemorate this saint's martyrdom. Its early foundation so far south in a fertile but open valley left the monastery vulnerable to Muslim raids, as when Al-Manṣūr in 985 laid siege to Barcelona or as late as 1112–1118 when the Almoravids penetrated Catalonia and threatened to cross the Llobregat River, also placed it in position to dominate the eleventh-century affairs of Barcelona's church and county.

Further west the Riojan borderland between Narvare-Aragón and Castile had eight monasteries, of which all but two were tenth-century foundations. Of these, San Martín of Albelda (924) proved to be one of the most influential by spreading the Cluniac reform; and San Millán de la Cogolla, actually a Castilian foundation on an old hermitage site, was to become another major cultural center. The most important Benedictine houses in Aragón proper were San Victorio and Alaón, and San Juan de la Peña which was to become the pantheon for the kings of Aragón. Leyre and Irache were the dominant houses in Navarre. These were reestablished from southern France and reformed as Cluniac houses that played a significant role in the abolition in 1071 of the Mozarabic rite and its replacement by the Roman rite, and that supplied monks and bishops for restored churches and frontier monasteries both in Reconquest Castile-León and Aragón. The post-tenth-century migration of monks into peninsular houses has been called an "ultra-Pyrenean monastic invasion"; their pervasive influence on both Castile-León and Arago-Catalonia was much criticized by anti-French Spanish historians writing after the Napoleonic occupation. The attribution to Cluniac Benedictines of the conversion of the Reconquest into something more militant than it had been, is not tenable; the papacy deserves this credit.

The most famous Catalan Benedictine monastery today is Montserrat, a monument of Catalan nationalism, culture, and regional pride, built on a "holy mountain"—a unique geological formation that is genuinely spectacular. Its foundation in 888 by Ripoll, also owed to the largess of Count Guifré, was confirmed by the Emperor Lothar in 982 and Pope Sergius in 1011, but it was not as important as Sant Benet de Bagés and other houses in the counties of Ausona and Barcelona until much later. Montserrat began humbly as four her-

mitages, two at the base of the mountain and two perched on ledges in a large crevice on the northeastern side. It became somewhat infamous in the late tenth century when in 971 one of its monks, Ceasarius of Santa Cecília de Montserrat, pretended to be the archbishop of Tarragona in exile. Around 1025 the hermits and various unorganized cenobitic communities around Montserrat were gathered together to form a monastery that embraced the Cluniac reform. Like its motherhouse, it later joined the congregation of St. Victor and during the twelfth century developed its famous cult of the Black Virgin. Its status, however, was only that of priory from 1082 until 1409 when Montserrat became an abbey. Its early years were upstaged by the abbey of Sant Llorenç del Munt, a castle (882) turned into a monastery by the monks of Sant Marçal de Montseny in 1067. A century later in 1161, Sant Llorenç faced a reform challenge that transformed several Benedictine monasteries: its monks converted themselves into a community of Augustinian canons.

Although the Benedictines were influenced by waves of reform in succession after the Cluniac (Camaldulesian, Vallumbrosan, Gramuntese), they were split permanently between the Black Monks and the new White Monks or Cistercians after the latter reform movement began in 1098 at Cîteaux and gained renown from the reputation of St. Bernard of Clairvaux (c.1090–1153). The Cistercians, reputed for their land reclamation elsewhere, appeared south of the Pyrenees as vanguard colonists in the late 1140s, contemporary with the most rigorous conversion of the Reconquest into a crusade. This conversion came in reaction to the Almoravid invasion from Africa and to a revival of Islamic militancy in the 1130s, with consequent Christian drives to secure Tarragona (1118–1129), and take Tortosa and Lleida (1148–1149). Invited south by Count Ramón Berenguer IV and the seneschal Guillem de Moncada, the first White Monks from Grandseigne (founded only a few years earlier, in 1145) settled temporarily in Valldaura by 1150 and moved on to the Tarragona frontier two years later. This monastery, Santa Maria de Santes Creus, which had an abbot by 1152, was followed shortly by a second colony from Fontfroide (1146) to occupy land donated after 1150 at the very base of the highland Muslim march of Ciurana, which was being subdued while the monks took position at Poblet. Its first abbot, Guerau, took office in 1153, the year Ciurana castle fell to the Christian allies. Their Cistercian cartularies document thereafter the assimilation of this Muslim territory, New Catalonia, into the Crown of Aragón. These two royal monasteries constituted the epitome of monastic institutionalization in northeastern Spain.

Santes Creus by 1158 consolidated its domain on the upper Campo de Tarragona (documented in its cartulary, *Llibre blanc*, compiled between 1194 and 1197), began construction of its exemplary Gothic-styled church in 1174 along with a major building program consisting of a chapter hall, dormitories, cloisters, courtyards, and outbuildings, followed after 1313 by a refectory and major cloister. Its scribes served the royal and archiepiscopal chanceries and by 1213 developed a reference library of more than sixty codices (which was to grow to 262 manuscripts and 150 incunabula by 1500). The monks built a hospital in 1129 and attracted the special patronage of King Pedro II who in 1285 was entombed there. During its apogee Santes Creus founded daughter houses at Valldigna (1298) in Valencia and Altofonte in Sicily (1308), and assisted in creating the military Order of Montesa (1319).

Poblet's domain grew more rapidly because of conversion of Muslim lands into its seignorial domain and King Alfonso II's patronage of his father's foundation; but its monastic complex developed somewhat differently from Santes Creus. It took over an old hermitage with a small chapel, the buildings turned into a refectory and hospital, and outlying Muslim castles that were converted into granges. These monks also began a magnificent Gothic church and cloister; and they inaugurated such a building program, including chapter hall and new refectory, sacristy, two dormitories for monks and conversos, a hospital, cellars, and forecourt, that by the end of the thirteenth century the abbots faced a financial crisis. When Alfonso II elected to be buried there, Poblet became the royal pantheon for the Crown of Aragón; the stunning royal tombs elevated on majestic arches on both sides of the main nave before the high altar were dedicated in 1340 by King Pedro III. The official character of Poblet's massive complex underscores the extent of its domain, the power of its abbots who became bishops of neighboring sees and served the crown as its treasures, and the influence of its scriptorium. The scriptorium saw much charter production and cartulary compilation, as well as the deeds of King Jaime I in his official *Chronica*, and records of the frequent stops by the royal court as it journeyed back and forth between Catalonia and Aragón along the old Roman road from Lleida to Tarragona. After 1369 the monastery was enclosed by massive walls and towers, and King Martín built his own residence there (1397–1406). Poblet's monks founded daughterhouses at Piedra (1194) on the other side of Zaragoza, at Benifassá (1233) in the kingdom of Valencia, and La Real (1239) in Mallorca; in 1287 they took over Valencia city's major shrine to St. Vincent.

The Cistercian impact on the settlement and evolution of the Crown of Aragón was profound. Cistercian sheep grazed from the foothills of the Pyrenees at the headwaters of the Tet, Segre, and Llobregat Rivers, to the south past Muslim boundaries by special privilege of the Almohads (1217) long before the Christian Reconquest. New Catalonia was resettled both by subcontracts to laymen and by the grange system that encompassed the entire drainage basin of the Segre River below Urgel and the Plains of Tarragona. Their trade goods were exchanged at permanent factories in Lleida, Tortosa, Tarragona, and latter Barcelona. White Monks took over the Benedictine sites of Clariana (1162), in the confluence and Labaix (1235), in Alta Ribagorça; and they founded abbeys at Escarp (1214) at the confluence of the Segre and Ebro Rivers, Vallbona (1242) in the Vallespir, Valldigna (1279) in Valencia, and Sant Bernat de Rascanya (1372), with priories of Roqueta (1287) at a Valencian shrine and Nazaret (1311) in Barcelona, with continued expansion at Les Franqueses (1452) in Noguera, Sant Pau (1472) at Manresa, and Tallat (1509) in Urgell. Of non-Catalan Cistercian houses, Fitero in Navarra (1140) was the most famous.

The convents of Cistercian nuns were far more numerous than older Benedictine convents. After the initial foundation at Valldemaria (1158) at Selva, they established houses at Cadins (1169) in old Empuries, Vallverd (1172) in Noguera; Vallbona de les Monges (1175) in the march of Urgell above Poblet; Les Franqueses (1186) long before its latter conversion to a male priory; La Bouera in Urgell (1195, translated to Vallsanta, 1249); Sant Hilari (1204) near Lleida, which moved to Tamarit; Bonrepòs (1210) in the former Muslim march of Ciurana that became known as the Priorat; Valldonzella (1237) in Barcelona; Valldaura (1237) in Bergueda; l'Eula (1247) in Perpignan; Vallsantos (1249); and in Valencia at La Saïda (1268). By 1492, when many convents or women's houses were consolidated or abandoned, fourteen men's and eighteen women's monasteries had been founded in Catalonia and more in Aragón. Nearly all were destroyed in the uprisings of 1835.

Although monasticism thrived in the Crown of Aragón throughout the Middle Ages, after the thirteenth century cloistered living came under severe competition from the semimonastic but more socially active mendicant orders. The Benedictines and Cistercians were affected by the reform canons of the Fourth Lateran Council (1215). The Cistercians had always congregated into some kind of suprastructure; the Black Monks were reorganized into the Congregación Claustral Tarraconensis, but later the Benedictines of Navarre separated from the Aragónese and Catalan

houses. In 1336, Pope Benedict XII divided the Tarraconensian congregation into those centered at Zaragoza for the Aragónese and those at Tarragona for the Catalans. The latter congregation subsequently split again when in the fifteenth century Montserrat, Cuixols, and Bagés were influenced by the reform from Valladolid.

MONASTERIES, LEÓN AND CASTILE

The main characteristics of monasticism and its development in León and Castile may be reasonably divided into three broad chronological periods. The first of these, from the foundation of the Asturian kingdom in the early eighth century to roughly 1075, was marked by the predominance of Iberian peninsular forms and rules derived from the Visigothic era and a fundamental independence of houses, one from the other. The second period began about 1075 with the advent of Cluniac organization and flourished down until about 1220. It was notable both for the spread in the peninsula of orders founded elsewhere in Europe, notably the Benedictines of Cluny, the Cistercians, and the Carthusians, and for the marshaling of formerly independent houses into orders and provinces of orders. The final medieval period may be said to begin with the foundation of their Madrid house in 1218 by the Dominicans and was the great age of the friars, which

continued until the time of the Catholic monarchs and St. Ignatius Loyola.

In the oldest period the indigenous rules of Bishop Isidore of Seville (600–630) and St. Fructuosus of Braga (c.600–665) largely governed monastic life and, in fact, most of the monasteries of the Christian north in Galicia, northern Portugal, and Old Castile either corporately survived from that period or were founded from the south by Mozarab refugees. During the Visigothic period, monasticism, like other formal Christian institutions, had been largely unknown in Asturias proper and in northern León and Galicia. The monastery at Liébana, flourishing in the late eighth century, is one of the earliest known. Nevertheless, there must have been dozens of others, for when the documentary record becomes substantial, the tiny monastery was typical. Founded very often by a family, some of whose members formed its first congregation, its lifetime might most often be limited to that of the family itself. Others, gathered about an influential anchorite, might also not outlive the founder who had given it impulse. Such small foundations not infrequently were double monasteries composed of houses of both men and women, both presided over by an abbess or an abbot. While many of them seem to have adhered to the rule of St. Isidore or St. Fructuosus, others were marked by a "pactual" form in which the authority and discipline were determined by an initial agreement between the monks and their abbot-to-be. This peculiar practice originated in the northwest of the peninsula in Visigothic times and subsequently spread west as far as the borders of the Rioja.

But if the typical monastery was a spontaneous and very local phenomenon, those that survived to have a wider, more enduring influence were likely to have been of episcopal or even royal foundation. Such were Valpuesta in the Rioja, founded by Bishop Juan in 804, or San Pedro de Montes in the Bierzo by Ramiro II in collaboration with San Genadio, bishop of Astorga, in 935, or again, Celanova south of Orense in 942, the work of Bishop San Rosendo of Mondoñedo, cousin of the same monarch. Such foundations had the prestige and the endowment that allowed them a chance at continuous existence. So too, more often, had the monasteries founded not in the countryside but in the towns, which at this time were little more than cult centers. The most favored houses of this type were, in fact, dedicated to the service of an episcopal cathedral or an important local saint's shrine. The monasteries of San Payo de Antealtares and San Martín de Pinario at Santiago de Compostela and the earliest history of San Isidoro of León are the most famous instances of this type of house.

These greater monasteries were the centers of such high culture as existed in the north during the early Middle Ages. This was a religious culture, of course, concerned with the teaching of Latin grammar so that the Scriptures could be read and appreciated. Beyond that, the *scriptoria* of these houses must see to the recopying of the various ordinals and antiphonals, service books central to the proper celebration of the liturgical life of the house. Some recopying of the patristic commentaries was also obligatory for such a house. But the greatest of them went beyond these merest necessities. At Liébana in the late eighth century a literature of controversy, centering on the adoptionist heresy championed by the metropolitan Elipandus of Toledo, was produced but one of the protagonists also wrote a *Commentary on the Apocalypse*. Ironically, the work has become world famous not for its theology but for the extraordinary illuminations of its manuscripts.

From the scriptorium of the monastery of Berlanga in the Sorian highlands we have not simply two manuscripts of the Bible, but also copies of some of the works of Cassiodorus and one of the homilies of the Carolingian author Smaragdus. The chronicle cycle of Alfonso III (866–910) found one of its major expressions in a version produced in the Riojan house at Albelda. From the nearby San Millán de La Cogalla a late tenth-century copy exists of the great, late Visigothic collection of church canons, the *Hispana*. The continued availability to at least that critical, literate portion of northern society of the latter work, which displayed the Visigothic Christian church at its most grand, and the associated collection of Roman and Visigothic law, the *Liber Iudiciorum* or *Fuero Juzgo*, which did the same for the Visigothic monarchy, supplied a fundamental intellectual identity to the emerging Christian society.

The initiation of a new era in Iberian monasticism was signaled by the formation of a close liturgical bond between the Burgundian monastery of Cluny under abbot Hugh the Great (1079–1109) and Fernando I (1037–1065). That arrangement provided for the payment of an annual *census* to Cluny by the Leonese in return for Cluniac intercession for the king and dynasty. But while these, and other initiatives were important, the growth of an actual Cluniac province made up of formerly independent Leonese houses is datable to the period 1073–1077 when Alfonso VI bestowed four monasteries on the French house. His daughter Urraca (1109–1126) was to be quite as generous and the nobility of the realm tended to follow the lead of the crown. By the mid-twelfth century the Burgundian dependencies in León-Castile numbered no less than fourteen houses. That represented, however, the high point of Cluniac expansion.

Urraca's son, Alfonso VII (1126–1157) rather favored the new order of Cîteaux in his benefactions. The Cistercians secured their first house, in Fitero, at his hands in 1140 and his successors followed his lead. By the end of the century the order boasted no fewer than twenty-nine houses in the realm, although most of these were affiliated with Clairvaux and Morimond rather than Cîteaux itself. At the same time, no fewer than four Cistercian monasteries in León-Castile were houses for nuns.

The spread of houses of women was, strictly speaking, not new but the reforming conceptions of the late eleventh and early twelfth centuries had been hostile to the older houses. The Cistercians were, on the other hand, eminently respectable. So too was the French order of Fontevrault. Its first house in León-Castile, Nuestra Señora de las Nieves near Mayorga, was secured in 1125. Three others are known before the century's end.

Of course, these orders all grew, to large extent, by the appropriation of existing monasteries. The contemporary ideas of reform encouraged that process as they also favored the consolidation of the monastic world. Many small monasteries, under family or even royal patronage, were donated to these new and larger monasteries affiliated with a prestigious order. In short, monastic houses became radically fewer but larger in both community and endowment. A perhaps much older impulse toward a strictly contemplative and liturgical monasticism, even if embodied in a new and wider incarnation, such as the Carthusian ideal, grew most slowly in these centuries and the hermits of La Grand Chartreuse did not establish a presence in Castile until almost the end of the fourteenth century.

Yet other orders that saw some development in León and Castile in this period were those corporations of military monks founded in the Holy Land in the aftermath of the First Crusade. As early as the reign of Urraca there is some evidence for the royal patronage of Templars and Hospitalers but neither of them saw the sort of solid expansion in the west of the peninsula that they did in Aragón or Catalonia. In 1146 Alfonso VII surrendered the newly taken fortress of Calatrava to the Templars but the order proved unequal to the demands of the defense of that exposed position. In 1158, Sancho III of Castile redonated it to a group of individuals who subsequently organized themselves as the Order of Calatrava, which received papal sanction in 1164 and affiliated with Cîteaux in 1187.

At much the same time, in the kingdom of León, another military order was taking shape—that of San Julián del Pereiro, which was later to take the name of the Order of Alcántara after Alfonso IX of León (r.1188–1230) established them in that city in 1218.

Also contemporary in foundation was the Order of Santiago, which was organized first in Cáceres in 1170 and had received papal approval by 1175. It had the blessing from the first of Fernando II of León (r.1157–1188) who was much interested in the acquisition of that city. But during the reign of Alfonso VIII of Castile (1158–1213) it gained favor in that kingdom as well and expanded southward from its new headquarters at Uclés.

At this same time, those monastic houses associated with a cathedral were either becoming distinct from it or were themselves being converted into chapters of canons regular. The process has not thus far been much studied because it has not been recognized for what it was. At Santiago de Compostela, for example, the separation of San Payo de Antealtares from the official worship of the cathedral may have occurred simultaneously with the initiation of work on the new Romanesque cathedral there in 1076. The organization of cathedral chapters is also difficult to study for such documents as do exist have ordinarily been altered subsequently in the course of disputes between bishops and their chapters. This is the case with the cathedral chapter of Palencia, ordinarily said to have been formed in 1090 but the crucial document is not entirely reliable. In any event, from roughly 1080 to 1130 the transition to cathedral chapters was taking place.

The resultant corporations of canons regular were often reputed to have taken the Rule of St. Augustine but, in fact, their customs and constitutions were shaped by their local history combined with a certain borrowing from the monastic world proper. On a wider stage, something of the same sort was to create the Order of Premonstré, or Norbertines, during the twelfth century. The history of that latter begins in León-Castile with the foundation of La Vid near Aranda de Duero sometime in the 1140s. During the twelfth and thirteenth centuries in Iberia, higher learning was, by and large, most conspicuous in the new cathedral schools that grew to provide for the professional training of chapter members and potential members. That scholarship continued to be marked by a concentration on Latin grammar and style, biblical studies, and scriptural commentary, and the most typical products of the chapter *scriptoria* continued to be mass books. The author of the *Chronicon Mundi*, Lucas of Túy, had been a canon of León and Rodrigo Jiménez de Rada, archbishop of Toledo (1208–1247) and author of the *De rebus Hispaniae* among other works, was closely associated with the cathedral school. In fact, by far the most famous of all of these schools in the peninsula was that of Toledo. Especially under Archbishop Raymond (1126–1151), Toledo became the center for a variety of scholars, both native and from beyond the

Pyrenees, who worked to translate the works of Greek science, of Aristotle's philosophy, and of Jewish and Muslim philosophy, theology, mathematics, and medicine, into Latin and so made them available to the remainder of the West. However, when the further development of the cathedral schools and their learning into universities took place, it was first of all at Palencia but most importantly at Salamanca, where some ten masters attached to the chapter may be identified in the last half of the twelfth century, that it took root, rather than at Toledo.

From the beginning of the thirteenth century, the monastic world in León-Castile displayed much of the same features prominent elsewhere in the medieval West. That is, the new orders of friars, above all the Dominicans and Franciscans, tended to eclipse the older ones. Organizationally, the new friars were more truly international in character with a membership that attached the individual friar to the order rather than to a particular house and in subjection to a "general" at Rome rather than to a local abbot or prior. Moreover, the primary liturgical focus of the corporate life of earlier monasticism gave way, in some degree, to an increasing role of some mission in Christian society, such as preaching or evangelization. The former was of rather more importance in Iberia for it drew peninsulars more fully into the life of western Europe and contributed to the further integration of Spain into that society.

Indeed, St. Domingo de Guzmán (c.1170–1221) may be said to be the first great Castilian churchman whose life and work had a general European resonance since the end of antiquity. Fittingly, the spread of the Order of Preachers in León-Castile was swift. Already in 1221 a Spanish province was created by the second general chapter and by 1301 it had become desirable to divide that province into a Castilian and an Aragónese one.

St. Francis of Assisi (1182–1226) had made the pilgrimage to Santiago de Compostela in 1213–1214 and a fair number of the houses of the Friars Minor in the peninsula subsequently would trace their foundation to the saint himself, while being unable to document that circumstance. Nevertheless, the Franciscan general chapter of 1219 would name Juan Parente provincial for a Spanish province and in 1227, Parente would become general of the order. Already by 1232 the popularity of the order in Iberia was such that it was regarded as necessary to subdivide the province into three—Santiago de Compostela, Castile, and Aragón.

Both orders of friars would boast women's houses from the earliest days, of course, and the latter would contribute to the increasing popularity of women's

convents in the peninsula. The Poor Clares, as the Franciscans were called, numbered no less than forty-nine houses in Spain by the end of their first century. The Dominican women's houses spread much more slowly even though that of Madrid dated to the lifetime of St. Domingo himself. There were but seven in the entire peninsula by 1300. Moreover, unlike the male friars, the nuns of those orders tended to be contemplatives rather than developing a social apostolate.

The later orders of friars also found their way into the peninsula, if more slowly and in fewer numbers. The Carmelites decreed a Spanish province in their general chapter of 1256 but the first known house in León-Castile only appears near Medina del Campo in 1315 and separate Aragónese and Castilian provinces were not created until 1416. The Augustinian mendicants, as distinct from canons regular who followed some variant of the Rule of St. Augustine, grew out of the "Grand Union" of 1256 and the creation of a Spanish province followed hard on that event. A Toledan convent existed by 1260. Further houses at Murcia, Seville, Córdoba, Casarrubias, and Badajoz had swelled the new congregation during the thirteenth century.

Two other new orders found particular occupation in the peninsula by reason of their primary mission. The first was the Trinitarian, founded in France in the latter twelfth century. Its purpose was the ransom of Christian captives in Muslim hands. Houses were established by the founder, Juan de Mata, in Toledo in 1206 and in Burgos in 1207. By 1221 two distinct provinces had been formed for Castile and for Aragón. In 1312 the former was divided into into a Castilian and a Portuguese province. The peninsula constituted a unique field for such work and the Mercedarian Order was itself founded in Catalonia. It had a house in Seville already in 1248 as a result of the Reconquest there. By 1311 its possessions were divided between the two provinces of Catalonia and Castile.

All these orders of friars soon produced associations of lay tertiaries that contributed to the former's material support and that enjoyed some benefits from the liturgical intercession of the full members. The latter of such practices tended, insensibly, to conform the newer orders somewhat to the older monastic tradition and practice. On the other hand, the friars' preaching, the saying of Mass, and the hearing of confession brought them into competition and conflict with the secular clergy and, above all, the bishops. At the same time, the superior educational opportunities of the order clergy would prove to give them an advantage in the competition for promotion to the episcopacy itself, which frequently overcame the general reluctance to permit the consecration of members of religious orders

to that office and further confused lines of authority in the church.

Nevertheless, the organizational model of the new orders recommended itself for the modification of the older monasticism as well. As early as the Fourth Lateran Council (1215) the practice of triennial abbatial chapters were enjoined for the otherwise unassociated monasteries in each ecclesiastical province. By 1336 Pope Benedict XII, a Cistercian himself, would work out a universal plan of such that provided for congregations of Santiago de Compostela in Seville and of Toledo in León-Castile. None of these plans prospered, though they clearly foreshadowed the future congregation of Valladolid.

That same pope also addressed himself to the stimulation of education among the more traditional monasteries and, for a time in the fourteenth century, the great Benedictine abbey of Sahagún responded with an attempt to broaden and revivify its school. Such attempts were destined to fail in the new age emerging, however, unless they could be assimilated to the newer university structures. The new orders, on the other hand, more routinely sent their members to study in Paris, Bologna, or Rome. There and in the peninsula they established houses of study in conjunction with the universities, such as the Dominican San Esteban in Salamanca, functioning already by 1265. Indeed, when a faculty of theology was at last instituted at Salamanca at the end of the fourteenth century, Dominicans and Franciscans made up the bulk of its members.

Under these circumstances, most of the identifiable scholars of León-Castile in the later Middle Ages are members of the regular clergy. Juan Gil de Zamora (c.1250–c.1319), author of the *Liber de Preconiis Hispaniae* and the *Liber Illustrium Personarum* was a Franciscan. Juan Puigventos was a Dominican educated in Murcia who later taught Arabic in Valencia. Also a Dominican was the Marian theologian Pedro of Compostela. The Augustinian and scholastic philosopher Alonso Fernández de Toledo y Vargas (1300–1366) taught at Paris and subsequently became bishop, in turn, of Badajoz, Osma, and then Seville. Curiously, however, the circle of scholars other than Gil de Zamora who collaborated with Alfonso X (c.1252–1284) and produced such a brilliant array of works, seem not to have been friars or even clerics.

MONASTERIES, PORTUGAL

The Portuguese territory as it is today had in the past a great quantity of monasteries unevenly distributed, side by side with the also uneven distribution of the population. The monasteries were extremely numerous in the north, but practically absent in the center and south. These latter regions, definitively conquered from the Muslims between 1227 and 1249, were much less inhabited. The distribution of monastic observances was also always unequal due to the correlation between the political and ecclesiastical phases of establishment in the territories conquered by Islam and the evolution of religious orders. Thus, there were mainly Benedictines and regular canons in Entre-Douro-e-Minho; Cistercians in Trás-os-Montes, Alto Minho, and Alto Douro; canons regular, Cistercians, and Jerónimos in Beira Litoral and Estremadura; Paulines in Alentejo.

Pre-Benedictine Observances

The monastic tradition in the north of Portugal has its origins in an era prior to St. Martinho of Dume but it was he who greatly influenced the region with his monastery of Dume (Braga). We do not know of other monasteries previous to the one founded the next century by St. Fructuosus (c.600–665) in Montélios, very close to Dume. Nevertheless, the existence of numerous monasteries at that time is clear. Several were associated in congregations and adopted the practices con-

tained in *Regula communis* due to the influence of Fructuosus. Some had double communities (monks and nuns), reserved the admission of their members to the relatives of the founding families (familiar monasteries) and practiced the monastic pact that restrained the abbot's power. Some of these practices were contested by St. Fructuosus but they endured and even took root because of the ecclesiastical and political disorganization resulting from the Muslim invasions (711). Such disorganization did not prevent the foundation of numerous monastic communities in the north of Portugal, mainly between the Douro and Lima Rivers before the reorganization started in 868. By that time, the counts who took power as the Asturian king's delegates also protected monastic life but preferred rich and large communities, true observant ones, as opposed to the surviving small monasteries, which were poor and unstable. The prototype for the new abbeys was the monastery of Guimarães, founded around 950 by Mumadona Dias, a relative of the monastic reformer St. Rosendo (d.966). The monastery of Lervão may also be included in this type. It was probably founded before the Christian occupation of Coimbra (878) but protected by the count of Coimbra, who was also related to St. Rosendo. In this way, we have documentary evidence of about thirty monasteries in Entre-Douro-e-Minho founded before 1000, and of seventy-six founded between 1000 and 1100. From the Council of Coyanza (1055) on, the divisions between the monasteries considered observant and the ones considered relaxed became deeper. Some foundations were inspired by an ideal of austerity and tried to restore the ancient Fructuosan observances, as in Pendorada in 1054 or Vacariça, founded earlier.

Benedictines

Although the Council of Coyanza agreed that the observant monasteries might follow the Rule of St. Benedict, no Portuguese monastery is known to have adopted it before 1084. Probably the change occurred when the Hispanic liturgical rite was replaced by the Roman rite, decreed in the Council of Burgos (1080). There is surely a relation between this change and the introduction of French culture and the establishment of French institutions supported by Alfonso VI. The French influence achieved great success among the Portuguese nobles who had recently obtained feudal powers. Until then several monasteries under their protection that had followed the peninsular rules adopted the Rule of St. Benedict and Cluniac practices. They did not, however, affiliate with Cluny. Pendorada, Santo Tirso, Pombeiro, Tibães, and Arouca, protected by the most powerful noble families, are some exam-

ples. The movement spread rapidly, mainly after the impulse given by the bishops of Coimbra, Crescónio (1092–1098), Maurício Burdino (1099–1109), and Bernardo (1128–1146), and the bishops of Braga, Geraldo (1099–1108) and Maurício Burdino (1109–1118). The renewal of monastic practice led to a time of great prosperity and the Benedictines could become the owners of many small monasteries that were transformed into dependent churches. The rare new monasteries were founded by Cluny between 1100 and 1127, Rates, Vimieiro, and St. Justa of Coimbra, but they fell into decay, especially from the thirteenth century on. The other Benedictine monasteries were dependent on the bishop of their dioceses and did not constitute a congregation until 1567. They also started falling into decay mainly from the beginning of the fourteenth century. Some disappeared in the fourteenth or fifteenth centuries. The richest ones started to be ruled by commendatory abbots who had not taken vows as monks and contributed to the complete corruption of monastic life. The first reform movements took place in the fifteenth century in Paço de Sousa and Pendorada, under the influence of monks who had been in Flanders or Italy, and later in Santo Tirso, Tibães, and Rendufe, under the influence of the Valladolid Congregation and the Jerónimos monks.

Cistercians

The Order of Cister was established in Portugal in 1143 or 1144 in the monastery of Tarouca, where a hermitic community following St. Benedict's Rule already existed. Soon later, other hermitic groups in Lafões and Salzedas followed suit. The adhesion of hermits and other communities to Cister continued until the end of the twelfth century, involving monasteries such as Fiães, Bouro, and Aguiar. The only new foundation was Alcobaça, which was given immunity in 1153 by Afonso Henriques, the first Portuguese king. Although the Alcobaça community had had a modest origin, the abbey developed within in a short period of time, thanks to its agricultural production and its rapid commercialization, having become a supplier of the city of Lisbon. Its prosperity is evident in the large abbatial church, built in the beginning of the thirteenth century, and in the library with its codex collection, accumulated between the twelfth and fifteenth centuries. Some kings, such as Alfonso II, Alfonso III, and Pedro I, wished to be buried in the abbey. From 1210 on, some ancient Benedictine monasteries became feminine Cistercian communities such as Lervão and Arouca (1223); others were new foundations such as Celas in Coimbra (1214), Almoester (1287), and Odivelas (1295). Opposite to what happened to

the Benedictines, and despite the general decadence, the Cistercians experienced less corruption in part due to the action of visitors from Clairvaux. They started as an independent congregation in 1567.

Canons Regular

Apparently some pre-Benedictine monasteries in the north resisted the adoption of the Rule of St. Benedict. Later, many of them became canons regular of St. Augustine, following the practices of Santa Cruz of Coimbra, probably because they were influenced by some Augustine bishops who had occupied the sees of Braga and Oporto since 1136. Santa Cruz had been founded in 1131 by Tello and St. Teotónio and adopted the rules of St. Ruf of Avignon shortly after. It was protected by kings Afonso Henriques and Sancho I, who are buried there. It came into possession of large estates in central Portugal and founded the monastery of St. Vincent in Lisbon immediately after the city was conquered from the Moors in 1147. It played an important cultural role by preserving some Mozarabic traditions and establishing an important manuscript library. Among the northern monasteries that adhered to its rules are Moreira da Maia, Grijó, Refojos de Lima, and Cárquere. Like other monastic orders, they were also afflicted by religious decadence in the fourteenth century and subjected to commendatory abbots during the fifteenth and sixteenth centuries. However, one can mention an important effort of religious reformation led by Prior Gomez, appointed as commendatory abbot (1441–1459). He had already actively participated in the reform of the Benedictine monks of St. Justina of Padova at the monastery of Florence and in the reform of the Italian Camaldoli monks. But the definitive process of reform came later, in 1556, with the congregation of Santa Cruz of Coimbra.

Other Monastic Orders

The other monastic orders were not so significant in Portugal. One can mention the Premonstratensians, who owned two small monasteries in Ermida de Paiva and Vandoma during the twelfth and thirteenth centuries, and the Paulines or Hermits of St. Paulo da Serra de Ossa. The Paulines founded several small hermitages in Alentejo that had been independent up to then. These hermitages formed a confederation in 1465 and a congregation approved by the Holy See in 1536. The Jerónimos, founded in Spain in 1374, were more important than the other two orders. They founded in Portugal the monastery of Penhalonga in 1390, and later, protected by several kings, especially Manuel I, founded other monasteries. The most important one is the monastery of Jerónimos in Lisbon (1498).

MONASTICISM

The multifaceted story of monachism in medieval Spain and Portugal commences obscurely in late Roman Hispania, when powerful currents of ascetic-encratic spirituality reached the Iberian Peninsula directly from the Christian east or by way of surrounding North Africa, Italy, and Gaul. By about 300–306, the Council of Elvira (Granada) was regulating the life of consecrated women (*velandae, devotae*), and later in the fourth century there are references to *monachi* (anchorites), who are carefully distinguished from comparable adherents of the widely popular dissident rigoristic movement of Priscillianism, by the Council of Zaragoza (380) and the First Council of Toledo (400), and in the correspondence of Metropolitan Himerius of Tarragona with Pope Siricius (384–385).

The turbulent fifth century of Germanic invasions is painfully lacking in monastic data; but the sixth century provides more than sufficient evidence that in both the Visigothic monarchy of Toledo and that of the Suevi at Braga in Galicia, not only anchorites and semi-anchorites, like St. Aemilian (San Millán; d. 574), but also organized communities of monks (*monasteria, coenobia*) are well documented. For the latter the pattern is a visibly regionalistic one: numerous houses in the Tarraconensian northeast under strong south Gallic influences; in the east and south, prototypical foundations established by refugee monks from North Africa; and in remote Galicia, the remarkable abbey-bishopric of Dumio (Dume), which its founder, St. Martin of Braga (fl. 550–580), made the protomastery of the Suevi and conjoined it to his metropolitan church of Braga.

The conversion of the Visigoths to Catholicism (589) was followed by a widespread series of monastic foundations by kings, nobles, and bishops, with abundant legislation by the Fourth Council of Toledo (633) and later councils, and in the royal *Leges Visigothorum*, aimed at enforcing uniformity of observance, liturgy, and relations with crown and episcopate throughout the monasteries of the kingdom. In this sev-

enth-century golden age of Visigothic monachism, the traditional cenobitic sources associated with Pachomius, Basil, St. John Cassian, Augustine, and others were richly supplemented by new, distinctly Hispanic rules: Leander of Seville's *De institutione virginum* (590–595?), Isidore of Seville's *Regula monachorum* (c. 620–625?), and the austere, similarly titled code of Fructuosus of Braga (ca. 635–640). Circulation in the peninsula of the Rule of St. Benedict, often defended, has yet to be proved; unquestionably no true Benedictine abbey can be found there before 711.

At the same time it is essential to allow, alongside the main Visigothic tradition, for a second, constitutionally distinct, cenobitism found in late seventh-century Galicia. This is the so-called pactual monasticism, in which the orthodox individual act of profession, pledging obedience to a monarchical abbot, is replaced by a synallagmatic covenant (*pactum*)—in effect a contract between abbot and monks defining the rights and duties of each and reserving to the monks the right of rebellion against abbatial misrule. This particular cenobitism—often mistakenly ascribed to St. Fructuosus of Braga—can be traced through such texts as the *Consensoria monachum*, the *De [septimo] genere monachorum* of Valerius of Bierzo, and—above all—the *Regula communis* and its terminal *pactum*, a collection of decrees by Gallegan abbatial synods of about 675–690. The phenomenon is of great historical interest in itself and for the transmission of pactualism as the basis of early Reconquest cenobitism in comital Castile and the Rioja.

For Iberian monasticism in general, the consequences of the catastrophic Arab-Berber overthrow of the Visigothic state in 711–714 may be classified under three heads. First, many houses, with their libraries and temporalities, simply disappeared. Second, a limited number of communities, chiefly around Toledo and Córdoba, survived into the earlier Islamic centuries; these constitute the so-called Mozarabic monasticism, best known from the *Memoriale sanctorum* of Eulogius of Córdoba, and sporadically sent monks and manuscripts to new centers on Christian soil. Third, scores of houses, founded by refugee monks from the south and by their soon far more numerous successors in the Cantabrian-Pyrenees zone and its extensions, sprang up in proto-Christian Spain. From there they spread monasticism in the wake of the Reconquest, creating new centers of ascetic spirituality and agrarian development while attracting lay settlers into desolate *despoblados*.

These monasteries of the early Reconquest clung tenaciously to monastic, literary, and artistic continuities with the Visigothic past, a notable example being

the composition by the monk Beatus of Liébana of his famous, richly illustrated, and much copied *Commentary on the Apocalypse* (c. 786). As regards observance, these monasteries of the early Reconquest in Asturias, León, Navarre, Aragón, and the northeast followed no single rule (*regula unica*) but selectively used traditional codes collected in *codices regularum* (*regula mixta*). At two key points Europeanizing Benedictinism entered the peninsula for the first time: early, in the Catalan northeast close to Aquitaine; later, in the late ninth and tenth centuries, in the pactualized zones of comital Castile and the Rioja, where the *Regula s. Benedicti* came to circulate embedded in the massive by-product of Carolingian reform Benedictinism, the *Expositio* of Smaragdus of St. Mihiel. Here there occurred a remarkable if ultimately frustrated effort to combine the pactual and Benedictine traditions, a synthesis clearly visible in the nuns' rule composed between 951 and 962 by the abbot Salvus of Albelda, and in the monastic sections of the *Liber ordinum* of the eleventh century.

By the early eleventh century, documentary evidence all across the Christian north showed clear signs of spiritual and disciplinary decline in this conservative, relatively isolated cenobitism. This in turn led to energetic royal, episcopal, and aristocratic efforts to reinforce policies of internal development and territorial expansion through programs of monastic revitalization along "Benedictinizing" (i.e., "Europeanizing") lines. These circumstances underlie the powerful attraction to peninsular rulers and churchmen of the Burgundian abbey of Cluny. King Sancho III Garcés of Navarre (r. 1000–1035) initiated formal Hispano-Cluniac ties west of Catalonia, but his aims were intercessional, not reformist. It was his son, Fernando I of León-Castile (r. 1037–1065), who enlisted the Cluniacs in support of his program of complete Benedictinization as well as of his claims to imperial rule over all Iberia. In 1063 he established a veritable dynastic alliance (*coniunctio*) with the abbey and endowed it with a rich annual subsidy of 1000 gold dinars (*metcales*) out of the tributary *parias* of his *tā'ifa* vassals. In turn Fernando's son, Alfonso VI (r. 1065–1109), doubled this stipend in 1077; and in 1073 he had already given the Cluniacs their first peninsular dependency, San Isidro de Dueñas. Other such transfers of established houses followed from Leonese-Castilian rulers and nobles, creating a string of what the Cluniacs organized as priories under the Burgundian abbot. Others were added: three in Portugal, another three in Catalonia. Hispano-Cluny, however, always remained a basically Leonese-Castilian phenomenon, the priories radiating reformist influences and contributing to the advance of Europeanization below the Pyrenees; never

a widespread or popular movement, its impact was confined to monarchs and the upper layers of Luso-Hispanic society.

By the mid-twelfth century, with Cluniac energies and prestige visibly waning, a new chapter in Iberian monastic history opened with the advent of the Cistercians, who represented a new fervent, mystical spirituality and crusading ardor and, in terms of geographical expansion and recruitment of large numbers of peasant *conversi*, constituted a more widely established, socially much more inclusive, movement of far broader appeal than the Cluniacs. Warmly welcomed from the 1140s and 1150s by such rulers as Alfonso VII of León-Castile, Afonso Henriques of Portugal, and Ramón Berenguer IV of Barcelona, the White Monks took over and organized as relatively independent abbeys numerous male and female houses throughout northern Spain and Portugal, as far south as the Tagus and Júcar Rivers, leaving the dangerous zones of Reconquest warfare beyond to the rising military orders. The siting of many of their abbeys, such as Alcobaça in Portuguese Estremadura and Santes Creus and Poblet in New Catalonia, and others in the two Castiles, clearly reflects the Cistercian predilection for isolation and the reduction of wilderness and frontier districts to human settlement.

From about 1250 the picture changed once again. Both Black and White Monks—with important exceptions of still vigorous communities—passed into a twilight zone of fading energies, sharp reduction in postulants, and a lamentable debasement of disciplinary, spiritual, liturgical, and intellectual standards, a decline intensified by the attacks upon them and their temporalities by kings, nobles, bishops, peasants, and townsmen. The condition was made worse by the emphatic swing of royal and popular enthusiasm to the new mendicant orders, with their greater attraction to an increasingly urban-oriented medieval society. Nevertheless, it would be erroneous to dismiss the Luso-Hispanic monastic tradition of the later Middle Ages as moribund, for countercurrents of renewed monastic faith and creativity also appeared, encouraged in part by the pervasive effects of the Observant reformism among the Franciscans and other mendicants, and in part by the new ascetic-mystico-interiorist piety flowing into the peninsula from Italy and the Low Countries.

Thus, the fourteenth century brought the rise of a major new semi-anchoritic order of marked austerity, that of St. Jerome, of Italian origin but very quickly transformed into a distinctly Iberian movement. Approved by Pope Gregory XI in 1373, and spreading rapidly from San Bartolomé de Lupiana (Guadalajara) in Castile, Portugal, and the Crown of Aragón, the

Jeronymites (Hieronymites) attracted rich benefactions from Juan I of Castile, other monarchs, and the aristocracy, drawing into their houses numbers of nobles and upper-class *conversos* (converts to Christianity). In 1389 they acquired their chief Spanish base, the celebrated Estremaduran monastery and Marian pilgrimage center of Nuestra Señora de Guadalupe; and in the fifteenth century, under such able generals of the order as Pedro de Alarcón and Lope de Olmedo, the Jeronymite Order enjoyed high prestige, great wealth, and a fruitful influence upon the church in Spain and Portugal. Also from the late fourteenth century on, the comparably rigoristic, semi-anchoritic Carthusian Order became established in the peninsula, with leading centers at Miraflores (near Burgos), El Paular (Segovia), and elsewhere.

In addition a revived, robust Benedictinism appeared with the foundation by Juan I of Castile, in 1390, of a deliberately organized monastic reform house that quickly became the head of an alliance of Black Monk monasteries joined in the strongly reform-oriented Congregation of Valladolid. Among these was the celebrated abbey of Nuestra Señora de Montserrat in Catalonia, the gifted abbot of which, García de Cisneros (1455–1510), wrote one of the leading manuals of fifteenth-century Iberian spirituality, the *Exercitorio de la vida spiritual*, later a principal guide for Ignatius Loyola. Nor were the Cistercians remote from these strong new religious forces: from the early fifteenth century on, under the inspiration of such abbots as Alcobaça and Poblet, much reformist legislation by their chapters-general, and the activities of talented generals of the order, gave the White Monks a significant role in the monastic revival.

All this dynamic reformism leavening the monastic life of the Iberian later Middle Ages constructed the foundations upon which, after 1574, Cardinal Cisneros and the Catholic Monarchs, and comparable royal and ecclesiastical leadership in Portugal, built. The long Luso-Hispanic monastic tradition thus continued unbroken into the age of comprehensive, innovative modernization, deeper spiritual exploration, and expansionist impetus that characterized the monastic, and in general the religious, life of early modern Iberia.

MONTCADA, HOUSE OF

Guillem de Montcada (d. 1040) took his name from the castle of Moncada (Catalan, Montcada), that dominates the gap through which the Besòs River flows into the plain of Barcelona. Through association with the count-kings of Catalonia-Aragón, his descendants grew in stature and importance. The family also established branches outside the kingdom of Aragón in Béarn and Sicily.

The Montcada name was long associated with the hereditary office of seneschal in Catalonia. This resulted from the marriage of Guillem Ramon II (c. 1090–1173), “The Great Seneschal” (whose ancestors were not related to the Montcadas), to Beatriu de Montcada in 1117.

Prominent early Montcadas included Guillem de Montcada II (c. 1120–1172), who acquired the viscounty of Béarn for his lineage (by marriage to Maria of Béarn); Guillem Ramon de Montcada I (c. 1165–1224), second Montcada viscount of Béarn, noted for his assassination of Archbishop Berenguer de Vilademuls in 1194; and Guillem de Montcada III (c. 1185–1229), an influential royal counselor during the minority of Jaume I.

Later generations of Montcadas included Pere de Montcada (d. 1282), master of the Knights Templar in Catalonia-Aragón; Guillem de Montcada i d’Aragó (d. 1283), bishop of Lleida; Guillem de Montcada (d. 1308), bishop of Urgell; Elisenda de Montcada (d. 1364), wife of King Jaime II of Aragón; and Ot de Moncada i de Luna (d. 1473), bishop of Tortosa and cardinal during the final years of the Great Schism.

Advantageous marriages contributed to the influence of the Montcada lineage, and many Montcada women were prominent as baronesses. Some Montcada women entered the church; two became abbesses.

MONTESA, ORDER OF See MILITARY ORDERS

MONTESINO, FRA AMBROSIO

Montesino (ca. 1440/1450–1514), a Franciscan friar who attained a high rank in the ecclesiastical bureaucracy (bishop of Sarda, in Albania), was a protégé of Cardinal Francisco Jiménez de Cisneros and of Queen Isabel, for whom he was both personal confessor and preacher. He was the author of prose religious texts, among which his collection *Epístolas y euangelios por todo el año* (Toledo, 1512), with numerous later editions, is especially worthy of mention. A work of major importance was his Castilian translation of Ludolph of Saxony's renowned text *Vita Christi, cartuxano romançado*, in four volumes (1502–1503), the first book published by the Renaissance presses of Alcalá de Henares. It had great influence on religious literature and thought.

In addition Montesino wrote religious poems. These appeared in two collections: *Coplas sobre diuersas deuociones y misterios de nuestra sancta fe catholica* (Toledo, ca. 1485) and *Cancionero de diuersas obras de nueuo trobadas* (Toledo, 1508). The *Coplas* consists of fourteen compositions later revised in part and included in the *Cancionero* along with other texts for a total of thirty-four in verse and three in prose. This work presents a series of meditations on the Virgin Mary, Christ, and the lives of certain saints, and includes apocryphal themes.

Besides the customary double five-line octosyllabic stanzas of this period, the presence of nine ballads—one nonreligious—should be mentioned, and of special note is the use of religious *contrafacta*. Occasional criticism of customs adorns the poems, and many cultured forms and, on the whole, an elegant, sophisticated style are found throughout. A preacher-turned-poet, Montesino was clearly influenced by another Franciscan, Íñigo de Mendoza, an influence that in certain instances lends itself to plagiarism.

MONTIEL, BATTLE OF

The battle of Montiel, which took place on 14 March 1369, represents the last stage of the civil war fought between Pedro I of Castile and his illegitimate half-brother Enrique de Trastámara from 1366 to 1369.

The two sides in this contest represented different interests, and both sides relied on military support from abroad. Unfortunately for Pedro, the English, who had

backed him during the earlier stages of the war but had not received the expected compensation, refused to commit additional troops after 1367. The only foreign soldiers supporting Pedro after that date were from the Muslim kingdom of Granada. Enrique's allies, the French, were more consistent in their commitment; the French king, Charles V, paid, a second time, for the military services of the mercenary captains Bertrand du Guesclin and Arnoul d'Audrehem, who arrived in Castile in January 1369.

In the early months of 1369 Enrique and his allies assembled their thirty-six hundred lancers at Orgaz, south of Toledo. Pedro had decided to travel north from his headquarters in Seville to meet his opponent. His force consisted of fifteen hundred Moorish cavalry and three thousand lancers. After a long and meandering march, he stationed part of his army in Montiel while the rest foraged in the surrounding countryside. On the evening of 13 March the garrison commander at Montiel, upon seeing torchlights, alerted Pedro to the possible approach of the enemy. Pedro dismissed this report, and the next morning, to his dismay, found himself surrounded by Enrique's soldiers, who had marched during the night. Because Pedro's troops were scattered, Enrique was able to win a quick victory.

Pedro sought refuge at the fortress of Montiel, and because it was a position ill suited to sustain a long siege, he began negotiations with Guesclin to buy his release. The French commander, after an initial refusal, agreed to help Pedro escape in return for highly generous promises of rents, titles, and lands, among them the towns of Soria and Atienza. On the evening of 23 March, however, Guesclin delivered Pedro to Enrique instead, whereupon Enrique stabbed the king to death. Guesclin, combining his best mercenary instincts and his loyalty to his employer, had been persuaded by his comrades in arms to place the offer before Enrique rather than refuse it outright. Since Enrique agreed to the terms, Pedro's fate was sealed.

The death of the king secured Enrique's claim to the throne, although several individuals and localities loyal to Pedro continued to resist the usurpation some two years after his death. The battle of Montiel, however, made possible the final Trastámaran victory and the establishment of that bastard dynasty on the throne of Castile.

MONTORO, ANTÓN DE

A *converso* (Christian convert) and a poet, he was probably born around 1404 in the town of Montoro

near Córdoba. The area around Córdoba was known for its large Arabic-speaking Jewish population in the late Middle Ages. The Jewish community there specialized in the making and marketing of textiles, especially silk, brocades, and other fine cloth. A great many Córdoban Jews were massacred in the anti-Semitic riots of 1391 while the remaining part converted to Christianity. Montoro seems to have been born to parents who converted to Christianity in 1391 or shortly thereafter, or to have converted himself at a very young age. The greater part of his life was spent in Córdoba, where he was a tailor and vendor of textiles, whence the sobriquet El Ropero de Córdoba. Montoro must have died in late 1477 or early 1478, since he professed to being mortally ill when he dictated his last will and testament in September 1477.

Throughout his life, Montoro was the target of the satire of other converso poets like Juan de Valladolid (also known as Juan Poeta), Rodrigo Cota, and Juan Agraz, who attacked him for being a tailor, ridiculed his low birth and infamous family origins, plus mocked his status as a "new Christian." Montoro responded in kind with brilliant satirical verse that shows great imagination, linguistic acumen, and merciless wit.

Although Montoro often denigrated himself in his own poetry, highlighting his status as an outsider and a newcomer (at one point he refers to himself as an "old Jewish faggot" *viejo puto, judío*), he quite consciously cultivated a subaltern identity and lower class status to gain access to influence and power at court by means of laughter. Although Montoro was indeed a tailor, it was to the fashion-conscious members of the Castilian aristocracy that he ministered his services. Using his sartorial talents and his poetic wit, Montoro became a well-connected individual at court, who during the course of his life corresponded poetically with, and even had the audacity to lecture, the marqués de Santillana, Juan de Mena, Gómez Manrique, Miguel Lucas de Iranzo, the conde de Cabra, Pedro de Escavias, Queen Isabel of Castile, and other distinguished members of the high nobility, with whom he maintained cordial relations. During Easter week of 1473, Montoro witnessed the anti-Semitic riots in Córdoba, which he evokes in a poem addressed to Alonso de Aguilar, himself a converso and a member of one of the leading families of the city.

Montoro's verse displays an astonishing range of registers: amorous, burlesque, angry, religious, satirical, even grossly obscene. He is one of the most complicated and subtle personalities to be found among the vast number of *cancionero* poets in fifteenth-century Castile.

MORISCOS

Moriscos is a term often applied in modern historical literature to Muslims who, after the Reconquest, were baptized and remained in Spain. The word "*Morisco*" in this sense (rather than in the older one, *Moorish*) does not occur in the historical source material until the mid-sixteenth century: before that, such general expressions as "new converts" and "the newly baptized" were in use. Forcible conversion of individuals had occurred in the last decade of the fifteenth century, especially in Granada (by 1525 Muslims in all parts of the Iberian Peninsula had been forced to accept Christianity). The Granadan Muslims should have been amply protected by the terms on which the city was surrendered (negotiated in December 1491). In accordance with the well-established medieval pattern, they had the right to continue to practice their own religion guaranteed; the capitulations also forbade any molestation of former Christians who had converted to Islam (the *elches*).

In the years immediately following the occupation of Granada, these terms were by and large respected. There were some individual conversions, notably that of Yahyā al-Najjār, who after baptism became Pedro de Granada Venegas, *alguacil mayor* of the city. (Significantly, such powerful and successful converts are never stigmatized as Moriscos.) The majority of the Granadan Muslims, however, held fast to the old faith. Francisco Jiménez de Cisneros, impatient at the slow progress being made by Archbishop Hernando de Talavera and other missionaries, launched a new and more vigorous drive to secure converts by all available means, including duress. A leading figure who succumbed after a period of rigorous confinement was El-

Zegrí Azaator, baptized as Gonzalo Hernández. At the same time the harassment of the elches led to widespread realization that the promises made in 1492 would not be kept.

A large section of the Muslim population of Granada and other parts of the kingdom took up arms in 1500 against the Castilian occupiers. The immediate consequence was that Cisneros fell from favor: "His rashness has lost us in a few hours what we have been years in acquiring," noted Fernando. In the longer term, however, it was the policy of Cisneros that prevailed. By driving exasperated Muslims into open rebellion, he effectively brought the Mudéjar period to an end in the lands of Castile. Forcible converts were rarely sincere converts, but Muslims who wished to continue to live in their homeland had to pretend outwardly to be Christians. Islam did not cease to exist, but it was driven underground. At the very end of the medieval period the intractable Morisco problem had been created. It was to continue to preoccupy Spain's rulers until a plan of expulsion was adopted in 1609–1611.

MOSES BEN NAḤMAN

Moses ben Naḥman (Naḥmanides), rabbi of the Jewish community of Girona during the middle decades of the thirteenth century, was a leader of Iberian Jewry during his lifetime, and one of the most distinguished intellectual and spiritual figures in all of medieval Jewry. Like so many Iberian Jewish luminaries, Naḥmanides is striking for the remarkable range of his intellectual abilities and achievements. He was a master of Jewish

law, mentoring important students and composing important *novellae* to major Talmudic tractates. He was, at the same time, a keen student of the Bible, composing an extensive commentary on the Pentateuch that is rich in exegetical insight and is still widely studied. He was one of the leaders in the rapidly developing school of Spanish Jewish mysticism, rather conservative in his approach to the explosive issues associated with the new mystical speculation but extremely important for the more traditional prestige and acumen that he brought to bear on the development of mystical teachings. His remarkable command of the Hebrew language in all its styles linked him to earlier tendencies in Iberian Jewry. The account that he composed of his public disputation with a former Jew, Pablo Christiani, who had become a Dominican friar, is a masterpiece of narrative art and one of the most effective Jewish polemical treatises of the Middle Ages.

That famous disputation highlights the public career of Naḥmanides. Prior to this engagement the rabbi was already known to King Jaime I of Aragón. In the face of the missionizing assault of the Dominicans, Rabbi Moses ben Naḥman was chosen as the Jewish spokesman for the encounter. Essentially the carefully contrived disputation involved an effort by the Dominican spokesman to prove to the Jews, from materials including both commentary on the Bible and rabbinic dicta, the truth of key Christian doctrines, most importantly the Christian claim that the promised Messiah had already appeared.

The role of the Jewish spokesman was to be limited to rebuttal of the Christian use of rabbinic texts only, with no allowance for Jewish negation of Christian teachings. Whether or not the limited parameters of Jewish rebuttal were in fact rigidly maintained is not altogether certain. In his brilliant narrative account of the disputation, Naḥmanides portrays himself as ranging far and wide in direct attack on central tenets of Christianity and on fundamental characteristics of Christian society. While modern researchers have questioned the reliability of these aspects of Naḥmanides' narrative, it is clear that the rabbi of Girona composed a captivating account of his public encounter and, in the process, provided his Jewish readers with appealing argumentation for the superiority of the Jewish faith.

The publication of Naḥmanides' narrative aroused the ire of ecclesiastical leadership and produced calls for punishment of the aged rabbi of Girona. The king of Aragón, who is portrayed most sympathetically in Naḥmanides' narrative, proved an effective supporter, although by 1267 Naḥmanides had made his way to the Holy Land. It is by no means clear whether this move reflects the pressures brought to bear against him

or whether it resulted from his personal religiosity. He exercised leadership briefly within the Jewish community of Jerusalem, and died shortly thereafter.

MOSQUE OF CÓRDOBA

Córdoba’s congregational mosque, the first in Spain, was built in stages over two hundred years. The first structure, by Emir ‘Abd al-Raḥmān I in 786–787, occupied a site purported to be that of an older Visigothic church, San Vicente, and an even earlier Roman temple. The mosque’s orientation is incorrect, which is only partly explained by the orientation of the former church. Instead of facing Mecca (east), as would be expected, it faces south, adopting the orientation of the Umayyad mosque of Damascus; politicoideological allegiances with the Umayyad and Syrian past, expressed in this manner, proved more important than correct direction of prayer.

The first mosque was a rectangular enclosure consisting of an open courtyard and a roofed hypostyle prayer hall with eleven aisles perpendicular to the *qiblah* wall, similar to the plan of eastern mosques, such as Al-Aqsā in Jerusalem. Its simple layout may be due to the transmission of architectural information by numbers and geometrical proportions rather than a written plan. In contrast, its elevation was extraordinary and unique. Architectural spolia were used in part because Roman and Visigothic materials were available and inexpensive, and in part to suggest the triumph of Islam over previous civilizations. Marble columns and capitals supported rhythmic arcades of colorful horseshoe arches (a Visigothic form) of white stone and red brick. The lower arcade bore a second tier, piggyback-style, that supported a flat pine ceiling bearing a roof of parallel gables. These techniques for heightening the interior and adding color appear to have been learned from the Roman aqueducts of Mérida. The shape, doubling, and polychromy of the arches demonstrate Muslim architects’ willingness to adapt

pre-Islamic building techniques and decoration to new ends.

The second emir, Hishām I (r. 788–796), added a staircase minaret that reached only to the height of the courtyard walls. In 836 ‘Abd al-Raḥmān II expanded the prayer hall eight bays to the south, replacing the *qiblah* wall and commissioning new columns and capitals. Muḥammad I restored the Portal of San Esteban in 855. A blind horseshoe arch with alternating voussoirs of red brick and white stucco with vegetal designs, it is the earliest known monumental exterior portal in a mosque.

In 951 Caliph ‘Abd al-Raḥmān III al-Nāṣir extended the courtyard to the north and built a new minaret next to the *miḥrāb* axis. This tall minaret survives today with seventeenth-century facing. Al-Nāṣir also added arcades (*riwaqs*) in the courtyard and planned other improvements to the mosque that were finished by his son, Al-Ḥakam II. In 962 the latter added twelve bays to the *qiblah* end of the prayer hall, doubled the *qiblah*-wall, and added ribbed vaults in three spectacu-

larly decorated bays that defined a reserved place (*maqsūrah*) in front of the new *miḥrāb*. The *miḥrāb* is a small octagonal chamber decorated inside with stucco and faced on the outside with glittering gold, red, and blue mosaics, the work of visiting Byzantine artists. The inscriptions inside and framing the *miḥrāb* and flanking chambers are from the Qurʾān and offer lengthy foundation texts giving the date of completion and the patron's name. The *maqsūrah* is articulated by three domes on squinches, the centermost encrusted with mosaics; at midlevel, interlaced polylobed arches form a visual screen that vigorously intensifies the already highly ornamental pattern of arches and alternating voussoirs elsewhere in the prayer hall. This screen, together with a corresponding fence at ground level, demarcated a ceremonial space for the caliph that was reached directly from the palace next door by a private entrance and raised passage (*sabat*). In the mosaics, the lofty interior of the prayer hall, and the alternating columns and piers of the courtyard, the Umayyad mosque of Damascus was evoked in conscious reference to the Hispano-Umayyads' lineage and source of authority.

In 987–988 the entire mosque was extended eastward by eight aisles. The river may have been a limiting factor, but the sideways direction of growth was probably due as much to political and aesthetic considerations as to lack of space. The addition to the great Umayyad mosque was ordered not by one of the Umayyad rulers but by Muḥammad Ibn Abū ʿĀmir, called Al-Manṣūr (Almanzor), who, as regent for young Hishām II, had seized power in 981. Al-Manṣūr astutely realized that his extension must conform to the existing fabric of the legitimate rulers and saw that destruction of Al-Ḥakam II's spectacular *miḥrāb*, the most highly charged place in the mosque, would be unacceptable to the Córdoba populace. Hence the remarkable conservatism of the extension; he did not try to surpass, but to conform to, previous stages of the mosque.

The mosque was converted to a church in 1236 when Córdoba was conquered by Castile; later alterations were made beginning in 1523, when the architects of Holy Roman Emperor Charles V (Carlos I of Spain) inserted a Gothic cathedral into the center of the prayer hall and added chapels along its side walls. Today the building continues to serve as a church.

MOZARABIC CHRONICLE OF 754

The *Mozarabic Chronicle of 754* is one of two anonymous chronicles written by Iberian Christians living under Muslim rule in the generation after the invasion of 711, the other being the *Arabic-Byzantine Chronicle of 741*. Unlike the earlier chronicle, the *Mozarabic Chronicle* focuses on events in Spain. In fact, it is the only contemporary source for Iberian events from the invasion through the period of the Muslim governors, which ended shortly after the chronicler died, with the establishment of the Umayyad emirate of Spain in 756.

The *Mozarabic Chronicle* was designed as an installment of the universal chronicle begun by Eusebius of Caesarea and continued in succession by St. Jerome, Prosper of Aquitaine, Victor of Tunnuna, and John of Biclaro, all of which Isidore summarized and extended to the year 615 in his *Chronica*. The chronicler of 754 began where Isidore left off—with the reigns of Emperor Heraclius and King Sisebut of Spain—recounting the events leading up to the Islamic conquest of imperial territory in the east and then backtracking to cover, albeit in a cursory way, contemporaneous events in Spain. When, shortly before the midpoint of the chronicle, the Visigoths are defeated by the Muslims, the chronicler simply replaces the Visigothic kings with the Muslim governors, and continues moving back and forth between Damascus and Constantinople in the east and Córdoba in the west. Fortunately the chronicler knew a great deal more about Spanish history after the invasion than before, his account of peninsular events becoming more detailed as he approaches his own day. He refers in three places to another, more detailed history that he wrote on the civil wars within Muslim Spain in the early 740s, but that work has not been recovered.

All that can be determined with any certainty about the author is that he was a Christian living within Muslim Spain. It is very likely, given his attention to Toledan councils and distinguished Iberian churchmen, that he was an ecclesiastic. Where he lived within

Spain is a point of contention. Córdoba and Toledo have been the traditional choices, although recently a case has been made for the Murcia region. He seems to have had access to the same source for Arab events in the east as the chronicler of 741, as evidenced by the similarity in treatment by the two chronicles. It seems likely, given his use of the Arabic calendar and the regnal years of the caliphs alongside the more Isidorean years of the emperor and the “era,” and his occasional use of some very Arabic-sounding similes, that he had access to Arabic sources, either written or oral.

Though he depicts the Arab victory over the forces of Heraclius as a scourge, he does not attempt to moralize the defeat of the Visigoths. He laments the fall of Spain with rhetorical flourish, but does not seem to hold it against the new rulers. He evaluates them according to their success in promoting peace and justice in Spain rather than according to their religious affiliation. There is virtually no information in the chronicle about Islam as a religion; only once is Muḥammad even identified as a prophet, and then only in passing, without further elaboration. Though the chronicler does not go so far as to applaud the Muslims for conquering Spain—as Isidore had done for the Visigoths in his *History of the Goths*—his willingness to ignore the religious identity of the invaders and evaluate them on political grounds served, as Isidore’s work had for the Gothic monarchy, to lend some legitimacy to the Muslim regime by giving it a place in Latin history.

MOZARABIC LANGUAGE

Mozarabic (< Arabic *must‘arab*, “quasi-Arab”) designates the Romance dialect, or group of dialects, spoken in Muslim Spain. Since there are exceedingly few direct attestations of Mozarabic, scholars have been obliged, in their attempts to determine its basic characteristics, to rely on the testimony of Hispano-Arabic authors, on the evidence provided by documents, and on the analysis of numerous putative Mozarabic loanwords in the other Romance vernaculars of the peninsula and in Arabic. As a literary dialect Mozarabic’s only claim to fame is its use in the *kharjas*, but the reconstructions of those elusive texts that have so far been attempted remain linguistically so problematic as to be of limited value in describing the dialect’s most salient features.

There is a broad consensus among scholars of Mozarabic on the following points: the preservation of the diphthongs /aj/ and /aw/, though the former may have evolved to /ej/ as in Galician-Portuguese; the diphthongization of the mid-open vowels /ɛ/ and /ɔ/; the appearance of the alveolo-palatal affricate /tʃ/ as the regular solution for the Latin /k/ before front vowels vs. the alveolar affricate /ts/ that became the norm in the other Romance languages of the peninsula; the maintenance of the palatal fricative /y/ before front vowels; and the shift to /-es/ of the feminine plural ending /-as/. The occurrence of other fundamental changes (i.e., lenition of the voiceless obstruents /p/, /t/, /k/, /f/, and /s/, and the palatalization of the geminate lateral /ll/ and nasal /nn/) remains a matter of controversy, largely because the Arabic script in which most Mozarabic material is preserved, though in principle perfectly capable of providing an accurate reflection of such shifts, in fact turns out to be opaque or ambiguous with regard to these and many other crucial linguistic issues.

The chief Arabic sources for Mozarabic are the *Glossarium latino-arabicum* (Leiden University Library Codex or. 231), the *Vocabulista in arábico* (Biblioteca Riccardiana, Florence, MS 217), the botanical treatise of the Anónimo sevillano (Academia de la Historia, Madrid, Col. Gayangos, MS XL), the vast collection of Toledan documents published by González Palencia, the *Vocabulista arauigo* of Pedro de Alcalá, the twelfth-century Córdoba poet Ibn Quzmān, and the *kharjas*. The single most important source for Mozarabic in Romance documents is the resettlement rolls drawn up by the Christian authorities shortly after their conquest of Seville, Murcia, Mallorca, and Valencia, though the rolls tend to be more relevant for onomastics (anthroponymy and toponymy) than for other aspects of the language. For the rest one must consult the major etymological dictionaries of the peninsular languages, as well as the specialized literature in the field.

MOZARABIC MARTYRS See CÓRDOBA, MARTYRS OF

MOZARABIC RITE

Although *Mozarabic* refers to the period under Muslim domination, the liturgy was established earlier, during

the Visigothic period. Hence it might properly be called the Visigothic rite or the rite of Toledo. This rite shares basic elements with Western liturgies, but issues of this earlier period are reflected in the prayers and are invoked as the motive for papal intervention in the eleventh century.

From 507 the Visigoths, who were Arian Christians, maintained their kingdom at Toledo. Though reasonably tolerant, they controlled episcopal appointments. These factors may have provoked the first extant expression of papal concern in Pope Vigilius's letter to the bishop of Braga in 538, dealing with baptism, penance, and reconsecration of churches. Among bishops sympathetic to Rome was Leander, archbishop of Seville (584–601), who had formed a friendship with Gregory I the Great while on embassies in Constantinople. Leander presided over the Third Council of Toledo in 589, during which the Visigothic king Reccared formally brought the Visigoths into Catholicism. The same council also formally introduced the *Filioque* clause into the Nicene Creed, later a provocation for the schism of 1054. Isidore, Leander's brother and successor as archbishop of Seville (601–636), presided over the Fourth Council of Toledo (633), which established uniform chants for the divine office and rites of the Eucharist. Concerns over ritual practices were reflected in his *De ecclesiasticis officiis*.

Among bishops with Visigothic roots was Eugenius II, archbishop of Toledo (647–657), who presided over four councils and took an interest in liturgical chants and the religious calendar. He continued Iberian interest in trinitarian theology with his *De Trinitate*, now lost. Ildefonso, his nephew and successor at Toledo (657–667), wrote *De cognitione baptismi*, possibly reflecting an anti-Arian position with the provision for a single dipping. Julian, from a family of *conversos*, presided as archbishop of Toledo (680–690) over four councils and was responsible for revisions to the *Hispana*, the Spanish collection of canon law, and to the liturgical rites. This concluded the creative development of this rite before the Moorish conquest of 711.

No definitive study has sought to explore possible Moorish influences on Christian liturgy. Rather than a response to the monotheism of Islam, the distinctive emphasis on "Trinity" as a title of address in many of the prayers of this liturgy has long been interpreted as a reaction to the Arianism of Visigothic origins. The *Filioque*, affirming the procession of the Holy Spirit from both Father and Son, reflects preoccupations with consubstantiality against a form of Arianism.

The five elements of the Eucharistic liturgy can be reconstructed from canonical legislation, treatises, manuscripts, and early editions.

The preparation includes the double washing of the celebrant's hands, prayers for each vestment, approaching the altar with psalms, a sign of the cross, a kiss, and possibly the preparing of the chalice.

The liturgy of the Word begins with the Gloria, except on Sundays in Advent and Lent, and a lengthy prayer often related to the Gloria. There follow readings from Scripture, with chants after the first reading and the Gospel. Normally there is one reading each from the Old Testament, the Epistles, and the Gospels. By the time of Isidore, deacons do the readings. There is a Gospel procession attended by incense and candles.

The offertory includes presentation of bread and wine by the people and preparation of the host by a deacon. Then come several prayers, including a call to prayer, commemoration of names, intercessions, and prayers for peace and for reconciliation. The kiss of peace follows in the Byzantine Order.

The canon opens with an invocation to the Father and Son in a preface, then continues with the consecration, the epiclesis, and a second elevation with the words "The faith which we believe in our hearts let us proclaim with our lips." Then comes the Nicene Creed following the Byzantine order. This was the first Western rite to include the recitation of the creed, probably in reaction to Visigothic Arian roots.

The service continues with the Lord's Prayer, the people responding "Amen" after each phrase, and after the "daily bread" with "Because you are God." Then the host is fractured into nine pieces, seven of them representing a mystery of Christ from his incarnation to his resurrection. There follow the Communion, a thanksgiving prayer, a dismissal, and a prayer in honor of Mary.

As Muslim power declined, Rome took an active interest in Spain. Pope Gregory VII (1073–1085) was a strong proponent of the Cluniac reform, and encouraged these monks to exert influence in Spain. To advance his centralizing interests, he wrote to the kings of León and Castile on 19 March 1074 that the rite of Toledo was contaminated by the heresies of Arianism and Priscillianism, and urged them to follow Roman practice. Catalonia in the north, under Cluniac influence, had made the change; Aragón had accepted it in 1071. El Cid is reported to have established a Cluniac as bishop of Valencia. Alfonso VI of León wanted outside, including papal, support. To offset enthusiasm for the Mozarabic tradition, he reputedly submitted texts of the Mozarabic and Roman rites to trial by ordeal. The Council of Burgos in 1080 officially sanctioned the Roman rite. To placate popular resistance, six parishes in Toledo were allowed to continue the Mozarabic rite. The Roman rite being imposed was

the creative Gallic rite that Cluniac monks had taken to Rome. It was distinguished by dramatic ceremonials such as the procession of psalms, the washing of feet, the veneration of the Cross with reproaches, the blessing of the new fire, the Paschal candle, and the Exultet. The papal policy was completed at the Council of León in 1090 by eliminating Visigothic script from ecclesiastical books.

The last phase of the Mozarabic rite began after the defeat of the Muslims at Granada in 1492. Francisco Jiménez de Cisneros, archbishop of Toledo (1495–1517), had Mozarabic texts prepared, and in 1504 designated a cathedral chapel at Toledo for this rite. So there, and occasionally in the Talavera Chapel in Salamanca, the Mozarabic rite of the Eucharist is still celebrated.

MOZARABS

The term *Mozarabs* is used by modern historians to refer to Christians in Spain who lived under Muslim rule. They are distinguished from the *Muwallads*, who were originally Christians but had converted to Islam. The generally accepted etymology of Mozarab is "musta'rib," Arabic for "Arabized." Although this is probably accurate, it is misleading in two ways. First of all, though Arabic in derivation, Mozarab was not used by the Muslims in Spain to describe subject Christians. As elsewhere they tended to refer to them as "unbelievers" or "Nazarenes." Secondly, "Arabized" implies a level of acculturation that was certainly not typical of every Christian living under Muslim rule. Some historians have avoided Mozarab altogether, preferring more neutral terms such as "Andalusian Christian." But the adjectival form of the word, used, for instance, by art historians to describe a distinctive architectural style, is more firmly entrenched.

From a Muslim point of view, the Mozarabs were a "People of the Book" and therefore, in accordance with Islamic law were allowed to maintain their separate religious identity and keep their property in ex-

change for their recognition of Muslim rule and their payment of a special tax (*jizya*). The Christians (or Jews) subject to such an agreement (*dhimma*, "pact") were referred to collectively by the Muslims as *dhimmis*. The most famous *dhimma* was the so-called Pact of Umar', which came to be considered normative by Islamic legal schools as early as the eighth century, included many restrictions aimed at limiting those aspects of the Christian cult that seemed to compromise Islam: the construction of new churches, bell ringing, processions, public funerals, and especially blaspheming Islam or its prophet. Others were designed to keep *dhimmis* from melting into Islamic society by prohibiting their adoption of Arab styles of clothing or the use of arms or saddles. *Dhimmis* were not allowed to assume government positions that would give them any kind of power over Muslims nor were they permitted to own Muslim slaves or even to marry Muslim women, although Muslim males could and frequently did marry *dhimmi* women.

The fact that the Mozarabs of Spain, as *dhimmis*, were subject to these restrictions de jure did not mean that they were de facto obliged to live in accordance with them. The Latin literature that survives from the ninth century—in particular that pertaining to the martyrs of Córdoba—reveals that Christians were paying the *jizya* and they were being executed for publicly disparaging Islam. But it also shows that bells were ringing in the streets of Córdoba, Christian processions were passing through Muslim neighborhoods, new monasteries were being founded all around the city, and at least some Christian youths were dressing as Muslims and studying Arabic. There is also evidence of Christians in the ninth century serving as soldiers, bodyguards, translators, and tax collectors in addition to the many who held positions within the Córdoba government that were designed to manage the affairs of the Christian population that, at that time, probably still outnumbered that of the Muslims.

The spectrum of Mozarab responses to Islamic society was wide, ranging from complete rejection to almost total assimilation. Mozarabs who lived outside of the cities, whether as farmers or as monks, had very little contact with Muslims, and as a result tended to maintain their pre-conquest cultural identity much longer than their urban coreligionists. The famous lament of Paulus Alvarus (864) about Christian youths in Córdoba who had forsaken Christian literature and the Latin language for Arabic studies, reveals the other extreme. It is interesting, in light of Alvarus's complaint, that there is so little in the way of extant Christian Arabic literature from Spain. Bishop Recemund's calendar (962), written in Arabic and dedicated to the new caliph, is apparently the closest that the bilingual

Christians of Spain came to producing anything in their adopted tongue. This is all the more remarkable when we consider the efflorescence of Jewish-Arabic literature in Muslim Spain beginning in the mid-tenth century with the groundbreaking efforts of Dunash ben Labrat and blossoming in the eleventh and twelfth centuries into a veritable Jewish renaissance.

The Mozarabs left a more enduring mark on Christian Spain. The *Chronicle of Alfonso III* (late ninth century) reports that King Ordoño I (850–866) populated a number of deserted cities in the north in part with people coming up out of Muslim Spain, one of the earliest references to the late-ninth and tenth-century northern migration of Mozarabs. Foundation inscriptions on churches, monastic charters, and the names of new settlements, especially in the Duero River Valley, confirm this. The reasons for the migration are not clear. Though many have pointed to increased persecution, the civil wars within Muslim Spain are perhaps a more likely cause of Mozarab dislocation. The influx of immigrants not only provided the northern kingdoms with much-needed frontier settlers, but led to an infusion of distinctive cultural elements. The Duero Valley contains some of the best examples of Mozarabic architecture, for instance, the church of San Miguel de la Escalada near León, with its distinctive horseshoe or keyhole arches. The famous illuminations in the manuscripts of Beatus's commentary on the Apocalypse (tenth through twelfth centuries) are the most famous example of Mozarabic art. The newly arrived Christians may also have left their mark in historiography, if they were indeed the ones who suggested to the Asturian monarchy that they could consider themselves the heirs of the Visigothic kings of Toledo. The Mozarabs may also have been the first to introduce Arabic urban institutions and agricultural products to the north. But they were also the cause of a liturgical dispute, when they insisted on performing the rite that they had inherited from the Visigothic church despite the Roman-sponsored changes that had taken place in the north. The crisis came to a head in 1080, when Pope Gregory VII decreed that Spain uniformly adopt the Roman rite. Local resistance led to something of a compromise which allowed a handful of Toledan churches to continue following the Mozarabic rite.

When the active phase of the Reconquista began with the takeover of Toledo in 1085 and Zaragoza in 1118, whole communities of Mozarabs found themselves within Christian territory without ever having moved. The Mozarabs in Toledo had become entirely Arabic speaking by that time and there is evidence that their descendants were still using Arabic to some degree two centuries later.

MUDÉJARS

As the eleventh-century Reconquest advanced, Muslims lived in greater number under Christians not only as slaves, freedmen, scattered individuals, and alien merchants, but also as integral surrendered communities. Still called Saracens and Moors, they received from Castilians the more specific name Mudéjars, probably from the Arabic *mudajjan*, "allowed to remain," as in the tributary Muslim groups under treaty in Islamic chronicles (*ahl al-dajjan*). Their surrender compacts, whether written or understood or applied as routine custom, established a parallel society with its own religious, legal, administrative, and fiscal autonomy and institutions, with adaptive mechanisms for subordination to Christian public authority, both royal and seigneurial. Probably borrowed from the analogous Qur'ānic *dhimma* for Jews and Christians, the status was prepared for and reinforced by general structures of Mediterranean and Christian society. In the sixteenth century, as forced or assumed converts, these Muslims continued an underground Islamic life as Moriscos until their expulsion.

Long debate about Islamic "continuity" or "discontinuity" in the Mudéjar enclaves is beside the point: they were survival cultures, a unique form of Islam whose continuities were discontinuous due to reactive acculturation. Modern Enlightenment "tolerance" is also irrelevant: Muslim and Christian societies then, religious in root and branch, recoiled from one another in mutual contempt, demanded civic expression of their respective revelations, and feared any assimilation or taint from the infidel. If overt interaction was discouraged by segregation and discrimination, however, constant colonialist interchange at many levels was inevitable.

The Mudéjar *aljama* was a jurisdictional unit that might include one or more Moorish quarters (*more-rías*). The morería was at first a privileged sanctuary,

usually suburban, but in the fifteenth century became a compulsory ghetto. The basic structure of an *aljama* involved a governing *qādī* and/or *qā'id*, a Qur'ānically learned *faqīh* stratum, sheiks or notables in council (also called *aljama*), one or more *amīn* functionaries as fiscal liaison with the Christian ruler, and officials including the consumer advocate (*muhtasib*), muezzin, prayer leader (*ṣaḥīb al-ṣalāt*), secretary (*kātib*), and tax collector (*mushrif*). This public structure and the quality of Mudéjar life depended on the defining contexts of place and time; and actual life, both public and private, could differ radically according to those circumstances. An early or a rural Mudéjar, for example, might inhabit an entirely Islamic ambience; seigneurial *aljamās* on the Ebro River might live as valued and affluent tenants, while town *morerías* suffered pogroms.

Castile soon drove out most of its Mudéjars, whereas Valencia kept and even imported them as economically essential. Mallorca had no *aljamās*, only numerous acephalous individuals; Catalonia's population was less than 3 percent Mudéjars, and those only on its borders; Aragón's population in the late fourteenth century was one-third, but its sister kingdom Valencia was two-thirds, Mudéjar. Sustained general scholarship on Mudéjars dates only from the 1980s, with most of it from the 1990s. Regular international congresses on Mudéjarism, Mikel de Epalza's annual bibliographies, surveys of Navarrese Mudéjars by Akio Ozaki and Mercedes García Arenal, of Murcia's by Juan Torres Fontes, of Aragón's by José Lacarra, of Castile's by M. A. Ladero Quesada and Joseph O'Callaghan, of Catalonia's by Rodrigo Pita Mercé, of Mallorca's by Elena Lourie and Ricardo Soto Company, and of Valencia's by M. C. Barceló Torres, John Boswell, Robert Burns, M. T. Ferrer i Mallol, Pierre Guichard, and Mark Meyerson are the beginning of those regional, and eventually local, studies essential before generalizations can be attempted about Mudéjars as a whole. Meyerson has already shaken the universal assumption that the Mudéjar condition worsened linearly with each generation, culminating logically in the expulsion of the Muslims. He finds Valencian history cyclical, with relatively acceptable circumstances in the thirteenth and fifteenth centuries and catastrophic circumstances in the fourteenth and sixteenth. He also notes the wholly opposing policies of Fernando the Catholic toward Castilian and Valencian Mudéjarism. Another assumption, that Muslim elites entirely fled at any conquest, leaving only rural peasants and a few artisans, needs to be carefully adjusted for each area and time span.

Mudéjar art has attracted research for a longer time and on a wider scale than other aspects of Mudéjar

culture. From the twelfth to the sixteenth centuries this brickwork Islamo-Christian hybrid flourished, especially in the fourteenth and fifteenth centuries in Aragón and Andalusia. Controversy has continued as to its nature: a form of decoration or stylistic language, or the only architecture besides Gothic truly native to Europe, or essentially Arabic construction borrowed for economic reasons by a Spain fallen on hard times? Though Valencian Mudéjars kept Arabic as their language to the end, with little Romance, Castilian Mudéjars were heavily acculturated to Romance, leaving, for example, the fourteenth-century *Suma* and *Leyes de moros* and (especially in the fifteenth century) the *aljamiado* Romance literature in the Arabic alphabet.

Eleventh-century Christian advance in Castile, followed by mistreatment of Toledo's Mudéjars, had led to Muslim emigration from the center toward the south, the southeast, or even the north. The main Islamic towns, and therefore the Mudéjar communities, came to center on Andalusia (Córdoba, Jaén, Seville) and Murcia. The 1264 Mudéjar revolt there occasioned expulsion and massive flight, until by 1300 only enclaves survived, often on large seigneurial estates.

Valencia always held the largest numbers of Spain's Mudéjars, first under a colonialist minority of Christians, and in 1450 constituted some 30 percent of the population. Though all but two main Valencian towns had surrendered on Mudéjar terms, regular thirteenth-century revolts, as well as paranoid obsession in the fourteenth century with invasion from the Maghrib, increased the townsmen's hostility, though the rural lords protected Mudéjars as tenants and allies. Around 1300 the bishop over the most settled half of the kingdom of Valencia complained that mosques outnumbered churches and that over half his people were Mudéjars. Ferrer i Mallol has surveyed the demographic diminution and ever harsher laws throughout the fourteenth century there; wars, plagues, anti-Moor riots, and (in Granadan invasions of 1304, 1331, and 1332) episodes of flight. Though the Mudéjars individually did help invaders, and as a group exhibited both unity as "the nation" of Valencian Mudéjars and pan-Islamic sentiment, they did not revolt after 1300, and they did fight frequently in the king's armies. In 1456 mobs sacked the capital's *morería*. Despite all blows they remained a proudly functioning Islamic society, prized by king and lords if not by townsmen, down to the 1522 forced conversion.

MUNIO OF ZAMORA See DOMINICANS

MUNTANER, RAMÓN

Ramón Muntaner (1265–1336), military man extraordinaire in thirty-two battles on land and sea, crown official and municipal administrator, and cloth merchant, composed a brilliant, novelistic autobiography, the most popular and extensive of Catalonia's four great vernacular chronicles. He was born at Perelada to a high bourgeois family, who were hosts to Jaime I and Alfonso X in 1274. In the entourage of the future Pedro III, Muntaner met Philip III the Bold of France in Paris. He seems to have served for a while in Roger de Lloria's fleet off North Africa. In 1286–1287 he had a major role in the conquest of Menorca, thereafter becoming "a citizen of Mallorca," and in 1300 he defended a section of Messina, Sicily, against the Angevins' siege.

Joining the corsair Roger de Flor, Muntaner served as chancellor and quartermaster of the Catalan Company in Byzantium from 1302 to 1307, distinguishing himself in the siege of Gallipoli (1306) and being taken prisoner at Negropont by the Venetians. Frederick III of Sicily invested him as governor of Djerba island, off North Africa (1309–1315), which he pacified. In 1311 Muntaner transported the future Jaume III of Mallorca, an orphaned infant, from Catania to the Perpignan court. After a term as procurator to the magnate Bernat de Sarrià (1316–1320), he helped organize the conquest of Sardinia (1324).

At his home at Xirivella in the Valencian *huerta*, Muntaner composed his memoirs (1325–1326) and engaged in the cloth trade. As a jurate of Valencia city he attended the coronation of Alfonso IV the Benign in 1328. On Mallorca in 1332 Jaume III made him knight and the bailiff of Ibiza, where he lived with his wife, Valençona, his daughter, Caterina, and his sons Martí and Mascarí until his death there in 1336.

Like Jaime I, Muntaner called his memoirs *Llibre* rather than *Crònica*; both must be assessed under the genre of autobiography, not history. They unabashedly propagandize for the Catalan dynasties at home and abroad, and adopt a lively novelistic style: personal, colloquial, and anecdotal, suitable for reading aloud to an audience. Over fifty chapters on the Catalan Company recount their high point, and provide our main information for that adventure, and the model for *Tirant lo Blanc*. Muntaner's unforgettable scenes of pageantry and war may be our best panorama of fourteenth-century life.

MURCIA

In the twelfth century, the Moorish kingdom of Murcia reached great political and economic ascendancy, as well as a cultural brilliance so extraordinary that its capital became the center of the entire eastern region of Al-Andalus. After the disappearance of the Almo-hads and Ibn Hūd's brief attempt at independence, Castilian rule began in 1243 with the imposition of a military protectorate. According to Ibn 'Idhārī, "La gente de Levante de al-Andalus pactó con los cristianos por una cantidad fija que les pagasen y los murcianos dieron su alcazaba a los cristianos, quienes la convirtieron en su alcázar" (the people of Eastern Al-Andalus made a pact with the Christians for a set quantity of money, and the Murcians gave their fortress to the Christians, who converted it into their own *alcázar*). The gradual Castilian intervention in Muslim life and the breaking of the Pact of Alcaraz, in which the terms of surrender were set, led to the 1264 uprising of the Mudéjares, whose decisive defeat in 1266 marked the introduction of Castile's complete sovereignty.

Until the end of the Middle Ages, the region's chief characteristic was its role as a frontier kingdom or *marca*, bordering Granada, Aragón, and the Mediterranean. This situation, given the limited number of settlers that came to the region during the *Repartimiento*, led the Castilian monarchs to distribute land to the military orders of the Temple Santiago, San Juan, and Calatrava, whose commanders faithfully protected the Granadan border with the aid of the city of Lorca. If the Christians were indeed able to score significant victories on the frontier, they could not prevent the frequent pillagings by the Granadan raiders, nor the

three bloody expeditions of the Naṣrid kings in the fifteenth century, which resulted in a great number of casualties and captives.

The repopulation of the cities and rural regions of Murcia, Lorca, and Orihuela led to the settlement of more than four thousand Christians who received territories either through royal donation or inheritance. By royal decision, most of these allotments were small properties, and recipients were required without exception to participate in the defense of the kingdom. The monarchy's concession of exemptions and privileges allowed for the establishment of councils (*concejos*) in all of the crown's populations, although only *hidalgos* and *caballeros* took part in their administration. The Murcian capital, where the *adelantados* (frontier governors) and bishops resided, achieved considerable domination because of its greater economic and human power, and was able to provide military aid to the whole kingdom when necessary.

A decade after the initial repopulation phase, an opposite phenomenon occurred: a gradual Christian and Mudéjar abandonment of the territory caused by the insecurity that the Granadan raids produced. This decrease in population led to military, economic, and demographic weakness; Jaime II of Aragón took advantage of the situation during Fernando IV's *minority*, annexing the northern part of kingdom. This action was later given official recognition in the judgment of Torrellas (1304), although Castile was able to recuperate part of this territory over the course of the fifteenth century.

The government of the frontier territory (*adelantamiento mayor*) and its territories in Villena and Elche was in the hands of the *infante* Manuel, and his delegates maintained intrusive political participation throughout the kingdom, especially in the resolutions of the *concejo* in the capital. His son Juan Manuel had interfered even more in the affairs of the kingdom through a period of forty years, although there were moments in which the Murcian citizens were able to assert their independence. Before Juan Manuel's death, small dominions (*señoríos*) within the territory began to be established. Their leaders—Ayala, Calvillo, and Fajardo—worked toward various purposes, but above all aimed to gain the favor of the monarchy, become successors to the throne, and impose their hegemony in the kingdom. At the same time the church in Cartagena acquired the only two territories it ever possessed during the Middle Ages, Alguazas and Alcantarilla; both were inhabited exclusively by Mudéjars who, under the protection of the church, were successful not only in revitalizing the economic development of both areas, but also in putting themselves in prominent positions compared to the rest of the Mudéjar population.

The civil war in Castile paved the way for a conflict between the Murcian *señoríos*, with the gradual imposition of the Fajardo family in the fourteenth century. The conflict, however, would continue for more than seventy years in the following century, this time among the Fajardos themselves, with Pedro Fajardo ultimately triumphant. The presence of the *señoríos* led to such an extreme that in 1480 only Murcia and Lorca remained under royal power, although Pedro was still involved in the administration of even these regions, as *alcaide* (mayor, leader) of their fortresses and as *adelantado mayor*. This situation is reflected in the letter written by Hernando del Pulgar in 1473 to the bishop of Coria: "Del Reino de Murcia os puedo bien jurar, señor, que tan ajeno lo reputamos ya de nuestra naturaleza, como el reino de Navarra, porque carta, mensajero, procurador ni cuestor, ni vienen de allá ni van de acá más ha de cinco años" (I swear to you, sir, that we deem the kingdom of Murcia to be as detached from our own character as the kingdom of Navarre, because not a letter, messenger, procurator, nor collector has arrived nor departed for more than five years).

The social and ethnic stratification peculiar to the late Middle Ages was maintained in Murcia without any significant difference: *hidalgos*, *caballeros*, *plebeians* (*pecheros*), Jews, Mudéjars, slaves, and foreigners made up its population, which brought with them juridical, ethnic, and economic differences. All were subject to the exceptional circumstances of the geographical location of the *adelantamiento*, which conditioned much of the area's decisions and activities.

The *hidalgos*, who enjoyed a privileged position because of their exemptions from royal and regional tributes, struggled successfully to maintain their status, although not all had enough possessions to dispose of the income necessary to maintain the quality of life they believed they deserved. An accord of 1418 recognized them officially, listing 372 men and 84 women, a qualified minority that only partially participated in the city's government. Those *pecheros* with relatively high quantities of money were required to keep a horse and weapons in exchange for tax exemptions, making them essentially equal to the *hidalgos*. At its highest, this population consisted of 256 people in 1475; this number decreased in the following years, with only 104 in 1489. Their economic benefits were attractive at first, but were later avoided because of the costly requirement of owning a horse dedicated exclusively for military action. Both groups held governing positions on the *concejo* and maintained their social distinction at all times. The *pecheros*, permanently in military service like all citizens, practiced all kinds of careers and services both in the city and in the rural

areas. They were, however, always subject to the instructions and guidelines set forth by the wealthy urban sector. They made up as much as 70 percent of the kingdom's population.

In 1266, after the Castilian occupation of the capital, Alfonso X established a Jewish neighborhood within the city walls, next to the gate of Orihuela, with the double purpose of offering them the protection mandated in the *Partidas*, and maintaining their separation from the Christian sector. This separation turned out to be beneficial for the Jews, since it guaranteed their security by setting them apart within the city walls, safe from the abuse and theft they would have suffered had they lived among the Christians. At the same time, their situation allowed for the continuity of Jewish customs and ways of life and permitted them to maintain their peculiar traditions. They were also free to leave their precinct during the day and participate in city activities, attending to everyday chores in their small stores, offices, and workshops until they returned to the *judería* before sundown.

The royal protection of the Jews was assumed by the *concejo*, which lent them strong support in the defense of their people, possessions, and rights. This protection saved the Jewish population from critical situations such as the persecutions of 1391: the city government not only prevented an assault on the *judería*, but also demanded that the leaders of Orihuela return the possessions left there by the Jews when they were forced to flee the area to avoid being robbed or killed. This was an oasis of peace, but it should be pointed out that the events of 1391 led some of the Jewish population to convert to Christianity through fear of losing all they had. Even more conversions were produced as a result of the long month that San Vicente Ferrer spent preaching in 1411. The Murcian chronicler, Diego Rodríguez de Almela, observed this process with clarity just before 1390: "Fueron tornados muchos judíos christianos por miedo, e asi muchos dellos nunca fueron buenos christianos nin los que dellos vinieron, segund lo que agora poco tiempo ha parecido, e los que fueron convertidos por su grado en la predicacion que fizo Fray Vicente, salieron buenos christianos, mejor que non los que fueron convertidos por fuerça e miedo" (Many Jews turned Christian by fear, and many of them were never good Christians, nor were those that descended from them, as has been shown recently, and those that were converted through Friar Vicente's preaching turned out to be good Christians, better than those that were converted by force and fear).

There are no Jews mentioned among those that worked the land, since they all sought jobs in the city. They were landlords; collectors (or assistants to collec-

tors) of taxes on food products (meat, bread, and wine), textiles, carpentry, shoemaking, and on the Jewish and Moorish populations; inspectors in the three custom houses (*aduanas*); and commercial brokers of clothing, animals, etc. Above all, however, they worked in the clothing industry: in 1409 there were a total of seventy-nine Jewish tailors and dressmakers listed. Fewer in number, though still significant, were those who worked as jewelers, binders, spice merchants, and apothecaries; some also worked as usurers, an occupation that caused great dislike among the humble sectors of the city. The total Jewish population in the last decade of the fifteenth century numbered more than 1,500 people, almost all of which lived in the *judería* of the capital. This number however, did vary throughout time, due to plague epidemics like that of 1396, in which 450 citizens died; emigration to the neighboring kingdom of Aragón during periods of economic depression; and conversion or escape in times of anti-Jewish crisis.

The treaty of Alcaraz initially promised the Islamic population peace, stability, and continuity of lifestyle, although their fortresses and half of their royal income were transferred to Castile, as well as a few occupied territories not addressed in the treaty. The pact was respected for the first few years, but the influx of the Castilians, their interferences and excesses, the creation of local *concejos*, and the occupation of Muslim houses and lands caused unrest and silent protest among the *Mudéjars*. This led first to emigration, then to uprisings of those that remained, who were supported by the king of Granada. After squelching the rebellion, the Castilian sovereignty would not encounter further obstacles.

There were many *Mudéjars* that died in the war or as captives, and others who were sent as captives away from the Iberian Peninsula. Also contributing to a loss in numbers was the Aragónese occupation of the territory at the end of the thirteenth, which led to the transfer of the most qualified men to Aragón. After the judgment of Torrellas in 1304, Fernando IV made a pathetic (and unheeded) plea to the *Mudéjars*, soliciting their return with promises of various privileges. Since then, the reduced *Mudéjar* contingent would be characterized by its economic weakness, and by social/racial discrimination. If the *Mudéjars* could count on the protection of the *concejos*, their commanders, and their lords, they did not enjoy such treatment from others, who dealt with them abusively. Lacking coordination and authority, their disunity was their worst destiny; continuous degradation and compliance with their fate were two ills that affected everyone.

Starting in the late fourteenth century, the increased security of the border allowed for the creation

of small señoríos in the country and the cultivation of new lands, which improved the living conditions for those Mudéjars that settled in those territories out of economic necessity. There was at the same time greater attention paid to fiscal exemptions for those still living in the urban sectors. Three negative factors, however, continued to dominate: low population, low quality of work, and poverty. The Mudéjar population's relationship with Granada did not benefit them, and emigration did not guarantee them better living conditions. Apart from their work in the fields and farms, the Mudéjars worked as fishermen, shepherders, smiths, potters, and cutlers. They also worked as laborers in the most menial jobs of daily life. At the end of the fifteenth century there were a score of Mudéjar families in the Arrixaca slums of the capital, and the total population in the kingdom would not have exceeded five thousand. An exception to the misery suffered by the Mudéjar was the advantageous situation of the vassals of the church, both in Alguazas and in Alcantarilla. They benefited not only from the committed protection of their masters, but also from their superior economic possibilities.

The number of Moslem slaves was not great, because very few Mudéjars lost their liberty through crime or frustrated attempts of emigration. Proximity to the border with Granada facilitated escape, especially when the fugitive could count on the assistance of Mudéjar vassals of the military orders near the border; but the welcome that waited them was not always pleasant, as is shown in the return of those that went to the Ricote valley only to be forcibly transferred by Abūl-Ḥasan in 1477. The scarcity of Muslim slaves required masters to turn to the acquisition of African subjects, but their high cost limited their numbers, and therefore they were largely assigned to domestic work.

Since the thirteenth century, even before the Castilian occupation of the kingdom, documents show the presence of merchants from Genoa in Murcian territory. This activity diminished during a long period of economic depression, but is renewed with greater intensity in 1370. These merchants formed businesses connected to members of the oligarchy in the capital, with whom they also established family ties. They were active in many aspects of social and political life: they acquired urban and territorial property; filled whichever municipal and economic positions benefited them (like those associated with the *aduana* [customs house], which provided them a way of controlling the traffic of merchandise); established money-changing stores; loaned high quantities of money to the city treasury, which was always in debt; created industries; and imposed their economic dominion through their monopoly of the dye industry, and especially through

Merino wool, which they exported as early as 1372. The Genoese merchants also traded products that the Mediterranean market demanded, including dyes, textiles, grains, weapons, and whatever else would provide them rich economic benefits—always, of course, counting on the support of the city oligarchy.

Agriculture was often burdened with debts caused by many factors: first, a permanent insecurity extended to every corner of the adelantamiento, caused by the Granadan invasions and the presence of a system of bandits; second, there was frequent flooding and prolonged periods of drought; finally, deadly plague epidemics persisted—in 1396 there were 6,080 killed in Murcia—and not only brought about a great number of casualties, but also weakened bodies and efforts, and threatened the Murcian territory unceasingly. Related to all of this is the shortage of population and the necessity to attend to the alimentary needs of those that resided in the urban world and did not work the land. These consequences led to a drastic reduction of land cultivation, which was forced to concentrate on the most essential products (grains and wine) at the expense of other traditional foods like olives, vegetables, almonds, figs, and other fruits. This produced a notable change in the rural landscape compared with the Muslim era and the first years of Castilian occupation. It also resulted in a gradual abandonment of the fields of Lorca and Cartagena, which were subsequently only used by transhumant livestock. As a result, the northern part of the countryside, lacking the necessary drainage, was converted into marshy lands that were only fit for cattle.

The end of the rivalries of the noble factions and the external and internal peace of the first part of the fifteenth century led to a magnificent urban and rural resurgence. The city grew and was beautified, and the increase of the Christian and Mudéjar populations promoted the creation of small señoríos in the countryside. The opening of the irrigation ditches of Monteagudo allowed for the drainage of swampy zones and a gradual increase in cultivation. In 1450, a rapid repopulation of the Murcian countryside of Cartagena began: the council regulated this process by granting the lands for indefinite periods of time or through estate pensions. New cultivations also contributed to the favorable situation: the orange tree ceased to be purely ornamental, and its fruit soon flooded the market, while the varieties of vegetable products multiplied. Finally, the replacement of the black mulberry tree with the white variety made way for the immediate fabrication of silk, which was an enormous economic staple for centuries in Murcia and its rural regions.

Agriculture's decadence was compensated by the livestock industry. Meat and wheat were essential sta-

ples in medieval alimentation, and were supported by the concejo, who made sure there was enough in supply. The mobility of sheep gave them the flexibility to use the extensive pastures in the countryside. In 1267, Alfonso X passed legislation regarding Castilian and Aragónese livestock that came to Murcian fields in the winter. Leather, wool, milk, cheese, meat, and manure were fundamental in the medieval Murcian economy, which also benefited from the taxes that were collected from the passage and stay of foreign livestock. A strong textile industry also begins during this period. The industry was already important as early as 1339, when Alfonso XI nurtured the industry through various provisions that kept products in supply. The exportation by the Genoese merchants of large quantities of Merino wool starting in 1372 also attests to this industry's importance. Two significant statistics: first, in 1488, 127,500 heads of transhumant sheep were counted in Murcia, originating from La Mancha, Guadalajara, Cuenca, and the kingdom of Valencia. This figure drops to 102,483 in 1499, when the end of the Granadan war allowed the herds to find other places to winter. Second, we know that in 1452 the Granadans robbed 40,000 head of livestock in one of their invasions. Uncertainty and vulnerability were always inherent characteristics of the Murcian kingdom.

The depopulation of a substantial part of the kingdom led to the growth of the forest and to the prosperity of the hunt. Alfonso XI's *Libro de la montería* and don Juan Manuel's *Libro de la caza* are faithful testimonies to the number and variety of animals in the area: bears, wild boar, deer, partridges, rabbits, hares, wolves, doves, herons, cranes, ducks, etc. Fishing, on the other hand, was less common, until the practice increased considerably in the early fifteenth century due to the concern of the concejos of Murcia and Cartagena, which responded to the increasing demands for fish. The muleteers' reports of the more than twenty types of fish, and the many misadventures described about fishing attest to the demand for and consumption of the product.

An extraordinary cultural era—in part a continuation of a similar period of glory achieved by the Muslims in the twelfth century—was promoted by Alfonso X in Murcia with the creation of an *estudio* (school or university) where works of classical antiquity were translated, and where the writing of the various *Partidas* and the *Cantigas* proceeded. Economic problems would prevent the university's longevity.

MURET, BATTLE OF

In 1209 the crusade of Legat brought Simon of Montfort and his warriors to the Occitan theater of operations. They were fighting Raymond VI of Toulouse and the counties of the Languedoc territorial principalities, which were suspected of conniving with the Cathars. Raymond called on Pedro II of Aragón, his brother-in-law, who, encouraged by Pope Innocent III, tried at first to avoid the conflict by diplomatic means; the failure of negotiations led to an armed struggle. In January 1213 the king of Aragón received the homage of the counties of Toulouse, Foix, and Comminges; he thus became the lord of Occitania. He directed his troops to the south of Toulouse, to the city of Muret. On 12 September 1213, after having refused to negotiate, he ordered his foot soldiers to attack one of the gates of the town, but they failed to take it. Simon of Montfort's counteroffensive was not long in coming. Although Raymond's forces were more numerous, they were disorganized; Montfort's army, divided into three groups, made three successive charges and approached the enemy lines.

Pedro II, having allowed himself to be seen at the head of his troops, was killed, which caused his men to flee. Many of them perished while trying to cross the Garonne. The French, who had trained in tournaments in the north of the kingdom, and who were encouraged by their religious zeal, demonstrated their military superiority. The disarray of Pedro's army, as much as his death, was a sign of the end of the Catalán-Aragónese hegemony in the south. The confederation, crippled with the debts caused by the expansionist adventures of Raymond, was caught up in internal wars until Jaime I came of age. Later, Jaime gave up the Occitan dream forever, choosing instead an unambigu-

ous Spanish policy against the Muslim kingdoms of Valencia and Mallorca.

MŪSĀ IBN NUSAYR

Mūsā ibn Nusayr, a general of Persian origin who converted to Islam and helped spread Islamic religion and culture to the far ends of the known earth, managed to pacify the Berbers in Africa and delegated two of his sons to put down their rebellion in Al-Maghrib, or Morocco. By 707 his efforts helped him become the governor of all North Africa. Strategically brilliant and tranquilly ruthless, Mūsā ensured Arab dominance for the caliphate all the way to the shores of the Atlantic. By 708 he had marched into Tangier and secured Arab domination over the southern Mediterranean. When he entered Tangier, he appointed Ṭāriq ibn Ziyād as governor there. A master strategist and politician, from his North African redoubt Mūsā immediately recognized the political weakness and disarray of the Visigoths in Iberia. In 710 he encouraged Ṭāriq to cross the Strait of Gibraltar and explore the possibility of conquering the Iberian Peninsula for Islam. At Mūsā's command, Ṭāriq crossed to Iberia a second time, in the late spring of 711, with an army of nine thousand men. Mūsā's military exploits and his reputation as a strategist, as well as the prospects of encircling the Mediterranean, sent terror through the heart of the Byzantine Empire and the rest of the Christian West.

When Ṭāriq encountered relatively minor resistance in Iberia, Mūsā was moved to jealousy. He crossed into Iberia in 712 with his own band of eight thousand men and moved from Algeciras against Seville, then on to Sidonia, Huelva, and Beja. Finally, following the Guadiana River north, he reached Toledo, where, in an effort to humiliate Ṭāriq for his overzealousness and insubordination, he caught up with him and whipped him in public. After the winter of 713, the pair moved east to Zaragoza, Lérida, Barcelona, Narbonne, Avignon, and Lyon. Although his forces were stretched thin, Mūsā, wrote to the caliph in Damascus of his intent to encircle the entire Mediterranean. Wary of his success, al-Walid, the caliph, stopped Mūsā short and ordered him back to the peninsula, where he proceeded to take Galicia and push the opponents of Islam into the mountains of Asturias. In 714, at the behest of the caliph, Mūsā returned to Damascus with booty and captives and too much success.

By 716 he had been humiliated, and his meteoric career advanced no further.

MUSIC AND MUSIC THEORY, ARABIC

Our knowledge of Arabic music in medieval Spain is confined to three main sources of information: Arabic theorists of the time; supposed influence in the Alfonso *Cantigas* and elsewhere; and what appear to be survivals of the Iberian tradition in the Maghrib. Unfortunately, these sources are not what they seem. Theorists, then as now, can delude themselves and their readers; the relationships between the apparently *zajal*-esque *virelai* forms of the *Cantigas* and the parallel of the Hebrew or of the Arabic forms *muwashshah* and *zajal* is not as straightforward as is sometimes assumed; and the belief that North African singers have preserved intact the medieval Iberian singing techniques is simplistic, to say the least. Indeed, the interrelationships of the Mediterranean cultures were clearly complex.

Theoretically, Arabic (and parallel Hebrew) song-poetry was dependent on *arūd*. Yet, as with Greek metric, the pleasing patterns of theory were traduced by music. We are fortunate in having the opening of a *qasīda* preserved in a treatise of the thirteenth century. Al Jāhīz gives the impression that this kind of song was typical of the *qaynāt* (singing girls), who in Spain were often Christians. The tablature notation conveys exactly the (relative) pitch of the notes, together with the note values and drumbeat accompaniment. Metric and rhyme schemes are appended.

As can readily be seen, the pattern of longs and shorts demanded by 'arūd (*ta'awīl* meter) is only loosely connected with the actual rhythm. Note also the "paragogic" use of the unelided *-I-*.

Such a song may have been the germ of the type of vulgar Arabic *zajal* made famous by Ibn Quzmān in the twelfth century. It also may have furnished one type of *Kharja* for the *muwashshah*, mostly written in classical Arabic (e.g., the thirteenth-century Ibn Sahl, one of whose *muwashshahāt* survives today in the Maghribine singing tradition) or the equivalent in Hebrew (e.g., by his contemporary Todros Abulafia;

again, one of his songs can be reconstructed from tradition—see Example 2). These writers, however, instead include scraps of Romance in the *kharja* (final section) of some of these lyrics, the significance of which is the subject of dispute, as is the relationship between Romance and Arabic metric and forms. Nonetheless, as Example 1 shows, Arabic rhythm was neither necessarily exotic nor irreconcilable with its Romance counterpart; and, granted the known importation of Arab and Persian musical instruments into Spain (and thence elsewhere), it is hard to believe that the CD player came without any discs, so to speak. Galician and Spanish lyrics mention the *alaude* (*al-ʿūd*, lute), *adufe* (*al-duff*, drum) and many other instruments. The lute, rebec (*al-rabāb*), and *nakers* (small kettle drums, *naqqārāt*) are among the host of instruments that were naturalized into Europe, often tenaciously retaining their Arabic names.

Arabic theorists such as Al-Fārābī (tenth century), were translated into Latin at Toledo, and became known by Vincent of Beauvais, Roger Bacon, Jerome of Moravia, and many other later writers. Although the Western writers tended to adapt the theory to their own ends, the transfer of musical lore was not entirely superficial. For example, “tablature” for the lute and other instruments is found in Europe from the fourteenth century on, but it had been used in Arabic notation for many centuries previously. That the Arabic word for love song (*ghazal*) appears in an Aquitanian song of the twelfth century (as *gazel*) is hardly coincidental; and the word “toccata” is arguably Arabic. Despite a widespread belief in its etymological connection with Italian *toccare* (to touch), the word first seems to mean a fanfare-like piece. A more likely derivation is from *takk* (onomatopoeic, meaning a burst of sound), having to do with the tonguing technique of the “Saracen trumpet.”

The musical influence did not necessarily run in one direction only. The *muwashshah* and *zajal* emanating from Spain may, like many of the singing girls, have been the product of mixed Romance and Arab parentage. The receptivity of the conquerors to the native culture may well have been heightened by the collapse of the Umayyads in the middle of the eighth century, and the arrival from Baghdad of the famous Persian tenor Ziryāb in 822. The resulting innovations may have found fertile ground in Spain, since neither the Berbers nor the Mozarabs were particularly interested in classical Arabic verse. Be that as it may, it is from this time that the *muwashshah* seems to have blossomed in Spain. In turn, elements of Spanish Arabic lyric forms (especially their virtuoso rhyme schemes) and their associated music might easily have

been transplanted north and east into the rest of Europe, since they were already vigorous hybrids.

As an illustration of this last point, the last stanza of a Hebrew *muwashshah* by Todros Abulafia is appended. Its tune survives in a Palestinian tradition, to the words of its model, a *muwashshah* by Ibn Zuhri, of the preceding century. Todros’s lyric is thus a *muʿārada*, a contrafaction, borrowing the music and other features of its model. In particular it takes Ibn Zuhri’s Arabic refrain (*maṭlaʿ*) and uses it as the *kharja*, or parting shot, of the Hebrew imitation. But because of the way the music of the latter is heard all through the lyric, the audience anticipates the punch line, a device that seems to have been at the heart of the technique, whether the *kharja* was borrowed from Arabic or Romance. An additional and striking feature is the rhythm. The Greeks called it Ionic, and associated it with orgiastic cults, such as those of the Celts. The same rhythm occurs in the Alphonsine *Cantigas*, written in *gallego* (Galicia being the Celtic fringe of Iberia). This congruence should not be overemphasized, but it serves to demonstrate the complexity of the problems of the relationship between Arab and European music. It also underlines the disparity between theory and practice, for once again the supposed ʿarūd is ridden over roughshod, and the Arabic treatises are silent on this particular rhythm.

MUWALLADŪN

Muwalladūn means “adopted” and is the past participle of the root *wllḍ* “to bring up.” It is applied to Andalusian native people who adopted the belief of the religious and political dominant class, Islam, and who

constituted the great majority of the Hispanic-Islamic population. *Musālīma*, a term closely connected, is infrequent in texts and has no precise meaning. The difference generally can be decided by the moment of religious conversion: *musālīma* refers to people just converted, and *muwalladūn* refers to a second generation of converts.

The new Muslims generally hid their origin with Arab names or by the *walā'* system, which showed them as clients of the Umayyad emirs.

The *muwalladūn* make a showing in chronical sources that relate to events of the second half of ninth century and the beginning of the tenth. They are shown there as a new group claiming its place in Andalusian society and causing great disturbances to Umayyad government. Their actions during this period, secondarily supported by the Christian element, show that the process of Arabization and/or Islamization of native people had reached an important and significant degree in the middle of the ninth century.

From the tension caused both by the assimilation of new Muslims to Arab-Islamic culture and the situation of "Muslims of second class" emerge the trend of the *šū'ūbiyya*, highly developed among the Persians. According to it, non-Arab Muslims living in the Arab Muslim world praised and claimed their own values.

Ibn García, a Muslim slave of foreign origin in Al-Andalus (a *saqāliba*), showed in his famous epistle the problems of non-Arab Muslims.

With regard to the language spoken by *muladíes*, a complex subject that has not been much studied, one could assume bilingualism. It is not probable that they spoke Romance after their conversion (at least not immediately); nor did the Mozarabs speak only this language.

MUWASHSHAḤA

Two highly distinctive poetic genres, the *zajal* and the *muwashshaḥa* originated in Islamic Spain during the Middle Ages. Classical Arabic poetry is monorhymed and quantitative (that is, the verse embodies a combination of long and short vowels), but these two innovative Hispano-Arabic genres exhibit a very different prosody: they are strophic, have variable rhyme schemes, and their meter is stress-syllabic (that is, the verse exhibits various accentuation patterns together with a certain number of syllables per verse). The two genres differ as to language: the *zajal* is composed in colloquial Hispano-Arabic and sometimes includes words or phrases in Mozarabic (the Hispano-Romance dialect of medieval al-Andalus), the *muwashshaḥa*, by contrast, is written in classical Arabic (or, in the case of Hispano-Jewish poets, in Hebrew), except for the final refrain (or *kharja* "exit"), which is usually in either Vulgar Hispano-Arabic or in Mozarabic, often in a combination of these two colloquial languages. Both the *zajal* and the *muwashshaḥa* embody variations of the following strophic pattern: An initial refrain in (Arabic, *maṭla'*, Spanish, *cabeza*), which establishes the metrical model to which subsequent segments will conform, is followed by verses in which both meter and rhyme change (Ar. *ghuṣn*; Sp. *mu-danza*); a third segment is the "return" (Ar. *qufl*, *simṭ*, or *markaz*; Sp. *vuelta*), in which the poem returns to the meter and rhyme of the initial *maṭla'*. Lastly, after the *qufl*, the *maṭla'* is repeated—chorally—to complete the cycle. This arrangement is repeated throughout the poem, usually in five successive strophes. The *kharja*, which usually occurs only in the *muwashshaḥa* (and not in the *zajal*), is the poem's final return strophe (*qufl*), in which the *muwashshaḥa* once again returns to the meter and rhyme established in the beginning *maṭla'*. The *kharja* embodies a radical change in language and in tone, by which, from the exquisite, erudite, classical language (Arabic or Hebrew) of the preceding strophes, we are suddenly and shockingly transported into a very different world, a world of everyday, vulgar—indeed sometimes even obscene—colloquial language. According to the twelfth-century Egyptian theorist, Ibn Sanā'al-Mulk, the *kharja* should be in "the vernacular, hot and burning, close to the language of the common people and the phraseology of thieves . . . the *kharja* is sometimes composed in the Romance dialect ('*ajamiyya*) . . . It is

the spice of the muwashshah, its salt and sugar, its musk and amber.” The *kharja*’s effect on contemporary Hispano-Arabic (or Hispano-Hebraic) listeners must have been electrifying and probably also highly amusing. It is important to bear in mind that both the *zajals* and the *muwashshahāt* were composed to be sung (not recited). They represent a highly learned complex poetry that was orally performed and orally transmitted. The *zajal*, composed in colloquial Arabic, in most cases—there are exceptions—does not end with a *kharja*, whose effect, dependent on a sudden, radical change in language, would in any event have been dissipated by the seemingly popular character of the preceding strophes. Some *muwashshahāt*, for their part, omit the initial, paradigmatic *maṭlaʿ* and simply start with the first *ghuṣn*; such poems are characterized as *aqrāʿ* (“bald”). There are also other differences between the strophic components of *zajals* and *muwashshahāt*: The *zajal* generally replicates, in its qufls, only half the rhymes of its beginning *maṭlaʿ*; the *muwashshahā*, on the other hand, will reproduce the entire rhyme scheme of its *maṭla* in each of its successive qufls. The typical rhyme scheme of a *zajal* will, then, exhibit the pattern: AA bbba (AA), ccca (AA), ddda (AA), and so on, while a *muwashshahā*—provided it has a *maṭlaʿ* (that is, is not *aqrāʿ*)—will embody the following pattern: [AA] bbbba (AA), cccaa (AA), dddaa (AA), and so on. The *zajal* and the *muwashshahā* may combine disparate and, from the perspective of Western readers, seemingly irreconcilable elements in one and the same poem, beginning, for example, with the poet’s own erotic complaint about a scornful or unattainable beloved, continuing with panegyric verses in praise of some important patron, and ending with an amorous lamentation, voiced (often said to be sung) by a beautiful (Christian) girl, seeking her mother’s advice concerning her unfaithful or absent lover. Yet an attentive reading can reveal the coherence of these elements and the songs sometimes achieve a very tight structure characterized by complex ring composition.

According to Ibn Bassām al-Shantarīnī (d. 1147), the *muwashshahā* was invented, at the end of the ninth or the beginning of the tenth century, by the Andalusian poet Muḥammad ibn Maḥmūd al-Qabrī, the Blind, who adopted, in his poems, “colloquial Arabic and Romance diction” (*al-lafẓa l-ʿāmīya wa-l-ʿajamīya*), while Ibn Saʿīd al-Maghribī (d. 1274), in a probably erroneous reference, names Muqaddam ibn Muʿāfā al-Qabrī in an identical role. Among the Muslim and Jewish authors of *muwashshahāt* with Romance (or partially Romance) *kharjas*, the earliest is the little-known Jewish poet, Yūsēf al-Kātib the Scribe (d. 1042), and the latest is Todrōs ben Yehūdāh Abū-l-ʿĀfia (d. 1306–?), author of three Hebrew *muwashshahāt*. Ara-

bic and Hebrew poets, who composed *muwashshahāt* with colloquial Arabic *kharjas*, flourished during the same period and, in a number of cases, the same authors, in other poems, also used Romance *kharjas*. The great author of *zajals* in colloquial Hispano-Arabic was the unrivaled Córdoba poet, Abū Bakr ʿAbd al-Malik ibn Quzmān (d. 1160), who could boast that his famous *zajals* were heard even in Iraq. The *zajal* was, of course, of ancient origin and was cultivated long before Ibn Quzmān, some of whose predecessors (Ibn Numāra; Ibn Rāshid) are known to us, though, at best, their works have been preserved only fragmentarily. After Ibn Quzmān, many other Hispano-Arabic poets cultivated the *zajal*, though relatively few texts have come down to us. An outstanding exception is the Granadan mystic, Abū-l-Ḥasan ʿAlī ibn ʿAbdallāh al-Shushtarī (d. 1269). The *zajal* (Sp. *zéjel*) can also be documented in poems composed in Hebrew, Galician-Portuguese, and Castilian. Solomon ben Yehuda, ibn Gabirol, Alfonso X, Juan Ruiz, and Alfonso Alvarez de Villanadino all used the *zajal* form. Needless to say, the *zajal*’s close relationship to a panoply of similar forms in medieval French, Provençal, and Italian poetry (*virelais*, *baladas*, and *laude*, among others) must be taken into account.

The *zajal*, the *muwashshahāt*, and the *kharja* have been the subject of intense and sometimes acrimonious debate. Without attempting to review in detail or resolve such problems here, some of the questions raised are: Which came first, the *zajal* or the *muwashshahā*? Was the earliest model for Hispano-Arabic strophic poetry a proto-*zajal* in Hispano-Romance? Was the *muwashshahā* a late, cultured elaboration of an earlier *zajal* tradition or was the *muwashshahā* the earlier form and the *zajal* merely a secondary derivative? Do *zajal* and *muwashshahāt* replicate Romance stress-syllabic metrical patterns or did they originate in some modification of classical Arabic quantitative meters? Do the *kharjas* reproduce—or at least imitate—traditional songs (or parts of traditional songs) in the Mozarabic Romance dialect or are they merely Romance verses arbitrarily invented by learned Arabic and Hebrew poets who composed the *muwashshahāt*? Recently Liu and Monroe, working with medieval Hispano-Arabic *muwashshahāt* surviving in the repertoires of a modern North African singers, have brought forward new evidence in favor of the precedence of the *zajal* and the Romance origins of Andalusian strophic poetry and its metrics. In regard to the *kharja*, numerous thematic, metrical, and formulaic parallels between the *kharjas* and Spanish *villancicos*, Galician-Portuguese *cantigas*, and Old French *refrains* suggest a genetic connection among all these genres, as manifestations of a pan-Romance oral lyric, going back to colloquial Latin

origins and ultimately linked to Greek and Near Eastern lyric traditions. In a few cases, it is even possible to identify whole-text parallels between Mozarabic *kharjas* and Castilian villancicos, as for example, in the following *kharja*, from a *muwashshaḥa* by the Jewish poet, Yōsēf ibn Ṣaddīq (d. 1149): “¿Ké faré, mamma? / Meu l-ḥabīb ešt’ad yanna” (What shall I do, mother? / My beloved is at the door). Compare the sixteenth-century villancico: “Xil González llama: / No sé, mi madre, si me le abra” (Gil González is knocking: / I don’t know, mother, if I should open for him”). Both poems represent an identical situation, both involve maiden, mother, and lover, and both exhibit the same *ā-a* assonance. In closing, it is, however, important to stress once again the wide differences of critical opinion concerning *zajals*, *muwashshaḥāt*, and *kharjas*, their origins, their relationships, and their interpretation.

N

NÁJERA, BATTLE OF

This military encounter on the border of Castile and Navarre on 13 April 1367 is the first of two important battles of the Castilian civil war of 1366–1369. The second and decisive one took place in Montiel two years later. The principal antagonists in this conflict were King Pedro I of Castile and his bastard half-brother Enrique de Trastámara.

Enrique's opposition to Pedro and his ambition to be king had become apparent less than five years after Pedro's ascent to the Castilian throne in 1350. Enrique found refuge and financial and military support for his ambitions in the French court of King Jean II and his heir Charles V.

With a force assembled in France, he marched into Castile against Pedro in 1366 at the head of an impressive army made up of many of Western Europe's most renowned mercenary captains. Given their number, Pedro chose to retreat and look for outside help, traveling first to Portugal, where he was rebuffed, and then to Bordeaux where he found a more sympathetic audience among the English occupying that region of France. In the Treaty of Libourne, signed 23 September 1366, the English, represented by Edward of Wales, the Black Prince and heir to the English throne, and the Navarrese, through whose kingdom any invading force would have to pass, agreed to help Pedro regain the crown in return for substantial financial and territorial concessions.

The Anglo-Castilian expedition arranged for at Libourne entered Castile through Navarre in early March 1367. The Black Prince chose to make his approach in the province of Álava, intending to cross the Ebro River at Miranda rather than the easier crossing at Logroño, the expected route and the scene of Enrique's and the mercenary companies' earlier road into Castile.

Enrique and his French allies were advised by all who knew the impressive military accomplishments of the Black Prince to avoid a pitched battle with him, urging him to wait until the inevitable falling out be-

tween the English and the Castilians, given the onerous terms of their alliance and Pedro's inability to pay.

In what proved to be another triumph for the Black Prince on 3 April 1367, he bypassed the area through which he was expected to meet Enrique's armies head-on, outside the town of Nájera on the main road to Burgos, and chose instead to take a detour away from the highway and surprise Enrique the next morning as the sun was rising. In the chaos that ensued, Enrique's soldiers abandoned their positions and fled in the direction of the town of Nájera. Many were killed, including four hundred knights, and a complete slaughter was prevented only because of the financial interest of the English in their prisoners. Among the concessions they had negotiated with Pedro was the right to ransom their captives, which in this case included an impressive number of notables such as the French mercenary soldier Bertrand du Guesclin, Enrique's brother Sancho, and Pedro López de Ayala, the chronicler of Pedro's reign. Enrique, however, managed to escape, first to Aragón and then to France.

The events at Nájera were a temporary success for Pedro, whose alliance with the English, as predicted, soon fell apart, leaving him at the mercy of Enrique and a second contingent of French mercenaries that eventually defeated him at the battle of Montiel in 1369.

NAPLES, KINGDOM OF

It took bands of Norman adventurers led by Robert Guiscard only three decades in the mid-eleventh century to overthrow the Lombard, Greek, and Saracen

principalities of mainland Italy and Sicily. The coronation of Roger II in Palermo (1130) united all these territories in the kingdom of Sicily, an association that lasted *de jure* and *de facto* for much of the succeeding seven centuries. An eclectic blend of Norman, Byzantine, and Saracen institutions gave the new state, with its capital in Palermo, a vitality unsurpassed in Europe. Papal overlordship sat lightly on its monarchs. It survived the failure of the male line to emerge seemingly more splendid still in the reign of Frederick II of Hohenstaufen. Under his dynamic autocracy the center shifted to the mainland provinces that, through regular parliaments and a uniform administrative system, developed a certain political unity centered upon Naples. In 1224 that city became the seat of a university founded by Frederick to train servants of the state.

Norman, and still more Hohenstaufen, ambitions inevitably clashed with papal pretensions within the kingdom and in Italy at large until the whole peninsula aligned itself in the factions of papal Guelf and imperial Ghibelline. In 1266 their enmity brought Charles of Anjou into Italy as Guelf champion with a French army that overthrew first Frederick's son Manfred, then his grandson Conradin (1268).

Charles made Naples his capital, settled large numbers of French followers and, contrary to expectation, did not lessen the pressures of government and taxation, all of which proved too much for his Sicilian subjects. They rose in revolt (Sicilian Vespers 1282) aided by Pedro III of Aragón, with the result that for the next 150 years an Aragónese dynasty in Sicily confronted an Angevin rival on the mainland with dire consequences for the social and economic health of both regions. During that schism the mainland state became known conventionally as the kingdom of Naples.

Until the death of King Roberto (1343), Naples remained an important cultural center; thereafter it sank to insignificance while the remainder of the kingdom fell prey to feudal mismanagement. Only a brief military revival under King Ladislao (r. 1386–1414) illuminated the subsequent fortunes of the Neapolitan Angevins. They were finally extinguished under the childless Giovanna II, whose reign witnessed a long struggle for the succession between French Angevins and Alfonso V, king of Aragón and Sicily. Alfonso, having emerged victorious in 1442, consolidated his conquest by establishing his seat of government in Naples and making his illegitimate son Ferruccio heir to its throne. His death in 1458 thus brought another division as Sicily passed with Aragón to his brother Juan.

Alfonso and Ferruccio succeeded, despite baronial opposition, in restoring the fabric of royal authority, reviving cultural life, and stimulating economic

activity. Ferruccio's death, however, saw French endeavors to reverse the verdict of 1442 come to fruition with Charles VIII's invasion (1494) followed by that of Louis XII (1500). Only the intervention of Ferruccio the Catholic, heir in the legitimate Aragónese line, sufficed to defeat the French. In the aftermath of his triumph the kingdom settled down to two centuries of existence as a Spanish vice-royalty where, in return for large subsidies in men and money toward imperial ambitions, the rulers of Spain allowed the landowning nobility virtually unfettered sway over economy and society to the detriment of both.

NAṢRID DYNASTY

The Naṣrid dynasty reigned from 1231–1492 and arose as a consequence of the decline of Almohad power in Al-Andalus after 1228. By 1238 the dynasty had expanded its influence and come to rule the only Muslim state to survive the twelfth-century Christian territorial expansion into the south of the Iberian Peninsula. The House of Naṣr traces its origins not to Granada but to Arjona, a small town in the present-day province of Jaén. It was there that Muḥammad Ibn Yūsuf Ibn Aḥmad Ibn Naṣr Ibn al-Aḥmar first came to prominence and laid the groundwork for a kingdom his descendants would govern for over two hundred years that stretched along the Mediterranean coast from Tarifa in the west to Almería in the east, and from the Mediterranean coast north to the city of Granada at the foot of the Sierra Nevada.

Muḥammad Ibn al-Aḥmar, later Muḥammad I of Granada, belonged to the Banū Naṣr or Banū al-Aḥmar clan, associated with the Banū Asquīlūla, or Banū Escayola clan of Málaga, with family connections in Arjona. Taking advantage of the political turmoil after the breakdown of the Almohad hold on Al-Andalus, and his own reputation as an austere proponent of Islam, by 1234 he had risen to distinction in the region and extended his dealings on into Córdoba, whose leader Ibn Hūd he promptly betrayed in order to assist Ferruccio III of Castile in the conquest of that city in 1236. In exchange, it is believed that Ibn al-Aḥmar was permitted to take the city of Granada two years later, and establish himself there as its king. From the outset, Ibn al-Aḥmar was thus obliged to recognize Christian sovereignty in the south and cooperate with the Castilians by becoming their tributary, often turning a blind eye in the name of expediency and survival.

From its start, the Naṣrid hold on Granada was precarious, wedged as it was between the Christians to the north and the North Africans to the south, both of whom laid covetous eyes on the territory ruled by the dynasty. As a result, the Naṣrids throughout their history would rely on diplomacy, cunning, and duplicity to ensure their continued survival.

Ibn al-Aḥmar died in 1273 and was succeeded by his son Muḥammad II (1273–1302), a learned jurist (*faqīh*), who sought to free the kingdom from pressure

exerted upon it by the successors of Fernando III, Alfonso X, and Sancho IV of Castile, by entering into an alliance with Merīnids in North Africa, a move that only worsened relations with the Christians and produced greater repression. By the time of his death in 1302, Granada enjoyed an uneasy peace with Aragón and their Merīnid protectors in Africa. His successor, Muḥammad III (1302–1308), known as the Deposed (*Majilū*), was a poet and builder responsible for the Great Mosque of the Alhambra. When he turned over

power to his vizier, who attempted to forge a peace with the Castilians, internal and regional dissension proved too much. Supported by prominent members of the Naṣrid clan, Muḥammad's brother Naṣr arranged for the assassination of the vizier and forced Muḥammad to abdicate. Naṣr (1308–1313) was an astronomer and mathematician who was unable to quell dissatisfaction at home. When the Castilians moved to take Gibraltar and Algeciras in 1310, Naṣr was forced to face the situation and counter the immediate threat on his kingdom by paying tribute to Fernando IV, circumstances that aggravated the internal political balance of the clan. Naṣr was himself deposed by his nephew, Ismā'il (1313–1325). Over the course of the ensuing century and a half, clan rivalries and quarrels would prove the decisive factor in determining the fate and decline of the Naṣrid dynasty.

Ismā'il was succeeded by his nine-year-old son, Muḥammad IV (1325–1333), who became a virtual captive of his tutor, Ibn Aḥmad al-Mahrūq. During Muḥammad IV's reign the Granadans took back Gibraltar and other Christian strongholds and were successful in holding the North Africans at bay. Muḥammad died at the hands of a Christian assassin in 1333. His brother, Muḥammad Yūsuf I (1333–1354), a reserved and timid individual, was placed on the throne by Ridwān, a powerful minister of the realm. Muḥammad Yūsuf's timidity was exploited by the North Africans, who sent an army to Algeciras and Gibraltar with the intent of taking the entire Iberian Peninsula for themselves. They were met by the combined forces of Castile, Portugal, and Aragón, which in 1340 at the Salado River inflicted a defeat upon the Islamic cause in Iberia second only to Las Navas de Tolosa in 1212. The Kingdom of Granada, alone and virtually unprotected, for the rest of its history would become a client state of the Christians, obliged continually to transact and bargain with them until the end of its days at their hands in 1492.

Yūsuf's successors, Muḥammad V (1354–1359), Muḥammad Ibn Ismā'il (1360–1362), Muḥammad VI (1362–1391), Yūsuf II (1391–1392), Muḥammad VII (1392–1407), Yūsuf III (1407–1417), Muḥammad VIII (1417–1428, restored to the throne 1430–1432, and again in 1433–1444), Muḥammad IX (1427–1429), and Yūsuf IV (1432), were all deeply affected by clan rivalries, internal civic turmoil, and civil unrest that often led to war and tore at the economic, social, and political stability of the kingdom. By the mid-fifteenth century, whatever little protection the Merīnids of North Africa could offer had disappeared, forcing the Granadans to turn to Egypt and the Ottoman Empire for moral and diplomatic support.

However, by the final fall of Gibraltar into Christian hands in 1462, the Kingdom of Granada found itself completely isolated and could now only depend on its wealth, stealth, legerdemain, and diplomatic acumen to guarantee its continued survival.

Throughout their reigns, Sa'd Ibn 'Alī (1445–1446) and his son 'Alī (1462–1482) were alternatively obliged to confront Christian suits for peace followed by demands for tribute, as well as incessant Christian incursions into Granadan territory all along the frontier. Although the Christians were divided in terms of a grand strategy against Granada, the Naṣrids continued to quarrel among themselves and failed to marshal sufficient force to counter their continuous harassment. In 1481 'Alī did manage to take back some strongholds along the western frontier and sought to forge a separate peace with Castile. His appeal, however, was met by a series of impossible stipulations imposed on him by Fernando V of Aragón. At the same time, a quarrel between 'Alī's wife and his Christian concubine for the rights of succession of their respective sons broke out, and this, combined with heightened social unrest in the kingdom, led to a revolt that brought Abū 'Abdallāh Muḥammad, his wife's son, known as Boabdil, to the throne. 'Alī fled to Málaga seeking the protection of his brother who governed there until Abū 'Abdallāh Muḥammad (Boabdil) was taken prisoner by the Christians during an expedition against them. 'Alī returned to Granada and, when taken ill with epilepsy, handed power over to his brother Abu 'Abd Allāh (known as Al-Zaghal), who had provided sanctuary for him in Málaga. Boabdil's freedom was obtained by his uncle, with whom he had good relations, in exchange for 400 Christian captives, 12,000 pieces of gold, and the recognition of Fernando of Aragón's sovereignty over the kingdom when Boabdil returned to the throne. Upon his return to Granada in 1487 to reoccupy the throne, Boabdil sent Al-Zaghal to govern the southern part of the kingdom. His actions were to no avail: Málaga fell to the Christians. In the process of his imprisonment and restoration, Boabdil had cooperated with Fernando of Aragón in handing over a number of key strongholds in the kingdom and had been turned into the Christian king's pawn. Despite Granada's attempt to steel itself against the territorial ambitions of Fernando and Isabel, after 1487 the damage was beyond repair. By 1492 Granada and the Naṣrids would fall permanently into the hands of the Christians and the last Muslim stronghold in Europe would cease to exist, bringing to a close a chapter of Iberian history that had lasted over seven centuries.

NAVARRÉ, KINGDOM OF

Today, Navarre is only a province located in the north of Spain, as well as Lower Navarre which, to the north of the Pyrenees, is one of the Basque provinces of southern France. During the medieval epoch, these two territories made up a kingdom that was largely spread out around the eleventh century; it then became less extensive, from the Adour to the Ebro rivers, and was hemmed in by the regions of Castile, Aragón, Béarn, and Aquitaine during the thirteenth to fifteenth centuries.

Like the whole of Spain and Aquitaine, the future Navarre was part and parcel of the Holy Roman Empire (Pamplona, its capital, was founded by Pompey) when in the fifth century the Visigothic barbarians crossed the Pyrenees and annexed it, in 476, to their independent kingdom. Navarre was then converted to Christianity, and the bishops of Pamplona took part in the seventh-century councils of Toledo. But this Visigothic kingdom collapsed at the time of the 711 Arab conquest; a governor came under the emirate of Córdoba and sat in Pamplona; Tudela was founded by the Muslim monarchs around 800. Charlemagne crossed the Pyrenees in 778, thinking he could take Zaragoza from the emirs; at the same time he succeeded in settling in the future province of Catalonia, to the east. But his troops sacked Pamplona on their way there; the inhabitants, the native Basco-Navarese, took revenge on his rear guard when he came back, in a high valley of the mountains, at a place called Roncevaux from the twelfth century on, when the *Chanson de Roland* transformed history for the geste, an era when the whole West used this pass to reach Santiago de Compostela.

In 830, the natives chose one of their leaders, Iñigo Arista, as king. Thus the kingdom of Navarre was born, claimed first by the Carolingians of Aquitaine, which was independent. Continually threatened by Muslim forays, Navarre was only a very small state but one that lasted with its dynasty, the Sánchez, who in the tenth century took the place of their relatives the Iñiguez.

Navarre succeeded in largely expanding its territory under King Sancho the Great (1005–1035), who

ruled the northern peninsula from Castile to the Val of Aran. A close relative of the princes of Gascony, he received the Lower Navarre from Saint-Jean-Pied-de-Port to the Adour River. This king is mostly known as one of the “God’s peace” monarchs, a protector of monasteries and organizer of councils in Leyre, one of those who started the pilgrimages to Santiago by using the Navarrese roads, rapidly giving it its originality and culture. But when Sancho died in 1035, his sons divided his states among themselves, giving rise to the kingdoms of Castile and Aragón on either side of Navarre. Navarre was several times included in the Aragónese sovereignty, and only recovered its permanent independence in 1134. The Navarro-Aragónese then reconquered the Ebro River valley (Tudela in 1119, after reconquering Zaragoza in 1118), Castile and Aragón becoming large states, thanks to the Reconquest; however, Navarre was very much reduced and, in 1200, lost the Basque provinces to Castile. The kingdom of Navarre no longer had a maritime outlet and had to negotiate with Castile for the use of Fuenterrabía, and with Aquitaine for the use of Bayonne.

In 1234, Sancho VII the Strong died without leaving any legitimate heir. (In 1212, he was one of the heroes of the victory of Las Navas de Tolosa, fought between a united Christian army and the last Almohads.) His successor was his sister’s son, the Comte Thibaut IV de Champagne. Henceforth, until the fifteenth century, the kings of Navarre came from French dynasties (successively by inheritances and marriage), counts of Champagne (Thibaut I, Thibaut II, Henri the Fair, from 1234 to 1274); kings of France (Philippe the Fair, through his wife Jeanne de Champagne-Navarre, Louis the Hutin, Philippe the Long, Charles the Fair, from 1274 to 1328); and the counts of Evreux (Philippe d’Evreux through, his wife Jeanne de France-Navarre, Charles II, and Charles III, from 1328 to 1425). It was not until the fourteenth and fifteenth centuries that the kings of Navarre—counts of Evreux—actually resided in Pamplona, Tudela, Olite, or Estella, their predecessors having only made brief appearances or none at all in their kingdom, which was administered by a governor. It was a long time, as with French politics, before the kingdom regained an initial independence, with the Evreux dynasty. Charles II, the Bad (r. 1349–1387), is particularly famous for his activities hostile to the Valois kings and for his concern to make people speak of Navarre and himself in all the events that occurred in the Iberian Peninsula as well as in France. His son Charles III the Noble had similar international influence. The princes and princesses of this family married into all the reigning houses of the neighboring kingdoms, and a Navarrese alliance was much sought after

during the Hundred Years' War by the English as well as by the French.

Charles III had no heir to succeed him when he died in 1425. His daughter Blanche as heiress brought the rights to Navarre to her husband Juan of Aragón (Juan II in 1458) and to their son Carlos, prince of Viana. But from 1450 to 1460, a civil war broke out in Navarre, a struggle between the nobles and supporters of the prince of Viana and the king of Aragón (who did not want to leave Navarre to his son). The prince's sister, Eleonor, married Gaston IV of Foix-Béarn. Henceforth their heirs bore the titles of King of Navarre, Count of Foix, and Viscount of Béarn. At the end of the fifteenth century, the young queen Catherine (heiress of her brother King François-Fébus) was Jean d'Albret's wife. But then, in 1512, the Castilian troops conquered the Iberian part of Navarre, leaving just Lower Navarre, but still the title king of Navarre, to the sovereigns in the north, and to their descendants: Henri d'Albret-Navarre-Foix-Béarn, his daughter Jeanne, and lastly Henri, the son of Jeanne and Antoine de Bourbon, who in 1589 became King Henri IV of France and of Navarre.

In spite of its size, the small kingdom of Navarre during the thirteenth to the fifteenth centuries had a wide range of landscapes and economic possibilities, from the hills of Lower Navarre to the agropastoral life of the mid-altitude Pyrenees in the mountains, the broad cereal plateaus and the viticulture of the Ribera, and even the *huerta* (farmland) and irrigation of the Ebro River valley around Tudela, where the right to use water was very expensive and could be bequeathed. The Basco-Navarrese were first of all mountain peasants; the Navarrese from the Ebro viticulturists and olive-oil merchants. The country had enough wheat, wine, and meat, but had to buy fish and salt in Bayonne: such trade was a source of wealth for the merchants of Bayonne, who also counted on the king of Navarre's right to pass through their port to reach his Norman possessions. Navarre, which held the Roncevaux Pass, one of the Somport passes, and controlled a part of the Ebro, relied even more on trade. The merchants from all Western countries who wanted to go from the French regions to the Spanish lands had to go through Navarre. Moreover, the presence of a royal court in Pamplona, Olite, Tudela, or Estella; an aristocracy; and a bishop and canons in Pamplona represented a continual demand for much sought-after products. The Cruzats and Itoizs from Pamplona, Pons from Estella, and Caritats from Tudela were great bourgeois families that traded horses, spices, and cloth for upper-class Navarrese customers or for the numerous buyers from the border countries. Jews from the

main towns took part in this trade and handled the capital for all the customers (as did the bourgeois).

The Navarrese nobility (the *hidalgo*) was made up of about a dozen big families: the Gramonts, Luxes, and Echaux (viscounts of Baigorri) in the north, and the Montaguts, Aibars, Medranos, and Leets in Iberian Navarre. The knights played a major part as well, but a great proportion of *infanzones* (the lowest order of the nobility) laid claim to hidalgo status, without having the important means of socially asserting themselves and dissociating themselves from the peasantry. However, hidalgo status amounted to a fiscal exemption, and the king, with a charter, could grant it to any deserving individual.

At the time of the armed expeditions of the fourteenth and fifteenth centuries, the sovereigns granted *hidalguía* and a small income (the *mesnada*) to numerous subjects, who were then forced to serve as an army (cavalry and infantry). Next to this nobility that had representatives in the *cortes* (the assemblies that granted the monies asked for by the sovereigns and that also played a political role) were the prelates of Navarre. Of these, the bishop of Pamplona and the prior of Roncevaux were key; beside them, the abbots of the Benedictine and Cistercian monasteries were much revered. At the end of the Middle Ages, the townspeople gave all their devotions to the mendicant orders. Among these towns people (as a third "arm" of the *cortes*), an aristocracy made up of tradesmen and head craftsmen was formed by the "Francos," who had come with the pilgrimages to Santiago and with the Reconquest. These were often originally French, but also Navarrese and "free bourgeois," keeping the urban councils as much as the origins of their fortunes. A *fuero general* (book of laws and customs) detailed in writing the rights and duties of everybody in the twelfth to thirteenth centuries.

The socioethnic non-native communities were much represented in Navarre. Tudela and the surrounding villages had Moors, witnesses of the Andalusian era, until the sixteenth century, when they were expelled. The Muslims from Navarre, in the thirteenth to fifteenth centuries, were both farmers and craftsmen, specializing in building work and ironwork. A particular *fuero* protects their rights, which they bought with a special yearly contribution: the *pecha* (different from the kingdom's commoners' *pecha* and that of the Jews). The Alpelmi family from Tudela was the most important. Many these Muslims took part in the armed expeditions of Charles II, even in Normandy. The Jews were equally protected by a *fuero*, for a *pecha*. Free in their choice of religious and intellectual life, they had access to landed property, and could also farm that land, and could live by lending money as much as on

trade. Some of them were purveyors by appointment to the court, which also entrusted them with embassies and offices in the kingdom's fiscal administration. The Ben Abbas, Menirs, Ben Shuaibs, Falaqueras, and Benvenistes are among the most important of those Jewish families, mostly present in Tudela (where there were three synagogues and two mosques), and in all the Navarrese towns.

Such was this kingdom that had its court officers, provinces, treasury, justice, assembly representatives, state life, and urban and social life. It was located in a remarkably strategic position and represented a tempting prey. The fifteenth-century civil wars weakened it, but it lived on until 1512, when it was no longer able to defeat Fernando the Catholic's armies.

NAVAS DE TOLOSA, BATTLE OF LAS

The battle of Las Navas de Tolosa (16 July 1212), a victory for the combined Christian armies led by Alfonso VIII of Castile, was the last great battle fought by the Almohads in Spain.

After his defeat at Alarcos in 1195, Alfonso VIII had made a truce with Abū Yūsuf Yā'qūb al-Manṣūr. But beginning in 1209, Innocent III and the prelates of Spain encouraged the Christian kings of the Iberian Peninsula to continue the Reconquest. Yā'qūb al-Manṣūr had died in 1199, and the Almohad empire was waning under his son, Muḥammad al-Nāṣir. Alfonso VIII contravened the truce with the Almohads, raiding the provinces of Jaen and Murcia in 1209 and settling the town of Moya in 1210. Pedro II of Aragón also raided in Muslim territory, capturing Adamuz, Castellfabib, and Sertella in the kingdom of Valencia.

In response to these raids, Muḥammad al-Nāṣir landed in the peninsula in 1211 and headed toward the city of Toledo. He besieged and captured the castle of Salvatierra. Alfonso VIII's heir, Fernando, died during the siege. The siege delayed Al-Nāṣir, who decided to return to Córdoba and resume the campaign against Toledo the following spring.

Alfonso VIII, who had been criticized for not waiting for his allies at Alarcos, organized the Christian defense during the winter of 1211–1212. Innocent III proclaimed a crusade, which attracted troops from Aragón, Navarre, León, and north of the Pyrenees. Pedro II of Aragón and Sancho VII of Navarre also joined the campaign. In June 1212, the Christian forces recaptured Calatrava, but most of the French knights left soon after. The Christian army then retook Alarcos, Piedrabuena, Benavente, and Caracuel, arriving at Las Navas de Tolosa on 13 July.

The Muslims, led by the caliph, encamped on the eastern wing of the Sierra Morena. The Christians attacked the morning of 16 July. Al-Nāṣir was unable to hold his troops, and his Andalusian contingent fled, possibly because Al-Nāṣir had executed their general for losing Calatrava. The Christians penetrated the Almohad forces and reached the caliph's tent. Al-Nāṣir escaped, but the Christians captured enormous amounts of booty, which was distributed throughout Christian Spain. Alfonso VIII sent a report of the battle to Innocent; his oldest daughter, Berenguela, wrote an account to her sister, Blanche of Castile.

Both Al-Nāṣir and Alfonso VIII died shortly after the battle. But the battle of Las Navas de Tolosa altered the balance of power in the peninsula. The kingdoms of Castile-León and Aragón were able to capture the great cities of al-Andalus, leaving only Granada under Muslim rule by 1252.

NAVY AND SEA POWER, PORTUGAL

The growth of naval and sea power in the kingdom of Portugal has a long history. The first important occasion when naval power was utilized by the king of Portugal to achieve a military objective was in 1147 when Alfonso I contracted with a crusading fleet from England, France, Flanders, and Germany on the way to the Holy Land to assist him in the siege of Lisbon. By blockading the city by sea and by land, the king was able to force its surrender. One of the ships served the king and was commanded by a *rector de galatea regis*. In 1189 Sancho I similarly benefited from the naval power provided by another northern crusading fleet when he besieged and captured Silves in the Alg-

arve. Apparently Portuguese ships (thirty-seven *gales e naves de alto bordo*, and *setias*) also participated. Again in 1217 a northern crusading fleet aided Alfonso II in the capture of Alcácer do Sal. These were ad hoc usages of foreign naval power.

The kings of Portugal evidently recognized the importance of maritime enterprise and granted privileges to mariners in royal service. In 1179 Alfonso I granted the juridical status of knights to the men serving on his ships, including an *alcaide* or ship commander, two *espadeleiros* or helmsmen, two *proeiros*, and a *petintal*; the meaning of the last two words is uncertain. Letters of Sancho I in 1204 and 1210 mention Fernandus Martini, *pretor navigatorum* or *pretor navigii*, a ship commander acting in the king's name. During the reign of Sancho II the *palacium navigatorum regis* in the parish of Santa Maria Magdalena was cited in 1237; evidently this was the royal shipyard, where ships were built, and also where naval provisions and equipment were stored. According to custom the Jewish community had to supply an anchor and a cable for each new royal ship.

In the late thirteenth century King Dinis extended the rights and privileges of his mariners. The ninety-six *marineiros do conto* or seamen recruited for royal service from maritime towns, and the caulkers (*calafates*) and carpenters of the Ribera de Vila Franca de Xira were granted the status of knights. He confirmed the *foros* and customs of the *alcaides*, *arraizes*, and *pitintaes das galees*, that is, the commanders and crews of royal ships, exempting them from tributes; in 1298 he conferred the rank of *infanção*, a step above an ordinary knight, on the *alcaides das galés* or ship commanders in 1298.

Most important for the future development of the Portuguese navy, Dinis contracted with the Genoese Emmanuele Pessagno (Manoel Pessanha) in 1317 to build up the royal fleet by recruiting twenty Genoese sea captains, whom he would maintain at his own expense whenever they were not serving the king; Pessagno would receive three thousand *libras* annually in recompense. The king also appointed him as *almirante mor* with the right to transmit that title to his heirs. With an eye to providing material for shipbuilding, the king undertook to plant a pine forest in the region of Leiria.

The most common types of ships were the *galé*, *galera*, or galley manned by a crew of oarsmen and utilizing a single sail. Much heavier were *naus*, which could carry many men-at-arms and could wreck a smaller ship simply by ramming it. The *barcha*, *barinel*, and *setia* were ships of about twenty-five to thirty tons, but swift and maneuverable. The *caravela*, which played such an important role in Portuguese overseas expansion, came into use after 1441.

In the fourteenth century both Pedro I and Fernando affirmed the privileges of mariners in royal service and continued to encourage shipbuilding. During his wars with Castile, Fernando had need of fleets and assembled a fleet of thirty-two *galés* and thirty *naus* for an attack on Seville in 1369. He also sent ships to assist England against France in 1374. More than likely, the office of *capitão mor da frota* with authority much like that of an admiral dates from Fernando's reign. In 1377 and again in 1380, he granted additional benefits to shipbuilders, caulkers, and carpenters, exempting them from tolls and other duties. New shipyards (*taraçanas*) were erected near the Ribera Velha. From about this time bread and biscuit for the mariners was baked in ovens on the right bank of the Coia River. Nearby was the arsenal of Telha where arms were kept. The placement of artillery on ships in the fifteenth century demanded much larger crews capable of using these weapons. Many mariners called *vintaneiros* were recruited from maritime towns and were obliged to provide one oarsman from every twenty men (*vintenas do mar*). Captive Moors and criminals were also often set to man the oars.

The most rapid development of Portuguese naval power came in the fifteenth century when João I, prompted by his sons, undertook the capture of Ceuta on the Moroccan coast in 1415. As is well known, the king's son Henrique, better known as Henry the Navigator, sponsored numerous expeditions to explore and colonize the west coast of Africa and the islands of Madeira, the Azores, and the Canaries. Nevertheless, Henry's activities were not necessarily identical with those of the crown. Afonso V was also active in naval affairs, building warships, manufacturing arms, ammunition, and artillery for his attempts to conquer Alcácer Seguir, Arzila, and Tangier.

In general one can say that from the thirteenth century onward Portuguese maritime trade increased steadily along the Atlantic coast, the Bay of Biscay, and the English Channel. The number of merchant ships and seamen obviously grew to meet this challenge, and it is likely that the king, when in need of ships and men for naval warfare was able to draw on the merchant marine. The need to maintain a royal fleet on a permanent footing was not of the greatest importance except during the wars with Castile in the late fourteenth century, and then in the exploratory activities of the late fifteenth century.

NAVY AND SEA POWER, SPAIN

The development of naval and sea power in the Iberian Peninsula proceeded by fits and starts as needs required. For example, in the seventh century the Visigothic kings organized fleets to expel the Byzantines and to protect the coast against initial Muslim assaults. In like manner 'Abd al-Rahmān I (756–788) erected shipyards in Seville, Cartagena, and Tortosa to build ships to protect his realm from attacks by the caliphs of Baghdad. 'Abd al-Rahmān III (912–961) constructed new shipyards and sent his ships to guard the coast against pirates.

The first important evidence of the use of fleets in Christian Spain dates from the early twelfth century. The Christian rulers were dependent on the Italian maritime republics of Genoa and Pisa for both mercantile and naval shipping. The Catalan assault on Mallorca in 1114, for example, was carried out with the essential collaboration of a Pisan fleet and the Genoese provided the ships that made possible the capture of Almería in 1147 and Tortosa in 1148. On the Atlantic coast Archbishop Diego Gelmírez of Santiago de Compostela assembled a fleet in 1112 to repel pirate attacks; he also built a shipyard at Padrón and hired a Genoese to supervise construction of two galleys. Similarly crusading fleets from northern Europe enabled the kings of Portugal to capture Lisbon in 1147, Silves in 1189, and Alcácer do Sal in 1217.

Not until the thirteenth century did the Christian rulers develop a naval arm of their own as the port towns of Cantabria along the Bay of Biscay and of Catalonia on the Mediterranean shore began to engage in regular maritime trade. The Cantabrian towns organ-

ized an *hermandad de las marismas* to protect their maritime interests. For the first time Christian rulers were able to call on their own people to provide ships for naval operations. Thus when Jaime I of Aragón decided to attack Mallorca in 1227 he was able to utilize Catalan ships. That prompted him to build shipyards at Barcelona, which were reconstructed in the late fourteenth century. His contemporary Fernando III of Castile in 1248 entrusted Ramón Bonifaz with the task of securing Cantabrian ships to assist in the siege of Seville.

The beginning of a Castilian royal navy dates from the reign of Alfonso X, who constructed shipyards in Seville, Castrourdiales, and Santander, and hired twenty-one *comitrés* from Cantabria, Catalonia, France, and Italy, each to captain and maintain a galley with a crew of one hundred. He also appointed Ruy López de Mendoza as the first *almirante de la mar* or admiral of the fleet. The position of admiral became hereditary in the Enríquez family, illegitimate descendants of Alfonso XI, who often had little or no naval experience. The admirals' functions in the later medieval centuries tended to be judicial and financial, that is, they adjudicated maritime litigation and were entitled to certain levies on trade.

In the *Siete Partidas* Alfonso X devoted an entire section to the theme of naval warfare, the responsibilities of the admiral, the ship captains (*comitrés*), navigators or pilots (*naucheros*), ordinary seamen, and the marines or armed men. These included *proeres*, stationed in the prow of the ship ready to be the first to go into battle; the *alieres*, who followed next; the *sobresalientes*, whose task was to defend the ship; and archers (*ballesteros*). The *Partidas* also spoke of the need to supply each ship with weapons, armor, biscuit, salt meat, vegetables, cheese, vinegar, and fresh water.

The principal type of warship was the *galea*, *galera*, or galley, a long ship propelled by oars but carrying an auxiliary sail. Others included the *nao* or *nave*, a large round ship carrying lateen or triangular sails on one or two masts; the *saetía*, a small, swift vessel, and the *ballener*, used to transport troops. In the fifteenth century the *coca* and *carraca*, adaptations of the heavy square-rigged northern cog came into use. The *carabela* or caravel, a small light ship with two or three masts utilizing lateen sails was especially favored during the era of exploration and colonization.

Pedro IV of Aragón also drew up the *Ordinacions Sobre lo Feyt de la Mar*, a code concerning naval armaments and discipline. He gave his admiral charge over the royal shipyards and authority to hear and punish crimes committed both at sea and in the ports. All ships were required to have a seneschal in charge of supplies, a *comiral* or boatswain to direct the sailors, a pilot,

Thirteenth century CE battleships. Alfonso X, the Wise, *Cantigas de Santa Maria* Spain, 13th c. Copyright © Giraudon/Art Resource, NY. Biblioteca Real, El Escorial, Madrid, Spain.

and a *comitré* or captain, and a requisite number of seamen who were often recruited in public places. The office of admiral became hereditary in the Catalan family of Cardona.

In the late thirteenth and early fourteenth centuries Castilian fleets were exceedingly busy defending the peninsula from invasion by Moroccan forces. With that end in view the kings besieged by land and sea the ports of Tarifa (taken in 1292), Algeciras (taken in 1344), and Gibraltar (taken in 1309, lost in 1333). In the struggle for control of the straits, Castile continued to utilize the services of Genoese mariners such as Benedetto Zaccaria. In the latter half of the fourteenth century Enrique II supplied France with Castilian ships commanded by the Genoese Ambrosio Bocanegra for service against England. These ships raided the English coast and even sailed up the Thames River. Enrique III also maintained a fleet to pursue pirates. Meantime Catalan fleets had facilitated the conquest not only of the Balearic Islands, but also of Sicily (1282) and Sardinia (1323–1325). Throughout the fourteenth century the kings of Aragón were involved in war with Genoa for control of Sardinia and mastery in the western Mediterranean. In the fifteenth century the Aragónese royal navy declined significantly in the time of Alfonso V and Juan II, while their contemporaries Juan II and Enrique IV of Castile similarly neglected the Castilian navy. Fernando and Isabel revived the royal fleet for use against Portugal during the war of succession and then for the reconquest of Granada.

The maintenance of a permanent fleet by the crown was financially difficult and for the most part the navy was neglected until there was a crisis. Then the monarchy was often dependent on leasing private ships for naval use.

NEBRIJA, ELIO ANTONIO DE

(c. 1441–1522), Spain's leading pre-Renaissance humanist was born Antonio Martínez de Cala e Hinojosa in the Andalusian town of Lebrija. Opinion is divided concerning the year of his birth. In the prologue to his undated Latin-Spanish dictionary he gives his age as fifty-one and states that he was born in the year prior to the battle of Olmedo (1444). However, other obser-

vations in the same prologue concerning the age at which he went to Italy, the length of his stay there and of his subsequent service to Alonso de Fonseca, archbishop of Seville, have led some specialists to place Nebrija's date of birth in 1441.

At the age of nineteen Nebrija left for Italy to study in the Spanish College of San Clemente in the University of Bologna, where he was exposed to the writings of Lorenzo Valla and to his critiques of the medieval system of teaching Latin grammar. Nebrija was appalled at the state of Latin instruction in the University of Salamanca, by the teaching manuals employed (typified by the highly popular verse *Doctrinale* of Alexander de Villadei), which stressed rote memorization of paradigms, and by the lack of attention paid to classical authors. Nebrija returned to Spain determined to introduce the reforms advocated by Valla. In 1476 he took possession of the chair of Latin grammar at Salamanca, where he remained until 1487, when he entered the service of his former student Juan de Zúñiga, master of the Order of Alcántara and future cardinal archbishop of Seville. The years spent with Zúñiga were among Nebrija's most productive. At the beginning of the sixteenth century, Nebrija joined the group headed by Cardinal Cisneros, that was preparing the edition of the *Biblia Poliglota* at the newly created University of Alcalá. Nebrija's insistence on applying strict philological criteria to the text of the Latin Bible brought him into conflict with the group's theologians. After Cisneros lent them his support, Nebrija chose to withdraw from the project and returned to the University of Salamanca where he held various chairs. In 1513 Nebrija failed in his bid to win the chair of *prima de gramática*. Embittered, he left Salamanca. In 1514 Cisneros granted the ageing Nebrija the chair of rhetoric at Alcalá de Henares, which he occupied until his death on 2 July 1522.

Nebrija can be described as Spain's first linguist, perhaps best known today for his studies of Latin, Greek, Hebrew, and the Castilian vernacular. Despite his pioneering work on Castilian, Latin seems to have been Nebrija's primary concern as a linguist. His first major book was *Introductiones Latinae* (1481), a direct result of Nebrija's concern with the quality of Latin teaching at Salamanca and his belief that *grammatica*, the acquisition of Latin, was the key to all other scholarly disciplines. *Introductiones* was designed as a clear and systematic pedagogical manual for university students, with which Nebrija sought to reintroduce into Spain classical models and the premedieval grammatical theory of Donatus and Priscian. This work was an instant success. It was revised and reedited several times during Nebrija's life and frequently reprinted (often under different titles) throughout the sixteenth

century in Spain and elsewhere. At the insistence of Queen Isabel, Nebrija published around 1488 (apparently reluctantly) a bilingual Latin and Spanish version of this manual. *Introductiones* became the basic manual for university teaching of Latin in Spain and was one of the books most often exported to the New World during the colonial period. Throughout his career Nebrija published a series of *Repetitiones*, formal university lectures dealing with the pronunciation of Latin, Greek, and Hebrew.

Within the intellectual framework of late-fifteenth-century Spain, Nebrija's Latin-Spanish (1492) and Spanish-Latin dictionaries (c. 1495) as well as his *Gramática de la lengua castellana* (1492) represent major innovations. In all likelihood the two dictionaries were designed to provide access to Latin rather than to constitute repositories of contemporary Spanish. They may well represent the fruits of an announced larger "*obra de vocablos*," which was to include lexicons of civil law, medicine, and the Scriptures (his *Ius Civilis Lexicon* of 1506 and his *Lexicon illarum vocum quae ad medicamentariam artem pertinent* appended to a 1518 edition of a Latin translation of Dioscorides). The Spanish-Latin dictionary was the first systematic and comprehensive work in which Spanish was the source language. Both dictionaries, in many respects quite modern in their lexicographic principles, were revised by Nebrija and underwent several editions. The Latin materials served other early sixteenth-century lexicographers in the preparation of bilingual dictionaries involving Catalan, French, and Sicilian.

According to its prologue, Nebrija published his *Gramática de la lengua castellana* to fix and stabilize the Spanish language in order to prevent its further decay, to facilitate the acquisition of Latin grammar, and to provide a means of learning Spanish for those peoples over whom Spain would one day rule. Within a framework of Latin grammatical theory, Nebrija examines the linguistic facts of Spanish, with emphasis on form rather than on function. The *Gramática* treats orthography and pronunciation, prosody, etymology (that is, morphology), the syntax of the ten parts of speech, and closes with an overview of Spanish for the second-language learner. Motivated by the belief that standardized spelling would contribute to language stability, Nebrija published a second spelling treatise in 1517 under the title *Reglas de orthographia en la lengua castellana*, essentially a resume of book 1 of the *Gramática castellana*. Nebrija's *Gramática* was not reprinted until the eighteenth century and did not seem to have much impact on the work of other sixteenth- and seventeenth-century Spanish grammarians, many of whom may not even have known this work.

In addition to his activities in the realm of language studies, Nebrija composed Latin verse and prepared in that language commentaries on Scripture, rhetorical treatises, works of historiography, geography, and cosmography, as well as editions of and commentaries on the writings of other humanists. Unfortunately, hardly any of these works is available in a modern edition (for titles, see Odriozola).

NEOTRADITIONALISM

Two opposing theories have dominated discussions about the origins of the medieval epic. The individualists claim that every epic is the product of a single poet who composed his work in writing based on learned sources. The traditionalists consider the medieval epic to be the product of a long oral tradition, the earliest written forms of which were chance survivals. *Neotraditionalism* is the term adopted by Ramón Menéndez Pidal to distinguish his views concerning the origin of the Romance epic from those of his traditionalist predecessors and contemporaries. In opposition to the lyric song (*cantilènes*) theory of Gaston Paris and that of legendary origins espoused by Pio Rajna, among others, Menéndez Pidal argues that the epic came into being as a contemporary account of a historical event, which was then continually revised as it was sung over and over again. It was the need to remember notable happenings and to pass on this knowledge from one generation to another that gave rise to the traditional epic and was responsible for its long and fruitful life.

According to the neotraditionalist view, the poets of the successive versions of an epic remained anonymous, representing the collective voice of the society of which they were a part. It was a collaborative effort in which many individual bards and their audiences participated. During the silence of the early centuries, disturbing to many scholars because of the lack of written testimony, the epic flourished in oral circulation just as the Spanish ballad (*romance*) had during the seventeenth and eighteenth centuries when critics be-

lieved that ballad-singing had ceased. Any texts that might have been written down were lost.

Concrete evidence of an epic tradition and lost epics in Spain does not appear until the early twelfth century, the source of which are the chronicles. In France it is not early historiography but rather ecclesiastical documents, monasterial chronicles, and saints' lives that produce proof of an epic tradition a century earlier. A scrutiny of the Spanish chronicles from the early Latin to the great Castilian ones brought to light references to and prosifications of many epics, some unknown from any other source. Furthermore, different chronicles sometimes prosified variant versions of the same *cantar de gesta*, attesting to the fact that these epics had undergone changes as they were being sung.

The most succinct presentation of Menéndez Pidal's ideas is to be found in the introduction to his *Reliquias de la poesía épica española*. A more detailed exposition appears in *La Chanson de Roland y el neotradicionalismo*, where he applies the same theory, now called neotraditionalism, to the French epic in particular and, by extension, to the Romance epic as a whole.

NIÑO DE LA GUARDIA

One of the most infamous, and earliest, cases of the Inquisition in Castile was the prolonged trial (1490–1491) of some Jews and *conversos* (Christian converts) as well as “Old Christians” accused of having murdered a Christian boy (whose body, as usual in such cases, was never found). The accused were from Toledo, but Torquemada ordered the trial to be under jurisdiction of the Inquisition, in Avila where that court met.

Every effort was made to establish the authority and jurisdiction of the Inquisition by this sensational trial, complete with obviously false testimony and a growing series of charges against the Jew, Yucé Franco, that he and the others had “crucified” the supposed child, and that he had conversed with Christians, attempting to convert them to Judaism! For good measure, it was charged that Franco had also stolen a consecrated host (another common charge in Europe against the Jews). The notorious anti-Semite Alonso

de Espina had already fabricated such charges against Jews a few years earlier.

After severe torture, and also the torture of his father, Franco “confessed,” and he and several of the others were condemned to death at an auto-da-fé in Avila in November of 1491.

Lope de Vega and other lesser dramatists composed plays on the legendary “holy child” of la Guardia.

NOBLES AND NOBILITY

In the high Middle Ages, nobles in the Christian kingdoms were those who fulfilled administrative and judicial functions in territorial circumscriptions or gave counsel at the king's court: they were the *comites*. During the tenth century, some of them made themselves independent and negotiated as equals with the kings, such as the counts of Castile and those of Barcelona. A lower class of owners of great domains, who had legal powers and who brought to or imposed upon the countrymen their protection, joined them; they were known according to their duties to the public authority as *seniores* and *domini* in the west, as *vicarii* and *castellani* in the east.

Al-Manşūr's campaigns in the years 980–1002 disorganized Christian society. In the eleventh century, the ancient *vicarii* or *veguers* of the eastern regions became independent from the count's authority and, through vassalic links, submitted to their power a great numbers of *fideles*, *milites*, and *homines*; they thus contributed to the feudalization of the future Catalonia. In the western kingdoms of the Iberian Peninsula the successful Reconquest and gifts by the king allowed the rising of an aristocracy that often chose to live at the court and was entrusted with the government of lands and cities in the king's name. The *infanzones*, the lowest scale of nobility, disappeared during the twelfth century, being replaced by the *fijosdalgo* or *hidalgos*; as the *ricos hombres* or “rich men” from the royal court. These *fijosdalgo* or “sons of something” were defined by their wealth and had fiscal and legal privileges. The war of reconquest witnessed the development of urban militias, with horsemen and others who served on foot. The first, called *milites* or *cabaleros*, soon took over the government of the cities and,

thanks to the profits of warfare and the possession of lands and flocks, succeeded in being considered to have the rank of *hidalgos*.

In the middle of the thirteenth century King Alfonso X in his *Partidas* defined nobility according to its functions within the kingdom. Members of the court and aids in government, from the officials of the court and the central administration to those who exercised power in the king's name in his territories, constituted the first nobility. To this nobility "of function," a heritage from ancient Rome, the king added those who served the common good fighting his battles, the *defensores* or *caballeros*. Eventually, under the influence of Italian lawyers, the *Segunda Partida* gave the same privileges and exemptions of the nobility to the masters and doctors in law.

But the end of the military operations at the time of the Reconquest of Córdoba (1236) and Seville (1248) created a grave crisis. The king could no longer pay his nobles for their services and had to reduce the value of the money. In order to alleviate the loss of income, the nobles tried to increase their landholdings and the fiscal pressure on their dependents, while staying at the court to benefit from rents and gifts; in Castile, the nobles stood up for the future Sancho IV in 1282, and struggled to control the regency during the minorities of kings Fernando IV and Alfonso XI. In Aragón, the nobles had, in 1247, obtained from the king the *ius maletractandi*, or right to ill-treat their dependents; Catalan nobles, in 1283 by the article *En les terres o llocs*, imposed the institutionalization of serfdom. From the years 1340 to 1350, a strong royal policy and new military campaigns against the Moors put an end to the troubles; the civil wars, military operations, and eventually the plague resulted in the extinction of many noble families in Castile and Portugal.

Under cover of the internal struggles between Pedro I of Castile (1350–1369) and his half-brother Enrique II (1369–1379), between Beatriz of Portugal (1383–1385), and Master of Avis João I (1385–1433), new families became important and dominated the political, social, and economic life of the fifteenth-century peninsula. As owners of huge *estados* in which they had jurisdiction and enjoyed some royal rights, the nobles lived in the cities; earned from the king's favor rents, privileges, and titles; acted as *mecenas*; sent their sons to study abroad, and introduced Italian humanism and Flemish art. In the kingdom of Aragón the nobles, divided as high and middle nobility, composed two of the four *brazos* at the *cortes* (parliament), opponents to the royal policy of expansion in Italy, they ended in struggling in each of the crown's kingdoms—Aragón, Catalonia, Valencia, and the Balearic Islands—for their privileges.

The accession to nobility was still easy and the three "ways" mentioned in the *Partidas*—government, military service, and university—allowed a great number of the king's subjects to become *hidalgos* and *caballeros*. The trials for *hidalguía* kept at the chancery of Valladolid attest, as do the treatises on nobility, that wealth, real military service, and public offices were considered to be noble characteristics.

Cities often complained about their decreasing incomes due to the increase of *hidalgos* who enjoyed tax exemptions. On the other side, within the nobility, some mechanisms operated to forbid new nobles from enjoying the same privileges and prestige as those of ancient nobility. Lineage, which had always been important, became essential. It was no longer considered just an accumulation of virtues, and so a guarantee that the descendants of such illustrious ancestors would not display fewer virtues; henceforth the antiquity of the line would bestow a guarantee of purity, of the elimination of any lack of virtue and vileness in the ancestors, or of the deep stain of Judaism. The true nobles, at the end of the fifteenth century, were those who had the purest, cleanest blood.

The appearance of the concept of "pure blood" permitted the nobility to establish levels of ranks among themselves, but did not impede the creation of new nobles according to Spanish tradition, and both concepts—based on law and on purity of blood—were operational in modern times.

NOTA EMILIANENSE

The earliest witness to a Hispanic *Song of Roland* tradition, the hundred-word Latin *Nota Emilianense* (c. 1065–1075) embodies a highly distinctive narrative: In 778, King Carlus comes to Zaragoza, accompanied by his twelve nephews, including Rodlane, Bertlane, Oggero of the short sword, Ghigelmo of the curved nose, Olibero, and Bishop Torpini, each with three-thousand armored knights. The besieging army endures hunger, until the king’s followers persuade him to accept gifts and return home. Rodlane, in the rear guard as the army goes through Sicera Pass, is killed by the Saracens at Rozaballes. The following features are particularly significant: The twelve peers are all Carlus nephews and they include extraneous heroes, by French epic standards: Bertrand, Ogier le Danois, Guillaume d’Orange. The Spanish tradition has apparently sought to reshape the Roncevaux narrative by adding the most famous French heroes of other cycles to Charlemagne’s forces. Notable too is the absence of Ganelon: There is no treason; Carlus simply withdraws at the behest of his followers. The *Nota* may thus exemplify a primitive form of the Roland story in which the traitor as yet played no part. The vernacular names *Rodlane* and *Bertlane* are crucial in exemplifying the archaic “paragoric” -e, a prosodic feature attested in Spanish epics and in later ballad tradition (and even in the same heroic names, *Roldane* and *Beltrane*). Such features—among others—qualify the *Nota* as a witness to a distinctively Spanish vernacular epic tradition antedating the Oxford *Roland* by a full quarter-century. Traditionalist criticism sees the *Nota* as the first in a series of testimonies documenting the Roland epic on the Iberian Peninsula, either approvingly, as in the *Poema de Almería* (1148), *Roncesvalles* fragment (c.1230), *Vida de San Ginés de la Xara* (c. 1400), and various sixteenth-century and modern ballads, or in a hostile Hispanic reaction to French boasts of conquest, as in the *Chronica Silense* (1110), *Coplas de Zorraquín Sancho* (1158), and *Bernardo del Carpio* (early thirteenth century).

NUNEZ, AIRAS

A Galician-Portuguese court poet close to the political center during the reign of Sancho IV. Nunez’s career flourished in the 1280s and fifteen songs of an unusual thematic and formal variety comprise his poetic corpus. He shared a reverence for Occitan troubadour art with Alfonso X, king of León and Castile (1252–1284), to whose *Cantigas de Santa María* he may possibly have contributed. In an era when his fellow poets (Johan Zorro, Nuno Fernandez Torneol, and the young Dinis, future king of Portugal, among them) were, in their *cantigas d’amor*, fixated on—and exalting—the theme of the pains and sorrows (*coita*) that love brings, Airas Nunez, more closely identified with his Occitan forebears, was celebrating in his songs the delights and happiness (*ledicia*) to be found as a thrall of love. The poet-lover, devoted and respectful, attains a state of grace and joy in the simple act of loving, celebrated in “Amor faz a mim amar tal senhor” (number 4), “Nostro Señor, ¿e porque foi veer” (number 10), and “Falei n’outro dia con mia senhor” (number 12). Admiration keeps the male persona of his *pastorela*, “Oí og’eu a pastor cantar” (number 1), from approaching the lovely shepherdess, a departure from precedents set in the traditional *pastorela*. There is a difference, too, in his satirical poems which, instead of the bountiful private satire to be found in many *cantigas d’escarnho y mal dizer*, instead focus on moral and political themes, harking back to the classical Occitan *sirventés* in “Porque no mundo mengou a verdade” (number 2) and “O meu señor, o bispo, na Redondela u dia” (number 13). Airas Nunez expands his repertoire with a spring song, “Que muito m’eu pago d’este verão” (number 3), and two *cantigas d’amigo*, “A Santiagu’en romaria ven” (number 5) and the beautiful and much-anthologized “Bailemos nós ja todas tres, ai amigas” (number 7), a song modeled on Johan Zorro’s “Baylemos agora, por Deus, ay velidas.” This technique of recycling themes and forms, but giving them new energy and elegance, is characteristic of Airas Nunez’s art. This latter song, although by theme and style a *cantiga d’amigo*, does not so much reflect a popular vein in poetic composition as it does a cultivated Occitan strain, one evident in his love songs and his didactic verse as well. His preference for the decasyllable line seems to evince an artistic preference for Occitan metrical forms, as does the frequent use of a

seven-line stanza. The mix of lines of differing metrical measures in his refrains, as well as the varying length of refrains even within a single composition, endows his songs with a liveliness that does much to underscore the motif of happily-being-in-love that he so often celebrates.

NÚÑEZ DE TOLEDO, ALFONSO

Alfonso Núñez de Toledo was born in the early fifteenth century and died after 1481. He is known only through his *Vençimjento del mundo*, an ascetic treatise composed at the behest of Doña Leonor de Ayala and sent to her from Elche on the last day of the year 1481, according to the *explicit* of the work's sole surviving manuscript (Bib. del Escorial, MS h.III.24, folios 67r–79r).

In the *Vençimjento*'s exordium, Núñez de Toledo acknowledges his correspondent's request that he write on the comportment of those who have achieved the state of grace through penance. Choosing to stress the consequences of a fall from grace rather than attempting to inspire a state of greater perfection, he underscores the lasting nature of God's rewards as an incentive for rejecting the world, which offers only "cobdicia de la carne e cobdiçia de los ojos e soberuja de la vida" (I John 2:16). Expostulating against these three evils, he cites three examples of the pernicious

effects of each: the deluge, the destruction of Troy, and the fall of Spain to the Moors resulted from sins of the flesh; the Egyptian captivity, the punishment of Giezi, and Judas's death by his own hand stemmed from greed; and pride led to the fall of Lucifer, the expulsion of Adam from Paradise, and the defeat of King Juan I of Castile at Aljubarrota. The author exhorts his reader to combat these worldly enemies with the appropriate weapon (humility against pride, alms against greed, and fasting against carnal desires), to place her trust in divine mercy as illustrated in three New Testament examples (the adulteress, Mary Magdalene, and the good thief), and to join him in wishing for death, "la puerta por donde avemos de entrar a la vida ynfinjta." (the door through which we enter eternal life).

Ostensibly destined for the private edification of Leonor de Ayala, the *Vençimjento* resembles a popular sermon (*divisio extra*) in its structure, rhetorical devices, and use of *exempla*. Sources include the Old and New Testaments, patristic writings (those of saints Augustine, Jerome, Gregory the Great, and Bernard of Clairvaux), Innocent III's *De Contemptu Mundi*, and such "jéntiles filósofos" as Socrates, Cicero, Seneca, and Boethius.

O

OLIBA

A member of the Cerdanya-Besalú branch of the House of Barcelona, Oliba was born around 971, the son of Count Oliba Cabreta. Oliba shared with his brothers the title of count, but appears to have renounced it shortly after entering the monastery of Ripoll in 1002 or 1003. Oliba became the abbot of Ripoll in 1008 and, at the same time, abbot of Cuixà. He became the bishop of Vic in 1017 while retaining his monastic offices. Oliba was an ally of Ermessenda, widow of Count Borrell of Barcelona. She acted as regent for her son, Berenguer Ramón I, and grandson, Ramon Berenguer I. Oliba cooperated closely with the embattled comital family during a period of aristocratic violence. The Truce of God, proclaimed shortly after 1020, is credited to Oliba and represented an attempt to regulate the times when war could be fought. It extended the earlier Peace of God, which exempted noncombatants and sacred places.

Oliba was also responsible for an artistic efflorescence, sponsoring construction of a new cathedral at Vic, renovating Ripoll, and supporting *scriptoria* at Vic and Ripoll. He died in 1046.

OLIVER, BERNARDO

One of the most important church figures in the fourteenth-century kingdom of Aragón-Catalonia was the Augustinian, Bernardo Oliver. Born in Valencia, he studied theology at Paris and became master of theology at the cathedral school of his native city (1320), also becoming prior of the Augustinian convent there and, in 1329, head of the provincial order. Shortly afterward he also came to the attention both of the king (Alfonso IV) and the Avignon pope (Juan XXII). He

preached sermons both at the royal court and before the pope. In 1337 he was named bishop of the important see of Huesca and was preacher and a counselor to Pedro IV. When Pope Clement VI decided to intervene against Pedro's campaigns in Mallorca, Oliver was part of the official delegation sent to present the papal bull to the king (1344). In the same year, with the king's approval, Oliver was named to the vacant see of Barcelona, and in 1346 the vacant see of Tortosa was also transferred to the jurisdiction of Barcelona, so that Oliver was from that date bishop both of Barcelona and Tortosa. In 1348 he was sent on a certain diplomatic mission by the king, and upon his return he died as a consequence of the plague.

Of the several works attributed to him or known to be his, mostly in manuscript, mention may be made of a commentary on the "Sentences" of Peter Lombard, the moralistic work *Excitatori de la pensa á Deu* (published 1929, a Valencian version of a Latin original), a concordance of the *Decretum* with biblical passages, and the *Tractatus contra Antichristum*.

Of most importance, however, is his small polemic against the Jews, *Contra caecitatem iudaeorum* (written c. 1317, and thus, apparently, while still at school in Paris). The work shows influences of St. Augustine and Isidore of Seville. A dispassionate work, its main purpose is to show the abrogation of the "old" law (Torah) and the imperfect nature of that law and of those (Jews) who observe it; it utilizes the falacious argument that Jews believe in the "perfection" of the Torah due to miracles, and that the miracles of Jesus are "superior" to those of the Old Testament.

There is nothing either original or persuasive in the argumentation, and the book appears to have had no impact on subsequent polemical literature in Spain (a possible exception might be a minor polemic by another Augustinian, Alonso [Fernando] Vargas of Toledo, the bishop of Badajoz and archbishop of Seville, d. 1366). Nevertheless, Benedict XIII, a notoriously anti-Jewish pope, had not one but *two* copies of Oliv-

er's book, and the possible impact of this on the Tortosa Disputation may be considered.

OPPA

Bishop of Seville (?), early eighth century. The little that we know about Oppa comes from conflicting chronicles. According to the *Mozarabic Chronicle of 754*, he was a son of the Visigothic king Egica (687–702), and therefore a brother to King Witiza (698–710). The same source reports that Oppa assisted Mūsā ibn Nusayr in rounding up and executing Visigothic nobles who were attempting to flee Toledo during the Muslim conquest of Spain. The late-ninth-century *Chronicle of Alfonso III* also depicts Oppa as a collaborator with the Muslims, but identifies him as a son of Witiza and a bishop, either of Seville (according to the Oviedo version of the chronicle) or Toledo (according to the Roda version). There is, in fact, an Oppa listed among the early eighth-century bishops of Seville. The *Chronicle of Alfonso III* describes a legendary encounter between Oppa and Pelayo in which the former, in cooperation with the Muslim army, tried in vain to convince the latter to surrender. Pelayo refused and subsequently defeated the Muslims at the battle of Covadonga (c. 718).

ORAL-FORMULAIC COMPOSITION *See* NEO-TRADITIONALISM

ORDENAMIENTO DE ALCALÁ *See* LAW

ORDENAMIENTO DE MENESTRALES

One of the principal outcomes of the Castilian *cortes* (parliament) held at Valladolid in 1351, this piece of legislation attempted to set limits on the wages and prices that laborers and artisans could respectively demand. These measures, applicable to men and women,

were deemed necessary to counteract labor shortages and the high cost of staples caused by the first wave of the Black Death that hit Castile from 1348 to 1350. The *Ordenamiento* is important as one of only a handful of such price- and salary-setting documents in the history of medieval Castile. It is also part of the only extant set of cortes proceedings for the reign of Pedro I (1350–1369).

Five regions of Castile received their own *Ordenamiento*, each reflecting local realities: Toledo and Cuenca; Seville, Córdoba, and Cádiz; León, Oviedo, and Astorga; Burgos, Castrojeriz, Valladolid, and Tordesillas; and Murcia. Regulated were farm laborers, planters, pruners, reapers, flax gatherers, grape pickers, harvesters, carpenters, shepherds, masons, roofers, smiths, tailors, shoemakers, furriers, oxdrivers, weavers, jewelers, house servants, nursemaids, saddlemakers, and armorers.

According to the *ordenamiento*, an average agricultural laborer received sufficient monthly income to purchase five quarts of wine, two chickens, one and a half bushels of barley, one lamb, two pairs of inexpensive shoes, and an unlined coat. It would have taken him two months to earn enough for a cow and a full year to buy a saddle. No matter how hard he worked, he would never have been able to afford a charger and a suit of armor.

Although the economy of Castile recovered by the middle of the decade following the meeting of the Cortes, it is not clear, for lack of direct evidence, how these measures contributed to the recovery. It also remains unclear whether the crown had at its disposal the means to enforce the terms of the *ordenamiento*.

ORDER OF CHRIST *See* MILITARY ORDERS

OROPESA, ALONSO DE

General of the Order of San Jerónimo, Alfonso de Oropesa played an important role in the history of Jewish-Christian relations in Castile. He headed the council of nobles that in 1465 settled a peace with Enrique IV and imposed certain demands on the king, among which were a series of anti-Jewish restrictions, the work of Alfonso. He was one of three named by that

council to oversee the “welfare of the kingdom”—that is, that the demands were complied with. Alfonso particularly objected to Jews holding public office over Christians and the general influence Jews had at court and with the nobles. Although there is little evidence that these anti-Jewish measures were in fact carried out, the attempt contributed to the growing anti-Jewish sentiment.

Alfonso (who certainly was not a *converso*, a Jew who had converted, as has been claimed) wrote an important treatise defending the *conversos* against the attacks of “Old Christians.” In it, he fluctuates between admiration for “Old Testament” Jews and Judaism and contempt and vilification of the “perfidious Jews” of his own time. Arguing at one point that the ancient Jews were the only true people, since only they had a (divine) law and concept of justice, he then attacks the imperfection of the law since the people itself was imperfect. Not only was the Jewish law imperfect—so also was its faith, which did not “reveal” to them the truth of the Trinity; as was the sacrificial cult and the teachings as to the ultimate perfection of man, based on “temporal rewards” not leading to salvation (an old argument, derived from Thomas Aquinas).

Alonso reveals that he was not entirely unfamiliar with rabbinical traditions, and at one point seems to allude to a statement found, in fact, in the *Mekhilta*. Yet if so, he ignored, deliberately or otherwise, the explanations given by Spanish Jewish authorities, Maimonides, and others.

He complains again of Jews holding office, of having Christian servants who live with them and keep the Sabbath, farming the taxes of the kingdom and the churches, and even the old anti-Semitic barb that Jews rape Christian women and are generally suspect of “lewdness.”

Nevertheless, he could write that Israel was the “people of God,” to whom Christ belonged according to the flesh, and by whom salvation is promised. This, of course, he did in the context of defending conversos. Very important is the correct observation of his editor that his whole book gives the impression that, while there were no doubt some “bad” conversos, these were few in number.

Ironically, after his death, his own powerful Order of the Jeronimites was to be condemned as a hotbed of (supposedly) such “bad” conversos.

OROSIUS, PAULUS

Orosius was a Spanish priest, probably of the diocese of Braga, who left Spain around the year 413 for reasons that may be related to disturbances in the Iberian Peninsula following the Germanic invasions. Little is known of his earlier life, but he appears to have been involved in opposing the spread of Priscillianism in Spain. He made his way to Hippo in North Africa, to seek the advice of St. Augustine, for whom he wrote his *Liber apologeticus Contra Pelagianos* (Warning concerning the Error of the Pelagianists and Origenists, 414). Augustine replied with the treatise *To Orosius against the Pelagianists and Origenists*. In 415 to 416 he served as an intermediary between Augustine and Jerome in Palestine in their efforts to coordinate Western and Eastern condemnation of the teaching of Pelagius. He returned from Palestine in 416 with relics of St. Stephen the Protomartyr, which were intended for the Church of Braga, but the conflicts in the peninsula between the Visigoths and the Vandals and Sueves prevented him reaching the mainland. He therefore deposited the relics in a church in Minorca. At this time he began his best known work, *Historiarum adversus paganos libri VII* (Seven Books of History against the Pagans), a synoptic history of Rome from the foundation of the city up to 416, which he dedicated to Augustine. This attempted to rebut pagan claims that recent military disasters had befallen the Roman Empire in consequence of it having become Christian. This Orosius sought to deny by arguing, rather unconvincingly, that worse things had occurred before the conversion of Constantine. Nothing more is known of Orosius after he completed this work in 418.

OVID

The works of Publius Ovidius Naso exerted a broad influence on medieval Iberian letters. Whatever the ultimate source of the European love lyric, it is clear that the vast body of amorous poetry written in Galician-Portuguese, Castilian, Catalan, and Provençal throughout the Middle Ages owes many of its themes, classical

references, and much of its stylistic expression to the works of the Roman poet Ovid (43 B.C.E.–17 C.E.) Already in the early Middle Ages, Ovid's works were known to writers such as Isidore of Seville (c.560–636), perhaps through florilegia. The earliest known translation of Ovid into a peninsular language is found in the thirteenth-century Alfonso the Wise's *General estoria*, in which passages from the *Metamorphoses* and *Heroides*, together with selections from medieval commentaries on these works, are translated into Castilian.

In fourteenth-century Castile, the *Libro de buen amor* by the archpriest of Hita, possibly influenced by the pseudo-Ovidian *De vetula*, also includes an art of love with clear debts to Ovid's *Ars amatoria*. It is, however, still a matter of debate as to whether the archpriest knew the work directly or in some florilegium or student anthology. Ovid's works were probably taught in centers of higher learning in Spain in the fourteenth and fifteenth centuries. Although little concrete evidence survives this chaotic period of Spanish history, we do have one interesting manuscript of Ovid's *Metamorphoses*, which bears a Latin marginal commentary and a Castilian inscription stating, "This is the Ovid from which the teacher lectured" (Soria, Bibl. Pública, MS 4-H).

The fifteenth century was a veritable *aetas ovidiana* in Castile. The language of the *Ars amatoria*, together with the *Heroides* and *Metamorphoses* enjoyed strong favor with courtly poets. At the same time there arose the "sentimental romance," a genre that draws upon Ovidian themes, situations, and characters, as already received by Giovanni Boccaccio in Italy, for much of its inspiration. Juan Rodríguez del Padrón, the author of the earliest of these romances (*Siervo libre de amor*), also made a new translation of the *Heroides* into Castilian, including in it a medieval Latin commentary on the work.

In eastern Iberia, the influence of Ovid is still more firmly documented. Already in the twelfth century, Guerau de Cabrera recommends a knowledge of several myths from the *Metamorphoses* to would-be troubadours in his Provençal *ensenhamen*. There were at least two medieval translations of Ovid's works into Catalan, one a late-fourteenth-century translation of the *Heroides* attributed to Guillem de Nicolau and another of the *Metamorphoses* by Francesc Alegre, printed in Barcelona in 1494. In the fourteenth century, the influence of Ovid is most strongly seen in the works of Bernat Metge, especially in his *Somni* and in a fragmentary translation of the pseudo-Ovidian *De vetula*.

Ovid flourished in fifteenth-century Catalonia and Valencia. At the turn of the century, Jordi de Sant Jordi composed a *Passio amoris secundum Ovidium* and both Pere Torroella (c. 1436–1486) and, especially,

Joan Roís de Corella (d. 1497) show a thorough familiarity with his works. Ovid's influence can also be seen in the moral-theological works of Francesc Eiximenis and in the chivalric romance *Tirant lo Blanch*.

OVIEDO, CITY OF

For the Spanish imagination, the city of Oviedo continues to carry a special significance for monarchy and the idea of a sustained Christian reconquest of Muslim lands during the Middle Ages. Sometime during the

Sta. Maria de Naranco, Oviedo, Spain. Facade, built ca. 842–850, converted to a church after 905. Copyright © Scala/Art Resource, NY.

first part of the ninth century, the royal residence of the kings of Asturias was moved by Alfonso II (791–842) from Cangas de Onís in the mountains to Oviedo, a location with easy access over the Cantabrian range to the Duero River valley. Since that time, the city has been closely identified with the restoration of medieval Christian monarchy in the north of the Iberian Peninsula after the Muslim conquest of 711 and is cited always as the seat of the ancient kings of Asturias, progenitors of the all the great medieval kings of Spain. In Oviedo, Alfonso II not only built a splendid palace and ceremonial space for himself on the mountainside (the present-day Church of Santa María del Naranco), but several other buildings destined for civic and religious use as well. When Alfonso moved the royal residence to Oviedo, he saw to the creation of churches,

a bishopric, and a see for the new municipality, a circumstance without precedent in antiquity. At the same time, the king made sure that the name used to designate this new political space and structure centered at Oviedo was “regnum christianorum.”

For nearly one hundred years Oviedo served as the seat of the kings of Asturias, until Ordoño II (910–925) moved the royal residence to León, closer still to the Duero River, which served as the frontier between Christian and Muslim lands after the beginning of the tenth century.

P

PABLO CHRISTIANI

While conversion from Judaism to Christianity is documented all through the Middle Ages, beginning in the middle of the thirteenth century the phenomenon of conversion on the part of learned Jews and their subsequent involvement in either attacks on Jewish life or missionizing efforts aimed at their former coreligionists became increasingly prominent. One of the earliest of these new style converts was a southern French Jew probably named Saul, who subsequently took the Christian name Paul and eventually became a member of the Dominican Order. The conversion of this Jew obviously took place during his later years, since he left behind in the Jewish community a wife and children.

As a Christian, Friar Paul, generally known in recent historiography as Pablo Christiani, became heavily involved in activities related to his former coreligionists. Concerned with a wide range of Jewish issues, he is best known for his proselytizing preaching and disputing and is particularly noteworthy for his pioneering efforts to utilize rabbinic materials as the basis for arguing to Jews the truth of Christianity. His most famous missionizing endeavor took place in Barcelona in 1263, when he engaged the distinguished Girona rabbi, Moses ben Nahman, in a disputation sponsored by King Jaime I of Aragón, one of the most striking proselytizing encounters of the Middle Ages.

Toward the end of his life, during the late 1260s, Pablo Christiani moved northward to the court of the pious King Louis IX of France. He was supported by the monarch in his effort to introduce a special Jewish badge in royal France, as well as in his ongoing missionizing preaching. Once again, he was successful in winning royal backing for a proselytizing disputation with a leading rabbi, this time in Paris in the last year of the 1260s or in the early 1270s. While he does not seem to have been particularly successful in bringing Jews to baptism, the new argumentation that he set in motion eventually does seem to have played some role

in the massive conversions on the Iberian Peninsula during the late fourteenth and fifteenth centuries.

PABLO DE SANTA MARÍA

Pablo de Santa María was *converso* bishop of Cartagena (1403–1415) and then archbishop of Burgos (hence sometimes referred to as Pablo de Burgos) until his death. As Bishop of Cartagena, a major diocese that included the kingdom of Murcia, he instituted various reforms, resistance to the “schism,” and support for Benedict XIII as pope. Prior to his conversion, he was Solomon ha-Levy, a rabbi of Burgos. He did not convert because of the pogroms of 1391, but rather prior to that date. A hitherto ignored document shows that in 1396 he was already in the service of Benedict XIII. As Bishop of Burgos he became counselor to Enrique III, was appointed Apostolic Nuncio by Benedict, and chancellor of the infante (later king) Juan II. Before his conversion he was a member of a large family (seven brothers and sisters), all of whom eventually converted. The most famous of these was Alvar García de Santa María. Pablo’s son, who apparently converted with him, took the name Alonso de Cartagena and succeeded his father as Bishop of Burgos, and another son, Gonzalo García de Santa María, became Bishop of Astorga and Plasencia. Alonso de Burgos, a nephew of Alonso de Cartagena, was bishop of Córdoba, Cuenca, and Palencia, and confessor of Queen Isabel.

Virtually all members of the Santa María–Cartagena family were, for centuries, famous writers, theologians, and churchmen. Yet another of Pablo’s sons, Alfonso Díaz, was the father of Juan Díaz de Coca (1389–1477), Bishop of Calahorra.

Pablo himself wrote several works although he was by no means as prolific a writer as other members of the family. Prior to his conversion he wrote a Hebrew satirical “Purim letter” (the historical background of which still needs clarification), and shortly after his conversion he received a letter from his friend Joshua al-Lorqi inquiring as to the reasons for his conversion, to which he replied (in Hebrew). Joshua himself later converted and took the name Jerónimo de Santa Fe. Later in his life, Pablo, who had a thorough theological training, wrote *Scrutinium scripturarum*, a biblical commentary not without some anti-Jewish polemic (numerous editions from 1469 on) and *Additiones* to the *Postillam* (glosses) of Nicholas de Lyra (also numerous editions, from 1481 to 1498), and a poem, “Las siete edades del mundo” or “Edades trovadas,” dedicated to Juan II. In spite of his natural preference for Christianity and orthodox Christian interpretation of the Bible, he never “persecuted” the Jews, as has been falsely suggested. In 1604, Felipe III granted—only to the descendants of Pablo, and not the entire family—the privilege of *limpieza de sangre* (“purity of blood,” removing the *converso* (conversion) “taint” from them).

PACHECO, JUAN MARQUIS OF VILLENA

See ENRIQUE IV, KING OF CASTILE

PADILLA, JUAN DE

A Carthusian friar (c. 1467–1520) of obscure, illegitimate birth—a matter that caused him certain difficulties—Padilla was very active in his religious order, where he reached a high rank. He was the author of two extensive religious poems in *arte mayor* (Stanzas with dodecasyllabic scansion). Fundamental to both are numerical and symbolic organization, based on ancient biblical and medieval roots. The first of these two works is *Retablo de la vida de Christo* (1505), in which he consciously imitates the pictorial art of the

times; at the end of the poem, Padilla writes, “Asy como hazen algunos pintores / que tiran el velo delante su obra / quando ni mengua ni falta ni sobra / a las figuras bious colores, / assi los poetas et los oradores / quitan delante sus obras el velo / [. . .] / Assi pues hagamos en esta pintura, / tirando su velo que tiene delante” (Just as some painters do, / who remove the veil over their work. / When their figures and Vivid colors / neither exceed or are lacking, / thus poets and clerics / remove the veil). This piece constitutes an authentic Christology divided in four *tablas* corresponding to the four canonical Gospel books. *Retablo*, which was reprinted in numerous editions, consists of 1,289 eight-line stanzas in *arte mayor*, plus a series of octosyllabic prayers and lamentations in prose. Despite the obvious influence of Juan de Mena, Padilla explicitly rejected pagan and literary invocations. Both in this poem as well as in *Los doze triumphos de los doze apóstoles*, numerous details relate the text to Íñigo de Mendoza’s *Vita Christi*, including some hidden references to the Franciscan’s work.

Of greater complexity is *Los doze triumphos*, a work published posthumously (1521) of 1,144 strophes in *arte mayor*, with a pompous tone and a decidedly allegorical and cultured form. Padilla shows here the clear influence of Dante, Mena, and, to a lesser degree, Petrarch. Divided into twelve parts corresponding to the twelve apostles, the twelve months, and the twelve Zodiac signs (at the center of which is the sun, that is, Christ), this poem’s astrological and, above all, numerical symbolism make it difficult to read. If, on the one hand, the cultured construction and use of latinisms are abundant (*nitente*, *manante*, *rubente*, *clarífico*, *dulcisona*, and *serénico*), on the other it can be considered, also in the fashion of Mena’s *Las trescientas*, as a “national” poem, with reference to Castilian topics of the past and of the fifteenth century, as well as an “Isabelline” poem (Granada, the expulsion of the Jews, and so on). Padilla demonstrates a more personal approach in his allusions and comparisons with actual reality (the Medina del Campo fairs, the witches of Durango, and Seville, and the *Torre del Oro*). An important question to consider that has yet to be addressed by scholars is the identity of Padilla’s readers.

PADILLA, MARÍA DE

The daughter of a Castilian family of the lesser aristocracy, María de Padilla became Pedro I's favorite in 1352, shortly after meeting through the Pedro's chief minister Juan Alfonso de Alburquerque. María was a member of the household staff of Alburquerque's wife, Isabel de Meneses. In spite of two subsequent marriages, Pedro's attachment to María was the most enduring relationship of his life. It lasted, with brief interruptions, until her death in 1361.

María's reputation has remained largely unscathed, in spite of Pedro's many excesses. Contemporary sources generally praise her for her beauty and charm, and for attempting to soften Pedro's harshness. A notable exception is the collection of anti-Pedro ballads, *Romancero del rey don Pedro*, in which she is portrayed as cruel and vengeful. In Romance 9, for example, she is held responsible for breaking up Pedro's marriage to Blanche de Bourbon in 1353. Jealousy leads María to hire a Jewish necromancer to put a spell on a gem-encrusted belt that Blanche gave the king to wear on their wedding night. As Pedro puts it on, the belt turns into a snake; the king, horrified, flees from his bride.

Pedro's refusal to live with his French wife, and his attachment to María, served as a political excuse for his enemies and resulted in the alienation of Alburquerque. At the same time, María's relatives gained ascendancy at court and replaced Alburquerque and his circle. Juan Fernández de Henestrosa, an uncle, became *camarero mayor* *mayordomo mayor*, and *canciller mayor*. María's brother Diego García de Padilla owed his election as Master of the Order of Calatrava to Pedro's influence. He later became the king's *mayordomo mayor*. A half-brother of María received the *encomienda mayor* of the Order of Santiago, while another relative, Juan Tenorio, became *repostero mayor*.

María, with Pedro's financial support, founded the monastery of Santa Clara at Astudillo in 1354 which, together with an earlier cession of Huelva, constituted the only significant settlement the king made on her.

María died in July 1361. She bore Pedro four children: three daughters and a son. Immediately after her death Pedro proclaimed María queen of Castile and ordered a royal burial at the monastery at Astudillo. The following year, Pedro hastily assembled a meeting of the *cortes* at Seville to declare their son Alfonso, then two years old, heir to the Castilian throne. Upon the child's death the following year, Pedro designated his first daughter Beatriz his heir. He also insisted that he and María had been legally wed and had her remains transferred and buried in the royal chapel at Seville. The Trastámaran usurpation of the Castilian throne in

1369 made Pedro's succession arrangements moot. However, Pedro's line eventually returned to the throne when his granddaughter Catherine of Lancaster, daughter of his and María's second child Constanza and John of Gaunt, duke of Lancaster, wed Enrique III of Castile.

PAGANISM

Residual traces of pre-Christian beliefs and practices survived in various forms in medieval Spain and Portugal. The purely literary awareness of pre-Christian myth and belief through written sources must here be distinguished from the survival of such practices and beliefs at the level of folk tradition and popular observance. The survival of various manifestations of classical paganism under the Visigothic kingdom is well documented. Some beliefs persisted longer; examples are elements of astrology, and the use of bird-flight as an augury. An *auguriator* appears in a document of 1204; accusation of belief in such auguries was leveled at el Cid in the late eleventh century and at Alfonso el Batallador of Aragón in the early twelfth. Literary reflections of this mantic practice are found in epic poems (*Poema de Mio Cid*, *Siete infantes de Lara*). Numerous texts attest a continued vogue for divination by this technique up to the fifteenth century; it appears to have been particularly associated with the office of *adalid*, in connection with which it is still mentioned in a source of 1430. Some popular superstitions, in particular those associated with agricultural magic and personal malefice, have evident pagan roots. Other possible survivals are more obscure and controversial; dancing in the guise of stags (*cervulum facere*) is condemned as a pagan abuse in early church authorities (fourth to seventh centuries), and some such tradition may form part of the background to the image of the lover as stag in the *cantigas* of Pero Meogo in the thirteenth century. The beating of el Cid's daughters in *Poema de Mio Cid* finds parallels in folk customs from cultures as distant chronologically as classical Rome and Victorian Wales; it also, however, has obvious parallels with elements found in Christian martyrology. The reference in *Poema de Mio Cid*, lines 2694–95, to an "Elpha" shut in a cave has been seen as arising from a local tradition concerning otherworld beings, but has also been explained by reference to a contemporary feminine personal name. Further episodes may well have unsuspected pagan substrata. In

Poema de Fernán González, for instance, the adoption of a stone image by the Castilians as their leader during the imprisonment of the Count in Navarre has striking similarities to practices associated with the worship of Cybele in the Mediterranean world and to ancient Germanic and Nordic rituals reported by Tacitus and other sources. That Christian elements may also have contributed to the formation of this incident in a thirteenth-century clerical poem should not surprise us, for, as with much material of this nature, the situation is complicated by the well-documented practice of adapting pre-Christian elements into popular Christian observances. Where, then, parallels exist for a particular literary motif or episode in both Christian and pagan culture, the presumption must generally be in favor of a Christian origin unless specific factors indicate otherwise, always allowing for the possibility of an intermediate Christian source for ultimately pagan material. For popular observance and belief, sources including chronicles and legislation provide information on pagan elements.

PALENCIA, ALFONSO DE

Royal secretary, historian, and humanist, Alfonso was born in Palencia, the son of a secretary, in 1423. At seventeen he was in the household of Alfonso García de Santa María (de Cartagena), Bishop of Burgos, and later in 1441 took part in a mission to Álvaro de Luna on behalf of Juan II of Castile. Some years later he appeared in Florence and Rome in the household of Cardinal Bessarion; in later years he recalled the tutoring he received from George of Trebizond ("que didici, tu docuisti"). After the fall of Constantinople he returned to Spain to join the household of Alfonso de Fonseca the elder, Archbishop of Seville. On 6 December 1456 he was named royal chronicler and secretary of Latin letters to Enrique IV. By the 1460s he seems to have taken up residence in Seville and to have openly sided with the nobles in opposition to the king. Several nobles sent him to Paul II in Rome to complain about Enrique's actions. When young Alfonso, Isabel's brother, was proclaimed king at the famous Farce of Avila (June 1465), Palencia claimed he was close to the pretender. At his death in 1468, Palencia shifted his allegiance to Isabel and Fernando, and played a

major role in smuggling Fernando into Castile to marry Isabel in Valladolid in October 1469. From then on Palencia became a devoted supporter of Fernando, thick with the conspirators in the conflict with Enrique IV, but with growing suspicions of some of Isabel's advisers, particularly Pedro González de Mendoza, later *el gran Cardenal*, who preferred Isabel to dominate in Castile. Eventually in the 1480s it was clear that Palencia had lost Isabel's support as chronicler; she then appointed Fernando del Pulgar as her own historian. Although it appears that Palencia was still classified as secretary and chronicler up to his death, he did not appear as an active figure in politics. A place was granted to him for his tomb and books in the Seville cathedral, but no trace survives. Palencia was not a cleric but a professional man of letters, like Elio Antonio de Nebrija, whose normal written language was Latin. He collected books for Fonseca and himself; he copied Latin manuscripts translated from the Greek, and maintained correspondence with Italian and Spanish scholars. He wrote political treatises, grammatical and lexicographical compilations, a treatise on ancient Iberian geography, and translations of Plutarch's *Lives* and Josephus's *De Bello Judaico*. Many others have disappeared, like ten books on the antiquities of Spain. His major work, *Gesta Hispaniensis ex annalibus suorum dierum collinentis*, or *Decades* for short, covers the years from 1453 to the end of the Granada campaign. It is a savage political and moral criticism not only of Enrique IV and his main advisers, like Juan Pacheco, Marqués de Villena, for their self-serving behavior, but also in later years, of the counselors of Fernando and Isabel, as well as Isabel herself, whom he did not think as capable as Fernando. No wonder it was never printed. Despite the declared prejudices, it cannot be discarded, since Palencia was well acquainted with most of the protagonists and witnessed many of the events he records. Like Joan Margarit, whose work he knew, Palencia has many affinities with the Italian humanist scholars of his day. He possessed an idiosyncratic Latin style, classical in its inspiration, with a pronounced Terentian flavor in some of his more caustic moods. The history itself started off in traditional fashion as a movement from turbulent darkness into the light of justice, but this crescendo weakens as Palencia seems to lose faith in those he had once trusted.

PAMPLONA

City in present-day Navarre that dates back to Roman times. Possibly founded by Pompei in 75 B.C. it was an episcopal see from the fifth century on and, due to its strategic position, housed both Visigothic and Muslim garrisons during the Middle Ages. During the ninth century, it became the focal point for major political activity, laying the foundation for the emergence of the Kingdom of Pamplona there in the tenth century. The development of pilgrimage along the Road to Santiago de Compostela led to the appearance of new townships and suburbs close to the episcopal seat, the area now called Navarrería. Places like San Cernín and San Nicolás had appeared by the end of the eleventh and the middle of the twelfth centuries respectively. The three townships, each with its own municipal government and fortifications, vied for economic supremacy and control of the urban areas well into the fifteenth century. During this period, the monarch and the episcopate also competed for control of temporal jurisdiction in the city. Tensions between church and monarchy culminated in 1276 in the so-called Guerra de la Navarrería (War of Navarrería), made famous by a Provençal poem of the same name composed by Aneier de Toulouse. With some fifteen hundred households, by the twelfth century Pamplona was the recognized capital of the kingdom of Navarre. It did not become the permanent seat of the royal court, however, until the fifteenth century, after the monarchy had united the three competing townships of Navarrería.

Pamplona is distinguished for its religious architecture. A Romanesque church was erected over a primitive religious structure in 1127, marking the origins of the present cathedral. A Gothic cloister was added between 1286 and 1374, replacing the original Romanesque cloister. After the collapse of the Romanesque church, between the years 1394 and 1501, a Gothic edifice was constructed in its place. The original Romanesque facade, which survived the collapse of the Romanesque church, was replaced with a neo-classical one in 1783. The Church of San Cernín was built in the twelfth century and was reconstructed in 1297. In 1758 the church's Gothic cloister was torn down and replaced with a baroque chapel. The Church of San Nicolás dates from the twelfth century and was restored in the Cistercian style in 1231; a Gothic head-wall was added at the end of the thirteenth century. Both San Cernín and San Nicolás have fortified towers. Only two examples of medieval civil architecture remain, each partially preserved, and both in the Gothic

style and of uncertain date. These are the Royal Palace and the Palacio del Señor de Otazu, since the sixteenth century referred to as the Cámara de Comptos as the treasury was housed there.

PAPER

Paper, used in China by 105, came to the Islamic World in 751, and was manufactured at Baghdad and Damascus before 800. By the early 900s papermaking became a general craft in Islamic Spain; by 1150 Játiva's paper was internationally famed. Exported to Christian Spain, paper became common there only in the thirteenth century, though severely restricted to governmental use. Christian Spain's manufacture dates from Játiva's conquest, especially its full absorption after 1250.

César Dubler's fantasy of how fugitives from the Almoravids/Almohads multiplied paper mills is now compounded by Oriol Valls's fantasy of twelfth-century Catalan paper mills from the Pyrenees to Tarragona, erroneously argued from the standpoint of the history of cloth mills (especially the 1193 Copons mill). Authorities also unwarrantedly assume Maghribian and therefore Christian production by hydraulic mills; domestic hand processing instead prevailed. Aragón's crown did introduce Játivan mills in the 1280s (the Italian Fabriano's 1268 claim as Europe's pioneer mill cannot be sustained). Hydraulic technology plus proliferating material codices, private use, and royal registers constitute the "paper revolution."

The crown controlled manufacture, quality, marketing, and export. Linen rags, not flax or cotton, were the usual materials. Centers also sprang up in Murcia (1266), Mallorca (1280s), and perhaps Castile. New techniques and marketing sharpened rivalry with Italy in the fourteenth century; identifying watermarks multiplied then. By 1456 Barcelona had a mill, but no notice survives for Castilian mills. Printing definitively expanded both manufacture and use.

PEASANTS AND PEASANTRY

The lives of peasants, the economic and social bonds that linked them to their lords and to the soil, the structure of the village community, and the tenor of their very lives was determined in Castile by where and when the peasants lived. The history of the Castilian peasantry is a complex one indeed, and any attempts to generalize about their status ignores the heterogeneous character of their lives. Most of the standard interpretations and accounts of medieval rural life, the classical formulations of Marc Bloch and others do not fully apply to the Castilian setting; thus, comparisons with the peasantry in better-known regions are not always useful.

In Castile, few peasants were exempted from seigniorial dues. Whether these dues were paid to the king (in lands of *realengo*), to the church (*abadengo*) or to lay lords (*señorío*), the result was much the same. Peasants paid rent for their land, annual contributions to the crown, and to their lords. In some cases, they had to perform labor duties during the high points of the agricultural cycle (the *señas*) and pay the equivalent of *mainmorte*, entry fees, and a host of other dues for which one finds rough equivalents in the north. Yet peasants in Castile were seldom tied to the soil. In short, servile labor was not the predominant mode of production in Christian Castile. Instead, peasants and their lords were bound by intricate bonds of reciprocity, often oppressive to the peasantry, but also allowing for forms of resistance, denial, and escape.

The dynamic character of Castilian society, dominated by the military tide of the Reconquest and the repopulation of new lands, provided a setting that favored the peasantry. Villages in the northern mountains were, on the whole, small, and the peasants worked under heavier seigniorial dues and obligations. Villages south of the area of Burgos and into the Duero River basin were often large, with most of the work duties commuted into money payments. But even in the mountains, the obligations of individual peasants in the same village differed according to status and the nature of their ties to the lords. Everywhere in Castile, as one moves into the later Middle Ages, we find well-to-do peasants building sizable holdings, and fairly independent from seigniorial excesses.

The village was the communal focus of peasant life. As such, the community of village "citizens" exercised their collective rights. In times of trouble or litigation with their ecclesiastical and secular lords (and there were an endless number of litigations in the late Middle Ages), one can witness the inhabitants of villages standing as one. At the ringing of the church bells, the petty noblemen, the curate, and those peas-

ants who "owned" a household and property came to the village church or to the opening in front of the church door to voice their opinions and to vote on the pressing issues of the day. In litigation after litigation, it is the rural council that speaks with one voice in its attempt to protect itself and its members from excessive demands or abuses. In the communal world of the Castilian peasantry some were more equal than others, and women, newcomers, and those who lived by hiring themselves to others were not called by the ringing of the bells to make decisions for all. The apparent leveling structure of rural communities was indeed a mirage, and rigid social hierarchies were already in the making in the Castilian countryside by the thirteenth century.

Within villages social gradations and social distinctions based essentially on property or on the enjoying of a beneficial lease led to the hierarchization of political and economic power at the village level. These distinctions, sharpening with the economic downturn of the thirteenth and fourteenth centuries, were made more onerous by the authority of the village council to sell property or to assign work. Moreover, as urban oligarchs began to purchase houses and land in the countryside around the cities, they acquired not only property but also rights to the village commons.

Along the lines stated above, we can make a very rough typology of the different kinds of peasants living in medieval Castile. First were the peasants in royal lands. They were, for all practical purposes, the proprietors of their holdings, with the right to sell, buy, bequeath, or dispose of their lands or, more accurately, of their *dominium* over the land. Some restrictions on their rights can be found in the extant documentation, limiting their ability to sell land to magnates or monasteries, but these provisions were often disregarded. Peasants working royal lands paid dues to the crown, and their burden was often lighter than that of other peasants. Their obligations were met in kind (mostly in the mountains of the north), in issue (mostly in the plains), or in both. Next were men and women working ecclesiastical and/or seigniorial lands who paid dues to the king and to their lords. In older settlements, this also included work duties and other more oppressive obligations. Third were men and women of *behetrías* (free cities), those peasants with the right to choose their own lords and to abandon their service if not satisfied. Fourth, as we move into the late Middle Ages, we find an increasing number of peasants who worked for a wage. There are strong indications that these men and women owned or held small farms of their own, but that these holdings were not sufficient to support them and their families. The tendency to the fragmentation of rural property led to the emergence of

a salaried rural underclass. Most of the domains of northern Castilian monasteries were plowed, tended, and their crops harvested by day laborers. Moreover, there is also a clear move to the leasing of land either for life or for a set number of years, with monasteries and lords collecting a share of the crops.

By the mid-fourteenth century, there was a concerted effort by the crown and the nobility, as seen in the ordinances of the *cortes* (parliament) of 1351, to bind the peasantry under more harsh and economically exacting obligations. How successful were these attempts is hard to assess. What it is clear, however, is that by the fifteenth century the overall conditions of the peasantry had deteriorated considerably. Reports of rural poverty and upheaval marked a radical change from the stable conditions of the central Middle Ages.

PEDRO ALFONSO, OR PETRUS ALFONSI

Moisés Sefardí, a noted Jew from Huesca, adopted the name Pedro Alfonso when he was baptized on 29 June 1106, with King Alfonso I el Batallador serving as godfather. Pedro Alfonso probably left the Iberian Peninsula soon after his baptism; a few years later he was located in England as a *magister* of liberal arts, where he likely contributed to the diffusion of Arabic science, especially astronomy and calculus, around the monastery of Malvern. Whether he was the physician to both Alfonso I and Henry I of England, as is often claimed, is not certain.

The preserved literary production of Pedro Alfonso is in Latin, and can be separated into three fields of interest: apologetic, scientific, and didactic literature. As a response to the scandal caused by his conversion, he wrote *Diálogos contra los judíos*, in which two characters, Pedro and Moisés, represent the author before and after his baptism. Throughout the work's twelve chapters, Pedro turns to a wide variety of medical, cabalistic, and theological arguments to show Moisés the error of his ways. At the latter's insistence, in the fifth chapter Pedro traces a broad critical panorama of Islam. If the *Diálogos* enjoyed especially wide distribution, as the more than seventy preserved manuscripts dispersed throughout European libraries prove, the repercussions of this chapter were even greater.

Very few of Pedro Alfonso's scientific works are preserved, and only some incomplete *Tablas astronómicas* can be attributed to him with surety. These tablas are preceded by a curious preliminary text titled "Carta

a los estudiosos franceses", which seems to have been motivated by a stay in France, and which becomes an important document with regard to the author's position on the cultural renaissance of the twelfth century. In the letter, Pedro Alfonso criticizes European intellectuals for their bookish culture, far removed from the world of scientific practice. He also addresses the traditional division of the liberal arts, positioning himself among those partial to the quadrivium, which includes the study of medicine; in the trivium only the study of dialectics is saved from the author's condemnation, but is still only regarded as a supplementary subject.

Pedro Alfonso's name has become unquestionably most associated with the *Disciplina clericalis*, a combination of exempla (thirty-four total), comparisons, proverbs, and so on—all focusing on the indoctrination of students as the title indicates. For the subject's organization, the author likely found inspiration in the books of the Bible, Hebrew religious texts, and mixed genres of oriental origin. The dialogue between anonymous characters (father-son, teacher-disciple) creates a frame that reaches its maximum development between examples 9 and 17. The subject matter—knowledge of self and of neighbor, but always remembering the fear of God—corresponds to other similar works of oriental literature. The most popular stories, though, deal with misogynistic themes, and are closer to the *fabliaux* in their narrative scheme. Medieval preachers turned to the *Disciplina clericalis* frequently, explaining its wide diffusion and its importance in the origins of the novel. Because it was written in Latin, the *Disciplina clericalis* became the first pathway through which oriental narrative began to circulate in the West.

PEDRO I THE CRUEL, KING OF CASTILE

Born 30 August 1334 in Burgos, Pedro was the only legitimate child and heir of Alfonso XI of Castile (1312–1350). His mother was María daughter of King Afonso IV of Portugal. One of the most controversial kings of the Castilian Middle Ages, he is the only one who came to be known by the sobriquet of "the Cruel" for the many acts of violence associated with the last stages of his rule. Aside from the personal excesses that inspired this reputation, Pedro's reign (1350–1369) is distinctive for a number of other reasons.

His subjects experienced the full economic and demographic effects of the first wave of the Black Death that hit Castile from 1348 to 1350. He led an aggressive war of expansion against Aragón that lasted, intermittently, from 1357 until the end of the reign. His policies and alliances contributed to the involvement of international troops in the peninsular conflict, making Spain, from 1366 to 1369, the main theater for the larger military conflict known as the Hundred Years' War. His treatment of the aristocracy and his poor relations with the Castilian Church and the Avignon papacy alienated a substantial portion of his most important subjects, causing many to side with his chief rival, his half-brother Enrique de Trastámara, during the Castilian civil war of 1366–1369. The reign ended violently with Pedro's death and the usurpation of the throne by Enrique.

Coming to the throne 28 March 1350 shortly before his sixteenth birthday, Pedro spent the first two years under the influence of Juan Alfonso de Alburquerque, a Portuguese nobleman who had been in the service of Queen María, and had become Pedro's first minister. Under the auspices of Alburquerque, Pedro convened the Cortes of Valladolid in 1351, the only such meeting for which we have any detailed records for the entire reign. Through a series of measures redacted during these proceedings, Pedro attempted to remedy some of the economic consequences of the plague such as the abandonment of arable lands, and the steep rise in the cost of living. At the same time, the *cuadernos de cortes* (records of the courts) reveal Pedro's interest in a healthy royal treasury and an effective system of tax-collection. This concern with sound finances remained a constant feature of his reign, and resulted in the unpopular appointment of Samuel Halevi, a Jew, as his chief treasurer and the extensive use of Jews as tax-farmers. These measures, for which Pedro was severely criticized, served as evidence to his detractors of the king's presumed philo-Semitism, a quality almost as objectionable as his cruelty.

From the early days of his reign, Pedro also had to contend with an endemic feature of Castilian medieval politics, a restless and rebellious aristocracy. In his particular case, the situation was aggravated by the existence of a rival group of wealthy and influential individuals composed of the bastard children of Alfonso XI and his mistress Leonor de Guzmán, their allies, and retainers who challenged Pedro's authority almost from the beginning of the reign. Pedro reacted to these challenges in an increasingly suspicious and retaliatory manner.

In 1353 Pedro married the French princess Blanche de Bourbon and abandoned her two days after the wedding. It is likely that Blanche's sponsor, the

French crown, was not able to fulfill the financial obligations of the marriage contract, and that Pedro left her for that reason. The more popular yet unverifiable reason given to explain the king's actions states that he abandoned Blanche because he could not bear to be away from the woman he loved, María de Padilla, whom he had met in 1352.

Whatever his motives, Pedro's refusal to cohabit with Blanche served to alienate his mother and Alburquerque, the principal architects of the marriage contract with the French, and gave his half-brothers a pretext for rebellion. As the minister and the bastards became allies, they were joined by other prominent Castilians displeased with the king's behavior. Outnumbered, Pedro gave himself up to the rebels at Toro only to escape after a month to begin a slow but successful campaign against them. With the capitulation of Toledo in 1355 and Toro in 1356, the main centers of antiroyal activity, Pedro succeeded in defeating the first serious challenge to his authority.

Shortly after this victory, Pedro went to war against Aragón, seeking redress over several territorial and dynastic grievances. Pedro IV was soon joined by Enrique de Trastámara, who had escaped from Castile before Pedro's victory at Toro, and other Castilians who had fled fearing the king's justice while Pedro counted on the support of Pedro's hated half-brother Ferrán. Pedro experienced several successes at Tarazona (1357); Guardamar (1359); Calatayud (1362); Teruel; Segorbe and Murviedo (1363); Alicante, Elche, Denia (1363), and Orihuela (1365); but he was never able to win a decisive victory. Several truces and peace efforts mediated by papal legates did not succeed in bringing a lasting peace between the two kingdoms.

Meanwhile, from the conspiracy at Toro onward Pedro had turned increasingly against those he suspected of treason. He eliminated many of his former allies; several of his half-brothers, among them Fadrique; and his aunt Leonor and her son Juan, and he was believed responsible for the death of his wife Blanche in 1361.

Pedro's policies, Enrique de Trastámara's ambitions, Pedro's predicament, and even the politics of Navarre all contributed to the participation of the French in peninsular affairs, beginning in 1360. The French crown agreed to sponsor Enrique's ambitions by commissioning Bertrand du Guesclin and an army of mercenaries to fight in Castile. When they entered the kingdom in 1366, Pedro was forced to flee in search of outside help, which he finally secured from Edward the Black Prince in Bordeaux. The ensuing battle at Nájera on 13 April 1367 was a resounding, albeit short-lived, victory for Pedro. His alliance with the English collapsed when the Castilian would not meet the terms

of their agreement and, as the Black Prince's troops withdrew from the peninsula, Enrique and Guesclin returned in 1368 and received the support of several important regions.

Pedro determined to meet his enemy in the vicinity of Toledo. At the Battle of Montiel on 14 March 1369 Enrique and the French soundly defeated Pedro's scattered army. Pedro, who had fled to a nearby fortress, tried to buy his freedom from Guesclin. Some days later, believing that the French captain had accepted his terms, Pedro went to Guesclin's tent where, within a few minutes, Enrique arrived. He killed Pedro with a dagger, after a short struggle on 23 March 1369. Through this fratricide Enrique became uncontested king of Castile, a title he began to use when he first entered the kingdom alongside the French in 1366.

In addition to his marriage to Blanche de Bourbon, Pedro is said to have married María de Padilla—at least he claimed this following her death in 1361 in order to declare their four children (three daughters and a son, the youngest) legitimate heirs to the throne. Shortly after his marriage to Blanche, he had also wed Juana de Castro, but this marriage was just as ephemeral as his first and left no children. Eventually Pedro's line returned to the Castilian throne when his granddaughter, Catherine of Lancaster, daughter of John of Gaunt and Pedro and María's second daughter Constanza, married the future Enrique III of Castile.

PEDRO III, KING OF ARAGÓN

Pedro III the Great, Pere III of Aragón, Pere II of Catalonia, Pere I of Valencia, and Pere I of Sicily (1240–1285), “was the troubadour-warrior ruler of the realms of Aragón (1276–1285) and liberator-conqueror of Sicily. He was born at Valencia, two years after that Islamic city fell to his father Jaime the Conqueror, of Jaime's second wife Violante of Hungary. Jaime named him heir to Catalonia in 1253, procurator or vice-regent there at seventeen in 1257, and—at the death of Jaime's son Alfonso by his first wife in 1260—procurator of the Catalonia, Aragón, and Valencia realms. (Pedro's brother Jaime became procurator of the Balearics, Roussillon, and Cerdanya.) In 1262 Pedro married Constance, the daughter and heir-

ess of Manfred, the Hohenstaufen ruler of Sicily-Naples. Besides four sons and two daughters by his mistresses María and Agnés Zapata, he had four sons (including his successors Alfonso II and Jaime II, and Frederico III of Sicily), and two daughters (Queen Violante of Naples and Isabel Queen of Portugal).

Although his formal reign lasted only nine years versus his famous father's sixty-three, the Infante Pedro enjoyed a fifteen-year public career as procuratorial co-ruler and soldier before his coronation. He restored feudal order as a teenager, plunged into Mediterranean Ghibelline politics during negotiations for his marriage, championed Occitan refugees after such troubles as the 1263 Marseilles revolt, captained the first phase of the Murcian Crusade in 1265–1266, replaced his father at home during Jaime's abortive Holy Land Crusade in 1269 (and intervened in the Urgell wars of 1268), and prepared an invasion army to seize Toulouse in 1271. Relations with his father deteriorated in 1272, with Pedro stripped of all offices and revenues; reconciliation came the following year. When the northern Catalan nobles revolted, Pedro captured and drowned their leader, his bastard brother Ferran Sanxis. During a diplomatic visit to Paris, he met Philippe the Bold. His greatest test came in 1275–1277, when the Mudéjars of Valencia with Maghribian support revolted and nearly recovered their land. Pedro had one thousand horsemen and five thousand foot soldiers at first, but soon had to assume the entire responsibility when his father died on the field (27 July 1276). Burying Jaime provisionally at Valencia and deferring his coronation at Zaragoza to 17 November, Pedro grimly set about conquering much of Valencia “a second time,” as the contemporary memoirist Ramón Muntaner puts it. Meanwhile his brother Jaime II of Mallorca received the Balearics, Cerdanya, Montpellier, and Roussillon.

With the Mudéjar headquarters at Montesa castle fallen (September 1277), Pedro began a vigorous domestic and international program. He demanded tribute from Tunis, harrying it through his admiral Conrad Llança, pressured Jaime II of Mallorca into accepting vassalage, and moved strongly against the still-rebellious northern barons, ending their six-year war by his siege of Balaguer (1281) and winning their support by his clemency. By holding as “guest hostages” the Infantes de la Cerda, he dominated the Castilian succession crisis. His negotiations with Philippe the Bold at Toulouse in 1281, and his treaties of Campillo and Ágreda with Alfonso X and the Infante Sancho of Castile that year, stabilized his peninsular situation. He established understandings with Byzantium, England, Genoa, Granada, Portugal, and the papacy, and was finally ready for his life's coup: to foil the Angevin

power that had absorbed Occitania and taken over Sicily-Naples, and to assume the Hohenstaufens' Sicilian kingdom and Ghibelline leadership in the western Mediterranean.

Massing his naval and military strength, he simulated a crusade against Tunis, actually taking Collo there; the pope refused crusade title or aid. Previously in contact with the Sicilians, Pedro now supported the Sicilian Vespers revolt of 30 March 1282. He moved eight hundred knights and fifteen thousand foot soldiers by sea to Trapani, receiving the crown of Sicily-Naples at Palermo and starting a twenty-year war. A succession of naval victories by his admirals, especially Roger de Llúria, established the Catalans as the dominant maritime power of the western Mediterranean after Genoa. Besides Sicily and much of the Italian mainland, Pedro also took Malta and Tunisian Djerba island.

Meanwhile Pope Martin IV, feudal lord of Sicily and proponent of its Angevin king Charles of Anjou, excommunicated Pedro in November 1282, deposed him in March 1283, and transferred all his realms to the son of Philippe the Bold of France, Charles of Valois, in February 1284. The Catalans supported their king, but the Aragónese had been ill-disposed toward the Sicilian adventure from the start. In that long and bloody war, one episode stands out—the Challenge (*desafiament*) of Bordeaux. Anjou offered to settle the war by personal combat with Pedro, but instead arranged a trap for his arrival at English Bordeaux; Pedro still appeared, met the challenge, and escaped, to the edification of Europe's chivalric classes (1283). More formidably, a papal crusade to set Valois during Pedro's reign saw an army of 118,000 foot and 7,000 horse under Philippe the Bold sweep into Catalonia. Pedro delayed this greatest army since ancient Rome at Girona until Llúria's fleet from Sicily could arrive to destroy the French naval flank and logistics, ending the invasion (September 1285). Pedro suppressed a plebeian revolt in Barcelona under Berenguer Oller that same year, negotiated a major commercial treaty with Tunis, and mounted a punitive amphibious expedition against his traitorous brother on Mallorca, but died on the road to join the fleet.

The contemporary memoirist Bernat Desclot calls Pedro "a second Alexander" for his generalship. Dante lauds him as "the heavy-sinewed one [who] bore in his life the seal of every merit"; and he appears both in Boccaccio's *Decameron* and Shakespeare's *Much Ado about Nothing*. Pedro was a troubadour (two of his poems survive) and their patron. He presided over a constitutional revolution (Aragón's Privilege of Union, Catalonia's *Recognoverunt procures* annual parliament) in 1283–1284. He stabilized coinage with his

silver croat, and maritime law with his restructured *Llibre del Consolat* (1283). He protected Jews and gave them important posts in his administration. As a politician and diplomat he is thought superior to his great father, and he presided over a commercial, literary, and architectural flowering in Catalonia.

PEDRO IV

As a product of the new court system ushered in with the Crown of Aragón by Jaime II (1291–1327), Pedro IV was a strange mixture of intellectual brilliance, emotional aloofness, and cruelty. Born in 1319 to a weak father, Alfonso IV (1327–1336) and a strong-willed mother, Teresa Entenza, the prince, feeble and rickety at birth, spent most of his early life in the care of wet nurses. When his mother died in 1329 to be replaced by his father's second wife, Leonor of Castile, the isolation of the young prince seemed to deepen. Despite this emotional upheaval, Pedro attained an excellent education. This conflicting background made Pedro into a man of keen intellect, but with an absolute lack of scruples. A nagging sense of inferiority to such figures of the great reconquest as Jaime I (1213–1276) drove Pedro to accomplish great deeds. The psychological labyrinth of his adolescence informs the long series of foreign and domestic struggles he engaged in, as well as the tragic atmosphere that hung over his personal life.

Pedro's foreign policy was openly motivated by a desire to consolidate his loosely connected realms. Inheriting a number of Mediterranean outposts, he methodically moved to gain clear titles to the Duchy of Athens (1354) and Sicily (1373). Sardinia, however, remained a battle zone that he would never subordinate, despite immense military expenditures and operations. As is evident from the lingering wars in the 1360s and 1370s, Genoa, Catalonia's principal rival in the region, was not prepared to easily accede to this phase of Pedro's aggrandizement.

The most violent response to this Mediterranean policy came not from foreigners but from Pedro's relative, Jaime III of Mallorca (1324–1343). With the death of Jaime I in 1276, the Balearic Islands and certain Pyrenean and southern French holdings were sepa-

rated from the Crown of Aragón and made into the Kingdom of Mallorca. Though ruled by brothers and then cousins, the two realms became economic rivals and dealt very difficultly with the French: the Mallorcans seeking accommodation with the French monarchy, and the Aragóense harboring undisguised antipathy for it. Even when they became in-laws, the hatred between Jaume III and Pedro was palpable and came to the fore in 1341 when the Mallorcan dynasty was locked in a dispute with France over the rights to Montpellier and Jaume neglected to go through the formality of accepting Pedro (his junior) as his overlord. Pedro quickly moved to declare Jaume a traitor and in 1343–1344 conquered the Balearics and the Pyrenean counties, largely leaving the rest to the French. Though pressing their claims for decades to come, Jaume and his successors would remain ever afterward kings without a kingdom.

Even while the memory of his victory against his cousin lingered, Pedro quickly became entangled in a disastrous war with Castile, the War of the Two Pedros (1356–1367). Though Aragóense relations with Castile had generally been unfriendly for decades past, the war began in the fall of 1356 with the Catalan capture of two Genoese vessels. Allied to Genoa, the Castilian king, Pedro I (1350–1369), declared war on the Crown of Aragón. For the next two years, the Castilian king, principal enemy to Pedro IV, ravaged Valencia and Catalonia, even threatening Barcelona in 1359. When this spurred an Aragóense counterattack on Castile in 1360, the Castilian king agreed to peace at Terrer in May, 1361. Arranging an alliance with Granada, Pedro I started hostilities once more some two months later and by September had captured the Aragóense border town of Calatayud. Pedro IV's new alliances with King Charles the Bad of Navarre and Pedro I's half-brother, Enrique de Trastámara, allowed him to consistently outman his rival, who would soon be occupied with a much more pressing matter—an escalating civil war with his half-brother (1367–1369) which ultimately cost his life.

The unstable record of Pedro IV's foreign wars was reflected in his intrigue-ridden court and the growing opposition his government engendered within his own realms. The royal household was a hotbed of factionalism and favorites. In the first half of Pedro's life, it was dominated by Bernat de Cabrera. Scion of an important Pyrenean clan, Cabrera's advancement in the late 1340s marked the emergence of a strong group of middling nobles, the Roussillon faction. Though surely the most talented of Pedro's advisers, Cabrera quickly gained powerful enemies, such as Queen Leonor of Sicily and the royal uncles Pedro and Ramón Berenguer, who conspired to undermine his position.

Sacrificed to Pedro's insatiable distrust, Cabrera was executed for treason in 1364. The dominant figure in Pedro's last years was his fourth wife, Sibilia de Forcia who used bribery and intimidation to establish a stranglehold over the court. The principal victim of Sibilia's regime was the crown prince, Juan, and his young wife, Violante de Bar, who endured one indignity after another until his accession in 1387.

Pedro's policies and the expense they caused had violent repercussions through eastern Spain. The scale of change to royal government and succession infuriated the Aragóense and Valencian barons who gathered at Zaragoza in the summer of 1347 to register their disfavor with the establishment of yet another union. When the king was slow in acceding to unionist demands, war loomed. Though delayed for some months by the intrusion of the Black Death into the Iberian littoral in early 1348, the struggle reached a critical point at Epila (21 June 1348) where the royalist forces emerged victorious. Pedro symbolically ended the historical importance of the *Unión* by burning all its privileges and smashing the seals which had given them legal validity. While Epila was a victory for royal sovereignty, Pedro's profligate spending in the second half of his life ironically undermined his power and endowed great autonomy on his parliaments (*cortes*) which largely took over the logistical and fiscal aspects of his later wars. Because of this, the parliament in all his realms became full-fledged institutions, whose executive committees (*Diplutació del General, Generalitat*) attained a permanent existence.

Pedro IV died at Barcelona on 30 December 1387. He had been married four times: to María of Navarre (1334), Constanza of Sicily (1347), Leonor of Sicily (1349), and Sibilia de Forcia (1377). The third union produced the princes Juan and Martín, the last sovereigns in the Barcelona line. Known by historians as Pedro the Ceremonious for his wholesale changes to court protocol and de la Punyaleit (of the dagger) for the dagger he used to hack apart unionist documents after Epila, Pedro IV was a pillar of the Barcelona dynasty whose life extended its greatness, but also clearly presaged its demise.

PEDRO MÁRTIR

Pedro Mártir (Pietro Martire d'Anghiera, Petrus Martyr; 1457–1526) was a humanist, letter writer, historian, and one of the most important classical scholars to be invited to Spain from Italy during the early Renaissance period. Born in Arona near Anghiera on the shores of Lake Maggiore, he completed his education in Rome. Íñigo López de Mendoza, the second count of Tendilla (and Santillana's grandson), persuaded him to come to Spain in 1487. He visited Zaragoza, Salamanca, and Granada as a tutor to the highest nobility and became acquainted with Arias Barbosa, Elio Antonio de Nebrija, and Marineus Siculus. He entered Queen Isabel's service in 1501 as chaplain and in the same year was sent as royal envoy to Egypt to discuss the spice trade and other mercantile interests. The rest of his life was spent in court as tutor, member of the Council of Indies (1518), and chronicler of the Indies (1520), which gave him access to material brought back by explorers. He became friendly with Carlos V, and this brought him many patrons, like Adrian of Utrecht, later Pope Adrian VI. Like Marineus, he used his acquaintances to further his career, and entered the Church for the same purpose. He was buried in the cathedral of Granada. He was a more prolific letter writer than Marineus. His *Opus epistolarum* was published posthumously (1530). It contains over eight hundred letters covering the years 1488–1525, and addresses major noblemen and churchmen in Spain and Italy. In the letters describing Columbus's arrival in the Caribbean, he is supposed to have used for the first time the expressions "New World" and "Western Hemisphere."

Pedro Mártir is best known for his historical works. *Legatio Babylonica* is the fruit of three reports of his visit to Cairo, which he dedicated to Francisco Jiménez de Cisneros (1511). The first decade of the famous *De orbe novo* was probably completed around 1501; a revised edition was supervised by Nebrija and published in Alcalá de Henares in 1516. The complete ten decades was issued in Alcalá in 1530. Its importance can be calculated from the fact that an unauthorized Italian version of the early part was published in Venice in 1504. Mártir's classical training transforms the New World into the land of the Golden Age, idealizing the Indians and recognizing the legitimacy of their society; he omitted all accounts of atrocities. Modern scholarship has recognized the value of Mártir's

work, dismissed by nineteenth and early twentieth-century writers as fantasy or facile journalism.

PEDRO AFONSO, CONDE DE BARCELOS

Great-grandson of Alfonso el Sabio and son of the poet-king Dinis of Portugal, Pedro, Conde de Barcelos (c. 1280–1354), is remembered as the man who established a distinctive historiographic tradition in Portugal. One of several illegitimate sons of Dinis, Pedro enjoyed favorable treatment by his father until a rift in the royal family caused his exile in 1317, when he went to Castile. His return to Portugal in 1322 was to help Dinis's son Afonso in rebellion against his father, a dispute that continued sporadically, facing Pedro with conflicts of loyalty until the king's death in 1325. Afterward, under Afonso IV, Pedro lived on his own estates, becoming involved outside only in major events like the defense of Portugal against Castile in 1336, and the joint struggle against the Marinids in 1340.

Like many contemporaries, Pedro wrote *cancionero* poetry. Five love poems and six *cantigas d'escarnio* survive. His will of 1350 confirms this interest, as he bequeathed to Alfonso XI of Castile "o meu livro das cantigas," probably a compilation of poems by contemporaries. A taste for compilation is shown in Pedro's best known and more innovative projects, composed in his later years. *Livro das linhagens* is a genealogical work, using a number of sources to create a history of Portuguese royalty and nobility that gives them an honorable and legitimate place in an Iberian, and partly wider, continuum. Similarly, *Crónica geral de 1344* places the history of Portugal in context. For it, Pedro used various sources such as genealogical material, including *Livro das linhagens*, an Arabic text translated into Portuguese, and a chronicle based on the Alphonsine tradition, to construct his own history to the battle of El Salado. The *Crónica* is inconsistent in form, but it is a landmark in Portuguese historiography and Pedro's finest monument.

PEDRO, CONSTABLE OF PORTUGAL

Pedro of Portugal (1429–1466), as Constable of Portugal and Master of Avís (1443–1446) and “intruder” king of Aragón and Catalonia (1463–1466) embodies a cultural unification of three Christian Iberian kingdoms. Son of Dom Pedro de Avís, Regent of Portugal, he received an excellent education grounded in Italian humanist ideals via the *Prohemio e carta* from the Marqués de Santillana, considered the first literary history in Castile.

After the death of his father (1449), Pedro fled to Castile where he was welcomed at the court of Juan II and where he completed three works in Castilian representative of then current literary genres and themes. *La sátira de infelice e felice vida* (1450–1453), written in an alternation of prose and verse, is a “sentimental novel” that incorporates elements from Latin rhetoric and allegory, and biography, and includes reflections on the character of women and the subtleties of courtly love. *Las coplas del menosprecio e contempto de las cosas ferosas del mundo* (1453), written as a reaction to the untimely deaths of Don Álvaro de Luna and members of Pedro’s own family, is a reflection on the mutability of life and fortune, and the need for Stoic morality in the face of misfortune. *La tragedia de la Insigne Reyna Doña Ysabel* (1457), written in response to the death of his sister, Queen Isabel of Portugal, is the first tragedy so entitled in Castilian and is informed by the medieval concept of tragedy as basically the fall of princes. An innovative composite for Castile of several genres, including tragedy, consolation, elegy, and dream vision, the *Tragedia* focuses on the author’s personal lament, situating the queen’s death within the context of the family’s other famous figures and emphasizing the political influence and fame of Pedro’s relations. Influences from Seneca, Boethius, Dante, Petrarch, Boccaccio, and the Marqués de Santillana are discernable throughout the text.

Upon his return to Porgual in 1457, Pedro’s titles and privileges were restored. As the only grandson of the last Count of Urgell, he was offered the kingdoms of Aragón and Catalonia in 1463 by the Generalitat of Barcelona as part of its revolt against the legitimate heir Juan II of Navarre and Aragón—thus his title of “intruder king” in Catalan history. It has been argued that Pedro’s fame as an intellectual figure was instrumental in his selection as king, thus demonstrating the growing significance of arts and letters in the political arena. He remained in power for almost three years.

After several military defeats he died—most likely poisoned—in 1466 at the age of thirty-five.

PEDRO, DUKE OF COIMBRA

Son of João I and Philippa of Lancaster, Pedro (1392–1449) was the second in succession to the throne of Portugal. In 1429 he married Isabel, daughter of Jaime II of Aragón, and had six children by her. He fought alongside his brothers and his father in the assault on Ceuta (1415) and, on his return to Portugal, was made a duke by João I. He was a well-educated man with strong humanistic leanings. At his request, the humanist Vasco Fernandes de Lucena translated into Portuguese the panegyric of Trajan by Pliny the Younger. Between 1433 and 1438, Pedro translated into Portuguese *De Officiis* by Cicero. With the assistance of his confessor, he also produced a version of Seneca’s *De Beneficiis*, a work composed intermittently between 1418 and 1433, and enlarged it with his own comments and reflexions. The book closes with a beautiful allegory about the order of the universe and its relations with a hierarchical society.

King Duarte died 19 September 1438, leaving his six-year-old son Afonso V as successor. As he was underage, Pedro was chosen by the *cortes* (Parliament) of Lisbon (1439) as regent and protector of the realm. The regency (1440–1446) was a brilliant period for Portugal. Pedro favored the plans of maritime expansion promoted by his brother Henrique, and in six years, 198 leagues of the West African coast were explored. He strengthened the power of the crown and promoted the publication of the *Ordenações Afonsinas* (1446), the first Portuguese civil code, which broke the medieval mold of the country. Pedro developed a policy that furthered the interests of the merchants. Fearing for its privileges, the old nobility pushed Afonso V into a military confrontation with Pedro, who was killed in the battle of Alfarrobeira (May 1449).

PEDRO, INFANTE OF CASTILE

Pedro, Infante of Castile, (1290–1319), son of Sancho IV of Castile (1284–1295) and María de Molina, was regent to Alfonso XI (1312–1350). During the minority of his brother, Fernando IV (1295–1312), María de Molina left Pedro nominally in command of Valladolid to guard it against the attempt by Jaime II of Aragón and Infante Juan to dispossess Fernando in 1296. Pedro later acted as *mayordomo* to Fernando, but as an adult he was primarily a warrior. His mother arranged a diplomatic marriage for him with María de Aragón, daughter of Jaime II, in 1311. They had no surviving children. Upon the death of Fernando in 1312 Pedro proclaimed Alfonso XI as king, and at first supported Fernando's widow, Constanza, as regent, but soon switched alliances to favor María de Molina. The faction surrounding Constanza, which included the infantes Juan and Felipe, refused to recognize Pedro as regent. After Constanza died in 1313 Pedro, Juan, and María de Molina were designated regents by the Concord of Palazuelos (1 August 1314), confirmed by the *cortes* (parliament) of Burgos in 1315. Most of Pedro's activities as regent focused on military affairs to continue the Reconquest and to subdue noble dissension. Immediately after Fernando's death Pedro had tried to continue his brother's campaigns against Algeciras. He later became involved in the war with Granada, and by 1316 he and his forces advanced almost to the city of Granada and later occupied Tiscar. In 1319 he and his coregent, Infante Juan, made plans for a great campaign on the plains of Granada where the two died in battle on 25 June 1319. Their deaths caused major disruptions in the kingdom—disruptions that lasted until Alfonso XI came of age.

PELAYO, BISHOP OF OVIEDO

Appointed bishop in 1101 or 1102, Pelayo continued in that see until deposed by the Council of Carrión of

February 1130, apparently at the behest of Alfonso VII of León-Castile. Pelayo appealed his deposition and Pope Innocent II suspended his successor in that office, one Bishop Alfonso. After the death of the latter in 1141, Bishop Pelayo was again named as bishop of Oviedo in private documents of the years 1142–1143 but not in any royal ones. The royal actions were doubtless related to the continuing revolt and civil war in the province of Asturias, although the extent of the involvement of Pelayo in the resistance to royal authority there cannot be determined at present. At the Council of Valladolid in September 1143 the see of Oviedo was newly filled by a Bishop Martín. Nevertheless, according to the calendar of the cathedral of Oviedo, Bishop Pelayo lived until 28 January 1153.

Pelayo had been a court figure during the latter part of the reign of Alfonso VI of León-Castile (1065–1109) and was the chief biographer of that monarch. The (brief) biography appears as the final portion of his continuation of a series of earlier chronicles. The bishop was also an enthusiastic promoter of the dignity and prerogatives of the episcopal see of Oviedo at a time when the spectacular growth of the pilgrimage to Santiago de Compostela was threatening the established position of other episcopal seats and also when the general reorganization of the Church of León-Castile was resulting from the very success of the Reconquest. To further the cause of his church, the bishop is credited with an elaborate series of forgeries of documents, both royal and private.

There are indications that Pelayo was himself of Leonese rather than Asturian origin. While his career before his appointment to Oviedo cannot be presently traced, he was certainly at least a minor court figure in the time of Alfonso VI and continued to be important during the reigns of Urraca (1109–1126) and that of Alfonso VII (1126–1130) before his deposition at Carrión.

PELAYO, KING OF ASTURIAS

Pelayo (r. 718/9–737) was the first ruler of an independent Christian realm in Asturias after the Arab conquest in 711. According to the earliest records, Pel-

ayo was of Visigothic origin—by some accounts of royal stock, by others the royal swordbearer or *alférez*. Fleeing into the mountains of Cantabria sometime during the collapse of the Visigothic kingdom, he organized local resistance there. When this achieved such substance as to attract the attention of the Muslims, Pelayo defeated an Islamic force led by a general named Alkama, accompanied by a Christian bishop of Seville named Oppa, at Covadonga in 718–719. This mountain cave is near Cangas de Onís, about sixty-five kilometers east of Oviedo, and on the edge of the Picos de Europa, the highest portion of the Cantabrian chain of mountains. The battle is generally celebrated as the first victory in the struggle to reclaim the Iberian Peninsula for Christianity and the founding of the Spanish kingdom. The cave at Covadonga is now a national shrine.

PEÑAFORT, RAMÓN DE

Ramón de Peñafort (c.1180–1275) was the greatest canon lawyer of his century, third master general of the Dominicans, and architect of the century's novel program for proselytizing Muslims and Jews. Born at his father's castle or seignorial residence of Peñafort at Santa Margarida del Penedès, Ramón presumably received his arts education at the cathedral of Barcelona, where he became a cleric and *scriptor* in 1204. A decade later he undertook legal studies at the University of Bologna and subsequently taught there. By 1223 he was back at Barcelona Cathedral as provost canon of its chapter. He soon left all to become a Dominican mendicant, presumably at Barcelona's Santa Caterina priory. He is thought to have assisted Cardinal Jean d'Abbeville, the papal legate, in his travels across Spain beginning in 1228 to reinforce the reforms of the Fourth Lateran Council; he was certainly at Zaragoza in 1229 to decide the annulment of the marriage between Jaime I and Leonor of Castile. In 1230 he was called to Rome as papal chaplain and confessor. Pope Gregory IX commissioned him there to construct the *Decretals*, promulgated in 1234; with Gratian's *Decretum*, this systematization of a century's laws in some two thousand sections remained the code of the church until the twentieth century. Ramón then refused the metropolitanate of Tarragona, and in 1236 returned to the Barcelona priory. Continuously involved in important canonical cases there, he was active at the parlia-

ment (*corts*) of Monzón in 1236, was delegated to lift the papal excommunication from Jaime I (whose friend and counselor he was), and became involved in the dismissal of Tortosa's bishop and the provision of Huesca's and Mallorca's bishops. The Dominican chapter general elected him head of the order in 1238. He left a lasting mark especially by his revision of their constitutions and his integration of the order's nuns before suddenly resigning in 1240.

Returning to Santa Caterina priory, he spent the next thirty-five years there on massive missionary projects and in most of the Crown of Aragón's religious crises. He was active against heresy, persuading King Jaime to allow the Inquisition; he was regularly counselor to the king; and he adjudicated important public quarrels. Ramón's main preoccupation was with the founding of language schools for intrusive missionary disputation with Muslims and Jews, and with devising a program of persuasive confrontation and handbooks of polemical argumentation. He opened an Arabic language and disputation center at Tunis in 1245 and at Murcia in 1266. He persuaded Thomas Aquinas to construct his masterwork, *Contra gentiles*, for these missions.

Through the school centers, compulsory sermons in mosques and synagogues, the public disputation of 1263 in Barcelona, censorship of rabbinic books, and the aggressive labors of Dominicans like Pau Cristià and Ramon Martí, Ramón helped turn Mediterranean Spain into a stormy laboratory for the new rationalist-confrontational missionary methods. This was part of the wider mendicant effort to convert India, China, and Islamic countries by polemical dialogue. Jeremy Cohen argues for an even more revolutionary orientation in Ramón's vision: a conviction that Talmudic Judaism was antibiblical, depriving Jews of their right by Christian teaching to practice their faith in Christian lands. Contemporary hagiographers stress instead Ramón's mission to the Muslims of Spain, and he himself reported euphorically on the successful conversion of many. The roots of these movements, and the inevitability of their ultimate failure, have been more recently discussed by authors such as Robert Burns, Jeremy Cohen, and Dominique Urvoey.

Throughout all his activity in public life, missionary disputation, or Dominican administration, Ramón remained a scholar on the cutting edge of Roman and canon law. His legal publications multiplied from the start of his career at Bologna to his last year of life in Barcelona. The writings circulated throughout Europe and had immense influence. The most important were his *Summa iuris canonici*, written at Bologna; his *Summa de casibus poenitentiae* (or *Summa de confessoribus*), written in 1222–1225 but redone in

1234–1236; his *Decretales*, written between 1230 and 1234; and the Dominican constitutions. Some sermons and letters, as well as legal responses (*dubitalia*) survive. The *Decretales* had as great an influence on national codes, like Alfonso el Sabio's *Siete Partidas*, as his confessors' handbook had on the ethical and behavioral life of Christendom. Though a Tarragona Council presented a special report and petition for his canonization in 1279, that honor came only in 1601.

PEÑALOSA, FRANCISCO DE

Classed by Cristóbal de Villalón as a musician who exceeded even the "inventor of music," Apollo, Peñalosa (c.1470–1528) outdistanced every Spanish composer of his generation in gaining court and papal favors. On 11 May 1498 Fernando V appointed him a singer in his chapel choir. Thanks to royal request, Peñalosa was named on 15 December 1505 to a vacant canonry in Seville Cathedral. Only a month later papal bulls arrived at Seville naming an Italian Cardinal, Raffaele Riario, to the canonry, but on 28 September 1506 Peñalosa's father, Pedro Díaz de Segovia, successfully interceded before the Seville chapter on his behalf.

In 1511 he became the teacher and maestro de capilla to Fernando V's like-named grandson. The next year while residing at the royal monastery of San Pedro de Cardeña (near Burgos) he corresponded in elegant Latin with the humanist Lucio Marineo, who saluted him as "prince of musicians" ("musicorum princeps"). Despite occasionally attending Seville Cathedral chapter meetings, Peñalosa continued uninterruptedly in royal service until 1516, the year of Fernando V's death on 23 January.

Following several months residence at Seville, Peñalosa in 1517 responded to Pope Leo X's summons to Rome, where he enjoyed the highest marks of favor until Leo's death on 1 December 1521. Thereafter he resided continually at Seville, where on 24 March 1525 he rose to the position of cathedral treasurer and on 2 April 1527 saw his nephew Luis de Peñalosa appointed a canon.

Peñalosa's complete works include six masses and part of a seventh (written cooperatively with Pedro Fernández, Pedro de Escobar, and Alonso de Alva, all Seville cathedral maestros), one odd-verse and five

even-verse magnificats, some thirty motets (one of which, *Sancta mater istud agas*, for four voices, wrongly attributed to Josquin Desprez, was published in Amsterdam in 1969), four hymns, a Maunday Thursday lamentation, and ten secular part-songs (the latter in the *Cancionero musical de palacio*). Peñalosa's compositions—all sacred for four voices—are the most virtuosic before Cristóbal de Morales. They survive in five locations: Barcelona, Coimbra, Madrid, Seville, Tarazona, and Toledo. All of his masses except the Marian, are based on secular tunes (*Adieu mes amours*, *El ojo*, *L'homme armé*, *Nunca fue pena maior*, *Por la mar*). In the last Agnus of the *Ave Maria Peregrina* he combines the reversed tenor of Hayne van Ghizighem's chanson, *De tous biens plain*, with the Salve Regina plainsong.

PER ABBAT See CANTAR DE MIO CID

PÉREZ DE GUZMÁN, FERNÁN

Minor noble, poet, translator, and biographer, Fernán Pérez de Guzmán (c.1377–c.1460) was descended from families that had changed sides in the civil war of Castile that led to the Trastámaran succession and prospered under the Trastámaras, like the Ayalas and the Alvarez de Toledo. His grandfather was Pedro Suárez de Toledo, chamberlain to Pedro I, and his father was Pedro Suárez de Guzmán. Fernán was nephew to the chancellor Pedro López de Ayala and uncle to Íñigo de Mendoza, Marqués of Santillana. Never politically very active, he figured first among the followers of the Infante Enrique and then in 1429 as an emissary of the young King Juan II of Castile. A few years later he joined the opposition to Álvaro de Luna, and was probably imprisoned for a short time. There is no further data on his life beyond what Alfonso García de Santa María says in his *Duodenario*, that political disturbances at court left him little time for study. He retired early to his estates in Batres, south of Madrid, and died at an advanced age in this rural retreat.

Pérez de Guzmán was in touch with the major cultural figures of his time, to whom he dedicated his compositions, most of which would have belonged to the later period of his life. The surviving library list at Batres must contain some of his books. His poetic works are in the main devotional, didactic, and allegorical with some light satire; he showed little sympathy for amorous poetry. Best known are long compositions on moral, historical, and patriotic themes, like *Loores de los claros varones de España*. He ordered translations of Seneca's epistles and Sallust's two works; one translation of importance to his biographical work is *Mar de historias*, a version of Giovanni (not Guido, as he claims) della Colonna's *Mare historiarum*, a collection of sketches of classical and biblical kings and heroes and fictional figures. Echoes of this can be found in Fernán's main work, like the choice of certain physical characteristics, reference to family links and lineage, the mixture of vice and virtue in the same person, and glosses on topics like fame, science, and letters. *Generaciones, semblanças e obras de los eçelentes reyes de España, don Enrique el terçero e don Juan el segundo e de los venerables perlados e notables cavalleros que en los tienpos destos reyes fueron* is a key text, the prologue of which illustrates an awakening critical sense in the writing of history. Like Enrique de Villena, he deplored the quality of contemporary historians of Castile who had either failed to record what was worthy in the past, or who had agreed to write flattering accounts of their princely employers. And like Villena, he demanded that a historian be a rhetorician, capable of expressing what he had witnessed, or if he had not, to use reliable sources, and that no history of a prince should be published in his lifetime, so that the author is free to express opinions. His preferred model is the history of Rome and its faithful subjects. *Generaciones* reveals traces of the Sallustian and Suetonian approach in thirty-four succinct portraits of three kings, a queen, twenty-two nobles, seven prelates, and one clerk, ordered more or less chronologically from Enrique III to Juan II. The majority are chosen because of their political importance or exemplary behavior, but the criteria of choice for minor figures are not too clear. It is possible that the author knew most of his subjects directly; he acknowledges evidence from others but makes it clear this does not imply acceptance, and he has consulted standard vernacular histories. Presentation of subjects varies in length; some are extensive, others merit only a few lines. A formal schema is evident, consisting of reference to lineage, physical characteristics (which infer a belief in the pseudoscience of physiognomy), temperament, and moral qualities. In general individuals are not seen as exemplars of particular virtues or

vices, but as an indefinite composite of both. At times personal glosses break the laconic narrative in passionate indignation at displays of princely or aristocratic self-regard, rivalry for political power, but without revealing any precise political doctrine beyond that of noblesse oblige, a well-defined dedication to the common good, and a balanced exercise of arms and letters. It is difficult to argue in favor of any humanistic impact on Fernán's cultural education. However, he is an example of many of the noble class whose reading does not include the romances of chivalry, nor does he live in the same literary world as the author of the *Crónica de don Pero Niño*. Disabused about the human condition, he affects a Senecan stoicism that counsels fortitude in the face of present adversity.

PETRONELLA OF ARAGÓN

Born 11 August 1136, Petronella was the only child of Ramiro II el Monje, king of Aragón, and Inés of Poitou, daughter of William IX, duke of Aquitaine. Although a son might better have served his need to resolve the succession crisis in Aragón, Ramiro moved swiftly to secure an advantageous marriage alliance for his daughter. Petronella was betrothed at Barbastro on 11 August 1137 to Ramón Berenguer IV (1113–1162), the count of Barcelona since 1131. According to the marriage agreement, Ramón was to govern Aragón, and the royal title was to pass to his and Petronella's children. Their marriage was celebrated at Lérida in August 1150 when Petronella had reached the minimum marriageable age of thirteen.

Her first child, Pedro, was born in April 1152 in Barcelona, but died sometime before 1158 in Huesca. Her second, the future Alfonso II the Chaste, was born in March 1157, probably in Barcelona. Other children included a second Pedro, Sancho, and Dulce. Ramón Berenguer died at Turin 7 August 1162, leaving Aragón and Barcelona to Alfonso, and placing him under the protection of Henry II of England. The lands of Besalú and Ripas were left to Petronella for her lifetime. On 18 June 1164, Petronella renounced her royal rights to Aragón in favor of her son, an act that made possible the foundation of the Crown of Aragón. She spent much of the remainder of her life in Catalonia, dying in Barcelona, 24 October 1173, at the age of

thirty-seven. She requested interment in the cathedral of Barcelona, but no remains of her tomb have survived.

PETRUS HISPANUS BONIENSIS

Known also as Petrus Hispanus the Elder to distinguish him from another Petrus Hispanus known as the Younger, he was a decretist and glossator of Gratian's *Decretum* whom William Durandus cites with admiration in his *Speculum iudiciale* (c. 1275). Between 1193 and 1198, Petrus wrote an extensive set of glosses to Bernard of Pavia's *Compilatio prima*, the earliest of the *Quinque compilationes antiquae*. Although no complete text of these glosses survives, their detail and complexity can be perceived through many decretalist commentaries that rely on them. They consist largely of clarifications of Roman law procedure. Petrus had studied with Azzo, one of the great glossators of Roman law.

Documents from the 1220s refer to Petrus Hispanus, the Younger. He was the author of *Notabilia ad Compilationem quartum* (after 1215) and two small expositions on Roman law known as *De ordine iudiciorum*. Many of his contributions were incorporated into the works of Bartolo de Sassoferrato, one of the great legal authorities of the Middle Ages.

PETRUS HISPANUS PORTUGALENSIS (PEDRO JULIANO REBOLO OR REBELLO)

He was born at Lisbon before 1205 and was the son of one Julianus. Petrus died at Viterbo, Italy, on 20 May 1277. He is the Petrus Hispanus quoted by Ugolino of Orvieto in his *Declaratio musicae discipline* (c. 1430). From 1220 to 1229 he studied at the University of Paris. He visited the north of Spain c. 1231. After

stays in Toulouse and Montpellier, he taught medicine at Siena, Italy, between 1245 and 1250. In 1250 he was elected the archbishop of Braga. From 1272 to 1276 he was court physician to Pope Gregory X at Viterbo; he attended the General Council at Lyons in 1273–1274. Elected pope on 15 September 1276, Petrus took the name John XXI and died at Viterbo 20 May 1277.

Ugolino quoted tractatus 1 of Petrus Hispanus's *Summule logicales* concerning the property of sound (*Sonus igitur est quicquid auditu proprie percipitur*). According to Claude Palisca, Ugolino drew many new insights from the works of Petrus Hispanus. The popular medieval handbook *Thesaurus pauperum* has traditionally been regarded as his work, although modern editors have recently questioned his authorship.

PHILOSOPHY, CHRISTIAN

Iberia's paradoxical location in the intellectual milieu of medieval Europe substantially influenced the development of its Christian philosophy. On the one hand Iberia was a provincial area far from Paris, the cultural capital of Latin Christendom. As such it is not surprising that a great deal of Iberian philosophy was derivative and textbookish. On the other hand, the Iberian Peninsula was the arena in which Latin Christendom and the Islamic world overlapped most thoroughly and enduringly; in consequence the great minds of Iberia tended to devote their attention primarily to the important if subsidiary philosophical work of selecting, translating, and adapting great works of Arab philosophy, or to applying philosophy to religious polemic and apologetic.

Islam had not, of course, arisen during the Visigothic period, but what little philosophical thought there was between the fifth and eighth centuries in Iberia was wholly devoted, as in the rest of western Europe, to preserving those aspects of Greco-Roman thought that the great patristic writers had baptized for Christian use. Isidore of Seville (560–636) was by far the most important figure. Although he was not primarily a philosopher, but a bishop and encyclopedist, his works carefully preserve a broad, but eclectic range of philosophical ideas: Stoic ethics, Neoplatonic anthro-

pology, late-Roman dialectic. What Isidore preserved, moreover, became the common repository of philosophical ideas for all of Europe for several centuries to come: his *Etymologiae* was one of the most widely read books in Latin Christendom.

The whole of the peninsula was conquered by Arab Muslims in the second decade of the eighth century, as the eastern and southern Mediterranean coastal lands had been previously. But the response of Iberian Christians to Arab rule was in some ways quite different from that of Christians in other areas of the Islamic world. Where eastern Christians often assimilated to the Arab intellectual milieu at a fairly early date, embracing in the process the fruitful Arab philosophical tradition, the Christians of Iberia tended not to do so. Rather Iberian Christians during the first two centuries of Islamic rule rejected the Arab philosophical tradition entirely, but had little interest in Latin philosophy either, choosing instead to perpetuate in Latin the legacy of Isidore, shorn largely of its philosophical concerns. It is only in the mid-tenth century that we hear of two Arabic-speaking bishops, Reccemund and Abū al-Ḥārith, who were said to have an active interest in Arabic philosophy, but no philosophical works by either of these churchmen, if such works ever existed, survive. The only persuasive evidence we have of Arabic-speaking Iberian Christians actively engaged in the Arab philosophical tradition comes from fully two centuries later in the form of two twelfth-century fragmentary Arabic apologetic works which use, in rather simplistic ways, Arab philosophy to defend the doctrine of the Trinity. And it is notable that these two works were almost certainly written in Christian-controlled northern Spain and under the influence of contemporary Latin thought.

The incremental conquest of al-Andalus by Iberian Christian kings in the High Middle Ages resulted in the incorporation into their kingdoms of enormous numbers of non-Christians. But at the same time, the cultural and spiritual energies of Latin-Christian civilization were flowing into all Christian-controlled Iberia in ever more intensive ways. The effects of these two circumstances on Iberian Christian philosophy in the High Middle Ages were manifold. The twelfth-century Latin fascination with the philosophy and science of the Arabs brought northern European intellectuals such as Gerard of Cremona to the Christian-Muslim frontier in Iberia where they translated important Arabic works into Latin. These immigrant masters were joined by native translators, such as Domingo González or Gundisalvo (d. after 1181), who likewise contributed heavily to this translation project. As a result, scores of Arabic philosophical works found their way into Latin versions, and the story of the enormous influence of

these Latin translations on the great scholastic thinkers requires no retelling here. However, some of these twelfth-century translators, most notably Gundisalvo, were creative philosophers in their own right. As Etienne Gilson has pointed out, Gundisalvo was the first philosopher of Latin Christendom to integrate aspects of the Neoplatonized Aristotelian philosophy of the Arabs into his Latin writings. In his *De divisione philosophiae* Gundisalvo anticipates the practice of the great thirteenth-century European universities by recommending the inclusion of Arab-Aristotelian physics, psychology, and metaphysics among the traditional studies of the quadrivium. His *De processione mundi* is a distinctly Avicennan inquiry into the doctrine of creation.

Gundisalvo, therefore, had been both truly philosophical in his interests and notably innovative as well. No thinker of this stripe could be found in Iberia in the thirteenth century. Rather, Iberian philosophers of that century tended to depend on northern-European thought, while the more innovative souls were not primarily philosophers or, at least, did not make their greatest contributions in the area of philosophy. Both the Dominican Bernardo de Trilla (d. 1294) and the Franciscan Gonzalo de Balboa (d. 1313) exemplify the former tendency in closely recapitulating the thought of Thomas Aquinas and Duns Scotus, respectively, and most of the other Iberian philosophers of the thirteenth century did likewise. The greatest Iberian scholastic philosopher of this age was surely Pedro Hispano (1226–1277) whose *Tractatus* eventually became the standard logical manual in the universities. Although it is a textbook that he is most remembered for, however, this handbook is itself a work of brilliant concision and clarity. Moreover, he had wider philosophical interests as well, though these are little understood since his other works have been insufficiently studied.

On the other hand, in the towering thinkers of this age, philosophy was the handmaid that served other, more deeply felt purposes. Ramón Martí's (c. 1230–1286) well-schooled Thomism was but an ancillary tool in religious polemical works such as the *Pugio fidei*, his preferred instruments being scriptural, exegetical, and historical arguments arising from his intimate familiarity with the Hebrew-Aramaic *Talmud*, and the Arabic *Qu'rān* and *Ḥadīth*. Arnau de Villanova (c. 1235–1312), physician, Hebraist, Arabist, and translator, made his greatest contributions in medicine and religious reform. But in his advocacy of medical empiricism he does stand with Roger Bacon as a great, early advocate of the experimental method. Philosophical currents run far deeper in the life and work of the Mallorcan mystic, missionary, and Arabist Ramón Llull (1232–1316). Nevertheless, as many interpreters

have pointed out, “when Llull wrote on philosophy, it was not as a philosopher.” Combining, in effect, the goals of Marti and Villanova, Llull’s dominant desires were conversion of unbelievers and Christian reform. Toward this end, he fashioned a method of persuasion that he called in Catalan his *art* (in Latin *ars*, both words meaning “technique” or “method”), this persuasive art being founded upon a series of Neoplatonic philosophical ideas and nonsectarian monotheistic axioms assented to by nearly all contemporary Jews, Christians, and Muslims. In particular Llull believed, and attempted to demonstrate in more than two hundred Latin and Catalan works, that one could “find truth”—indeed that one could demonstrate such doctrines as the Trinity and Incarnation—by properly extrapolating from the widely recognized attributes of God (goodness, omnipotence, wisdom, will, truth, and so forth) that he called “dignities.” In devising his art, Llull made at least two important contributions to Western thought. First he insisted that the “dignities” be seen not only as principles of being, but also as principles of action, thereby introducing “a new category in the history of metaphysics.

His second innovation was the combinatory mechanism at the heart of his persuasive system. To derive new truths from the “dignities” one had to combine them systematically and draw conclusions. The wheels, tables, and procedural rules that Llull devised to achieve this end represented a considerable advance in the “mechanization of thought,” one that decisively influenced Gottfried Wilhelm Leibniz in the formation of his justly famous—and similarly named—*Ars combinatoria*.

There is rather little that is notable in fourteenth- and fifteenth-century thought in the peninsula. There were a number of Iberian scholastic thinkers in this age, but their works, though they have been insufficiently studied, appear rather unremarkable. The great preacher Vicente Ferrer (1350–1419) was a thoroughgoing Thomist in his philosophical works, for example, while Antonio Andrés (1280–1320), who studied under Duns Scotus in Paris and commented on the old logic, was a stout defender of Scotist realism against William of Ockham’s terminism. Though from the latter fourteenth-century on there were a number of intellectuals, such as the *converso* bishop Alfonso de Cartagena (c. 1385–1456), who had humanist interests, very little in the way of properly Renaissance philosophy was produced. Nevertheless, the most important philosopher in the peninsula in this period, the Catalan Ramon Sibiuda (d. 1436), though he was in many ways a realist follower of Llull, anticipated certain aspects of Renaissance Neoplatonism, especially in his emphasis on man as the focal point of creation.

PHILOSOPHY, JEWISH

There exists a particularly rich history of Jewish philosophy in Iberia that extends from the eleventh century right up to the expulsion of the Jews in 1492, after which its enforced move produced a significant afterlife through its influence on European philosophy as a whole. The first significant thinker was Solomon ben Yahuda ibn Gabirol (1021/2–1054/8) who produced a number of poetic and philosophical works heavily influenced by Neoplatonism. Despite the brilliance of his writing, his thought failed to win many adherents, largely due to his concentration upon Plato and his failure to address the issue that was to remain the leitmotiv of Jewish philosophy in Iberia that is, the relationship between faith and reason. Judah Halevi (c.1075–1140) also wrote a mixture of poetry and philosophy, but his theoretical works do embody an original defense of Judaism against the objections of a variety of competing ideologies, including philosophy. This came to be much discussed among Jewish philosophers, especially given the interest in Christian areas for public disputations between members of different religions. But even more important was the feeling that there is a difficulty in reconciling religion with philosophy, in particular the tradition of peripatetic philosophy, which had become so elaborately developed in the Islamic world. This philosophy came to have the status of science and modernity, and was in danger of replacing religion in the minds of those intellectuals given to theoretical inquiry.

Hence the great interest in reconciling religion with philosophy, which Aristotelians like Abraham ibn Daūd pursued, but which reached their climax in the thought of Maimonides (1135–1204). It is difficult to exaggerate the importance of Maimonides with respect to Jewish thought right up to the present time, and although political instability forced him and his family to leave Córdoba for North Africa and Egypt, he embodied the very finest elements of Iberian culture in his writings. His enduring reputation rests not only on his legal works, but also on his philosophical writings,

in particular the enigmatic *Dālālat al-ḥairīn* (*Guide of the Perplexed*). The real intentions that Maimonides had in writing this work have remained a controversy over the centuries, with most commentators arguing that he sought to hide his genuine heterodox views by the use of deliberately misleading and ambiguous language. The apparent aim of the book is to show how one can reconcile religion with philosophy, with the proviso that one must be careful not to challenge the faith of ordinary believers at the same time as one stimulates the intellectual interests of those capable of a deep philosophical understanding of the real meaning of scriptural passages.

This was very much a theme in the philosophy of Maimonides's Muslim countryman, Averroës, and formed a part of much Jewish philosophy. Certainly if we examine some of the ideas in the *Guide* that Maimonides mentions with apparent approval we are confronted with grave difficulties if at the same time one wishes to adhere to orthodox Judaism. Maimonides provides very radical interpretations of scriptural passages, which seem to have to be understood as in accordance with the sort of philosophy (*falāsifa*) produced by Al-Fārābī and Aristotle. Perhaps most radical is Maimonides's theory of language, according to which there is no relationship whatsoever between ordinary language and our language about God except insofar as the terms themselves are the same. That is, when we say that a person is wise, and when we say that God is wise, we have used the same word but should not be fooled into thinking that they describe the same, or even a similar, property. We can form no positive notion of the deity; we can only describe him using negative expressions, saying what he is not rather than what he is. There is no point in praying to God, since God does not listen to our prayers. Praying is only a custom appropriate to certain times, as sacrifices were appropriate forms of religion in earlier times. God cannot even really be said to know what goes on in our world, since this is to identify him with human-knowing subjects. Maimonides claims that these and other equally challenging doctrines are reconcilable with Judaism, but if Maimonides is to be taken at his word, an immense gap exists in his metaphysical system between the deity and his creation, a gap which his philosophical successors have tried to explain.

The writings of Maimonides caused huge controversy in the Jewish world, perhaps rather more outside the Islamic countries than within them. Philosophy in Iberia turned in a very contrary direction through a renewed interest in mysticism based upon the Cabala, a movement influenced by the writings of Judah ha-Cohen (early thirteenth century), Isaac ibn Latif (c.1210–c.1280), and Abraham Abulafia (1240–

c.1291). These philosophers often took the Maimonidean text and emphasized the hidden nature of much of it, interpreting the deity as unknowable and infinite, but also reflected partially in his creation.

The fourteenth century saw the celebrated debate on the comparative merits of Christianity and Judaism put forward by Abner of Burgos and Isaac Pulgar, the former arguing with all the vigor of the apostate for the superiority of Christianity over Judaism. This debate was pursued with considerable philosophical rigor, based upon the ways in which Al-Fārābī and other *falāsifa* had sought to compare religions in terms of their differing qualities and the relationship between these qualities and rationality. This sort of confrontation between a convert and a continuing adherent of Judaism took place quite often in this and the next century, and these arguments are interesting for the ways in which they employ an eclectic approach to the understanding of Jewish philosophy, theology, cabala, and law by disputants of equal intellectual standing and similar cultural background.

There are three major thinkers in fifteenth-century Jewish philosophy. Hasdai ben Abraham Crescas (1340–1412) presents a thorough critique of Maimonides's approach, putting emphasis upon action rather than on thought, but more important, perhaps, seeking to replace Aristotelianism with a metaphysics more amenable to religion. His defense of theology against philosophy has the flavor of the much earlier attack by al-Ghazālī upon peripatetic philosophy in Islam, in seeking to disclose the damaging philosophical attack on religion by using philosophy itself to support and strengthen the rational basis of faith. His disciple, Joseph Albo (ca.1380–ca.1444) directed his attention to a detailed discussion on the nature of divine law, and an argument for the superiority of Jewish law against its alternatives, again within the context of the public disputations in Spain that sought to demonstrate the errors of the Jewish religion. Isaac Abravanel (1437–1509) tried to steer a philosophical course between Maimonides and Crescas, but the greatest originality in his thought is to be found in his discussion of history. He distinguishes between natural and artificial situations, where the latter refers to civilized forms of life and the former to those states like that of Adam before the expulsion from the garden. The arrival of the Messiah will result in the rejection of the false lives implicit in urban civilization and the return to a natural and specifically human form of existence.

Jewish philosophy achieved great things in the Iberian Peninsula. It was very much part of the cultures that surrounded the Jewish community, so much of it was written in Arabic (often in Hebrew characters) and even in Catalan as well as in Hebrew. It was influenced

very much by *falāsafā*, Islamic philosophy, and later also by scholastic philosophy from Christian Europe and local antagonistic theologians. The thinkers mentioned here are just a part of what was a very considerable philosophical project, pursued by a large number of Jewish thinkers. One can only admire their productivity, especially when one considers the perilous political and economic circumstances of much of this period, together with the heavy involvement of the leading characters in the lives of their political and religious communities. This philosophical movement entered Western philosophy through its impact on Baruch Spinoza and Gottfried Wilhelm Leibniz, and remains important to this day in the realm of Jewish thought.

PHILOSOPHY, MUSLIM

Muslim Spain (al-Andalus) was a difficult area for philosophy to get a firm grip. The area was often far from stable both politically and militarily, and was in constant contact with anti-Islamic forces. In addition, there were frequent incursions from North Africa (Maghrib) by Berber groups intent on usurping power, and much internal conflict between the divergent Islamic regimes. Even jurisprudence was limited broadly to the school of Mālik ibn Anas, which discouraged speculation concerning the rules of law apart from those aspects of law that can be perspicuously answered. This tended to be accompanied by an unadventurous theology, supported by the Almoravid dynasty and the politically important network of legal figures, the *fuqahā'*, who stoutly defended a rather simplistic view of the limits of Islam.

Despite these apparently unfavorable conditions, philosophy in Al-Andalus reached extraordinary heights. There are four major figures. Ibn Bājja (Avempace) died in 1139 and lived in Zaragoza, combining a political career as vizier of the Almoravid ruler's brother-in-law with philosophical and political works, many of which are no longer extant. Ibn Bājja established the philosophical tradition in Al-Andalus as firmly based upon the works of Plato, Aristotle,

Alexander of Aphrodisias, and Galen, thus linking Spanish philosophy with that practiced in the eastern regions of the Islamic world and typified by al-Fārābī and Ibn Sīnā (Avicenna). Although Ibn Bājja is clearly writing within the Neoplatonic tradition of Islamic philosophy as a whole, he produced some very interesting and original texts on a whole variety of topics, ranging from a most unusual interpretation of the notion of the active intellect (that which makes thought possible) to a protracted discussion of the responsibility of the philosopher to a society that rejects him. This latter discussion is surely in some ways a heartfelt response to the rather grim intellectual climate in which philosophy in Al-Andalus initially had to survive.

The overthrow of the Almoravids by the Almohads around the middle of the twelfth century introduced rulers who were interested in discussing philosophy at court, while at the same time preserving the appearance of rigid orthodoxy to the community at large. The ruler Abū Ya'qūb Yūsuf is said to have attracted scholars to his court to discuss with them the views of the Greek philosophers and their Muslim critics. Both Ibn Ṭufayl and Ibn Rushd attended this court, the latter being introduced by the former. Ibn Ṭufayl (1106–1185) is best known for his philosophical novel, *Risālat Hayy ibn Yaqzān*, in which he explores the notion of attaining scientific, philosophical, and religious knowledge through the application of reason alone. This highly original text, sometimes called a philosophical *Robinson Crusoe*, succeeds in summarizing the views of many of his philosophical sources while at the same time striking out in new directions. A particularly unusual aspect of the book is its conclusion that the highest level of happiness is attainable not through union with the active intellect but with God himself, and without having to go through any intermediaries. In addition, this state of union is available through the application of reason alone, and in such a way as not to contradict any of the teachings of Islam. The text itself embodies a variety of literary techniques, some more accessible to the unsophisticated reader and some only to a reader with philosophical and mystical knowledge.

The outstanding philosopher in Al-Andalus was undoubtedly Ibn Rushd (Averroës, 1126–1298). He spent forty years producing commentaries of the Aristotelian texts that were then available in Arabic, together with other Greek texts surviving in Arabic. These commentaries were produced in a variety of forms, very detailed long commentaries together with middle commentaries and summaries, and this work was very much an official project commissioned by the Almohad authorities. Ibn Rushd's commentaries are far from slavish comments upon the Arabic text.

They are often informed by arguments and discussions from his own philosophy. In addition to the commentaries he produced a large number of philosophical works which take to task the opponents of philosophy in the Islamic world, and argue for the compatibility of *falsafā*, philosophy in the Greek tradition, and Islam. This is despite the very radical conclusions which his arguments have, for example, that there is no such thing as spiritual, let alone corporeal, personal immortality, that the universe is eternal and so not created by God out of nothing, and that philosophy represents the most privileged route to the nature of reality that is available to human beings.

Ibn Rushd tried to free philosophy not only of the assaults on it by the Muslim traditionalists but also of the accretions to Aristotelianism represented by the Neoplatonists among his predecessors. He had very little time for those thinkers who had a deep respect for mysticism as a way of finding out what really exists. He argued that revelation and reason must be different routes to the same reality, the truth, and that different kinds of language are appropriate to different sorts of audience. Ordinary people will require Islam to lead them to the truth, since they are dependent upon figurative and anthropomorphic language, while those more sophisticated can employ philosophical methods to understand the world and the role of human beings within it. He does suggest that philosophy is in many ways the superior means of attaining understanding, and poured scorn on the ways in which theologians (*mutakallimūn*) tried to reserve their interpretative techniques as the most decisive in making sense of scripture. Many commentators suggest that even when he writes that the opinions of ordinary people and non-philosophers have to be respected, since they are just less sophisticated versions of the truth more clearly grasped by philosophers, he is really concealing his own views in order to keep with the religious authorities of the time. Others argue that he should be taken at his word, since the notion of the existence of different routes to the same truth is a logical aspect of his entire approach to the role of language in philosophy.

If there is anything characteristic about philosophy in Al-Andalus, it is this concentration upon the notion and significance of language. Ibn Rushd argues that those who insist upon a literal understanding of Islam are guilty of using language in incoherent ways. They argue that God must really be able to know what goes on in the world, that he has total power over everything that happens, that there is nothing logically possible that he cannot do, and yet if we follow through the implications of these statements we can see that they involve serious damage to the way in which we use language. They imply that things in the world exist only because God maintains them in existence as a

direct effect of his will, and yet this is to contradict the possibility of the process of naming things in the world and understanding the course of natural events. The theologians represent the deity as some sort of superman, while the philosophers interpret his qualities as very different from those perceived in his creation, so that when God is said to know what is meant is a very different type of knowledge than that which we human beings experience. Given the radical nature of Ibn Rushd's philosophy, it is hardly surprising that he was tried for heresy in Córdoba in 1195 and spent some time in disgrace in North Africa before he was allowed to return to Al-Andalus.

The philosophy of Averroës came to have enormous influence in Christian Europe, yet disappeared almost without trace in the Islamic world. The thought of Ibn al-ʿArabī of Murcia (1165–1240) has remained popular wherever people have been interested in mysticism. His enormous output of both prose and poetry is replete with metaphysical symbolism designed to move its audience both rationally and imaginatively. He represents a very powerful strain in philosophy in Al-Andalus—namely, the desire to combine personal mystical experience with intellectual argument. He presents a unified view of the world through the person of God, where the world is the manifestation of God together with his reflection. Human beings are images of the divine, and gain some understanding of the deity by apprehending the aesthetic qualities of the world. All religions are to a degree valid, since they all embody the same truths, albeit in different forms. It is a particular feature of Ibn al-ʿArabī's style that he manages to transform the rather technical languages of theology, law, and philosophy into a mystical synthesis of quite remarkable fluency. Most of his extensive output was produced after he left Al-Andalus, where it is likely that his adherence to Sufism did not please the religious authorities, yet his thought is heavily marked by his upbringing in that politically unsettled but culturally rich area of the Islamic world.

PICATRIX

The supposed author and the title of the Latin version of the Arabic *Ghāya al-hakīm* (*The Aim of the Wise Man*). The Arabic text was written in Spain in the eleventh century and was ascribed to the well-known mathematician and astronomer from Madrid, Maslama al-Majrīṭī. The Latin text is a translation of the Spanish version of the Arabic text; both Spanish and Latin versions were made in the 1250s under the aegis of Alfonso X, king of Castile and Leon. *Picatrix* is a hodgepodge of prayers to the planets, astrological theory, and recipes for fumigations and talismans, thrown together from Indian, Persian, Egyptian, and Greek sources. Under the veneer of a spurious Neoplatonic cosmology, it gives practical details for performing magical liturgies, which allow the reader to harness the spiritual powers of the planets and perform wonders, such as changing into the shape of an animal and becoming invisible. The *Picatrix* suddenly acquired popularity as a handbook on magic in the Renaissance, when it was frequently copied and excerpted, and was translated several times into European vernaculars.

PILGRIMAGES

The phenomenon of pilgrimage to a place or thing holy for one reason or another was the commonest of occurrences in the medieval Christian West, though far from exclusive to it or to Christianity. The pilgrimages to the Holy Land or to Rome are the best known but any church that possessed or came into the possession of well-known relics of any sort could become an object of pilgrimage from its surrounding countryside or even from much more distant parts if they became very famous.

Iberia was no exception to this. The most famous of all Iberian pilgrimages was that to Santiago de Compostela, where the relics of the apostle, St. James the Great, were believed to have been discovered in the early ninth century. But by the eleventh century that pilgrimage route had become so traveled that it spawned side devotions, so to speak. At León, King Fernando I (1037–1065) had recovered the bones of St. Isidore of Seville and the church of the same name there became not only a mausoleum of the dynasty but also a center of veneration of the saint. At Oviedo,

Bishop Pelayo (1100–1130) published a list of all sorts of precious religious marvels supposedly contained in the arca sancta of his cathedral in a successful effort to make his church attractive to pilgrims. The latter could also stop not far outside León at the great royal monastery of Sahagún where the relics of the early Iberian Christian martyrs San Facundo and San Primitivo were housed.

León-Castile was not singular in this respect, however. In Catalonia, from the port of Barcelona, with its cult of Santa Eulalia the early Iberian feminine martyr, the pilgrims could fan out in turn to the miracle-working shrine of the Virgin at the nearby monastery of Montserrat or trudge south to the port of Tarragona to pay their respects to its patron, San Narciso. Should they have come south by land there was the great Cistercian monastery of Santa María de Ripoll to be visited even before they reached Barcelona.

As with León-Castile and Catalonia, the kingdom of Aragón proper also had its pilgrimage shrines. Chief among these was the church of the Virgen of the Pillar in Zaragoza. It was believed to mark the spot where the Virgen appeared to St. James the Great when he preached in the peninsula in apostolic times; particularly after the recapture of the city from the Muslims in 1118 pilgrimage grew in popularity.

PINAR, FLORENCIA

A presence at the court of Isabel and Fernando, Florencia Pinar is the sole female poet from the *cancionero* period represented by complete poems, yet almost nothing is known of her life. A few compositions are attributed to her, and may be by her brother, but only three are surely hers: "¡Ay! que ay quien más no vive," "Canción a unas perdizes que le embiaron bivas," and "El amor ha tales mañas." These poems place Florencia as a poetic force at odds with male-centered views of women. In her poems, the dominant attitude toward love is an ambiguous one. The lover is not praised and love, far from being exalted, is portrayed as deceiving and hurtful. Passion overwhelms common sense, it overbalances prudence. In "Canción a unas perdizes," the poetic persona reveals her feeling as parallel to that of the caged partridges at the core of the composition, free spirits now entrapped by the snares of an unavoidable but fatal attraction. Here, as in "El amor ha tales mañas," bestiary imagery is richly explored to the det-

rimment of love perceived as ennobling. The burrowing, cancerous worm of the latter poem makes for a richly allusive attack on love, which wears a sweet mask in the world but, when stripped of it, is revealed as devious, enslaving. The undeniable pleasures that love can bring are exposed as dangerous, even signs of sickness. Images of love, passion, and illness are tools of a poetic craft in which Florencia Pinar is singular for her depictions of its malignant effects on the woman; her male brethren speak only of its deleterious effects on men.

PINHEIRA, MARGARIDA

An early-sixteenth-century manuscript contains the history of the convent of Jesus in Aveiro. This manuscript, edited by António Gomes da Rocha Madahil appears to have been written either by Catherina Pinheira or, more likely, her older sister Margarida, both nuns of the convent. The manuscript seems to date from 1525; it could, however, be a copy of, or based on, an earlier work. The work recounts the history of the founding of the convent by Brityz Leytoa, who started her religious career in 1458 and died in 1480. This is followed by the life of the princess (and later saint) Joana of Portugal, who entered the convent in 1472 and died there in 1490. There also are lists of dates relating to the lives of the other nuns of the convent. The work's main theme is that the convent is more attractive than marriage. Brityz Leytoa and her friend Micya Pereyra, both widows, resisted much family pressure to remarry and founded the convent together. Joana of Portugal and her friend Leonor de Meneses resisted the same kind of pressure and entered the convent after corresponding with each other secretly for a very long time.

Other women had an easier time. This was true of Brityz Leytoa's daughters, Catherina and Maria Datayde; Micya Pereyra's niece of the same name, and Ynes Eanes and Margarida and Catherina Pinheira, the three nieces of Johan de Guimarães, a priest who was

instrumental in founding the convent. These women entered the convent very young and played an important role in its history, a role that the text stresses repeatedly. Maria Datayde was the convent's third prioress, after Brityz Leytoa and Leonor de Meneses. She died in November 1525, one month after the completion of this manuscript. Only Margarida Pinheira and her sister Catherina, who was the associate prioress and, thus, a natural candidate for the position of prioress, remained at the convent. Catherina Datayde had died in 1466. Ynes Eanes had moved to Leyrea in 1498, and Micya Pereyra had moved to Santarem in 1513.

The author declares her intention to praise God and invoke his help in such evil times. It is possible that there was a political struggle between the old guard and the younger generation. In such circumstances, it would make sense to write or rewrite a book glorifying the convent's founders and emphasizing that Catherina Pinheira had received Brityz Leytoa's special blessing and that Margarida Pinheira had been particularly close to Joana of Portugal. The battle, if there ever was one, was lost. Isabel de Castro, a younger nun, became prioress, Catherina Pinheira continued to be associate prioress until her death in 1528, and Margarida Pinheira left for Setubal in 1529.

POEMA DE ALFONSO XI

The *Poema de Alfonso XI* was probably written by a poet of Leonese descent, Ruy Yáñez, in 1348. It consists of nearly ten thousand octosyllabic lines, in quatrains rhyming *abab*. Some 6,530 lines concern Alfonso's military campaigns, of which the battle of Salado (1340) stands out. It contains remarkable similarities to the Portuguese *Poema da batalha do Salado* by Afonso Giraldes.

There are several hypotheses about the original language of the *Poema de Alfonso XI*. Some critics have argued that the poem was written in Portuguese or Galician, and translated into Castilian. Others believe that it was written in a western Leonese dialect which included some Galician features. A final conclusion has not been reached because some of its linguistic configurations resist classification. The poem has been referred to by some critics as a "rhymed chronicle"

because it was wrongly believed to be based on the *Gran crónica de Alfonso XI*. However, in light of new evidence it has been demonstrated that it was the author of the *Gran crónica* who drew on the firsthand information of Ruy Yáñez. Furthermore, the poet does not adopt a given text or use a specific source for his poem, which is also completely independent of Fernán Sánchez de Valladolid's *Crónica de Alfonso XI* (1344). The poem has also been described as a "gesta erudita" or a learned text because it drew some features from the *Libro de Alexandre* and the *Poema de Fernán González*. The *Poema de Alfonso XI* stems from a court tradition but its author—in contrast to those who wrote in *cuaderna via* (monorhymed alexandrine quatrains)—does not boast about his erudition. The *Poema de Alfonso XI* was originally composed in writing and not on the oral tradition. However, its relatively high percentage of oral formulae (18 percent), indicating residues of oral composition, and its many popular epic characteristics clearly prove that it was directed to a popular audience, and was most probably meant to be transmitted by singing. The poet's sympathy for the sufferings of the common people at the hands of the nobles seems to confirm this. Perhaps it would be better to designate it as a "new epic" because it was composed most probably in reaction to the excesses of the heroic epic.

POEMA DE ALMERÍA

The Latin *Chronica Adefonsi Imperatoris* is a prose narrative that covers the internal political events as well as the external battles and victories of King Alfonso VII of León-Castile (1126–1157) against the Moors, who had been occupying Spain since the early years of the eighth century. The *Chronica* ends with 386 Leonine hexameters, known as the *Poema de Almería*. The *Poema* was inspired by the enthusiastic desire of the chronicler to alleviate the boredom of the prose and to sing in a heroic mood the historical siege of the Muslim stronghold of Almería, an event that took place in August 1147. The theme and structure of the *Poema* are very simple and straightforward: to review the preparation for the siege and to describe the Christian contingents that, under the leadership of

King Alfonso VII, took part in it. Because the text ends abruptly in the middle of line 386, we do not know if the poet-chronicler ever completed the actual battle scenes and final elegy of the Christian heroes and their victory, that we know did occur historically. On the other hand, perhaps he died before completing his opus. In any case, what remains of the *Poema* was certainly written soon after the siege and most likely during the year 1148. As a literary composition, it is a clear imitation of a classic topos: the "catalogs" of participants in a battle of the classical epic, or a "desfile," or "dénombrement épique," as it is called in Romance epic.

The author of the *Poema* is unknown, but there is strong evidence that it was Arnaldo, bishop of Astorga and active participant at the siege. The name Arnaldo, rare in Castile in the twelfth century, would indicate that he probably was from eastern Iberia; attempts have been made to identify him with Arnaldo of Ripoll, but we should not exclude the possibility that he might have come from France. This hypothesis would explain his familiarity with French epics, although his epic knowledge could have also come from his residence in Astorga, a very important town along the Camino de Santiago, the route frequently traveled by French jongleurs.

The *Poema de Almería* as a literary genre lies on the borderline between chronicle and epic. Contemporary scholars on close examination, consider it the best epic work in Latin of the Spanish Middle Ages, and for its aesthetic values certainly it is much more than a rhymed chronicle. The widest audience, and by far the most admiring one, has been drawn from scholars working in the field of Romance epic, and for good reason. During the late twentieth century this group of researchers subjected the text to a very intense scrutiny in order to unveil the contents of its allusions to the epic legend of Roncesvalles to find out how the poet came to know about it and, more importantly, how was the poet able to connect it with the Cidian epic theme which so preeminently dominates some parts of the text.

The significance of the *Poema de Almería* stands up mostly on two fronts. First, it is an invaluable source for the study of the origins of Romance epic and a witness to its early manifestations. In this respect it has been extremely useful for the purpose of dating it, clarifying its contents, and illuminating other literary and cultural implications. But perhaps its major significance lies in the value of the *Poema* itself. Being at the crossroads of the epic literary history of the Middle Ages, the *Poema* represents a rare and extraordinary example of a popular Latin epic tradition that coexisted with that of the Romance epic. It is this extraordinary

concept of epic poetry that has made the *Poema de Almería* a unique and in many ways a special instance of the genre.

POEMA DE FERNÁN GONZÁLEZ

A rhymed chronicle about the life and exploits of the emancipator of Castile, Count Fernán González (c.915–970), the *Poema de Fernán González* is thought to have been composed around 1250 by an anonymous monk affiliated with the monastery of San Pedro de Arlanza in Old Castile. The original manuscript has not survived, although an incomplete copy from the fifteenth century, preserved in a codex with four other manuscripts, is housed in the library of the Monastery of San Lorenzo del Escorial (iv. b.21).

Together with Rodrigo Díaz de Vivar, popularly known as el Cid, Fernán González is one of the most revered epic heroes of medieval Spain. His military prowess and piety earned him a reputation that inspired numerous ballads, Golden Age plays, and even a nineteenth-century Spanish novel. The anonymous Arlanzine poet sought to portray the first Count of Castile as a self-proclaimed vassal of God whose constant aid and intervention the Judeo-Christian warrior sought in order to guarantee Castilian supremacy over the infidels and other Christian rivals.

In weaving his tale, the poet borrowed from learned sources, including the Scriptures, the *Chronicon mundi* by Lucas of Túy, and St. Isidore's *Historia gothorum*, but he also relied to a considerable degree on legendary materials. He molds the various epic, folkloric, and monastic influences that inform his literary creation into a tripartite structure, the first of which treats the history of Spain prior to the appearance of Fernán González. The second section, most probably based on popular sources, deals with two important battles waged against the Moors as well as the rivalry between the kingdoms of Castile and Navarre. In the last section the Count is imprisoned in Navarre but manages to escape with the help of Princess Sancha who later becomes his wife. Finally, the hero wins the autonomy of the County of Castile in exchange for a horse and hawk, an act which may have some basis in history or may simply be a traditional folk theme.

POEMA DE MIO CID See CANTAR DE MIO CID

POEMA DE YÚCUF

The *Poema de Yúçuf* or *Poema de José*, a narrative poem in Aljamiado consisting of ninety-five stanzas in *cuaderna vía* (monorhymed alexandrine quatrains) and based on the Islamic version of the Joseph legend (Qur'ān, chapter 12). It is one of the principal monuments of *aljamiado* literature. Two manuscripts exist: one, the more complete, was published by Heinrich Morf in Leipzig in 1883; the other, an older version, was published by Ramón Menéndez Pidal. Pascual de Gayangos originally dated the text to the sixteenth century, believing that no *aljamiado* was produced before that time. In fact, the poem should be considered the work of Mudéjares and not Moriscos, and was probably composed in the late thirteenth to early fourteenth centuries (a period closer to the heyday of *cuaderna vía*); the Menéndez Pidal manuscript appears to be of the late fourteenth or first half of the fifteenth.

The poem's version of the Joseph legend departs in several respects from both the Old Testament and the Qur'ānic versions. The wolf that Joseph's brothers accuse of having eaten Joseph miraculously speaks to protest his innocence; on his way to captivity in Egypt Joseph weeps at his mother's tomb; and a harsh storm subsides when the boy forgives the blows of his African guard. In Egypt, Joseph's intercession with God helps the merchant's twelve wives all to conceive and bear twins. Pharaoh's wife, to tempt Joseph from his chastity, has the walls of her chamber painted with lascivious scenes. The poem breaks off with an event that is included in the Qur'ān: the women of Egypt, who are peeling grapefruit when they first see the young man, are so distracted by his beauty that they cut their hands.

The language of *Poema de Yúçuf* shows many Aragónese features, especially in the older manuscript A.

POETRY, ARABIC

Provincial Beginnings

Little poetry has come down to us from the century following the Arab conquest of Visigothic Spain in A.D. 711, with the possible exception of the famous poem attributed to the first Umayyad emir, 'Abd al-Rahmān I (r. 756–788), in which he likens himself to a palm tree, exiled like him far from his native Syria. This dearth of poetry is hardly surprising in view of the enormous practical task that faced the new masters of the Iberian peninsula, both before and after the establishment of the emirate: settling the various tribes in their respective new homes, consolidating something like political unity, and generally getting used to the place.

With the reign of 'Abd al-Rahmān II (822–852), al-Andalus began to acquire the cultural trappings of a province, with the eastern metropolis of Baghdad providing cultural but not political leadership. The most famous case in point is the arrival in 832 of the Persian singer Ziryāb, who brought the newest Baghdad fashions in verse and song to the furthest outpost of Arab society; other easterners followed, bringing the latest in philology or jurisprudence as well as poetry, and many Andalusians visited and studied in the Arab East during the formative ninth and tenth centuries. Soon court poets such as 'Abbās ibn Nāṣih (d. 844) were imitating the poetry of Abū Nuwās (d. 813), while others such as Mu'min ibn Sa'id (d. 844) emulated Abū Tammām's neoclassical verse. None of the poets of this period was more than proficient at following Eastern themes in Eastern forms, and no poet of greatness or even individuality had yet appeared in al-Andalus.

Maturity

By the reign of 'Abd al-Rahmān III (912–961), Córdoba had become a haven for artists, scholars, and poets. The first of the latter to leave us a substantial body of verse that may be said to have more of an Andalusian than a derivative theme (as opposed to form, which is still resolutely Eastern) is Ibn 'Abd Rabbihi (d. 939 or 940). He is best known for an ingenious reasoned anthology called *al-ʿIqd al-farīd* (*The Unique Necklace*); his own *qaṣīdas* in the Eastern manner, in which he makes a cold and somewhat tentative use of the rhetorically ornamented *badi'* style; and a long poem in the "lower"-register *rajaz* meter. This 445-line composition recounts the newly proclaimed Caliph's martial exploits against the Christians in a manner which has been likened to that of the *chansons de geste* and other medieval Romance epics.

Later Andalusian poets of the caliphate, such as Ibn Darraj al-Qaṣṭallī (d. 1030) and the Umayyad prince ash-Sharif aṭ-Ṭalīq (d. 1009), also followed the Eastern neoclassical school, widening their palette to cover all the traditional genres of Arabic poetry: *ghazal* (*nasīb*) or love poetry, *nauriyyāt* or floral poetry, *khamriyyāt* or bacchic themes, and *fakhr* or boasting. Prose masterworks of deep relevance to poetry were composed: *Risālat-at-tawābiʿ wa-z-zawābiʿ* (*Book of Familiar Spirits and Demons*) by Ibn Shuhaid (d. 1035), a first-rate poet who applied Neoplatonist ideas to form an almost romantic theory of the "poetic soul"; and *Tawq al-hamāma* by Ibn Ḥazm (c.990, 1063). This is a treatise on love and poetry which is one of the extremely rare medieval Arabic prose works of intense human and artistic interest.

Poetry in the Time of Troubles and in the Era of the Party Kings

As the political unity of Al-Andalus unraveled, leading first to chaos (the Time of Troubles from 1009 to 1031), and then to a fragmented mosaic of city-states (the party kings era, from 1031 to 1092), each local court in such places as Zaragoza, Badajoz, Silves, Denia, and Elvira as well as Toledo, Córdoba, Seville, and Granada began to vie with the others for preeminence in poetry, and for the allegiance of the best poets. One poet of this period stands out, perhaps the one name in Andalusian letters that is held in the very highest regard among Arabic poets of all ages and places: Ibn Zaydūn. His briefly requited love affair with the liberated Umayyad princess and poetess Wallāda is as famous in Arabic literature as *Romeo and Juliet* is in the West, but in this case the story is true. His masterpiece, rhymed on the letter *nūn*, deserves to be quoted in full, but two lines (much appreciated by contemporary and later Arab critics for its double *tibāq* or antithesis) conveys something of its taut emotion and brilliant imagery:

Having lost you, my days have gone all dark
While with you, even my nights were white.

Whether or not this period was a "golden age," it was a remarkably fertile time for good poets sounding vibrant and creative chords. Thus, Ibn 'Ammār of Silves (c.1040–1086), famous for his poem beginning:

pass round the glass for the breeze has arisen
and the stars have slackened the reins of night-travel.

Even the kings of the various city-states put their hands to poetry, in at least one case with memorable felicity: Al-Mu'tamid of Seville (c.1040–1095). His fateful decision to call in the Almoravids led first to the victory

of Zallāqah (Sagrajas) in 1086, and then to the exile and dispossession of his and other ruling families of the previous era. He left bitter poems of exile and loss, an increasingly recurrent theme in Andalusian poetry, which contrast the verdant gardens of Spain with the drier climes of refuge:

Would that I knew whether I shall ever again spend a
night
With a garden before me and a pool of water behind
me.

Al-Muʿtamid's friend and court poet Ibn al-Labbāna (d. 1113) became famous for his fidelity after his patron's exile and ruin, as well as for his fine poems.

Decadence and Decline

If the later party kings period marks a high point of culture in Al-Andalus, its political fragmentation favored the Reconquest and this in turn led directly to intervention by warlike zealots from North Africa: the Almoravids at the end of the eleventh century, and the Almohads who invaded in 1145. Those invasions also marked the beginning of a decadence and then decline of letters. Good poetry continued to be written, but with increasingly common themes of nostalgia and regret, *carpe diem* contrasted with premonitions of impending doom, escapist nature poetry in a miniaturist rather than the earlier impressionistic style. This is visible in the work of poets of this period such as Ibn ʿAbdūn, author of a famous elegy and court poet to the Bani Aftas in Badajoz (d. 1134); or Ibn Khafāja (d. 1138), whose name became synonymous with nature poetry, while his nephew Ibn az-Zaqqāq (d. 1133) wrote satire and sensuous wine and love poetry.

Ar-Ruṣāfī of Valencia (d. 1177), among the better poets of the post-party kings period, was a nature poet of the Ibn Khafāja school. One Andalusian who fled abroad as the Reconquest engulfed Al-Andalus is Ibn al-ʿArabī (d. 1240), a great mystical poet whose wistful odes and *muwashshahāt* (rhymed odes) on Sufi themes have stood the test of time. Ḥāzim al-Qarṭājannī (d. 1285) wrote, besides poetry, a prose work entitled *Kitāb sirāj al-bulaghāʾ wa minhāj al-udabāʾ* (*Book of the Lamp unto the Eloquent and Pathway for the Lettered*). In it he discusses Aristotle's *Poetics*, holding that imitation—*mimesis*—is a form of embellishment of nature, not slavish copying. Finally, Ibn Zamrak, a court poet and sometime Vizier of Granada, wrote finely crafted *qaṣīdas* (odes) and *muwashshahāt*, some of which decorate the walls of the Alhambra; murdered along with his children in 1393, he was the last great Arabic poet of Muslim Spain, indeed perhaps the last one of real merit.

Innovation: Muwashshah and Zajal

While the Andalusian poets never completely broke with the thematic context of Eastern Arabic poetry, the one truly Andalusian innovation is a formal one: the use of strophic forms, odes broken up into symmetrical strophes and refrains. These have a common rhyme in the opening couplet and the refrain, and differing ones in each stanza: AA bbb AA or, with different internal rhyme in the refrain, AB ccc AB. The most complex structure has multiple internal rhymes: ABCDEC fghfghfgh ABCDEC (the opening couplet rhymed like the refrains is occasionally lacking; without it, the poem is said to be “bald.”) Called *muwashshah* or “girdled,” these poems are written in quantitative meters identical to or closely derived from those of the classical Arabic; their themes are also similar to those of other Hispano-Arabic poetry, with the notable exception of the finale or *kharja* in Romance or in colloquial Arabic. There was some precedent for strophic forms even in the Abbasid East, but their intricate development (which later spread to Egypt and the East) was new, and the use of nonclassical language—possibly a snippet from a popular song of the day—as “spice” could only have arisen in a bilingual culture such as al-Andalus. Some of the best Hispano-Arabic poets of the party kings era composed *muwashshahāt*: Ibn Bājja (d. 1138, the “physician-poet” known as Avempace), or the blind poet al-Aʿmā at-Tuṭlī (d. 1126). The latter's strophic compositions were not originally included in his *Dīwān*, being considered insufficiently dignified.

The strophic form itself, the origins of which are shrouded in obscurity and clouded by decades of heated scholarly controversy, gave rise to a further innovation. Beginning sometime in the late eleventh or early twelfth century, we find strophic compositions entirely in colloquial Andalusian Arabic. Sometimes these contain Romance words or phrases, providing a uniquely preserved, lively vignette of street dialogue from twelfth-century Córdoba. The most famous practitioner of this colloquial form, known as the *zajal*, was Ibn Quzmān of Córdoba (d. 1160). His choice of the colloquial language effectively excluded his poetry from the mainstream of Arabic letters, but his poems are not only linguistic and societal anecdotes of substantial interest (which they undoubtedly are), but great poetry in their own right, against any standard.

Arab Origins Debate

No account of Hispano-Arabic poetry would be complete without a mention of the various arguments adduced by Romanists (especially) or Arabists to the general premise that the flowering of Romance lyric

in the eleventh century was caused or at least influenced by Andalusian poetry in Arabic, and the converse belief that the Hispano-Arabic lyric was influenced in its form and/or content by early Romance poetry or song. The internal evidence for such contamination adduced by proponents of a decisive influence in one direction or the other includes formal similarity between the strophic poetry described above and Hispanic forms like the *villancico*, as well as painstakingly compiled thematic parallels and the possible occurrence of Arabic words in obscure or misunderstood Romance texts. External evidence such as slave girls who might have been captured and brought north of the Pyrenees is no more convincing than the internal evidence adduced so far, and one is thus led to conclude that (1) we will never know; (2) that there is in any case no real anomaly that requires explanation; and therefore (3) we should not waste time on this question.

The Legacy

Besides enriching as it did the corpus of Arabic poetry, at a time—the eleventh, twelfth, and thirteenth centuries—when Arabic literature in the East was going through a period of relative sterility followed by catastrophic decline, the lyric poetry that flourished in al-Andalus for over three centuries has considerable documentary value, as demonstrated in Pérès's invaluable survey. It offers eyewitness accounts of the unique tribal, ethnic, and religious mosaic of Al-Andalus, of popular festivals (including some of Persian origin such as *nawrūz* and *mihrijān*), the life of the palace, street, and bazaar, industry (the poet ar-Ruṣāfī was a weaver of silk), and more of the seamy side of life than in any Eastern poetry (Ibn Quzmān stands out there). New strophic genres were added to the narrow *qaṣīda* form, and Andalusia also produced poet-anthologists to whose labors we owe much of what we know about literary society, the biographies of poets, and a good deal of poetry. Thus Ibn Bassām (d. 1147), whose *al-Dhakhīra fī mahāsin ahl al-jazīra* is (as its name tells us) a treasure-trove of information and poetry; the *Qalā'id al-iqyān*, an anthology by the tendentious Ibn Khāqān (d. 1134 or 1140); or Ibn al-Khatīb (d. 1374), who was a first-rate poet as well and whose anthology *al-Ihāta fī akhbār ahl Gharnata* contains a mine of details about life and poetry in Granada and elsewhere.

POETRY, DIDACTIC

A large number of medieval poems have at their foundation a didactic intent; that is, they aim to impart some form of moral or practical instruction. Lessons conveyed by didactic poetry may be of a practical, secular character (for example, advice regarding acceptable modes of social or political conduct) or of a religious nature (for example, instruction relating to questions of devotion and salvation). It should not be surprising, therefore, that much of this poetry was cast by clerkly hands in Alexandrine verse. Indeed, as Alvar and Gómez Moreno indicate, the mere presence of the *Cuaderna vía* (monophymed alexandrine quatrains) was a clear announcement that the poetry at hand was of a didactic, moral type.

Gonzalo de Berceo (c. 1196–c. 1264) wrote three types of poetry—that of the saints' lives, Marian works, and liturgical-doctrinal poems, all of which aspire at some level to instruct the audience. The hagiographic texts (*Vida de San Millán*, *Vida de Santo Domingo de Silos*, *Vida de Santa Oria*, *Martirio de San Lorenzo*) are clearly intended both to offer the positive example of the saint for the audience to emulate and to teach the public devotion to the particular saint, which often includes paying tributes to him; *San Millán*, for example, begins with the claim that the public will gladly render the tributes owed to his monastery upon hearing the poem, and concludes that they will be richly rewarded if they resume payment of the tributes. Like the hagiographic texts, the Marian works (*Duelo que fizo la Virgen*, *Loores de Nuestra Señora*, *Milagros de Nuestra Señora*) have at their center the purpose of instructing the public in devotion to the Virgin, who, Dutton argues, is Our Lady of March at San Millán de Yuso. *Milagros de Nuestra Señora*, the best known and studied of these poems, offers twenty-five miracles relating the fall and the salvation of individuals and illustrating the redemptive role of the Virgin, a role that Berceo invariably highlights at the conclusion of each miracle. The liturgical-doctrinal poems (*Sacrificio de la Misa*, *Himnos*, *Signos del Juicio Final*) are varied in content, but again contain some didactic message. *Signos*, for instance, treats the fifteen signs of the Apocalypse and admonishes "good Chris-

tians" in the conclusion that these horrific visions may be avoided by leading better lives, doing penance, and praying.

Three thirteenth-century *cuaderna vía* poems deal not with the lives of saints but of heroes. *Libro de Alexandre*, a long and complex poem, narrates the life of Alexander the Great, who is unable to dominate his own nature (that is, his arrogance, pride, and lack of restraint), and consequently dies at the hands of a traitor. At the conclusion of the poem, the narrator echoes the *de contemptu mundi* and draws for the audience the lesson to be learned from Alexander's life, instructing them that they should put their faith in God and not in things of this world. In *Libro de Apolonio*, the protagonist represents the opposite of Alexander: a hero who suffers not because of his own sinful nature but because of the persecution of an incestuous and avaricious king; the sinner and his daughter are punished with death and, in the end, the hero is amply rewarded for his constant virtue and faith in God. In the final strophes of the poem the poet makes clear that the audience may find in Apollonius a moral example to be followed. *Poema de Fernán González* is an epic poem that offers in the figure of its hero a model of exemplary Castilian leadership. The extraordinarily devout Fernán González receives divine endorsement for his mission in the form of prophecy (Pelagius promises him victory over the Moors), visions (St. Emilianus and St. Pelagius appear in dreams), and direct intervention (St. James participates in battle).

At the end of the thirteenth and into the early fourteenth centuries, there is a cycle of didactic poetry written in *cuaderna vía* that, Walsh argues, served as a bridge between the earlier *clerezía* (clerical) texts and the *Libro de buen amor*. Many of these poems are homiletic in nature. In *Castigos y ejemplos de Catón*, based on the popular Latin *Disticha Catonis*, Cato offers his son practical and ethical advice against follies such as gambling, money, court proceedings, and astrology. *Proverbios de Salamón*, whose dating is problematic (some argue for composition in the thirteenth century, while others place it in the mid- to late-fourteenth century), derives from Ecclesiastes, which explains its aphoristic character. The poem reflects in many ways the sociopolitical turbulence of the period, focusing on such topics as the relations between the wealthy and the poor and death as the great equalizer. A similar tone is found in *Libro de miseria d'omne*, a poetic adaptation of *De miseria conditionis Humanae* by Innocent III. Perhaps intended for reading at Lent, the *Miseria* encourages its audience through its negative presentation of life, death, and judgment day to abstain from vices and to repent; the poet is especially harsh with regard to social practices such as the abuse

of vassals by their lords, the evils of money, the selling of justice, and the abuses of the clergy.

Dating from the first years of the fourteenth century, *Vida de San Alifonso por metros* serves multiple functions. The first of these is common to all hagiographic texts: to inspire veneration of the protagonist, in whom the audience may also find a model to imitate. Ildefonso stands out for his chastity, humility, and most especially his dedication to the Virgin. In addition to instructing the audience to revere Ildefonso, it is clear that the poet intended to illustrate for his audience the importance of Marian devotion as well. The Virgin occupies the position of co-protagonist, appearing to Ildephonsus's mother twice (during her pregnancy and before her death) and to the saint (upon his mother's death), causing him to establish a convent in her honor; Ildefonso later writes a treatise defending her virginity against attacks by nonbelievers, which results in yet another visit by the Virgin. The most clearly didactic function of the poem is its goal of encouraging familial support for a child's decision to enter religious orders. The saint's father initially opposes his son's resolution, while his mother gleefully embraces it, a position which the poet admonishes his audience to follow.

Three poems cast in *cuaderna vía* (*Alhotba arri-mada*, *Poema en alabanza de Mahoma*, and *Poema de Yúçuf*) pertain to *aljamiado* literature and may date, as Thompson suggests, to the thirteenth or fourteenth centuries. Of these the most patently didactic is *Alhotba*, a sermon destined for Ramadān. The *Alhotba* derives from the *Sunna* (the Islamic ethical-religious laws and customs), and treats in similar fashion many of the themes found in other didactic poems—notably *Miseria* (see Connolly); and *Castigos* and *Libro de buen amor* (see Thompson).

As Walsh notes, many of the themes (and, indeed, direct passages) of the thirteenth-century *cuaderna vía* are parodied in *Libro de buen amor*, whose inclusion under the heading of didactic poetry is tentative at best. At the beginning of the *Libro* the author instructs the audience to interpret his poem correctly and repeatedly urges the audience to extract the appropriate moral lesson, but he does not aid in this enterprise. He merely states that we must interpret his work according to our understanding, which he repeatedly shows to be variable (for example, the debate of the Greeks and the Romans). The *Libro* includes many of the commonplaces one would expect to find in didactic literature (a treatise on the Seven Deadly Sins, and the evils of money), but these are undercut by the context in which they are found (the Seven Deadly Sins being included in the unsuccessful lover's tirade against Sir Love, and the exposition on money used by Sir Love to illustrate the power of money in amorous pursuits).

Even one of the traditional tools of didactic literature, the *exempla*, is undermined in the *Libro* (for example, the go-between uses *exempla* to lead Doña Endrina into sin rather than away from it). Many scholars have argued that the *Libro* teaches the futility of love through negative example; that is, that the first-person narrator/lover has but fleeting success in his affairs of the heart (as Don Melón, a “fictional” character, and with Doña Garoça, who dies shortly after the affair begins). Whatever the case, it is clear that if the *Libro* has a prescriptive function, it is unlike that of other didactic works.

The end of the fourteenth-century brings with it what may have been the last work written in *cuaderna vía*, *Rimado de Palacio* by Pero López de Ayala. Referred to by its author as a sermon and written in a most somber tone, *Rimado* is a highly didactic work. It includes a confession in which the poet enumerates his sins, social and political criticism that reflects a negative view of contemporary society, a contemplation of the art of governing based on *De regimine principum*, and a long treatise on Job derived from Gregory’s *Moralia*.

While a large number of didactic poems were written in *cuaderna vía*, many poets did not avail themselves of this form. Dating from the first half of the thirteenth century, *Vida de Santa María Egipcíaca*, cast in *pareados* (paired verses), narrates the life of a prostitute-penitent. The poet’s didactic aim is clear from the outset. In the introductory verses he orders the audience to listen attentively, for the story contains a moral lesson: like the sinner-saint, we may save ourselves through repentance.

The most clearly didactic of the debate poems are those that deal with the struggle between the soul and the body, in which the latter is portrayed as a vile prison for the former. The earliest of these, *Disputa del alma y el cuerpo*, written in *pareados* probably in the late twelfth century, survives only as a fragment. In the fourteenth century there are two versions (*Disputa del cuerpo e del ánimo* and *Revelación de un hermitaño*) of a debate poem in *arte mayor* (dodecasyllabic scansion), which derives not from the earlier Spanish poem but from *Visio Philiberti*. *Tractado del cuerpo e de la ánima* appears at the end of the fifteenth century, and contains a conclusion in which an angel delivers a written condemnation of the two opponents.

The very title of the sole work written in Castilian by the rabbi Santob de Carrión, *Proverbios morales*, indicates the didactic intent of the poem. A contemporary of another moralist, Juan Manuel, Santob describes a world in which man must guide himself through the exercise of caution and moral conduct. The poem aims to speak to two audiences: Pedro I (to

whom the poem is dedicated) and his subjects, and, as Perry indicates, the Jewish community (through coded messages).

Much of later didactic poetry treats the topic of death, a common subject throughout Europe in the late Middle Ages owing to the economic, demographic, and emotional devastation produced by the Black Death. *Dança general de la Muerte* dates from the late fourteenth or early fifteenth century, and was later expanded and printed in 1520. The poem pertains to the popular European tradition of the dance of death, and probably derives, directly or indirectly, from the French *danse macabre*. The didactic nature of the poem is evident: it begins with a friar’s sermon and ends with promises of repentance by those who have witnessed the horrific dance of the powerful (clergy and lay alike) before death.

Among the best known poems in Spanish is *Coplas que fizo a la muerte de su padre* by Jorge Manrique. The didactic intent of the poet is clear, not only by the choice of subject but by the exhortative tone employed throughout the poem. Like a preacher delivering a sermon, Manrique begins his contemplation of death with an admonition, entreating the soul and the mind to awaken to the fleeting nature of this life and of pleasure and to the certainty of death. He then proceeds with a general consideration of life and death, a review of the fate of the illustrious dead from the recent past, and his father’s own encounter with death who, unlike the figure portrayed in the *dança general*, treats him with utmost respect.

As Rico has shown, *Doctrina de la discreción* (also called *Tractado de la doctrina*) by Pedro de Vergüe dates from the fifteenth century and was inspired by the Catalan *Libre de bons amonestaments* by Anselm Turmeda. Drawing on aphorisms, the *Doctrina* is a work of religious instruction which also offers general moral advice and especially counsels prudence.

As this sampling has shown, the category of didactic poetry is an immense and diverse one encompassing a range of genres—saints’ lives, epics, doctrinal works, gnomic literature, debates, elegies, and the *danse macabre*. While the use of the *cuaderna vía* predominates, it is by no means the exclusive metrical form. The poems do, however, share certain characteristics. They teach, for example, by offering positive models for the audience to admire and follow (Apolonius, Fernán González, and saints) or negative ones for them to avoid (Alexander, the incestuous king). They employ many of the same tools (proverbs, *exempla*), and echoes of the same *topoi* and themes permeate the works (most notably, the *de contemptu mundi*, and *Ubi sunt?*). What ties these poems together is their

intent. The poets strive to instruct their audiences on some matter, (practical advice for survival in this world, religious instruction for the soul's redemption in the next), and to this end they avail themselves of many of the same recourses.

POETRY, HEBREW AND JEWISH ROMANCE

Hebrew Poetry

Medieval Hebrew poetry may be classified as either "secular" or "religious," with the latter further subdivided as liturgical (intended for recitation in services) or personal religious expression of the poet. "Religious" poetry (*piyyut*) dates at least to the Talmudic era (fourth century or earlier), as a separate literary genre; of course, such poetry is found already in the Bible. "Secular" Hebrew poetry, on the other hand, originated in al-Andalus directly under Arabic influence not earlier than the middle of the tenth century. The first generation of poets introduced both Arabic meter and themes into their innovation of Hebrew poetry. As early as the eleventh century, Samuel ibn Naghrillah created many additional meters not found in Arabic poetry and greatly expanded the themes used. Subsequent generations of poets expanded somewhat on these, but generally followed the "classical" forms already set by the Hebrew poets of Muslim Spain.

Hebrew meter, like Arabic, is "quantitative" (based on long and short phoneme elements), with the line divided into two hemistichs (not, however, a caesura, since the division is not of meaning but rather of elements, and can even come in the middle of a word). Rhyme is dictated, to a degree, by the nature of Semitic words. It is untrue that early classical Hebrew poetry was entirely monorhyme; *some* of that poetry was, but

a great deal of it (including most of Ibn Naghrillah) already shows considerable variation.

Themes employed by the Hebrew poets include friendship poems, praise of patrons or famous men, wine (praise of wine-drinking parties), love (of men or women), war (only Ibn Naghrillah), nature, the vicissitudes of fate, longing for Zion, and so on. There are many uniquely individual themes found in the poetry of the most outstanding poets.

Great care was used in composing poems, with at least equal attention given to form and content. The beautiful opening line was particularly praised—a line that expressed a complete thought and set the tone to follow. Biblical style was used but not slavishly imitated (again, contrary to the belief of some experts, classical Hebrew poetry was extremely innovative in vocabulary and did not merely copy biblical terms). Allusions to lines of other poets, perhaps even citation, was allowed, but actual plagiarism was severely criticized.

In addition to biblical phrases or images, Talmudic and Midrashic literature served as sources, and particularly Arabic poetry and literary ideals. New Hebrew words were coined based on adaptation from Arabic, or were given new meanings in light of Arabic cognates. In many Hebrew poems of the classical period (Muslim Al-Andalus), it is possible to discover actual Arabic sources or similar expressions. Judah ha Levy is known to have translated, sometimes modifying and improving, some Arabic poems.

The names of well over one hundred Hebrew poets of Spain are known, but poetry has not survived for the majority of them. Some of the most important Hebrew poets whose work has survived include: Dunash Ibn Labrat, Isaac ibn Khalfun, Joseph ibn Abitur, Samuel ibn Naghrillah (all of the tenth and eleventh centuries); Solomon ibn Gabirol, Isaac ibn Ghiyāth, Levy ibn al-Tabban, Moses Ibn 'Ezra, Judah Halevi, Abraham ibn 'Ezra (eleventh and twelfth centuries); Judah al-Harizi, Meshullam de Piera, Ṭodros Abulafia (thirteenth and fourteenth centuries). After the fourteenth century, poetry shifted primarily to Aragón-Catalonia, although there certainly was no "school" of Hebrew poets in Girona, as has been erroneously suggested. Important fourteenth- and fifteenth-century poets included Solomon de Piera (who also exchanged Hebrew poetry with Christians), Vidal Benveniste (de la Caballería), and Solomon Bonafed.

The audience for Hebrew poetry was simply the Jewish people in its entirety, chiefly in Spain, but also in Provence and as far away as Yemen. There is no evidence that these poems were "sung," as sometimes claimed, but they may have been recited orally. Cer-

tainly, and primarily, they were read and copied, and manuscripts circulated widely. Again, contrary to a common myth, the Hebrew poets were not “court poets”; they belonged to no aristocratic class and only rarely composed panegyrics for a patron. Few, if any, were professional poets who made a living from their poetry. Knowledge of, and ability to compose, poetry spread quickly among all levels of Jewish society. Common letters and numerous writings of Spanish Jews attest to this. Even children became proficient in poetry, and of course the love poems addressed to boys shows that they understood the often sophisticated language. The rabbi Solomon ibn Adret writes that he knew a boy in Lérida who, although he could not read, could compose poetry.

Jewish Romance Poetry

The earliest example of the use of Romance in poetry is to be found in the *muwashshaḥāt*, a special kind of strophic poem of definite meter and length with the final couple (*kharja*) either in Romance or Arabic, or a combination of the two. This form of poetry began among the Muslims of Al-Andalus in the tenth century and was quickly imitated by Hebrew poets. There are many erroneous and unfounded theories about this type of poetry.

Probably the first Jewish poet to write in actual Romance (that is, Spanish), however, was Shem Ṭov de Carrión, whose *Proverbios Morales* has been called the first “absolute poetry” (non-epic) in Spanish. (Prior to this, some Jews, and also women, had written in Arabic.) Moses ibn Zarzal, physician to Enrique III, wrote a Spanish poem on the birth of Juan II. Astruch Rimokh (early fifteenth century) sent a Catalan verse composition to Solomon de Piera (who satirized him, nevertheless, for not writing in Hebrew). Piera also refers to Catalan poems by Moses Abbas. There are also some anonymous Judeo-Catalan (or Provençal) secular and wedding poems of the fourteenth and fifteenth centuries. Mention should also be made of the apparently fifteenth-century (if not, in fact, later) Judeo-Spanish *Coplas de Yoçef*.

Hebrew Poetics

An important contribution of medieval Hebrew poets lies in the various works on poetics they composed. Unlike similar Arabic works, which were written entirely by non-poets and thus are of limited value, these works give real insight into both the historical development and aesthetic standards of Hebrew poetry. The most important such work, now available in an excellent Arabic edition and Spanish translation, is Moses ibn ‘Ezra’s *Kitāb al-muḥādara*. Other important

sources include various works of Abraham ibn ‘Ezra, Abraham and Yedaya Bedersi, and Shem Ṭov ibn Falquerah, the *Takhemoni* of Judah al-Ḥarizi, and many others. (Abraham Bedersi, a Provençal Hebrew poet, is particularly interesting because of his unique knowledge of contemporary Christian poets.)

Spanish Hebrew poetry already influenced similar developments in Egypt, North Africa, Yemen, and elsewhere prior to the Expulsion, and afterward this tradition continued to some extent, but Hebrew poetry has never again achieved the heights reached in medieval Spain.

POETRY, IMPROVISED

There is no direct evidence for orally improvised poetry in Hispano-Romance during the Middle Ages and there is only one witness in Hispano-Arabic. Monroe has studied a brief improvised poetic duel dating from the eleventh century, at the latest, and very possibly from the tenth. The insulting verses, recorded in Ibn Ḥayyān’s *Kitāb al-Muqtabis*, were purportedly shouted from a fortress wall by a supporter of the Hispano-Christian rebel, Ibn Ḥafṣūn, and were immediately answered in verse by a mule driver in the besieging army of the future caliph, ‘Abd al-Raḥmān III. They are the earliest known verses in Colloquial Hispano-Arabic. Such aggressive versified exchanges represent the Arabic *ḥijā*’ genre of improvised poetic invective. The custom of a competitive exchange of improvised rhymed insults (*echarse pullas*) is known in Castilian from the early sixteenth century and the related forms *repullar* and *repullón* already figure in the mid-fifteenth-century *Cancionero de Baena*. The custom of improvised poetic competition is known today throughout the Hispanic world, in Basque, Spanish, Portuguese, and Catalán, and on both sides of the Atlantic, while analogous competitions have also been recorded from France and Italy. The thirteenth-century

Sicilian *Contrasto*, written by Cielo d'Alcamo, may represent a literary re-creation of just such an improvised exchange. Similar practices in Latin are commented upon by classical authors (Horace, among them) and there is evidence for the same custom among various ancient peoples. Given such early parallels, as well as the widespread survival of poetic improvisation among modern Hispanic peoples, we would be ill-advised to disclaim its probable existence among Hispano-Romance speakers during the Middle Ages.

POETRY, SPANISH LYRIC

Lyric poetry, as its name suggests, involves elements of music, and so contains rhythm, expressive sounds, and emotional appeal. It may take the form of an independent composition, be a passage in a long poem (for example, the epic), or merely constitute part of a Spanish *kharja* (early woman's song) thus serving in a refrain to an Arabic or Hebrew poem.

Few traces of pre-thirteenth-century Spanish lyric poetry remain. Although Jimena's prayer on behalf of her husband, el Cid (in the *Cantar de Mio Cid*, ca.1200) is not entirely lyric, it may serve as an early example of an emotion portrayed in verse form. This semilyric was preserved because it was shielded by the epic in which it appears. Another instance of the "shielded" lyric is the May song, "El mes era de mayo," buried in the *Libro de Alexandre* (c.1250).

Religious poetry and song—such as Gonzalo de Berceo's early-thirteenth-century *Milagros de Nuestra Señora* or his *Duelo de la Virgen*—have been better preserved than popular lyrics, though profane works in prose were often relieved of monotony by the insertion of such poems as the doleful "Profeía de Casandra," or the love laments of Troilo and his lady Briseida and their grief at the prospect of parting in *Historia troyana* (c.1270) thus preserving these lyric poems in a prose context.

Lyric narrative is well exemplified in the anonymous early thirteenth-century *Razón feita d'amor*: love is the theme, springtime the setting. Wine and cool water blend with the fragrance of flowers. Lines vary in length, and they all rhyme, but without a set pattern.

The principal reason, apparently, for the paucity of learned lyric poetry in the early period is that poets preferred to employ the Galician Portuguese language, in vogue during the twelfth to the early fourteenth centuries.

The *Libro de buen amor*, attributed to Juan Ruiz, Archpriest of Hita (c.1283–c.1350), begins with a verse prayer followed by lyrical *gozos*, poems in praise of St. Mary, which together indicate that in Spanish lyric verse measure, both octosyllabic and heptasyllabic, as well as varying line-length strophe forms including the *copla de pie quebrado* (stanzas containing half-lines), were fully developed. The prayers and religious songs that relieve the monotony of heavy topics in *Rimado de palacio* by the melancholy Pero López de Ayala (1332–1407), contain strophes in octosyllabic verse and some *coplas de arte mayor* (eight-line stanzas of six-plus-six-syllable verse patterned (Ú) ˘ UU ˘ (U)/(U) ˘ UU ˘ (U), with the restriction that syllables five and six may not both be omitted, thus relieving the monotony of the *cuaderna vía* (seven-plus-seven-syllable monorhymed quatrains) and foreshadowing their fifteenth-century predominance in Spanish poetry. (Verse lengths here are given according to Spanish measure, which involves, as appropriate, synalepha, hiatus, syneresis, and dieresis.)

Juan Ruiz's young contemporary, Alfonso XI (1314?–1350), offers further evidence of Spanish employed as a lyric medium: his *cantiga* (song) beginning "Em hum tempo cogi flores" appears in the Galician Portuguese *Cancioneiro da Vaticana*.

Popular verse is found in the *coçsaute* (dance song) by Diego Hurtado de Mendoza (c.1340–1404); monorhymed couplets in oxytonic verse vary in length from nine to twelve syllables. Each couplet is followed by the heptasyllabic refrain.

The major impetus to the development of Spanish lyric verse occurred during the reign of Juan II (1405–1454), at whose court poetry recitation and singing apparently constituted principal forms of entertainment. Much of this verse composition has been preserved in the *Cancionero de Baena* (c.1440), compiled by Juan Alfonso de Baena, which contains works of at least sixty poets. A few selections are in Galician Portuguese. Topics vary from those of love for one's lady to devotion to St. Mary to those of local and general interest. The poet-for-hire Alfonso Álvarez de Villasandino (c.1350–1424) is the most prolific, and one of the earliest poets featured in the collection; his topics range from the pious to the obscene. Other lyric poets include Baena himself, Ferrán Manuel de Lando, Francisco Imperial, and the lovelorn Macías, who is less worthy of note for his poetry than for the romantic love legend his life engendered.

Independent of court activity, Íñigo López de Mendoza, Marqués de Santillana (1398–1458) introduced the Italianate sonnet with his *Sonetos fechos at itálico modo*, closely related to a certain *arte mayor* form in the *Cancionero de Baena*—that is, a poem consisting of an octave rhyming ABBAACCA, plus a quatrain rhyming ACCA. Santillana's highly learned style gave direction to a trend in poetic composition that gradually led to the stylized, mannered verse known as Gongorism.

Santillana's contemporaries Juan de Mena (1411–1456), author of the allegorical *Laberinto de la Fortuna*, and Jorge Manrique (1440–1479), whose unforgettable *Coplas por la muerte de su padre*, on the equalizing power of death, are the major mid-century lyric poets.

The medieval period ends with the appearance of the earliest known treatise on Spanish metrics: *Arte de poesía castellana*, included in Juan del Encina's *Cancionero* (1496).

POETRY, SPANISH, LYRIC, TRADITIONAL

In a conference in 1919, Menéndez Pidal encouraged literary historians to investigate the popular lyric of the Middle Ages, whose influence he had glimpsed through the *cantigas de amigo*, a few citations from fifteenth-century *cancioneros* (Song books), Renaissance and Baroque adaptations, and imitations from Gil Vicente to Lope de Vega. From this spark of interest were born anthologies that have progressively enriched our knowledge of this field, including collections by J. M. Blecua and Dámaso Alonso (1956), J. M. Alín (1968), and M. Frenk (1987).

Since then, our perspective on popular poetry has changed a great deal. For one, the *Kharjas* (vestiges of women's songs preserved in Hispano-Arabic poetry), the first link in the traditional lyric's development, have been discovered. Scholars have systematically explored Galician-Portuguese, Castilian, and Catalan texts and have studied their content, form, and themes, while in other European literatures such interest has disappeared with the progressive abandonment of traditionalist theories of the origins of the lyric. After these developments, several facts worth taking into account were clarified: like other Romance literature, lyric poetry has very old roots, and is divided into

different schools that share some essential characteristics but also differ in more than just a few aspects. It undergoes a marked chronological evolution that doesn't cease until between the fifteenth and eighteenth centuries with the origin of modern folklore, which itself displays traces of the popular lyric. But above all, we must emphasize the fact that there are very few medieval Spanish texts preserved, and the majority date from the fifteenth century.

Essentially, the popular lyric is a poetic mode first recorded around 1500 by the polyphonists (*Cancionero musical de Palacio*, *Cancionero de Upsala*, and later Juan Vásquez), and continuing with the sixteenth-century *vihuelistas* (Luis Milán, Alonso Mudarra, Luis de Narváez, and Enríquez de Valderrábano). But if these musicians were interested above all in the melody of the lyric, which they adapted to string accompaniment or to polyphonic modes that were then in vogue, there were at the same time poets who were attracted to the lyric's enchantment, and who then attempted to imitate or re-create its allure. The earliest of these was apparently Gil Vicente, but the best poets of the sixteenth and seventeenth centuries also glossed and imitated popular verses: some were interpreted *a lo divino* (given a religious interpretation) by mystical and religious poets, while others served as points of departure for more than a few theatrical works, like Lope de Vega's *El caballero de Olmedo* and *El galán de la Membrilla*, or Tirso de Molina's *La dama del olivar*. It is, therefore, a poetic trend of the Golden Age whose medieval precedents can be reconstructed to a certain point, but only following French and Galician-Portuguese texts.

In terms of form, the popular lyric consists of two- or three-verse *estribillos* (refrains; also called *vilancicos*) accompanied at times by glosses of a learned nature, and less often by more popular glosses. The gloss tended to follow the *zéjel* model (a two-verse stanza with *estribillo* typical of the Galician-Portuguese school and found only—and rarely—in the fifteenth century). Its style is dominated by what we now consider basic vocabulary of the language, with approaches both affectionate (diminutives, terms like *amigo*, *amor*, *vida*, *madre*, *corazón*, etc.), and intuitive rhetorical questions, exclamations, simple phrases, use of juxtaposition. The limited descriptive elements usually portray the physical landscape, but in a symbolic manner.

In terms of content, the texts are usually put in the voices of women discussing love. Most important, the subject matter selected generally appears to be truncated, without antecedents, without consequences, and without a logical solution for the situation presented in the poem, whose interpretation depends on

the cultural background of the reader: “¿Qué me queréis, caballero? / Casada soy, marido tengo. [“What do you wish, Sir? I am married and have a husband.”] For those readers familiar with earlier poetry and its subtle conception of emotions and passions (courtly love, Petrarchism), the popular lyric’s direct expressions of love, with little repression or shame, prove quite surprising, as do its aspirations for sexual satisfaction. The obstacles to this fulfillment, which generally make up the thematic content of the poem, come from the amigo (the often unfaithful, absent, or deceiving man with whom the woman has fallen in love) or from society (family, war). The young woman voices the pain caused by her situation (“La media noche es pasada / e no viene; / sabedme si hay otra amada / que lo detiene.” [“Midnight has passed / and he does not come; / would that I knew if he has another lover / who detains him.”]) or dreams of regaining her freedom (“Agora que soy niña / quiero alegría, / que no se sirve Dios / de mi monjía.” [“Now that I am still a young girl / I want joy, / God will not gain / if I become a nun.”])).

Unlike the tradition of erudite, refined love poetry, the popular lyric frequently expresses happiness, exaltation, the yearning for satisfaction, and the memory of pleasure. Its authors seem to be envisioning a society without repression, where no desire remains unfulfilled; they do so, however, through symbols that shroud the meaning, even for the attentive reader. The spring, river, and stream, settings for the romantic encounter, are enough to evoke this poetic reality (“en la fuente del rosel, / lavan la niña y el doncel.” [“In the fountain of the rosebush / the young girl and the young man wash.”]); flowers tend to express the fulfillment of love (“Ya florecen los árboles, Juan; / mala será de guardar.” [“Juan, the trees are in bloom; I’ll be difficult to keep.”]) and, like strands of hair carried away by the breeze, the loss of virginity (“Estos mis cabellos, madre / dos a dos me los lleva el aire.” [“These my tresses, mother / the wind blows two by two.”]) The most omnipresent element, though, is vegetation as a force of nature (“Dentro en el vergel / moriré; / dentro en el rosal / matarm’han,” [“Down in the glade / I will die; / down among the rosebushes / they will kill me.”]) or the well-known “De los álamos vengo, madre / de ver cómo los menean el aire.” [“I come from among the poplars, / from seeing how the wind rustles them.”])

These elements also frequently represent failed attempts at love, suggesting love’s difficulties (“Aquellas sierras, madre, / altas son de subir; / corrían los caños / daban en el torongil.” [“Those mountains, mother, / are tall to climb; / the streams ran down, ran down to the lemon garden.”]), the sorrows of the present (“Miraba la mar, / la malcasada, / que miraba la

mar / cómo es ancha y larga.” [“She looked at the sea, / the unhappily married one, / she look at the sea, / how it is wide and / long”]), despair (“Vi los barcos, madre, / vilos y no me vale, [“I saw the ships, mother, I saw them to no avail”]), pleas for help (“Aires de mi tierra, / vení y llevadme, / qu’estoy en tierra axena, ‘no tengo a nadiel.” [“Breezes from home / come and take me / I am in an alien land and have no one”]), or profound hopelessness (“Van y vienen las olas, madre, / a las orillas del mar: / mi pena con las que vienen, / mi bien con las que se van.” [“The waves come and go, mother / on the shores of the sea; my grief with those that come, / my happiness with those that go.”])).

Some images deserve separate mention, such as the metaphoric use of falconry (“Mal ferida va la garça. / Sola va y gritos daba.” [“The heron takes wing badly wounded. / She flies off crying out”]), revisited later by San Juan de la Cruz (“Tras de un amoroso lance, / y no de esperanza falto / volé tan alto, tan alto, / que le di a la caza alcance.” [“After an amorous affair, / and not without hope / I flew so high, so high, / that I reached my prey”])). The night, however, stands out as the most important symbol of the popular lyric, expressing the solitude and insomnia caused by love (“Estas noches atan largas / para mí / no solían ser ansi.” [“These nights so long / for me / used never to be like that”]); the hope brought by dawn (“¿Quándo salireis, alba galana! / ¿Quándo saliréis, el alba!” [“When you rise, oh beautiful dawn / when you rise, oh dawn”]); the eagerness with which the lovers await their encounter (“Salga la luna, el caballero, / salga la luna y vámonos luego. [“Let the moon come out, the gentleman, / let the moon come out and we depart”]); desire (“Besáme y abraçame, / marido mío . . .” [“Kiss me, embrace me, / oh husband of mine”]); or ambiguous dreams (“En la peña, sobre la peña, / duerme la niña y sueña.” [“On the cliff, over the cliff, / the young girl sleeps and dreams”])). Expressions of pleasure and of elegiac nostalgia usually dominate this genre.

At the same time, however, less serious compositions treating the love lyric’s components as a joke are not lacking. Sometimes these verses make fun of the general situation (“Por qué me besó Perico, / por qué me besó el traidor?” [“why did Perico kiss me, / why did the traitor kiss me?”]); in other cases, they ridicule the poem’s dearest symbols, including water (“Al pasar el arroyo / le vi las piernas, / ¡Ay la puta bellaca, / y qué blancas que eran.” [“On crossing the stream / I saw her legs / Ah, the cunning old whore, / and oh they were so white”]) and the wind (“Levantóse un viento / que de la mar salía / y alçome las faldas / de la mi camisa.” [“A wind rose up / that came from the sea / and lifted up the flaps of my shirt”])). Occasionally the popular lyric presents the reader with a direct exal-

tation of the beauty of the body that is rare in Spanish literature ("No me las enseñes más / que me matarás. / Estávase la monja / en el monesterio, / sus tetitas blancas / de so el velo negro . . ." ["Don't show them to me again, / you will kill me. // The nun was in her monastery, her little white breasts / under the black veil"])).

Because of its expressive qualities and its thematic focus, the popular lyric interested more than just philologists. Francisco Asenjo Barbieri's 1890 publication of the *Cancionero musical de Palacio* resulted in that collection's availability among the poets of the so-called Generation of 27 (Lorca Alberti and others), and helped them become acquainted with traditional poetry's merits. The rhythm and dramatism of one of the collection's poems ("En Avila, mis ojos, / dentro en Avila. // En Avila del Rio / mataron a mi amigo, / dentro en Avila." ["In Avila, my eyes, / inside Avila. // In Avila of the River / they killed my lover"]) likely inspired one of the compositions from Rafael Alberti's *Marinero en tierra* ("Mi corza, buen amigo, / mi corza blanca. // Los lobos la mataron / al pie del agua." ["My roe, good friend, my white roe. // The wolves killed her at the edge of the water"])).

POETRY, VERNACULAR, POPULAR, AND LEARNED, ARABIC EPIC

The fundamental role played by oral narrators and *juglares* (minstrels) in the transmission of epic poetry as an outwardly projected expression of the world is well known. In this context, it is important to remember that the historical Cid, in his half-Moorish Valencian court, listened not only to juglares in Romance but also in Arabic. We also know through Ibn Bassām's testimony that the Cid listened with great admiration and passion to epics about the valiant Moors.

In el Cid's Valencian court, a hybrid of Christian and Moorish *juglaría*, Romance juglares would also have learned Arabic epic poems. In fact, a comparative analysis of Arabic narrative and Castilian epic reveals, firstly, a series of thematic motifs common to both traditions. This is not so much a question of looking for literary models that may have influenced Castilian epic, but rather for shared myths, beliefs, social behavior, ideas, and manifestations (internal and external) of chivalry: in short, the unique poetic code which the Castilian juglares have been able to echo.

The first shared characteristic associated with the chivalric spirit that stands out is the tradition of giving a proper name to the knight's weapon. This practice responds to a concrete historical reality in the Arabic world, while in the Romance epic it is a mere literary device. This nominalization is without doubt related to the Arabic belief that words possessed magical strength. This leads to the Muslim warrior's practice of reciting before combat a few *coplas* (verses) that exalted his own strengths, thereby fulfilling the ritual of *faqhr*, or boasting, that was inherent in the Arabic knight's character. The thematic coincidence here highlights the existential approach to Arabic life that is later transferred to the Castilian epic.

The Muslim influence also sheds light on the very concept of the war against the infidel, which was conceived according to the doctrine of *jihād*, or holy war, as Américo Castro has emphasized. Another crucial element in this type of war is the presence of the angel Gabriel—Jibril, among the Arabs—who appears to the warrior in critical moments, warning him of danger and giving counsel necessary to achieve victory. Also important are the war strategies and schemes that are inherent talents of the Muslim paladin.

Many other characteristics of Arabic origin can also be recognized in the epic, such as: the presence of the woman in war, or the motif of the woman of noble lineage who comforts the captive, both evident in Arabic life and literature; falling in love by hearsay, which follows doctrines of love collected by the poet Ibn Ḥazm de Córdoba; birds as good omens, related to Arabic rules of divination; and treacherous letters commanding the recipient to kill the carrier, a frequent theme in Arabic tradition. Moreover, the disconcerting realism and historicity of the Castilian epic, concentrating on the human condition of the hero instead of his mythic qualities, are made to fit the Arabic models, as are the hero's burden of tolerance and his democratic aspirations; all is made to fit the framework of an irregular meter similar to the Arabic *rajaz* (rhymed prose), which differs from the *qaṣīda* (ode) in the same way as the Castilian *mester de juglaría* and *mester de clerecía*.

To summarize, the Castilian epic could very well have originated from echoes of the Germanic epic. Without doubt, however, it could not have come into existence without the strong decisive mark made by the Arabic chivalric epic. The resulting product, then, is a Mudéjar epic—the equivalent of an embroidered cloth interwoven with Western and Moorish threads.

POETRY, VERNACULAR, POPULAR, AND LEARNED: CANCIONEIROS OF PORTUGAL

The amorous and satirical lyrics composed by Portuguese and Galician poets during a period extending from roughly the end of the twelfth to the middle of the fourteenth centuries are preserved in three major collections, known as *cancioneiros*: *Cancioneiro da Biblioteca Nacional*, *Cancioneiro da Vaticana*, and *Cancioneiro da Ajuda*, which were all brought to light in the nineteenth century. The term derives from Old French *cançonier*, forerunner of Modern French *chansonnier*. The initials that best respect the shelf markings of these collections are *CBN*, *CV*, and *CA*, although some scholars, considering *C* a superfluous reference to *cancioneiro*, find these abbreviations cumbersome. The proliferation of manuscripts, characteristic of the poetic tradition in medieval France and Italy, is unknown on the Iberian Peninsula, where there normally is only one manuscript, kept in a royal or monastic library.

The *CBN* contains the largest collection by far. Copied down in Italy around 1500 under the direction of the Italian humanist Angelo Colocci, it was discovered by Costantino Corvisieri and Enrico Molteni in the library of the Counts of Brancuti in Cagli. The diplomatic edition, prepared by Molteni, bears the names of the former owners of the manuscript, *Il canzoniere Portoghese Colocci Brancuti*. Published in 1880, it covers only those poems that are not included in the *CV*. The manuscript was later owned by Ernesto Monaci, whose heirs donated it to the Portuguese government in 1924. It is now kept in the National Library of Lisbon. The *CBN* contains a total of 1,567 poems along with a fragmentary *Poética*, which establishes the traditional division of the lyrics into *cantigas* (songs) *de amor*, *cantigas de amigo*, and *cantigas de escarnho* or *maldizer*. The eight-volume Machado edition of the *CBN*, published from 1949 to 1964, is of limited usefulness.

The *CV* manuscript, (Codex Vat. Lat. 4803) was discovered in the Vatican Library by a Portuguese clergyman, Padre J. I. Roquete. It is not known whether Angelo Colocci played a supervisory role in the preparation of this manuscript, copied down in Italy during the late fifteenth or early sixteenth century. The attributions and some of the marginal notes have been traced to Colocci's handwriting, but not the texts themselves. The *CV* manuscript has reached us in a less than perfect state; the initial 390 poems are missing, and there are additional *lacunae*. Partial editions were put together by Varnhagen and Monaci, and a diplomatic edition: *Il canzoniere Portoghese della Biblioteca Vaticana*, was published by Monaci in 1875. Teófilo Braga's 1878 critical edition: *Cancioneiro português da Vaticana*, is unsatisfactory; the accompanying glossary is particularly poor.

The *CA* is the oldest and most reliable of the three major codices and the only one that was copied down in Portugal. Published together with the *Nobiliário do Conde de Barcelos*, the *CA* is incomplete, containing only 310 *cantigas* without indication of authorship. Colocci's inventory, the *Tavola Colocciana*, permits the attribution of 288 compositions to thirty-two known poets, and Carolina Michaëlis attributes the remaining twenty-two poems to six unidentified authors. Spaces left blank may have been intended for musical notations. The numerical arrangement of the *CA* material corresponds to that of the *CBN* up until numbers 242–45, though with *lacunae*. The *CA* shares fifty-six poems with the *CV*, 189 with the *CBN*, and is the repository of sixty-four *cantigas* not transmitted elsewhere. Only the *cantiga de amor* genre is represented. From the place of its discovery, the manuscript was initially labeled *Cancioneiro do Colégio dos Nobres*. It was later transferred to the Biblioteca Real in the vicinity of the Ajuda palace, hence its definitive designation. The early history of the codex is unknown, but it is generally assumed that the manuscript never left Portugal. Partial editions of the *CA* material were put together by Lord Stuart, C. F. Bellermann, and F. A. de Varnhagen. The subtitle to Varnhagen's 1849 edition, *O livro das cantigas do Conde de Barcellos*, is noteworthy in that it bears witness to the editor's belief in single authorship, but the Count of Barcelo's role as a mere compiler of *cantigas* has since been definitively established. The fate of his collection, bequeathed to the king of Castile, is unknown. These early works are superseded by Carolina Michaëlis's monumental 1904 edition: *Cancioneiro da Ajuda: Edição crítica e commentada*. Henry H. Carter provided a diplomatic edition in 1941.

The *Tavola Colocciana*, containing an inventory of authors, put together by Colocci, is preserved in

Codex Vat. 3217. The names are preceded by numbers ranging from 1 to 1675 and coinciding with the numbers and attributions proposed by the *CBN*.

The discovery of the *Pergaminho Vindel* lends support to Gustav Gröber's *Liederblätter* (broadside theory), in terms of which medieval poetry was transmitted through *rotuli* or fly leaves, containing all the poems written by each individual author and executed or ordered executed by him for propaganda purposes. Serving as cover for a codex of Cicero's *De Officiis*, this manuscript, containing all seven cantigas by Martin Codax, was discovered in 1914 by the Madrid librarian Pedro Vindel, who published a photographic reproduction in 1915, but the manuscript itself has since been lost. Related to the *CA* in graphical representation, the manuscript may date back to 1300, but is not necessarily the original. Not only does the *Pergaminho Vindel* offer concrete proof of Gröber's *Liederblätter* theory, but it also holds great importance as the only manuscript to provide musical notations.

The existence of *Liederblätter*, the uniformity of the manuscripts, and the formal perfection of the poems point to written transmission of the poetry. We may conclude that the cantigas were copied down in carefully executed *rotuli* for each individual poet, then inserted into *cancioneiros*.

POETRY, VERNACULAR, POPULAR, AND LEARNED: CANCIONEROS OF SPAIN

Spanish court poetry of the late Middle Ages is preserved in often substantial manuscript anthologies which were compiled from about 1430 onward. These books, of which some sixty contemporary examples survive, are known as *cancioneros*, (literally, "song-books," "collections of *canciones*") though none of the early manuscripts contains musical notation, and few give precedence to the *canción*, a short lyric with initial *estribillo*. In the 1480s the first printed *cancioneros* began to appear, culminating in the enormous *Cancionero general* of 1511. The term "*poesía de cancionero*" or "*cancioneril*," therefore, refers to all the extant

court poetry of a 150-year period, from the end of the fourteenth to the beginning of the fifteenth century, a corpus of several thousand poems, written by over five hundred named poets. Almost all of this verse was written in castilian, even by poets of a different linguistic background, like the Catalan Pedro Torrellas, and the Portuguese Juan Manuel. Catalan poetry was collected separately, but no contemporary manuscripts of Portuguese verse survive.

The extraordinary proliferation of poetic collections, on a scale unprecedented in the Iberian Peninsula, has been taken to mark the sudden flowering of Castilian court lyric after two centuries of dominance by the Galician-Portuguese. It would perhaps be safer to say that the survival of so much verse is more an index of consumer interest, or increased literacy, than of heightened productivity. Nonetheless, poetry obviously enjoyed a renewed vogue in the fifteenth century, playing a significant part in the cultural life of the courts and the courtship practices of the individual.

The Poetry

The term "*cancionero* poetry" is often generally used to refer to all forms of love poetry characteristic of the period. This includes various types of lyric-narrative poems (love allegories, dream-visions, *serranillas*), as well as the short lyric *canción* and the long amorous *dezir* or *coplas*. In fact, the heterogeneity of fifteenth-century verse cannot be overemphasized. It embraces a wide variety of subjects and treatments, including debate poems, disquisitions on moral or doctrinal themes, personal invective, political satire, and misogynist diatribe. The categories of religious verse alone range from Marian hymns to long narrative meditations on the life and Passion of Christ, shading over, rather disturbingly, into amorous parodies of the mass and other liturgical devotions. The poetry of burlesque and bawdy, little known from manuscripts, is elevated to prominence by a special section of *obras de burlas* (works in jest) at the end of the *Cancionero general*, and in its offshoot, the *Cancionero de obras de burlas provocantes a risa* (Valencia, 1519).

Much of this verse was occasional, commemorating events of national importance or trivial incidents at court. And most of it may have been performed, in improvised games, competitions, or semitheatrical entertainments. It is difficult to be sure that even the more intimate poems were intended for private reading rather than public display. Some of the shorter love lyrics must have been sung, but only with the appearance of songbooks in the closing decades of the century do we have a secure indication of poems that were songs.

The Poets

The authors of this verse come from a wide spectrum of backgrounds, ranging from monarchs, high-ranking nobles, statesmen, diplomats, and knights to bureaucrats, clerics, and latter-day *juglares* (minstrels). These differences may be reflected in the output of the dilettante for whom verse writing was a desirable social accomplishment (Juan II, Alvaro de Luna), the professional dependent on it for a living or preferment (Alfonso Alvarez de Villasandino, Montoro), and the dedicated man of letters who made poetry the focus of serious literary endeavor. In this last group we can include all the major poets of the fifteenth century: Francisco Imperial, Marqués de Santillana; Fernán Pérez de Guzmán; Juan de Mena; the two Manriques, Jorge and Gómez; Fray Íñigo de Mendoza; and Garci Sánchez de Badajoz; as well as a number of authors better known for their prose works: Juan Rodríguez del Padrón, Diego de Valera, the Bachiller Alfonso de la Torre, and Diego de San Pedro.

However, archival research has still to unearth biographical data for the great majority of names. All but a handful were men. Florencia Pinar is the only woman credited with more than one complete poem.

The Manuscripts

The latest register of this poetry (Dutton 1990–1992) records over two hundred manuscripts (hereinafter identified by Dutton's *sigla*). By no means are all of these strictly *cancioneros*; some are only fragments of lost collections (BM2, MN29) or prose miscellanies containing a few poems (MN31, PN2). Castilian court lyric also occurs in Catalan poetic manuscripts (BA1, BU1), in French and Italian songbooks (MA1, PN15); and as lyric insertions in sentimental romances (MN5, MN20). But the manuscripts that conserve the bulk of the poems were exclusively dedicated to verse, and such prose pieces as are included are either prefatory matter (Santillana's *Prohemio*, MN8, SA8), learned glosses (for example, of Mena's *Laberinto de Fortuna* in PN7), or related courtly works, such as pseudo-Ovidian epistles (PN4, PN8, PN12, PM1) or correspondence between poets (CO1, MN44), or, in the case of *cancioneros* devoted primarily to didactic or satirical genres (LB3, SV1), some wisdom literature.

We have in the region of sixty contemporary *cancioneros*, and another dozen sixteenth-century or later copies of lost collections. Few, if any, of the extant manuscripts are original compilations, but are through copied replicas of lost archetypes, some with local and/or personal additions by the compiler. Others, like EM9, SA9, SA10, and MN6 (the *Cancionero de Ixar*), are factitious, comprising two or more fragments of

different date and provenance that have been bound together.

Family relationships between a number of manuscripts reveal a complex network of transmission, suggesting the loss on a massive scale, not only of whole *cancioneros*, but of the more modest units that may lie behind their composition. Since many collections give prominence to the work of one individual, it is possible that a personal *cancionero* formed the basis of the extant copy. We have individual manuscripts for Fernán Pérez de Guzmán (MM2, NH4), Santillana (MN8, SA8, TP1), Gómez Manrique (MN24, MP3), Fernando de la Torre (MN44), and Juan Alvarez Gato (MH2), but none for equally or more eminent figures such as Juan de Mena and Jorge Manrique.

The manuscripts vary considerably in quality and condition. Generally they are undistinguished folio or quarto volumes, on paper, with minimal decoration, copied in clear book hands by professional scribes, rather than private aficionados. A small minority were clearly intended as presentation copies, notably three of the manuscripts produced in Italy, *Estúñiga* (MN54), *Marciana* (VM1), and *Roma* (RC1), and one of the personal *cancioneros* of Gómez Manrique (MP3). These are sumptuously executed on vellum with an illuminated frontispiece and decorated initials. The *Cancionero de Palacio* (SA7), uniquely, is adorned with polychrome sketches in the margins. The sexually explicit nature of some of these drawings led Whinnom to postulate a covertly erotic subtext for its (largely) chaste lyrics.

Codicological and typological studies are still in their infancy. Much remains to be clarified as to provenance, ownership, criteria, and methods of compilation, production, circulation, and readership. The following notes are intended as a rough chronological guide to some of the more important and/or accessible collections.

Cancionero de Juan Alfonso de Baena (PN1). The original *Cancionero de Baena* was completed around 1430; the Paris codex is only a copy, a plain folio volume that incorporates later additions made to its exemplar. It is nonetheless the oldest known manuscript collection, and the only one with a known compiler. Although Juan Alfonso de Baena's dedication and prologue, addressed to Juan II of Castile, suggest he was conscious of setting a precedent, its sheer scope and size (over 550 items covering four reigns from Pedro the Cruel to Juan II) indicate almost certain reliance on written sources. Organized in principle by author with generic subdivisions (*cantigas*, *preguntas*, *dezires*), it gives pride of place to 217 works by Villasandino (ca.1345–1425) and privileges the genres of

poetry favored by his contemporaries, commemorative poems and learned debates. Fewer than one-sixth of its compositions are love poems. The compiler and several other contributors were natives of Andalusia, or, like Francisco Imperial, resident there. *Baena* has been published several times, but see especially the edition by B. Dutton and J. González Cuenca, which gives an up-to-date account of its codicological history and a critique of previous editions, including the facsimile by H. R. Lang.

Cancionero de Palacio (Now in Salamanca; SA7). *Cancionero de Palacio* was compiled in the following decade (ca.1437–1440). It has a small overlap with *Baena* (Macías and Villasandino), but is quite different in character. It is devoted almost entirely to love poetry, with a predominance of actual canciones, short lyrics of varying metrical type with an initial *estribillo*. They are not arranged in any discernible order. It contains the earliest extant texts of Santillana, Suero de Ribera, and Pedro de Santa Fe, and a host of minor figures, most of whom do not reappear in any subsequent collection. The presence of a few Catalan poems and some scribal aragonesisms indicate an eastern provenance. The pioneering edition by Vendrell de Millás, still valuable for its introductory study, has been superseded textually by that of A. M. Alvarez Pellitero.

Paris A, E, and H (PN4, PN8, PN12). Of slightly later date (ca.1442) is the lost Castilian archetype (Vàrvaro's *a*) for three manuscripts, now in Paris, which Dutton believes were copied in a Naples scriptorium in the 1460s or 1470s. This archetype, which all follow more or less faithfully, contained a core collection of love poems by Mena, Lope de Stúñiga, the Bachiller de la Torre, Juan Rodríguez del Padrón, and Santillana, some of which were to enjoy wide and continuing circulation in later collections, up to and including *Cancionero general*.

Cancionero de Gallardo or *de San Román* (MH1). The next most substantial manuscript safely associated with Castile is *Cancionero de Gallardo* or *de San Román*, which dates from about 1454. It was clearly planned as an official register, with spaces left blank for additions to the work of individual poets. It contains most of the known verse of Juan de Dueñas, a key figure of Santillana's generation, as well as unique items by Diego de Valera, Pedro de Escavias, and Santillana himself. It was published in full for the first time by Dutton's volume 1, 1990.

Cancionero de Herberay (LB2). *Herberay's* claim to uniqueness are the compositions that link it to the Na-

varrese court of Leonor de Foix in the early 1460s, and a series of anonymous love poems which have been attributed to the diplomat poet Hugo de Urries. These are incorporated around another core of earlier favorites (Vàrvaro's *v*) by Macías, Mena, Pedro Torrellas, Lope de Stúñiga, Pedro de Santa Fe, and Juan Rodríguez de la Cámara (= del Padrón). The *Cancionero de Modena* (ME1), copied in northern Italy, was based on the same archetype. *Herberay* has been edited by Aubrun.

The Neapolitan "Cancioneros" (MN54, RC1, VM1). The Aragónese court at Naples was the provenance of the last significant family of cancioneros (1465–1475), which graft on to a common base selected from the core represented by Paris A, E, and H (see above) the work of a group of expatriate Spaniards writing in the last years of the reign of Alfonso the Magnanimous. Carvajales is the most interesting poet of this group. The *Cancionero de Estúñiga* (MN54) is the fullest collection; *Roma* (RC1) adds a second section deriving from a complementary core of moral, political, and satirical poems (Vàrvaro's *g*) of peninsular origin; and *Marciana* (VM1) includes Italian verse translations of a portion of its contents. All three manuscripts have been published in modern editions. See especially Salvador Miguel's study and edition of the *Cancionero de Estúñiga*.

The Era of Printing

From the mid-1470s on, the early Spanish presses produced numerous small books and *pliegos sueltos* (short folios) of devotional or moralizing verse, usually by a single author—some new, some already disseminated in manuscript. The first printed anthology, by Ramón de Llavía (c.1486), continues this trend with twenty-two compositions by thirteen poets. Another landmark is the first edition of the cancionero of the prolific and versatile Juan del Encina (1496).

The paucity of new manuscript compilations after about 1470 suggests perhaps a change in market forces as poetry became available to a more bourgeois readership. However, manuscript copies of fifteenth-century verse continued to be made in the sixteenth century and the *Cancionero del British Museum* or *de Rennert* (LB1) is important as one of the few collections to contain court lyric of the Isabelline period.

The Songbooks. Known somewhat tautologically as *cancioneros musicales*, three Spanish songbooks (MP4, SG1, SV1) are preserved from the end of the fifteenth century. The *Cancionero musical de Palacio* (MP4) is the most substantial (458 items), containing

works added in stages between about 1505 and 1520. Its contents represent the polyphonic repertoire of Fernando's royal chapel, including predominantly secular songs in Castilian, but also in Catalan, Portuguese, French, and Italian. The textual overlap with poetic collections is negligible. From the literary point of view it is valuable chiefly for the first solid evidence it provides of a court interest in folksong, as it includes settings for numerous traditional *villancicos* and thirty-eight ballads. It has been edited by Romeu Figueras.

Cancionero General de Hernando del Castillo (Valencia, 1511). As he states in his prologue, Castillo spent twenty years (1489–1509) assembling works of the most prominent poets, from Juan de Mena to those of his own time. The result is over one thousand items, more than half of which are unattested elsewhere, arranged partly by author and partly in generic sections. Recent scholarly interest has focused on the section of 156 canciones. It preserves most of the extant love poems of Jorge Manrique, and of other more enigmatic figures such as Cartagena, Guevara, Soria, and Tapia.

The first edition of one thousand copies, only one of which survives, was succeeded by a second edition in 1514 and seven further editions up to 1573. Evidently a publishing coup, it was the source or stimulus for many imitations, the most important being Garcia de Resende's equally vast compilation of Portuguese court poetry, the *Cancioneiro geral* (Lisbon, 1516). The success of Castillo's selection had the incidental effect of fixing the canon of fifteenth-century verse for Golden Age readers such as Juan de Valdés and Gracián. See the 1958 facsimile edition, with an introduction by Rodríguez-Moñino.

POETRY, VERNACULAR, POPULAR, AND LEARNED: EPIC

Like certain other areas of the Romance world (notably northern France and, to a lesser extent, Provence and northern Italy), Spain, and particularly Castile, developed an autochthonous local tradition of heroic narrative poetry during the Middle Ages. The origins of the Spanish epic—as well as the extent to which lost epic narratives may or may not be reflected in chronistic prosifications and balladic stories—have both been the subject of controversy. It has been argued that the Spanish epic is merely a secondary derivative of the French epic; that it is of ancient Germanic origin, inspired in the heroic poetry of the Visigoths; that it is basically an independent Spanish development; that it is essentially learned, or, again, that it is essentially oral and traditional in character. Each of these arguments merits serious consideration. Medieval minstrels were a multilingual, far-traveled, and cosmopolitan lot. French jongleurs went to Spain and their Spanish counterparts, *juglares*, also went to France. Both significantly influenced the other's epic repertoires. The French epics' influence in Spain was enormously important, not only in numerous Spanish adaptations of French epics and in some narrative components taken over by the Spanish national epics, but also in the innumerable formulaic elements shared by the poetic diction of both traditions. There are indeed some Spanish epic narratives (*Gaiferos*, for instance) and certain narrative themes that are (or, at least, may be) ultimately of Germanic origin, but whether these go back to the traditions of ancient Visigothic invaders or were, rather, taken over from French intermediaries is a debated question. Certainly the epic poetry that developed in Spain, whatever its origins, emerged as eminently and distinctively Spanish in character. Surely there are learned—even ecclesiastic—elements in the few poetic texts that have come down to us and, in some cases, chroniclers undoubtedly intervened to

modify—sometimes profoundly—the fragments of epic texts they prosified. An extreme individualist perspective would hold that none of the ancillary chronicle or balladic evidence can be used to reconstruct lost epics and that the only viable texts are the three epics that have been preserved in their “original” poetic form. All the same, the combined evidence of chronicles and ballads has been strengthened by recent traditionalist findings. At the same time, individualist critics have made enormously important contributions in demanding greater rigor in interpreting narrative and poetic elements preserved in secondary sources.

In terms of primary documentation, conditions in Spain contrast radically with those of northern France. There are well over one hundred different epic narratives (*chansons de geste*) in Old French (taking into account the problem of versions versus “different” poems and the flexibility of boundaries between one work and another) represented by an extremely rich manuscript tradition; in Spain, by contrast, only three epics (*cantares de gesta*) have been preserved in their original poetic form and only one, the *Cantar de mio Cid*, has survived essentially intact. The other two epics are *Mocedades de Rodrigo* (Youthful Adventures of the Cid), which is prosified at the beginning and breaks off after some 1,164 verses, and *Roncesvalles* (a Spanish avatar of the French *Chanson de Roland*), of which only two parchment folios—a mere hundred lines—have survived. Such a paucity of primary documents is deceptive. Medieval Spanish chroniclers treated heroic poems as authentic records of the past and consequently they have preserved for us lengthy prosifications of certain *cantares de gesta*, while fragments of various epics also survived in the form of ballads. Based on such secondary evidence, a substantial repertoire of Old Spanish heroic poetry can be partially reconstructed, to the extent that we can be reasonably certain of the poems’ narrative content and, in some cases, we can even sample some of their poetry in vestiges of assonant rhyme and traditional formulaic diction imbedded in chronicle prosifications.

The Spanish epic was concerned with two major topics: national narratives, pertaining both to Christian conflicts and to wars against the Muslims and Carolingian narratives brought in from France. Spanish national epics reflect two consecutive historical moments: the cycle of the Counts of Castile: the *Poema de Fernán González*, *Infantes de Lara* (Lords of Lara), *Romanz del infant don García* (Epic of Prince García), and perhaps also *La condesa traidora* (The Treacherous Countess), and the cycle of the Cid: *Mocedades de Rodrigo*, *Partición de los reinos* (Division of the Kingdom), *Cerco de Zamora* (Siege of Zamora), *Jura de Santa Gadea* (Oath at Santa Gadea), and *Cantar*

de mio Cid. The historical origins of these national narratives go back, respectively, to around 950–1030 and to el Cid’s lifetime (c. 1043–1099), though the texts of poems or prosifications that have actually been preserved invariably date from much later times (thirteenth and fourteenth centuries). Carolingian narratives, which generally were not prosified, or even summarized, in the chronicles, are much more difficult, though certainly not impossible to reconstruct. With the help of the *Nota Emilianense*, the *Roncesvalles* fragment, various sixteenth-century ballads, and other evidence, we can form a general idea of what the *Song of Roland*’s Spanish avatars may have been like. Exceptionally, chronistic prose accounts of *Mainete* (Youthful Adventures of Charlemagne) have survived and partial outlines of other lost Hispano-Carolingian epics, corresponding to the Old French *Chanson des Saisnes* (Epic of the Saxons), *Floovant*, and *Beuve de Hantone* (Bevis of Hampton), can be convincingly reconstructed in considerable detail, on the evidence of sixteenth-century and modern traditional ballads (*Belardo y Valdovinos*, *Floresvento*, *Celinos*). Another indirect echo of lost Spanish epics on Carolingian themes is reflected in certain poems that adopt a hostile attitude toward epic accounts of French heroism: *Historia Silense* (c. 1110) bitterly contests minstrel accounts of mythical French victories against the Muslims (for example, *Chanson de Roland*, vv. 1–6). So also, in the lost *gesta* of *Bernardo del Carpio*, the hero organizes a Spanish army, composed of both Christians and Muslims, to defeat Charlemagne’s forces at Roncevaux. *La peregrinación del rey Luis de Francia* (The Pilgrimage of King Louis of France), known only in a chronistic summary, adapts the Old French epic, *Pèlerinage de Charlemagne* (The Pilgrimage of Charlemagne) to a peninsular venue, stressing the superiority of Spain and the nobility of Spaniards. Likewise, in *Mocedades de Rodrigo*, King Fernando I invades France and defeats the French, while the young Cid—anachronistically—beats with his fist on the gates of Paris, challenging to battle the Twelve Peers of France. The legend of *La condesa traidora* also reflects a bitterly Gallophobic perspective.

The meter of Old Spanish epic poetry involved an anisosyllabic verse, divided into two hemistichs of between six and nine syllables, with assonant rhyme in the second hemistich. The percentage of octosyllables seems to have increased somewhat in the fourteenth century (over the twelfth and thirteenth), suggesting a gradual drift toward the regular octosyllabism of the ballads, while the earliest ballads are still slightly irregular, having a higher percentage of heptasyllables than most sixteenth-century ballads or those in the modern oral tradition. A significant feature of epic prosody is

the “paragogic -e,” occurring in oxytonic (acute) rhyme words, where the stress falls on the final syllable. In some cases, the paragoge is non-etymological (*acáe* “here”; *avíae* “had”; *sone* “are”), but in others the -e is etymological (*ciudade* “city”; *fablare* “speak”), reflecting an archaic phonological stage in the development of Spanish that has not been part of everyday Castilian speech since the tenth century and thus suggesting that epic poetry was already in existence at a time well before the historical events reflected in most of the *gestas* known to us today. The importance of the paragogic -e is confirmed by the equally archaic paragogic -d-, corresponding to the Latin -t of third-person singular verb endings (*diráde*, *faráde* “will say, will do”).

Certain lost epic narratives remain outside the major Castilian cycles. Hotly debated is the possibility of an early Mozarabic epic on *El rey don Rodrigo y la pérdida de España* (*King Rodrigo and the Destruction of Spain*). Traditional accounts absorbed by both Muslim and Christian chronicles are full of novelesque motifs. Whatever the narrative’s original form, the story is also reflected in the French epic *Anseïs de Cartage* (c. 1200). Vestiges of assonant verse and epic formulas are present in the prose accounts *El abad don Juan de Montemayor* (*Abbot John of Montemayor*), suggesting a pseudo-hagiographic legend in epic verse, centered on the Portuguese fortress of Montemor o Velho. Though the *Chanson de Roland* is parodied in a thirteenth-century *cantiga d’escarnho* (defamatory song) by Alfonso López de Baian, “Sedia-xi Don Belpelho en ùa sa maison” (“Mr. Fox was sitting in his house”), the epic genre seems to have been little cultivated in medieval Portugal. Chronistic accounts of *La campana de Huesca* (*The Bell of Huesca*), concerning a massacre of rebellious Aragónese nobles by King Ramiro II (d. 1157), are replete with assonant rhymes, suggesting the development of an epic tradition in Aragón, as well as in Castile. Onomastic data attest to the presence of the Old French epic (or more probably Provençal or Catalan adaptations) in Catalonia by the mid-eleventh century and there are ample testimonies in medieval Catalan chronicles to prosifications of Catalan epic poems about battles of the Reconquest. Convincing evidence exists for contacts between Romance epic poetry and heroic narratives in Arabic, both on the Iberian peninsula and elsewhere.

POLEMICS, POLITICAL

All polemics of the later medieval period, including those primarily concerned with religious or social issues, tended to have political overtones, and contemporary chroniclers certainly had political axes to grind, Pero López de Ayala and Alfonso de Palencia perhaps being outstanding in this respect. But some polemics were more overtly political in nature than others.

At an international and sophisticated level, Spaniards made outstanding contributions to the polemics on political power by their interventions in the debates at the General Council of Basel (1431–1449). At the council, the leading champion of what may be termed constitutionalism was Juan de Segovia who, by arguing that power resided with the community (in this case the council) and not an individual (in this case the papal monarch), was advancing theories about constitutional monarchy that anticipated the much later views of John Locke and Jean-Jacques Rousseau. His views were opposed by the *converso* Juan de Torquemada who, in supporting the absolutism of papal and monarchical power, anticipated the political thought of Jean Bodin. Clearly Spanish political thought had much to offer the rest of Europe in terms of sophistication and diversity.

Such diametrically opposed views reflected similar polemics within Spain. In the Crown of Aragón influential theories were developed with respect to *pactismo*: that is, the view that political power, and hence royal power, was ultimately based on contractual arrangements involving election and consent. The nature of such pacts meant that political domination had to be exercised in the interests of the community, it being understood that political power was ultimately vested in the *communitas*. Such views were most clearly expressed by the Franciscan Francesc Eixi-

menis (1340–1408), but they were also enshrined in the way in which the balance of power between the kings and the various *cortes* of the Crown of Aragón was regulated.

In Castile extreme notions of royal absolutism developed and tended to predominate, especially during the reign of Juan II (1406–1454). The king derived his power from God, not the community, and claimed to make or revoke laws on the basis of his “certain knowledge, own will and absolute royal power.” These assertions ran directly counter to conventions that had grown up during the fourteenth century, most notably during the reign of Juan I (1379–1390), whereby the making or revoking of laws was envisaged as a matter of the king and the *cortes* acting together.

Nevertheless, both the prevailing tendencies, constitutionalism in the Crown of Aragón and absolutism in Castile, encountered opposition and gave rise to polemics. In Castile, for example, the nobles used the *cortes* (courts) at one stage to advance notions of pacatism, and during the reign of Enrique IV (1454–1474), particularly during the crisis that culminated in the curious ritual deposition of the king’s effigy at the Farce of Avila of 1465, they based their actions on the claim that royal power depended on “election” and “acclamation.” But they also resorted to accusing the king of tyranny, justifying their actions by appealing to precedents in Castile (especially Perdo I, the Cruel) and, more vaguely, elsewhere in western Europe, coupling this accusation with that of a *rex inutilis*. The king, therefore, was both a tyrant and useless. The crisis gave rise to an important polemic, although some of the contributions to it have been lost. For example, Francisco de Toledo, a professor of theology, at first railed violently against Enrique IV but changed sides and wrote at length about the illegality of the deposition, the chronicler Fernando del Pulgar referring to this lost work written “against those who cause divisions in kingdoms and presume by their own authority to remove a king and replace him with another.” Others who joined in the polemic were the Franciscan Antonio de Alcalá, the Dominican Juan López, and above all the bishop of Calahorra, Pedro González de Mendoza, who delivered a powerful speech in support of the king at a crucial stage. In it he accepted that the king, as head of the *corpus reipublicae mysticum*, suffered from an *ynabilidad* (inability), was unskilled in the art of kingship (*yndoto*), and was *inutilis* (useless). But—crucially—he did not even hint at tyranny, and he argued that the community or *respublica* had absolutely no say in the removal or bestowal of a title that was exclusively God’s gift.

During the crisis there were clear echoes of the political polemic that had occurred at the Council of Basel. Indeed one of the leading protagonists at the Farce was Archbishop Carrillo of Toledo who had been the president of the Castilian embassy at Basel. Sophisticated arguments that had been used to justify the deposition of a pope could be used to justify the deposition of a king. Not surprisingly, therefore, the papacy became involved in the Castilian polemic on the royal side and also became the object of acrimonious attack by Alfonso de Palencia.

The sophisticated political polemics that have been briefly reviewed were usually paralleled by a more popular form of polemical literature. An important cycle of ballads, for example, vilified Pedro the Cruel by narrating the gory assassinations of his half-brother, Fadrique, and of his queen, Blanca, as well as by introducing prophetic shepherds and clerics who ostensibly warned the king that he would be suitably punished for his misdeeds. Ayala used some of these popular polemics, incorporating the essence of their contents in his chronicles. The crisis of Enrique IV’s reign gave rise to the sophisticated pastoral allegory, couched in popular terms, known as *Coplas de Mingo Revulgo*, which clearly reflects the debate about the relationship between the king (a shepherd), his subjects (the sheep), and rapacious wolves (the nobility). But it also witnessed the circulation of the highly obscene *Coplas del Provincial*, which contain infamous allegations against a long series of individuals at court, both male and female, many of whom are difficult to identify. In addition, the chronicles refer to other examples of popular polemical poems that have not survived.

Most political polemics were concerned with the nature of royal power or the relationship between the king and the nobility. There is evidence, however, of the existence of political polemics at a different level. In particular it is possible to detect a belief in, and support of, notions relating to such concepts as *el común*, *la comunidad*, and even *repúblicas*, all these being expressions of a not unimportant undercurrent of political ideology that surfaced in the revolt of the *comuneros* in 1520. There was, for example, the attempt by the Count of Luna to establish a kind of Italian commune in Seville in 1433; the resistance proffered by the citizens of Seville when threatened by the Infante Enrique in 1444, a resistance apparently eulogized in a chronicle (now lost) by a certain Juan Guillén; an uprising in Fuenteovejuna in 1453 that was followed by the famous rebellion of its *comunidad* in 1476; and numerous attempts to establish *comunidades* in Andalusian towns, in some cases expressly aping Italian models, most notably the conspiracy in Seville in 1463, fomented by Archbishop Fonseca, which

aimed to free the city completely from royal control and turn it into a comunidad.

It is possible to find echoes of the political polemics to which such episodes gave rise in the chronicles of Palencia and Hernando del Castillo, but their accounts tend to be brief and hostile. Palencia, for example, portrays Fernán Gómez de Guzmán, the *comendador mayor* of Fuenteovejuna fame, as a kind and generous lord who even visited the sick of the town. When Lope de Vega wrote his play about the heroic uprising against the tyrannous *comendador mayor* he drew on a different and later source, the *Crónica* about the military orders of Santiago, Calatrava, and Alcántara written by Rades y Andrada.

POLITICAL THEORY

Medieval Hispanic political theory was founded principally upon the writings of St. Isidore of Seville (c.560–636), who brought together many of the essential ideas of the ancient world concerning kingship, law, and government. Although there are traces of Isidorian political ideas in early medieval Hispanic writings, it was not until the thirteenth century that Spanish authors, influenced by the revival of Roman law and the Aristotelian conception of political society, began to develop a conscious political theory.

The principal repository of these new ideas were the law codes compiled during the reign of Alfonso X of Castile (1252–1284), namely the *Espéculo* and *Siete Partidas*. Both codes accepted the notion of the state as a corporation comparable to the human body. Both also stated the principle that the king had no superior in temporal matters and within his own realm enjoyed the same powers as the emperor.

The genre of "Mirrors of Princes" also began to appear, as for example, *Llibre de la saviesa* attributed to Jaime I of Aragón (1213–1276) and *Libro de la nobleza y lealtad* dating from the reign of Fernando III of Castile (1217–1252). Alfonso X's *Setenario* was intended as a work of counsel for his successors, while

Juan Gil de Zamora (d. 1318) composed *De preconiis Hispaniae*, a melange of historical and geographical data, for the instruction of the future Sancho IV (1284–1295). The latter, in 1293, completed his *Castigos e documentos*, a book of advice on the art of kingship addressed to his son, Fernando IV.

Around the beginning of the fourteenth century a certain Master Pedro penned *Libro del consejo y de los consejeros*. For the advice of the future Pedro I, Juan García de Castrogeriz in 1344 completed his adaptation and translation of Giles of Rome's *De regimine principum*. Álvaro Pelayo (d. 1353), in his *Speculum regum* dedicated to Alfonso XI, denounced the sins and failings of kings. His contemporary, Infante Juan Manuel (1282–1348) discussed the three estates constituting human society and the relation between kings and their subjects in his *Libro de los estados*. Later in the century Pero López de Ayala (1332–1407) lamented the failure of kingship in a lengthy poem, *Rimado de Palacio*. The Catalan Franciscan Francesc Eiximenis (c.1340–1408), in his *Regiment de la cosa publica* and the later *Regiment de princeps* or *El Dotze*, expounded the theory of contractual monarchy in which the several estates would have the opportunity to participate.

Many fifteenth-century authors chose to express their views on political society in poetic form. Fernán Pérez de Guzmán (c.1378–c.1460) in his long poem *Loores de los claros varones de España*, drew parallels between contemporary circumstances and the deeds and follies of the great men of earlier times. Juan de Mena's (1411–1456) *Laberinto de Fortuna*, an allegorical commentary on contemporary government marked by a strong sense of patriotism, offered counsel to Juan II, "the great king of Spain, the new Caesar." Íñigo López de Mendoza, Marqués of Santillana (1398–1458), an active politician and humanist, in his *La comedieta de Ponza* reflected on the misfortunes of princes. In his *Doctrinal de privados*, the marquess admonished those who might be tempted to imitate Juan II's erstwhile favorite, Álvaro de Luna, in his quest for power and riches.

In his letters to Juan II and Enrique IV, Diego de Valera (1398–1488) pointed out that unless they corrected their failings the monarchy might be destroyed. Comparing the state to the human body in his *Doctrinal de príncipes*, he stressed that all the members were interdependent and that the king, as head of the body, could not function without the members.

Among the ecclesiastical authors writing in Latin, mention should be made of Alfonso de Madrigal, el Tostado (c.1410–1455), who argued in his *De optima politia* that democracy was the preferable form of government. Juan de Torquemada (1388–1468), in his

Summa de ecclesia, emphasized the pope's right to depose kings or emperors. In his *Opusculum ad honorem romani imperii*, he upheld the claims of the Holy Roman Empire to universal dominion over all other rulers. On the contrary, Rodrigo Sánchez de Arévalo (c.1405–1470), in his *De monarchia orbis*, denied the emperor's sovereignty over the kingdoms of France and Spain. His *Suma de la política*, a vernacular treatise, stressed the need for unity in the body politic, while his *Vergel de príncipes* was a typical mirror of princes.

PÓRTICO DE LA GLORIA

The Pórtico de la Gloria, located within the western facade of the basilica at Santiago de Compostela, was sculpted by Maestro Mateo, a Frenchman, some time between 1168 and 1188. Its design, inspired by St. John the Divine's apocalyptic vision of the throne (Rev. 5), depicts St. James seated with his pilgrim's staff on the mullion of the central column, representing the tree of Jesse, and flanked, on the outer columns, by the Apostles Peter, Paul, James, and John to his left, and Moses, Isaiah, Daniel, and Jeremiah to his right. Upon these figures rests the magnificent tympanum, whose centerpiece is a twice life-size figure of Christ, ruler of the universe, seated with the palms of his hands facing forward. He is skirted on each side by a pair of angels, three of whom take charge of one of three beasts (eagle, lamb, and one with a human face). The fourth beast, a lion, is represented by two, which support St. James's seat. Christ is also surrounded by a huge chorus of angels. The entire scene is encased by an archivolt bearing the twenty-four elders of the Apocalypse, whom Mateo grouped in pairs, portraying them conversing with one another while tuning stringed instruments. Three types can be distinguished: lute (fiddles or *vielles* of various sizes and shapes, rebecs, and an organistrum); zither (psaltery); and harp.

The bold ciphers enclosed in parentheses designate the position (running clockwise) of each of the elders according to their respective instruments: three-stringed fiddles (1, 7, 11, 14–16, and 24); three-

Portal of the Portico de la Gloria. Copyright © Scala/Art Resource, NY. Cathedral, Santiago de Compostela, Spain.

stringed rebecs (9 and 20); four-stringed fiddle (2); five-stringed short-necked fiddle (6 and 23); undefinable fiddles (3 and 22); an organistrum or hurdy-gurdy, whose prototype can be found in the popular Galician *zanfoña* (here, however, its size necessitates two elders; 12–13); nine-stringed vertical psaltery (5 and 18); twelve-stringed horizontal psaltery (10 and 17); and a sixteen-stringed frame harp (8 and 19). Two elders (4 and 21) are depicted without instruments.

Earlier and distinct versions of this scene can be found on tympana of many churches and cathedrals in France and northern Spain whose inspiration may have derived from the miniatures in *In Apocalipsim (Commentary on the Apocalypse)*, (c.775) by the Asturian monk Beatus of Liébana. However, their sculptors, like Mateo, avoided a literal interpretation of John's vision (Rev. 5:8), wherein each of the elders held harps, together with golden flasks containing incense. Mateo assigned instruments to twenty-two of them and the flasks to only nine (3, 4, 8, 15–18, 21, and 24).

From a musicological standpoint, certain aspects of Mateo's pórtico are enigmatic. A basic problem is the absence of bows, begging an assumption that the

instruments of the lute type were plucked or, in some cases, strummed. Apart from the four- or five-stringed instruments that may have been performed in this manner, it appears more likely that the three-stringed instruments were bowed, with perhaps one of the strings functioning as a drone. Such is the case of the sculpture bearing King David on the south door of the cathedral—that is, the Puerta de las Platerías, where he is shown playing a three-stringed fiddle with a bow in the then customary fashion. Here, indeed, Mateo added a subtle touch, implying their being kept out of view, but not unutilized.

The question of the flasks (*redomas*) has also led to several speculations. They were either used as drinking vessels (carrying water or wine), inferred from the varied shapes sculpted by Mateo, which have the appearance of calabash gourds that are quite plentiful in the region surrounding Compostela, and which the pilgrims used to carry water. They may have also served as rhythmic instruments, as rattles with the insertion of pebbles or beads, or even as gourds emitting a tone when struck with the finger or another object, perhaps pitched to produce a natural drone.

Mateo may have indeed studied other sculptural programs in France, but this has not been substantiated. Inasmuch as Santiago was one of the most progressive music centers during the latter half of the twelfth century, Mateo was indeed exposed to the musical currents of his day. A detailed examination of his sculpted instruments indicates that he modeled them upon existing specimens.

Before the completion of the pórtico, the principal entrance for the pilgrims was the north door, the Puerta Francesa facing the Plaza Fuente San Juan, formerly known as Azabachería.

PORTUGAL, KINGDOM OF, EARLIER COUNTY OF

In the aftermath of the Muslim invasion of the Iberian Peninsula in 711, Christians from Asturias slowly pushed southward. During the tenth century, as the various monarchs of Asturias-León partitioned their realm among their children, Galicia, north of present-day Portugal, was given the status of a kingdom. A crucial ingredient in the development of an autonomous sentiment in that part of the northwest which was to become Portugal were the officials whom the monarchs appointed to oversee the affairs of lands recaptured from the Muslims. These officials provided for their regions' defense and helped consolidate the new territories by promoting settlement. They held a variety of titles, the most important being "count."

In 1072 Alfonso VI, king of León and Asturias took over the kingdom of Castile and annexed parts of Galicia and Terra Portucalense to his kingdom of León. He also captured Toledo in 1085. In the late eleventh century, in response to Alfonso VI's pleas for help against continuing Almoravid invasions, several contingents of French knights arrived in the Iberian Peninsula. Two of the most important of these adventurers were Raymond and Henri, countrymen of Alfonso's Burgundian wife, Queen Constance. Raymond married Urraca, Alfonso's daughter and heiress. Alfonso entrusted his son-in-law with the administration of the county of Galicia as well as that of Terra Portucalense and Coimbra as far south as the Muslim frontier along the Tagus River. But Raymond's authority over the region to the south of Galicia was short-lived, as Muslim forces soon overran the Christians southernmost boundaries.

In the meantime, Henri, another Burgundian, had arrived in Iberia and had distinguished himself in battle against the Almoravids. In 1095 he married the young Teresa, Alfonso VI's favorite, albeit illegitimate, daughter. Alfonso VI now awarded this son-in-law the governance of Terra Portucalense. By the end of the year Henry was being addressed as Lord of Coimbra, and by 1197 he was referred to as Count of Portucale. Henry established his capital at Guimarães and stimulated settlement in the territory under his administration. Although he continued to take part in Alfonso VI's campaigns against the Muslims and to advise Alfonso at court, he also sought opportunities to exert greater independence from the monarch. In this endeavor he was aided by the isolation of Terra Portucalense from the other Christian territories in the Iberian

Peninsula. Mountains formed barriers and there was scant communication by water. With the exception of the Douro, none of the rivers that flowed through northern Portugal originate to the east, in what is now Spain. Political factors, such as internal problems in the kingdom of León and Muslim threats to the Spanish kingdoms, strengthened this isolation. Thus local identity and self-reliance were encouraged. The attention of Terra Portucalense was directed to the southwest and to the Atlantic Ocean.

Succession problems in León enabled Henry, and later his widow, Teresa, to gain greater independence for the county of Portucale. Teresa, like her husband before her, encouraged the establishment of new settlements. She also tried to expand her authority beyond the Minho River by allying herself with a faction of Galician nobles headed by Fernando Peres. Some of the wealthiest and most powerful Portuguese nobles opposed Teresa's Galician adventures and rallied around Afonso Henriques, the son of Teresa and Henry, a youth who had been only three years old at the time of his father's death. At the Battle of São Mamede in 1128, Afonso Henriques' forces defeated those of his mother and her supporters. Afonso Henriques exiled Teresa and took over the rule of the county of Portucale. During his long reign Afonso Henriques firmly established his line on the Portuguese throne. Portugal's first ruling house came to be known as the Burgundian dynasty.

Afonso Henriques (also known as Afonso I of Portugal) and his successors had four chief aims: (1) to assert Portugal's independence from León and Castile by establishing a separate kingdom; (2) to drive out the Muslims to the south and carve out the boundaries of what would become the Portuguese nation; (3) to firmly establish the position of monarch with its accompanying sovereign power; and (4) to organize a church independent of León and Castile and then keep this increasingly powerful church in line by subordinating it to the monarchy.

By 1383, when the death of Fernando I of Portugal marked the end of the Burgundian dynasty, the first two goals had been achieved and the latter two were close to fulfillment.

Afonso Henriques made gains steadily in his move toward independence from León and Castile. In 1126 Afonso Henriques's first cousin, Alfonso Raimúndez, assumed power as Alfonso VII, King of León. In 1135, Alfonso VII was crowned by the *cortes* (courts) of León as emperor of the "whole Spain." Afonso Henriques refused to recognize the sovereignty that his cousin claimed over Portugal and was in almost constant revolt. Finally, in 1143, in the Treaty of Zamora, Afonso Henriques promised to stay out of Galician

territory and affairs and, in return, Alfonso VIII recognized him as king of Portugal. Afonso Henriques had already taken the title for himself in 1140 and had commended his kingdom to the holy see, declaring himself a vassal of the pope. The papacy of Lucius II accepted this offer in 1144 following the pact between Afonso Henriques and Alfonso VII. However, it was not until 1179 that a pope would address Afonso Henriques as "king."

The threat to Portuguese independence greatly diminished with the death of Alfonso VII in 1157. By 1185, the year when Afonso Henriques died, the task of asserting Portugal's independence from León and Castile was virtually complete. Although the successors of Afonso Henriques came into intermittent conflict with Portugal's Christian neighbors to the east and the north, it was not until the reign of Fernando I of Portugal (1367–1383), when Castilian forces invaded Portugal three times, that Spanish power seriously threatened Portugal's autonomy.

The second major goal of the Burgundian dynasty—to drive the Muslims farther and farther south—was not achieved as readily as the assertion of Portuguese independence. But Afonso Henriques did take some important steps in that direction by making significant inroads into Muslim territory. Early in his reign, he secured the region around Coimbra and transferred his capital there. In 1135 he gave further attention to his southern borders by fortifying Leiria. In 1139 he won an important skirmish at Ourique during one of his raids into Muslim regions. Afonso Henriques was aided by the chaos in Islamic Spain, which resulted from the breakdown of Almoravid rule and the corresponding Almohad revolt in North Africa that was spreading to Muslim Iberia.

Soon, Afonso Henriques began a big push against the Muslim forces along his Tagus River frontier. In the next two decades major territorial gains were achieved. In 1147 Afonso Henriques captured the important city of Santarém. This conquest opened the way to Lisbon, which was taken later the same year after a seventeenth-week siege, carried out with the aid of several thousand northern European knights, participants in the Second Crusade. This was the first of six times that crusaders on their way to the Holy Land would be asked to assist the Portuguese in driving out the Muslims.

With the aid of the Knights Templar and the orders of Santiago and Avis and adventurers like Geraldo "sem Pavor" ("the Fearless"), Afonso Henriques advanced further into Muslim territory. Such Muslim strongholds as Alcácer do Sal on the Sado River south of Lisbon were captured (at last temporarily) along with a number of important towns in the Alentejo and

across the Guadiana River in what is now Spanish Extremadura. But after the Almohads gained ascendancy in the southern part of the Iberian Peninsula, the Muslims recaptured many of the strongholds they had lost to Afonso Henriques during the 1160s. Eventually the Portuguese were pushed back to the Tagus. It would not be until 1249 that the last Muslim stronghold in Portugal would be captured.

Afonso Henriques initiated a strong royalist tradition in Portugal. In doing so, he was imitating León. He was aided in his endeavor by the territorial compactness of his kingdom. The great length of Afonso Henriques' reign (1128–1185) was an important factor in the development of royal ascendancy. Also, Afonso Henriques's decision to have his son and heir, Sancho I, rule jointly with him during the last fifteen years of his reign eliminated succession disputes that could have weakened the crown's position. Thus the sovereignty of the crown over the three estates of nobility, clergy, and commoners was established early in Portugal, though it was not unchallenged.

As part of the effort to create an independent Portugal, Afonso Henriques was anxious to establish a church in his kingdom separate from that in Santiago de Compostela and separate also from the church in Toledo, which had been awarded the status of primate see during the Visigothic domination of Iberia. Afonso Henriques's father, Henri of Burgundy, had backed the archbishop of Braga in his assertion of independence from Toledo. In 1103 the papacy gave Braga control not only over dioceses in Galicia, but also over those of Coimbra, Viseu, and Lamego in Portugal. A decade and a half later, however, Braga was stripped of its control over dioceses south of the Douro River. When Afonso Henriques came to power, he managed to recover the lost dioceses for Braga. However, the conquest of Lisbon and other cities in southern Portugal caused new problems because dioceses in this region had never been subordinate to Braga. Ironically, when the efforts to establish a Portuguese church succeeded, it was the church that offered the crown the fiercest rivalry. Of all the internal struggles for power in Portugal during the Middle Ages, those between crown and church were the most bitter.

The devastation and suffering that resulted from the three wars with Castile during the reign of Fernando I (1367–1383) paved the way for a new Portuguese dynasty. In 1369 Pedro I of Castile was assassinated by his illegitimate half-brother, Enrique of Trastámara, who then became the new king of Castile, Enrique II (1369–1379). Fernando I of Portugal, the nearest legitimate male heir of Pedro I of Castile, also claimed the Castilian throne and entered Galicia and the first of the three wars began. In 1372 Fernando

entered into an English-Portuguese alliance against the Trastámaras. By the Treaty of Tagilde, the Portuguese monarch allied himself with John of Gaunt, the duke of Lancaster, who had married an illegitimate daughter of Pedro I of Castile. This pact was followed in 1373 by the Treaty of Wesminster, in which Fernando promised to defend the duke of Lancaster's claim to the Castilian throne. The above-mentioned events were also part of the Iberian Peninsula's role as a side theatre of the Hundred Years War. The same period witnessed the beginning of the Great Western Schism. Portugal initially backed Clement VII in Avignon and received many benefits from the Avignon papacy. But because England backed Pope Urban VI in Rome, the Portuguese switched their allegiance to the popes of Rome.

Shortly before his death in the latter part of 1383, Fernando married his young daughter Beatriz to the recently widowed Juan I of Castile. But hostility toward Castile led to revolution and a new Portuguese dynasty.

The House of Avis was founded by João, the master of Avis and illegitimate son of the Portuguese monarch, Pedro I (r. 1357–1367) and half-brother of King Fernando. On 14 August 1385 outnumbered Portuguese forces managed to route the Castilians under Juan I at the famous battle of Aljubarrota. On 9 May 1386 the Portuguese and the English signed the Treaty of Windsor, "a treaty of perpetual peace and friendship." The following year João married Philippa of Lancaster, daughter of John of Gaunt.

Much of Portugal's history in the fifteenth century revolves around the legitimate and illegitimate children of João I of Avis and their heirs. Duarte, João's eldest legitimate son, succeeded his father on the throne in 1433. Pedro, the second son, famous for his travels throughout Europe between 1425 and 1428, served as regent from 1439 to 1448 for Duarte's young son, Afonso V (r. 1438–1481), before being killed as a rebel at the battle of Alfarrobeira in 1449. Henrique (Henry the Navigator), the third son, was duke of Viseu and the master of the Order of Christ. He devoted his life to crusading in North Africa, hoping to gain control of the Canary Islands, settling the archipelagos of Madeira and the Azores, and presiding over exploration and commerce down the western coast of Africa. The fourth legitimate son, João, was named master of Santiago and constable of Portugal. One of his daughters, Isabel, married Juan II of Castile and was the mother of Isabel "La Católica." Fernando, the youngest of João I's sons, was named master of Avis and was captured during Portugal's disastrous effort to seize Tangier in 1437 and died in Muslim hands in 1443. João I's legitimate daughter, Isabel, married Philip, Duke of Burgundy, in 1429, thereby helping to strengthen Portu-

gal's commercial ties with Flanders. She was the mother of Philip "the Bold" of Burgundy. Afonso, illegitimate, but the oldest son of João I, became count of Barcelos and later first duke of Bragança. Afonso's two sons played important roles during the fifteenth century in the struggle between the powerful landed aristocracy and those who worked to promote greater centralization and royal power.

Afonso V (r. 1438–1481) was very active in crusading against the Muslims in northern Africa. Because of this, he is sometimes called "the African." During his reign the Portuguese captured Alcácer Seguer (El-Qsar es Sghir), Arzila, and Tangier in Morocco. Afonso V's sister Joana (Juana) married Enrique IV of Castile and was the mother of Juana. Enrique's death in 1474 left Juana heiress to the Castilian throne, although her claim was challenged by Enrique's half-sister Isabel, the latter having married Fernando of Aragón in 1469. In the latter years of his reign Afonso V tried to marry his thirteen-year-old niece, Juana, and invaded Castile on her behalf. But the opposition of the Trastámaras Isabel and Fernando were too strong and after a number of years of warfare the Treaty of Alcáçovas was signed in 1479. It recognized Isabel as queen of Castile and ceded the Canary Islands to her kingdom.

Afonso V was almost profligate in giving lands and privileges to the landed nobility, especially, but not exclusively, to the count of Barcelos and first duke of Bragança and his family, at the expense of the royal patrimony. Afonso V's younger brother Fernando married Beatriz, another daughter of his uncle Prince João, and eventually became master of Santiago and Christ, and succeeded his uncle Henrique as duke of Viseu. When he died in 1470, Fernando was one of the wealthiest men in Portugal. His youngest son, Manuel, became king of Portugal (1495–1521). Manuel's sister, Leonor, married Crown Prince João, Afonso V's heir.

With João II, the Renaissance monarchy began in Portugal. Considered among the ablest European monarchs in the fifteenth century, João was determined to subordinate the landed nobility to the Crown. João II was opposed by Fernando, third duke of Bragança, one of the wealthiest and most powerful men in the entire Iberian Peninsula. Evidence of treason was discovered and the third duke was brought to trial, found guilty as charged, and publicly beheaded in Évora in 1483. The following year, João II's first cousin (and brother-in-law), Diogo, fourth duke of Viseu, who had continued to plot against the monarch, was stabbed to death by João II's own hand. Others involved in the conspiracies were executed or imprisoned, or sought refuge in Castile. With the support of the cortes, the extension of royal law and administration was greatly

increased. Although the high social and economic status of the nobility remained, any threat the nobility posed to the crown was extinguished.

João II was active in promoting expansion down the coast of Africa. São Jorge da Mina was established in 1482. Later that same year, the Portuguese monarch sent Diogo Cão on the first of two voyages to explore south of the equator. Cão became the first known European to see the Congo River. During his expedition of 1487–1488, Bartolomeu Dias discovered the Cape of Good Hope, thus paving the way for Vasco da Gama's epic voyage to India of 1497–1499.

PRESTER JOHN

The legend of Prester John was unique in medieval history not because it was taken seriously, but because it became identified with an actual person or persons—the negus, or emperor, of Ethiopia. Other legends, such as that of el Dorado, may have been more firmly rooted in fact, but the Iberians (and Germans) who searched for them never imagined or claimed to have realized them; the Portuguese actually awarded the office and title to a living ruler.

The origin of the legend had nothing to do with Portugal, but rather with the German chronicler, Otto von Freising, who claimed that in 1145 he had met a Syrian bishop in Italy who told him of a Christian priest-emperor named John, ruler of a vast realm to the east of Persia, who combined vast wealth with great piety, and who desired to march westward and liberate Jerusalem. Then, twenty-five years later, a hoax in the form of a letter was circulated that purported to be from this personage addressed variously to the pope or the Holy Roman or Byzantine emperors. In it, he proclaimed himself to be a descendant of the Magi, richer and more powerful than all worldly monarchs combined, and there followed a fanciful tale of seven

streams, bottomed with precious stones, flowing from his mountaintop palace and dividing his empire, which included the “three Indias,” into seven kingdoms. To Europeans, whose knowledge of extra-European geography was vague and fanciful and who thought of anything beyond Egypt as Asian, the whereabouts of this Christian Shangri-la was subject to continuous readjustment from lands recently known to lands still unexplored.

When reports of a great Christian monarch in Abyssinia began to filter into Christian Europe, curiosity was presently translated into action, in this case by the Portuguese, who were in a unique position to investigate them. From the time of Infante Henrique onward (as demonstrated in the chronicle of Azurara), the quest for Prester John became a major objective of Portuguese expansion, while in the reign of João II (1480–1495) expeditions and individuals were sent in search of his realm, most notably in the persons of Afonso da Paiva and Pero da Covilhã; Covilhã actually found the negus before the end of the fifteenth century, but was not allowed to return to Portugal; instead, the Ethiopian did send an Armenian named Matthew to Portugal as his ambassador, who reached Lisbon in 1514. Then it was not until 1520 that an embassy was returned under Rodrigo da Lima, who was accredited as ambassador to the court of Prester John. It actually made contact with the negus, then Lebna Dengel Dawit, on the Ethiopian plateau in 1520. A priest on the mission, Francisco Álvares, wrote an account of the mission called *Ho Preste Joam das Indias*, published in 1540. While the Portuguese continued to refer to the negus as “Preste João,” it is clear that thereafter the title became a mere convention and bore little relationship to belief in the original legend.

PRINTING

By the earlier fifteenth century, woodblock books (and perhaps also metal plates) circulated in Spain. As yet, however, no examples known to have been produced in Spain itself before 1473 have been discovered. This primitive form of printing has left short examples produced in the last quarter of the century. Likewise, no examples are known from the single letter, movable wood type (probably the invention of Lorenzo Jansoon Coster of Haarlam), modified by Coster’s apprentice,

Johannes Gutenberg, at Strasbourg soon after 1450 to arrive at movable, metal type. The primary candidates for the first book thus printed in Spain are *Les obres o trobes de labors dela verge Maria* (Valencia, c.1470), the *Catena aurea* of St. Thomas (Barcelona, c.1471), and a *Sinodal* (Segovia, c.1472). The first printer we can identify is Johann Parix from Heidelberg. The oldest example in the United States (in the collection of the Hispanic Society) of Spanish printing is the commentary on the Athanasian Creed by Pedro Martínez de Osma, printed by Parix at Segovia (c.1472).

The first printers in Spain were immigrants from northern Europe; they were primarily from Germany, but several came from France and elsewhere. Among them were Heinrich Botel, Pedro Hagembach, Johann Luschner, Nicolás Spindeler, Lambert Palmart, and Arnaldo Guillén de Brócar. Over thirty different Germanic printers worked in Spain before 1500 and many were peripatetic in the earlier years. The first known native Spanish printer is Alfonso Fernández de Córdoba (fl. 1477–1495), who first learned his trade at Naples. By the end of the fifteenth century, an almost equal number of native Spaniards had acquired the skill, usually as apprentices to the Germanic printers, and became independent. Some of the most active were Pedro Posa (Barcelona), Antonio Centenera (Zamora), and Juan de Burgos. The earliest books in Spain are printed with Roman type, suggesting that the earliest German printers arrived in Spain without their typefaces in hand and quickly cast less-complicated fonts. The first Gothic type seems to be that of Matthew of Flanders at Zaragoza in late 1475. Soon after, Gothic fonts dominated the publishing industry in Spain and thrived for most of the sixteenth century.

Incunabula, books printed before 1501, followed manuscript traditions with floriated or historiated initials printed with wooden blocks, as were illustrations. Printed on handmade paper with watermarks, the standard Spanish incunabulum tended to be folio page size (34 by 24 centimeters with full watermark in the center of every other page) or quarto (17.5 by 12 centimeters with half of the watermark at the center edge of two pages in every four). The earliest title pages were brief, but the last page, the colophon, gave precise and complete information, usually including day and month as well as year of publication. The art of book illustration developed quickly in the hands of Spain’s skilled but anonymous woodcarvers. Notable series include the blocks for Aesop, *Historia de Vaspasiano*, and *Celestina* usually imitated or even recut from tracings for subsequent publishers. Full-page title pages, often portraits with ornate borders, began to emerge, and most printers designed sometimes complicated logos for the

colophon, still retained for printing information. Bindings were often of crude parchment with a handlettered spine title. Luxury books were printed with a second color, red, and sometimes bound in tooled leather especially for presentation. Editions were small and all books were extremely costly. They were often subsidized by prominent or wealthy patrons thus meriting a dedicatory preface as well as their portrait.

By the end of the fifteenth century some nine hundred editions had been produced at twenty-five known sites, over 75 percent at only six cities: Seville, Salamanca, Barcelona, Zaragoza, Burgos, and Valencia. The major printers at each site, respectively, were Meinhardus Ungut, Stanislao Polono, the second Gothic group, Johann Rosembach, Paul and Johann Hurus, Fadrique (Biel) de Basilea, and Lope de la Roca. Almost half the texts published in all of Spain were in Latin, 40 percent were in Castilian, and over 10 percent in Catalan. Nine books were printed in Hebrew and one in Portuguese. Immigrant printers from Germany produced 62 percent of the total.

The Latin texts issued are primarily associated with the church, from theology to breviaries, missals, catechisms, and indulgences. Notable items from this group are the Catalan Bible (1478) and the Book of Solomon (1500) as well as a Torah (1490). Another large category, both in Latin and the vernacular, are legal and governmental texts as well as histories and chronicles. Texts in the vernacular reveal the emergence and popularity of secular literature. The most popular of these were the *Claros varones* of Fernando del Pulgar; the *Laberinto de fortuna* of Juan de Mena, as well as his *Coronación*; and *Celestina*, *Coplas de Mingo Revulgo*, and *Cárcel de Amor* by Diego de San Pedro. Catalan readers favored the novels of Juan de Flores and the chivalresque novel *Tirant lo Blanc*. Roman and Greek classics are well represented in Spanish translation by twenty-three printings with Aesop, Seneca, Aristotle, and Cato predominating. Other notable European authors in Spanish versions include Giovanni Boccaccio, Merlin, Alessandro Piccolomini, and Girolamo Savonarola. Lively interest in languages is indicated by some twenty-five printings of various works of Elio Antonio de Nebrija including his Spanish-Latin dictionaries and his grammar of the Spanish language. A Latin-Spanish dictionary (1490) by Alfonso de Palencia was also published, as were other linguistic treatises. Noteworthy clusters of works appeared in the categories of medicine (including surgery), astronomy, and cosmography, and science and technology including magnetics.

An unknown number of Spanish incunabula have been lost to posterity, but a substantial quantity remain carefully preserved and cataloged by libraries through-

out the world. The major collections in Spain include those of the Biblioteca Nacional and the Royal Library and Academies in Madrid as well as those of the Universities of Barcelona and Seville. Important groups and unique copies of Spanish incunabula are to be found throughout Europe and in the Americas, prominent among which are the National Library in Paris, the British Museum, the Herzog August Library (Wolfenbüttel, Germany), the Hispanic Society (New York), Newberry Library (Chicago), and various universities and other libraries in North and South America.

PRISCILLIAN AND PRISCILLIANISM

See CHURCH; HERESY; THEOLOGY

PROAZA, ALONSO DE

Asturian-born humanist, poet, editor, translator, and rhetorician, active in the final decades of the fifteenth and the first two decades of the sixteenth. Like others of his day, he was trained, apparently in rhetoric, at Salamanca, and helped promote the new university at Alcalá de Henares, a pet project of a group of humanists led by the powerful Cardenal Cisneros. Proaza's many interests embraced the works of Ramón Llull, some of which he edited and/or translated between 1510 and 1519, and later published with the patronage of Cisneros. No prose of Proaza's survives. As a poet he wrote in both Latin and the Castilian vernacular: a hymn to St. Catherine of Siena, as well as a few playful "*respuestas*"—courtly poems in the *tenso* style—survive in the *Cancionero general* editions of 1511 and 1514. His career ended in and around Valencia where, under the protection of the Duke of Gandía, he held chairs of rhetoric, first at the University of Valencia (1504–1506) and then at Tarazona (1505–1517). In 1505, he published a paean to Valencia, a unique heroic ballad, in his *Oratio luculenta*.

The enduring fame of Proaza, however, largely rests on poems he created corrector, for two acclaimed

works of the period, *Sergas de Esplandián* (Seville, 1510, fifth book of the *Amadís de Gaula* cycle), and *Tragicomedia de Calisto y Melibea* or (*Celestina*). To both works he appends original poems (the first to do so in the vernacular, and the first to style them—in the instance of *Celestina*—in his role as corrector of preprinting proofs) that are destined as parting commentaries to readers. The *octavas reales* (verses composed of eight hendecasyllabic lines rhyming abababcc) he provides for *Esplandián* spare little hyperbole in extolling the union of classical epic style with the skills of the author, Garci Rodríguez de Montalvo, and recommends it specifically to men and women of taste and learning.

His intervention in the 1501 Seville printing of the sixteenth-act *Comedia* have had wider repercussions. Proaza's poem at the conclusion of the work opens with references to the attraction of Orphic music and suggests that the reader would do well to speak the text, compares the work favorably to those of earlier playwrights, indicates how the work can be read aloud in small groups in the manner of *lesedrama*, reveals what secrets are to be found in the acrostic verses that form a prologue to the text, and ends by giving the date (Salamanca, 1500; a lost version of another sixteen-act *Comedia*?). Proaza adds to these another stanza, which appears first in the Valencia 1514 *Tragicomedia*, and which argues that the work merits being called a tragicomedy owing to the excesses that are ruefully punished in its pages. Proaza's placing the *Celestina* firmly among dramatic works meant for oral delivery has come to play a crucial role in the ongoing debate over its genre.

PROPHETIC CHRONICLE

A curious collection of materials closely related to the *Crónica Albeldense*, although previously thought to be independent. The chronicle contains its own internal dating to April 883, that is, during the reign of King Alfonso III of Asturias. It is chiefly remarkable because it predicts that expulsion of the Muslims from the Iberian Peninsula will take place in November 884 on the basis of a biblical prophecy from Ezekiel that actually does not exist in any known text of Scripture. That strange prediction was included in a potpourri of other materials including lists of the earlier kings of Asturias, of Iberian bishops, and of the Roman provinces of the peninsula. Throughout, the chronicle treats

the kings of Asturias as the rightful successors to the Visigothic rulers of the sixth and seventh centuries who are said to have lost their kingdom to the Muslims by reason of their sins and those of their subjects. It is believed to have been inspired by the contemporary successes of Alfonso III against the Muslims.

PROSE, BEGINNINGS OF

The initial period of Castilian prose encompasses the writings of Alfonso X (1221–1284), and this prose becomes the tool for scholarship and literary creation at the royal court. The study of this early period is difficult because of the scarcity of documents and the fact that they are of uncertain dates. Moreover, their literary value is scarce or nonexistent.

Religious Prose

The Church used vernacular language in its preaching, for the purpose of imparting Christian doctrine to the common people. These early sermons and homilies have been lost. They represented the first stage of oral prose used to address public audiences, both courtly and popular. According to Lomax, this practice was increased after the Lateran Council (1215). The incomplete copy of a *Disputa entre un cristiano y un judío* of the first third of the thirteenth century, which was perhaps written by a renegade Jew, is the earliest testimony of an encounter between different religions.

Legal Prose

The law promoted writing in Romance. Under Fernando III the Visigothic *Forum judicum* or *Fuero Juzgo* was translated into the vernacular. Some *fueros* were directly written in this common language. R. Menéndez Pidal proved that notarial practice, especially in documents relating to minor matters, was an important factor in the process of adopting the vernacular in writing. According to Rubio García, the use of the vernacular language in the royal chancellery dates back to the end of the thirteenth century.

Early History

The *Anales*, a simple form of historical narrative, were either written in Castilian or translated into this language at an early date. Such was the case of the *Anales Toledanos*. Royal history was written in Latin.

In the kingdom of Castile, the two main works in the Latin group are the *Chronicon mundi* (1236) by Lucas, bishop of Túc, and the *Historia Gothi* by Rodrigo Jiménez de Rada (1180?–1247).

The first known travel book is *La Fazienda de Ultramar*, whose author is known as Almerich, archdeacon of Antioquia. It describes, using biblical references, an itinerary to the Holy Land. The editor of this work, Lazar, considered the extant text as original, but Lapesa believes it is the Castilian version of a Latin, Provençal, or Gascon original, written in the first third of the thirteenth century. A Castilian cosmography compiled around 1223 by Isidoro and Honorio, the *Semeiança del mundo*, should also be mentioned.

The Vernacular Language: A Bridge between Arabic, Hebrew, and Latin

From the time of Archbishop of Toledo Don Raimundo (1126–1152) on, an oral romance version was used as an intermediate step between the original Arabic or Hebrew text and its Latin translation. The “Escuela de Traductores de Toledo” (School of Translators of Toledo) used this method to translate ibn Sīnā, al-Ghazālī, ibn Gabirol, and ibn Rushd. Such practice may have been a great incentive for the early development of prose.

Translations of Arabic Tales

Together with the great works produced under the sponsorship of Alfonso X, collections of Arabic tales were translated in this period. They represent the first stage in the development of prose-fiction. *Calila e Dimna*, stemming from the Arabic version by ibn al-Mukaffa, is a collection of tales intended to be a “mirror of princes.” *Sendebār*, of Sanskrit origin, is another educational tale collection, with a misogynous bias. In both books the stories appear within a frame structure, and they are intended to instruct. Later on, Juan Manuel produced *El Conde Lucanor*, the Castilian masterpiece of the genre.

Counsel Books

Some of the first samples of vernacular didactic writing are books in which learning is imparted by means of proverbs. Such is the case of *Poridat de poridades*, a collection of Arabic sentences presented as advice given by Aristotle to Alexander the Great. In the *Libro de los doze sabios*, twelve wise men counsel a young king. The *Libro de los buenos proverbios* presents a series of diverse advice, some in dialogue form, which are attributed to wise men of the Orient and the Occident. The *Flores de filosofía* and the *Libro de los cien capítulos*, both of uncertain dating, may have been written during the thirteenth century.

In sum, prose becomes established later than verse in literary practice. The process takes place within chronological limits difficult to specify. Vernacular language is subject to the strong influence of the learned languages: Latin, Arabic, and Hebrew. Vernacular prose was adopted by the church, and used for the formulation of laws, as well as for the purpose of teaching.

PROSTITUTION

In the Middle Ages, prostitution was not considered a crime, but rather a necessary evil. Consequently, in order to make sure that they were not confused with respectable women, society isolated prostitutes by making them live in designated places such as brothels (*mancebías*), and by requiring them to wear certain types or colors of clothing. Nevertheless, society ac-

cepted the prostitute for the necessary function she filled, as the extensive medieval legislation on prostitution shows.

Although prostitution has always existed, it only acquired a regulated urban presence with the rise of the cities and the middle classes. Prostitutes were generally women of lower social class status who turned to the profession after being left without family and without money. Prostitution was considered necessary because it provided a sexual outlet for men, who outnumbered women and in many cases lacked access to marriage because of a shortage of females.

Cities generally had one or several brothels where prostitutes lived and worked. Laws in the *fueros* (municipal codes) and especially in city ordinances, regulated the prostitutes' activities to assure that the practice did not disturb public order. The brothel had a manager who was responsible for making sure that the operation ran smoothly and that money was handled appropriately. The mancebías belonged to various institutions, including the crown, the Church (as was the case in Córdoba), and most frequently, the city. The crown could also transfer the earnings of its brothels to a particular noble as a reward for his services, as was the case in Málaga and later in Granada. The majority of the problems caused by prostitution occurred when prostitutes left the brothel to work on their own, an offense that was punished with fines.

Prostitution was the greatest form of the economic exploitation of women in the Middle Ages.

PROVERBS

Eleanor O'Kane, in her seminal work, distinguished among erudite sayings (*proverbios*), popular sayings (*refranes*), and proverbial phrases—grammatically incomplete proverbs.

Erudite sayings in medieval Iberian sentential works introduce a topic and provoke further thought. For this reason they sometimes take the form of enigmas or riddles whose referents need not be guessed: “El saber es nave de los obedientes” [“Knowledge is the ship of the obedient”] (*Libro de los buenos proverbios*). The hearer first conjures up the image and then draws up a mental list of correspondences in order to benefit from the lesson. Patronio, aware of how taxing sentential sayings could be, warns the Conde Lucanor that the *proverbios* listed as a supplement to his exemplary tales are enigmatic: “vos conversará de aguzar el entendimiento para las entender” [“You had better sharpen your understanding to understand them”] (*Cuarta Parte*).

Erudite proverbs occur in dialogues between a sage and a pupil (*Poridat de las poridades*, Conde Lucanor) a father and son in the manner of Proverbs and Ecclesiasticus (*Zifar, Vida de Ysopo*), as a transcription of an ancient work (*Libro de los proverbios*), as the proceedings of a meeting of sages (*Libro de los doze sabios*), or in riddle form as the contents of a battle of wits (*La donçella Teodor*).

On the other hand, *refranes* occur in discourse and illustrate, amplify, or reinforce meaning. Their principal function in discourse is to sum up a situation. The defeated Poro in the *Libro de Alexandre* warns Alexandre that fortune is undependable: “Ca son fado e viento malos de retener” [“It is destiny and wind and impossible to keep”]. *Refranes* also recommend a course of action; Trotaconventos in the *Libro de buen amor* tells her customer that her services are valuable: “El que al lobo enbía . . . carne espera” [“He who sends the wolf expects meat”].

The reader envisions the image adduced by the proverb, and selects the meaning that applies to the immediate situation. Unlike sentential sayings, *refranes* become intelligible only through the shared cultural experience of speaker and listener.

At times a proverb alludes to a familiar folktale even though the tale itself is no longer current; for example, “Ay molino te veas casado” [“Oh mill, would that you were married”] in the *Libro de buen amor*. Familiar sayings can appear in truncated form as proverbial phrases—for example, “com al carnero que fue buscar la lana” [“Like the ram that went looking for wool”] (*Poema de Fernán González*)—or they can be transformed comically—for example, “Moço malo, moço malo más val’ enfermo que sano” [“A bad helper, a bad helper is worth more sick than well”] (*Libro de buen amor*). Occasionally a speaker will create a chain of *refranes*: “Perezoso nin tardinero non seas en tomar; muchas cosas prometidas se pierden por vagar; Quando te dieren la cabrilla, acorre con la soguilla; Quien te algo prometiére, luego tomando

fiere” [“Don’t be lazy or late when taking; many promised things are lost because of delay; when they give you the goat, run with the rope; whosoever promises something later wounds by taking”] (*Corbacho*).

Recognizing *refranes* in literary texts from the past, and distinguishing them from sentential sayings or from individual flashes of wit that are preproverbial, is a difficult task in the absence of shared cultural resonance between reader and author. Abrahams defines proverbs as “among the shortest forms of traditional expression that call attention to themselves as formal artistic entities.” Frequently, their acontextuality, or strangely inappropriate subject matter, alerts the reader to possible proverbiality, particularly when, as Barley notes, an “underlying logical structure” is discernible: “Oro majado luçe” [“Beaten gold shines”] (Berceo, *Santo Domingo de Silos*).

In some cases the author identifies proverbs explicitly as *parilla*, *fabla*, *fablilla*, *palavra*, *pastraña*, *derecho*, *prouerbio antiguo*, or *retraer*, or prefaces the saying with such comments as “por ende dizen,” [“therefore they say”] or “dizen las viejas” [“old women say”]. Lacking this identification these popular sayings are identifiable by the acontextuality of their image (“ca de pequeña çentella se leuanta gran fuego” [“from a small spark a great fire arises”] or by their structure: *Quien* (He who)—“Quien bien see non se lieue,” [“He who sits well should not get up”]. *El que*—“El que suel ser vençido será el vençedor,” [“He who is usually conquered will conquer”]; *Mejor es* (It is better to)—“Mejor es tardar e recabdar que non auerse ome a repentir por se rebatar.” [“It is better to be late and get what you want than to withdraw”]; *Más vale* (more valuable than)—“Más vale saber que auer,” [“Knowledge is more valuable than wealth”]; *No hay . . . sin* (There is no without)—“Non ay paño sin raça,” [“There is no cloth without tearing”]; *Tal . . . tal* (He who, gets . . .)—“Qui tal faze, tal prenda,” [“What goes around, comes around”] (Berceo, *Milagros*); or *Qual . . . tal*—“Qual aqui fiziere tal avrá de padir,” [“He who does gets it back in return”] (*Apolonio*).

Proverbial phrases are even more difficult to validate because they can be confused easily with possibly preproverbial similes or metaphors. In the absence of authorial identification, these colorful fragments can be called proverbial if they appear in complete form elsewhere. Proverbial phrases are often sayings that derive from anecdotes about historical events or from folktales. Consider the saying: “Tijeretas han de ser” [“They must be scissors”] an echo of the tale of the drowning woman who died insisting that she had been right (*Corbacho*). The fragmentary “Amidos faze el perro barvecho” [“The wild dog gets little attention”] is understandable through its equivalent listed in the

seventeenth century by Correas: “Perro de barbecho, ladra sin provecho,” [“The wild dog’s howl is without profit”]. A modern compilation lists it as “Amidos hace el can barbecho.”

PULGAR, FERNANDO DEL

No complete study exists of the life and works of this royal secretary and official historian. We know little of his personal life, family, and friends. He was married, had a daughter who became a nun, and a brother Rodrigo, murdered in 1474 in obscure circumstances. A document, not fully authenticated, says his father was a court scribe, Diego Rodríguez de Toledo. Indirectly we know he came from the Toledo area (c.1420) and died of old age in Villaverde, a village near Madrid (c. 1490). He may have been educated in the household of the “relator” Fernán Díaz de Toledo and in the chanceries of Juan II and Enrique IV of Castile; the only acquaintance he names with special warmth is Fernán Pérez de Guzmán. From 1457 on his name appears in documents as secretary in the chancery of Enrique IV where no doubt he became acquainted with the official chronicler Alfonso de Palencia.

In the crisis over the succession in Castile, Enrique IV intended to send Pulgar to Rome in early 1473 to get dispensation for the marriage of his daughter Juana to the Infante Enrique Fortuna; the arrangement never came about. On the accession of Queen Isabel, Pulgar was entrusted with the first important mission to France to arrange the terms under which an alliance could be reestablished. It has been suggested that a letter sent to Pedro González de Mendoza, el “Gran Cardenal,” accused Pulgar of being a judaizer and of speaking ill of Queen Isabel, and that this forced him out of her favor, but no documentary proof has yet appeared.

In 1480, if Palencia's statements are to be believed, Isabel appointed Pulgar as official chronicler because she did not trust Palencia. From this point on we have two distinct regnal narratives, one favorable to Isabel and Pedro González de Mendoza, and the other more inclined to Fernando. Henceforward, Pulgar devoted his time to the preparation of historical works, and left evidence of his methods in his correspondence; These *Letras* were probably printed posthumously (Zaragoza, 1493). In late 1486 the *Claros varones de Castilla* were printed in Toledo, after his experiences in the Granada campaign. His official chronicle in its original version ended in late 1490, but was not printed until 1565 in Valladolid, falsely attributed to Elio Antonio de Nebrija. This was because Galíndez de Carvajal, as part of his plan to edit and print Castilian chronicles, had given a copy to Nebrija to be translated into Latin; this was completed in 1509 and printed in Granada, 1545. (The 1565 edition was an abbreviated version of the original, which was not itself edited until 1943). Galíndez had mixed feelings about Pulgar's methodology. He approved of his industry but not his selection of events, which gave too much prominence to "el gran Cardenal," nor did he care for the intercalation of harangues and moral commentaries that Pulgar put in the mouth of his protagonists. However, he did sanction the main thrust of the narrative, which traced the dramatic change in the political fortunes of Castile from the marriage of Isabel to Fernando to the last phase of the Granada campaign. Pulgar himself stated he was imitating classical prece-

dent in allowing protagonists to speak, as he says, in their own voices, sometimes using real documents as his inspiration. He identified himself totally with royal policies and gave the Queen his rough drafts to correct. His gloss to the *Coplas de Mingo Revulgo* (Logroño, 1502–1505) is another example of using poetic material for the purpose of educating those in authority in matters of government.

Pulgar is best known for *Claros varones de Castilla*, which, while acknowledging a debt to Fernán Pérez de Guzmán, is much more varied and subtle and drives toward a different goal. He would agree that unregenerate humanity was avaricious, power-hungry, and self-regarding, but he offers as examples to his readers certain lives of Castilian nobles who could outshine the Romans in their *amor patriae*. Where Guzmán admonishes, Pulgar encourages and creates a pantheon of heroes to inspire his aristocratic audience to greater deeds of virtues, to act in unison and bring about the completion of the Granada campaign. Included are one king (Enrique IV), fifteen nobles, eight prelates, and two intercalated addresses to Isabel. A *Tratado de los reyes de Granada* is also attributed to Pulgar.

Q

QABALLAH See DE LEÓN, MOSES

QĀḌĪ

Qāḍīs are judges or jurists (*fuqahā'*) appointed by the state who administer Islamic law. *Qāḍīs* are selected from the '*Ulamā*' or the corpus of pious religious scholars in the community. Since qāḍīs were appointed by the state, their judgments could often reflect more local political interests. As a result, they were sometimes the object of censure by the '*Ulamā*' and there are repeated expressions of disapproval of them from earliest Umayyad times.

The task of the specific interpretation of the law and its application in individual cases was vested in the *muftīs*, who could either be private individuals or public servants. A verdict on a particular point of law is called a *fatwā*. Over time a large body of *fatwās* was collected by the *Ulamā* that was employed by the qāḍīs in applying the law in cases that came before the courts. A *muftī* is thus an eminent judge or jurisconsultant, a qāḍī simply a judge. The collections of *fatwās* from the Middle Ages are an important source of knowledge about the nature, application, and integration of customary and Islamic law in Al-Andalus.

QASMŪNA BINT ISMĀ'ĪL

Qasmūna was the first known Jewish woman writer on the Iberian Peninsula. She is believed to have been the daughter of the famous eleventh-century poet, Samuel Ha-Nagid (Ibn Nagrillah), the vizier of the

king of Granada and the leader of the Jewish community. He apparently had four children, three sons and one daughter, Qasmūna, whom he instructed in the art of poetry. He reportedly often began a strophe and called on Qasmūna to finish it, a form of recreation common among medieval Arabic peoples. Indeed the first of the three extant poems by Quasmūna is a reply to a short poem by her father concerning someone who harms his benefactor. Qasmūna's clever response compares that person with the moon, which receives its light from the sun and yet sometimes eclipses it. Tradition has it that, upon hearing this, her father said she was a greater poet than he was.

However, Samuel Ha-Nagid wrote his poems in Hebrew, while Qasmūna wrote hers in Arabic. As a Jewish woman, she had no access to Hebrew poetry and certainly no audience for it, even if she had written it. On the other hand, as a member of the court in Granada, she did have access to Arabic poetry, as well as an audience of like-minded women poets. Indeed, although Jewish, she is considered one of the foremost Arabic women poets of Al-Andalus.

Critics have pointed out some Biblical resonances in Qasmūna's poems. They also have underscored the fact that her poems seem to allude to the importance of marriage for women, a very Jewish concept. In effect, her two other poems are laments about her loneliness. The first is about a garden which is going to waste without a gardener. Youth is passing by and the only thing that remains is something the poet does not dare name. In the second poem, she compares herself with a deer in a garden. Critics have commented that her father seems to have been too busy to select a son-in-law. However, one wonders if this is what Qasmūna was complaining about. Obviously, she felt alienated, but her alienation might have been of a more profound nature. Being the daughter of a powerful Jewish official in an Arab court must not have been easy. Being a talented woman with no outlet for her talent must have been even more difficult. Qasmūna could be talk-

ing about her spiritual isolation and the waste of her talent. The deer is a restless animal meant to be free, not confined in a garden, however pleasant. What Qasmūna does not dare name could be her frustration.

QUEENSHIP

Queenship in medieval Aragón, Castile, León, Navarre, and Portugal reflects a distinctive political culture that was both similar to and substantially different from England, France, or the German Empire. All queens faced the imperative to produce an heir and to raise and educate the children; they participated in public ceremonial functions, performed charitable work, and were important patrons of religion and art. Unlike their northern counterparts, however, Spanish and Portuguese queens were more likely to be active in the governance of the realm. The circumstances surrounding the Muslim conquest of 711 and the Christian Reconquest led to a pragmatic, less theocratic monarchy that, for the most part, did not explicitly prohibit women from inheriting or ruling. The resultant dynamic political partnership, sensitive to the prevailing legal customs and local culture, involved both king and queen and took into account individual abilities and temperament.

Birth determined a queen's inheritance rights and her suitability as bride for a foreign prince, but it was marriage that ultimately constituted a queen's political rights and responsibilities. Royal marriages forged alliances of great consequence to the consolidation of power among the Christian kingdoms. The dowry that Sancha, daughter of Alfonso V of Asturias-León (999–1028), brought to her marriage to Fernando I of Castile (1035–1065), enabled them to reunite briefly the two realms and initiate the reconquest. Philippa and Catalina of Lancaster, daughters of John of Gaunt, married João I of Portugal (1385–1433) and Enrique III of Castile (1390–1406), respectively, in a move that effectively ended Castilian and Portuguese intervention in the Hundred Years' War. Marie of Montpellier's marriage to Pedro II of Aragón (1196–1213) opened the door to Aragónese influence north of Pyrenees and set the stage for the conquests of their son, Jaime I (1213–1276). Teresa of Portugal, illegitimate daughter of Alfonso VI of León (1065–1109), married Henry of Burgundy, and together they governed the nascent kingdom of Portugal from 1109 to 1128.

In Castile and León, princesses could legitimately inherit in the absence of a legitimate male heir. Alfonso VI of León (1065–1109) designated his daughter Urraca as his successor and she ruled in her own right from 1109 until 1126. Married twice to powerful men, including Alfonso I of Aragón (1104–1134), Urraca defied the notion that a man who married a ruling queen should automatically share in the governance of his wife's realms. Isabel I, "la Católica" (1474–1504), arguably the most famous Castilian queen, held her realms separate from those of her husband, Fernando II of Aragón (1479–1516), who ruled Aragón in his own right but did not have sovereign power over Isabel; not even after her death could he rule as king of Castile.

It is one thing to inherit, but another to rule. Berenguela, daughter of Alfonso VIII of Castile (1158–1214), was legal heir but renounced her rights in favor of her brother, Enrique I (1214–1217); she was regent throughout his minority, and upon his death ceded her throne rights to Fernando III (1217–1252), her son by her former husband, Alfonso IX of León (1188–1230). Alfonso IX may have named his daughters Sancha and Dulce as his successors, but they renounced their claims in favor of their half-brother Fernando, resulting in the union of the Leonese and Castilian realms. In Aragón, Petronilla, (1137–1162), infant daughter of King Ramiro II (1134–1137), inherited the kingdom in 1137 and married the older (by perhaps twenty-five years) and politically experienced Ramón Berenguer IV, count of Barcelona. After Ramiro retired to a monastery, Ramón Berenguer acknowledged his status in Aragón not as king but as prince-consort, but Petronilla ruled more in name than in fact. When Ramón Berenguer died in 1162, she ceded her throne rights to the united realms of Aragón and Catalunya to their son, Ramón. Petronilla remained regent for her son, now called Alfonso (he ruled as Alfonso II, 1162–1196), until 1164. After 1164, three succession crises loomed, but none were resolved in favor of a female claimant.

The regency was the most common means by which a queen could participate in government. The queen-regent's political authority was accepted, at least in theory, as an extension of her maternal rights as the guardian of her children. In Castile, María de Molina, widow of Sancho IV was regent for both her son, Fernando IV (1295–1312), and grandson, Alfonso XI (1312–1350). Berenguela, regent for Fernando III (1217–1252), maintained order in Castile in the face of threat of invasion by her ex-husband and civil war. In Navarre, Toda Ansúrez, was regent for her son García I Sánchez (926–970); Urraca Fernández and Jimena González, grandmother and mother, respec-

tively, were regents for Sancho III Garcés, el Mayor (1000–1035). There are few regents in Aragón, which had instead the office of the queen-lieutenant. The lieutenancy, devised in the thirteenth century, was a means for both princes and queens to rule the Crown's extensive territorial possessions. It became a route to political power for seven queen-lieutenants: Blanca of Naples, wife of Jaime II, in 1310; Teresa d'Entença, wife of Alfonso IV (1324–1327); Violante of Bar, third wife of Juan I (1388–1430); María de Luna, first wife of Martín (1396–1406); Margarida of Prades, second wife of Martín (1412–1421); María of Castile, wife of Alfonso V (1420–1453); and Juana Enríquez, second wife of Juan II (1461–1477).

Little is known at present of Visigothic queens and many Portuguese and Navarrese queens, especially in the politically unsettled centuries before the reconquest, but a few queens stand out. Isabel, wife of Dinis of Portugal (1279–1325), was noted for her religious devotion. Blanca, daughter of Sancho VI of Navarre (1150–1194), married Thibault of Champagne; his rule, from 1234 to 1253, signaled the linkage of Navarrese and French interests. Another Blanca, daughter of Carlos III (1387–1425), inherited Navarre from her father and, in theory, ruled it jointly with her husband Juan II of Aragón (1458–1479).

QUR'ĀN

Qur'ān, the Holy Scripture of Islam, was revered in Spain from the Arab conquest until the expulsion of the Moriscos in 1609, a span of nine centuries. Considered by Muslims to be the direct word of God as revealed, in Arabic, to his prophet Muḥammad, it holds a unique place in Islamic culture. In the Middle Ages the precepts of the Qur'ān formed the basis for all law, and its memorization was the starting point of all education. Interpretation of, and commentary on, the Qur'ān constitute an important genre of Arabic letters. The Muslims' reverence for the book extends to its physical makeup, a fact that accounts for the luxurious ornamentation of many specimens (as well as for the place occupied by calligraphy in Islamic decorative art). In Spain in Caliphal times, many of the finest Qur'ān calligraphers were said to be women.

In the strictest Islamic view, translation of the Qur'ān is not permitted because God chose to reveal his word in Arabic. The first translations of the Qur'ān known to have existed in Spain were therefore made by and for Christians. In 1141 Peter the Venerable, abbot of Cluny, commissioned an Arabic-to-Latin translation that was carried out in Spain by Robert of Ketton and Hermann of Carinthia, with the assistance of a Muslim known only as Muḥammad. In the same century a Mozarabic Christian, Mark of Toledo, also produced a Latin text. Both of these versions are extant, and both were motivated by a wish to understand Islamic doctrine, the better to preach Christianity to its adherents.

The same purpose inspired, three centuries later, the first known translation of the Qur'ān into Spanish. This version was prepared by 'Isā ibn Jābir of Segovia, at the behest of Juan de Segovia, in 1456. We know from a statement of 'Isā's elsewhere that he fleshed

out his translation with a running commentary taken from a *tafsir* or interpretation of the Qur'ān that he had in his possession. It is not known whether this work was in Arabic or in Spanish. Since Juan in his turn rendered 'Isā's Spanish text into Latin (thus producing the first trilingual Qur'ān in Europe), the Spanish version may have been intended only as a transitional text, made necessary by the fact that 'Isā knew Arabic and Castilian but no Latin.

All of this work except Juan's Latin prologue has been lost. Yet in the sixteenth century we find in circulation in Spain a large number of Aljamiado manuscripts containing the very type of Qur'ānic translation-cum-commentary that 'Isā claims to have made, though most often they contain only part of the text. For example, where the Qur'ān 79:34 reads *fa'id-haḡa'at al-taḡmatu l-kubra* ["Then, when the Great Catastrophe comes"], one Aljamiado version renders the phrase by the amplification "I cuando venrrá la fortuna mayor, que será el soflo del cuerno la çaguera vegada, cuando traerán los del aljanna al aljanna y los del fuego al fuego" ["And when the great destiny comes, and when the horn blows the last time, and when the judged come to judgment and those of the fire to the fire"]. One is tempted to relate at least some of these versions to 'Isā's, although the specific connections are not clear. It is possible that where several Aljamiado

Qur'ān translations follow each other closely they descend from a single original; this being the case, that original might have been 'Isā's. Alternatively, they may go back to the *tafsir* that 'Isā himself consulted. But some of the extant versions differ so sharply from these that they must represent independent versions (for example, a Latin-letter Morisco Qur'ān of 1606 that translates the verse quoted above without commentary, "Pues cuando vendrá la fortuna mayor").

About seventy Aljamiado Qur'āns are extant. By the early seventeenth century copies must have been rare, for one scribe speaks of having borrowed his model for only a limited time. Most of those surviving texts exist in an abridged form in which the opening chapter or *Fātiḡa* is followed by only selected verses from the chapters up to 38; from that point on the text is usually complete (there are 114 chapters in all). This means that the Moriscos preferred the Meccan chapters, with their more inspired and hortatory tone, to the Medinan, or law-giving, chapters.

R

RABBIS

The term *rabbi* in medieval usage was actually an honorary title and denoted generally a scholar proficient in Jewish law, and not necessarily a community functionary. However, virtually every community in medieval Iberia of any size had at least one official rabbi, whose duties were to oversee the conformity to Jewish law, both “religious” and civil, and usually to head the court (*bet din*) of three to adjudicate cases. Some Jewish scholars attained such high level of proficiency in the Talmud and Jewish law that they became national and even international authorities, to whom other rabbis and communities turned to render decisions or explain problems too complex for them to resolve. The decisions (*responsa*; *she’elot u-teshuvot*) of these scholars serve as an important historical source. Outstanding rabbis, particularly in the earlier periods (tenth and eleventh centuries) even took upon themselves the authority to enact new decrees or set aside earlier ones. (Maimonides, who was not a rabbi but a universally recognized legal authority, sometimes acted in bold and audacious ways in this regard; as did Joseph ibn Megash and others.)

However, not all rabbis were as well trained or knowledgeable as they ought to have been. From the tenth century on we encounter severe criticism and ridicule of such rabbis in our sources, and this continued to be the case down to the fifteenth century. Rabbis in earlier generations were never salaried, and Maimonides particularly disapproved of any who dared receive money for his learning. Yet by the end of the thirteenth century, particularly in Zaragoza and elsewhere in Aragón-Catalonia, rabbis were customarily salaried. Nevertheless, while such rabbis may have taught in the community, they rarely preached sermons and never officiated at services. Only once do we hear of a *cofradía* (guild) that hired a sage to preach sermons in their synagogue every Sabbath. Usually, if sermons were preached at all, this was done by itinerant “preachers.” However, before major holidays and

on other special occasions, great scholars did preach sermons, many of which have survived.

Court rabbis, sometimes called “chief rabbis” (*rabí mayor*) were often appointed by the king. This position may have originated as early as the reign of Alfonso X, but became fairly widespread in the fourteenth century, when in the reign of Enrique II in Castile we find references to such royally appointed *rabí* or *viejo* (elder—a biblical term). In 1388, Pedro Tenorio, the archbishop of Toledo and *canciller mayor* (head chancellor), appointed his physician, Rabbi Hayyim ha-Levi, chief rabbi of all the Jewish *aljamas* (communities) in the province, to replace a previously named judge who did not fulfill his duties. In 1395, the archbishop appointed his physician “maestro Pedro” (who may have been the same Rabbi Hayyim, now converted?) to the same post. Sometime in 1383–1384, Juan I appointed David Negro from Portugal as chief rabbi of all Castile. He had joined the king when Juan invaded Portugal following the death of Fernando IV, whose chief rabbi Juda Aben Menir also joined the Castilian king. Maestre Samaya Lubel of Segovia, physician of Enrique IV, was *juez mayor* (head judge) of all the Jewish *aljamas* (c.1465–1469). Juan II apparently appointed Abraham Benveniste (c.1432) to a similar post.

In Aragón-Catalonia, such court-appointed rabbis were rarer. However, already in 1270 Jaime I appointed a rabbi and judge for Lérida, and the following year appointed Solomon Alfaquim as judge for all cases between the Jews of Zaragoza and the crown. In 1284, Solomon Avenbruch, who had been appointed judge of the Jews of Zaragoza by Pedro IV, was murdered by some Jews. When, in 1294, Solomon Constantin sought the intervention of Queen María de Molina of Castile to be appointed chief rabbi of Aragón, Jaime II refused, noting that he had not exercised that post, to which he had been appointed, in the reigns of Pedro III or Alfonso III.

Some of the many outstanding rabbis of Spain were Joseph ibn Abitur, Isaac ibn Ghiyāth, Joseph ibn

Megash, Isaac al-Fāṣī, Jonah Gerundi, Solomon ibn Adret, Moses ben Naḥman, Yom Ṭov Ishbīlī, Nissim Gerundi, Ḥasdai Crescas, Isaac ben Sheset, and Asher ben Yehiel and his sons Judah and Jacob. Many volumes of commentaries, responsa, and other material have survived from these authors.

RAIMUNDO, ARCHBISHOP OF TOLEDO

The second archbishop of Toledo after its reconquest in 1085 by Alfonso VI of León-Castile, Raimundo succeeded Bernard of Sauvetot in 1125 and held the post until his death on 20 August 1152. During his long career he was the chief confidant of Alfonso VII of León-Castile (1126–1157). Like his predecessor, he was an ardent defender of the primatial and archepiscopal prerogatives of Toledo and therefore was frequently in conflict with the archbishops of Braga and Santiago de Compostela over their respective jurisdictions. He managed to install canons of his own church as bishops of Salamanca and Santiago de Compostela. Raimundo is most famous, perhaps, as the patron of a group of Christian, Jewish, and Muslim translators at Toledo who were rendering many of the works of ancient Greek science and Aristotelian philosophy from Arabic into Latin during his episcopate. This process made Greek, as well as much Islamic and Jewish, lore available to the developing universities of western Europe.

Raimundo had been one of the French Cluniac monks recruited for the cathedral chapter of Toledo in 1096 by Bernard of Sauvetot. Before his elevation to Toledo he had been bishop of Burgo de Osma from late 1109 until the middle of 1125, when he was transferred to the former see. In that frontier position, Raimundo had been a leading supporter of Queen Urraca of León-Castile in her struggles with Alfonso I of Aragón (1104–1134).

RAMÓN BERENGUER IV, COUNT OF BARCELONA

On the death of his father in 1131, the young Ramón Berenguer IV (c.1114–1162) became the count of Barcelona at the age of seventeen. The first major event of his reign was the union of the Catalan principalities with the neighboring Kingdom of Aragón. In 1134 Alfonso I the Batallador died childless, and this raised the problem of who was to succeed him. His will, leaving his goods to the military orders, could not be applied; and this, together with the marriage of Ramiro, the brother of Alfonso I, made Alfonso VII of Castile give up all hope of succeeding to the throne. In August 1137 Petronella, born of Ramiro's recent marriage, was immediately promised to Ramón Berenguer, who became prince of Aragón; the marriage took place in 1150. In 1140 the holy see and the military orders gave up their rights over Aragón. It was by diplomatic means that Ramón Berenguer IV ended his disagreement with the king of Castile, whom he met in 1137 and 1140; at these meetings, he swore allegiance to the city of Zaragoza, and prepared a joint expedition against Navarre. Thanks to the diplomatic activities of Oleguer, archbishop of Tarragona, and the seneschal Guillem Ramón de Montcada, the count of Barcelona symbolized the union of the counties inherited from his father with the kingdom of Alfonso I. The Catalano-Aragóense confederation depended on a reciprocal respect for the institutions belonging to each territory.

Ramón Berenguer IV concentrated henceforward on the struggle against Islam. With Alfonso VII he participated in the expeditions to Murcia (1144) and Almería (1147). He later directed campaigns intended to extend his principalities. In 1148 he took Tortosa where the help of Guillem Ramón de Montcada, of the Genoese fleet, and of contingents from Languedoc was decisive for the success of this expedition, recognized by Pope Eugene III as a true crusade. Franchises accorded to the city attracted new inhabitants, while an arrangement with the qādī and the fuqahā' ensured the respect of the Muslim population. On 24 October 1149, the cities of Fraga and Lleida also fell before the troops of Ramón Berenguer IV and Ermengol VII of Urgell. Between 1152 and 1153 Miravet was conquered, and the surviving pockets of Islamic resistance destroyed. Ibn Mardānīsh, king of Valencia, then swore allegiance to the count of Barcelona, to whom he paid a large tribute. The Ebro River was reached; Ramón Berenguer IV considerably extended the territory of New Catalonia beyond Tarragona. The same thing hap-

pened in Aragón, where he annexed Huesca (1154) and Alcáñiz (1157).

His political activities were continued beyond the Pyrenees; the families of Béziers-Carcassonne, of Narbonne and of Montpellier paid homage to him. In 1154 he became the tutor of Gaston V of Béarn; he fought successfully at Toulouse, to which he laid siege with Henri Plantagenet II in 1156. But most of his activities took place in Provence. In 1144, his brother Berenguer Ramón, count of Provence was killed in his wars against the count of Toulouse and the family of Baux, as well as Genoa and Pisa. His son, Ramón Berenguer of Provence, was still a minor and was powerless against so many enemies. In February 1147 Ramón Berenguer IV came to his aid; the leading nobles swore that they would be faithful to him. He wiped out Ramon of Baux, and brought him back in captivity to Catalonia. Three more wars were necessary to put an end to the seditious revolt of Ramon's wife, Stephanía of Baux, their children, and their associates. During the summer of 1155 he took their castle at Trinquetaille; at the beginning of 1162, he laid siege to the fortress of Baux and conquered it. He then ensured that Frederick Barbarossa recognized Catalan dominion in Provence, ordering the marriage of his niece Riquilda and his nephew Ramón Berenguer of Provence. It was during the journey to Turin, where he was to meet the emperor, that Ramón Berenguer IV met his death in Borgo San Dalmazzo, on 6 August 1162.

The work of Ramón Berenguer IV was fundamental on institutional and administrative levels. During his youth, in order to oppose the revolt of the Catalan aristocracy, he convened the Assemblies of Peace and Truce. He organized the management of his domain in such a way as to increase his financial resources, which he needed for his expansionary policy. An inspection carried out by Bertran of Castellet in Old Catalonia in 1151 furnished him with a precise inventory of the revenues of his domains; these were administered by bailiffs (*batlles*) or by creditors who accepted them as payment. His vicars (*vicaris*) mainly brought him the fines imposed by tribunals, the tolls levied, and the *parias* (tributes) of the Muslim chiefs. Justice was henceforth carried out by specialists in law, who applied the *Usatges de Barcelona*, a Roman legal code that he had just promulgated. The *Usatges* established the monopoly of the count as regards certain royal rights; castles, mint, and organization of the peace were under his control. The ecclesiastical map was redrawn; the bishoprics of Tortosa and of Lérida (Lleida) were reestablished instead of Roda-Barbastro. In 1154, the metropolitan province of Tarragona, including all the Catalan and Aragónese bishoprics, was also reestablished. Cistercian monks from Grandseigne and from

Fontfroide founded Santes Creus and Poblet in New Catalonia; the Templars and Hospitalers, who had received indemnities for their renunciation of Alfonso I's will, were also given domains on the frontier. The count welcomed to his court the first Catalan troubadours, Berenguer of Palol and Guerau of Cabrera. In 1162 he was praised in the first version of the *Gesta comitum barchinonensium*, drawn up at Ripoll. In 1157, on the death of Alfonso VII of Castilla-León, Ramón Berenguer IV had become the most important of the Iberian kings, and the arbiter of their struggles; he had a preponderant role in Occitania. His reign laid the basis for the great Mediterranean expansion of the Catalano-Aragónese confederation.

RAMÓN BERENGUER V, COUNT OF PROVENCE

The son of Alfons II of Provence and of Garsenda of Forcalquier, Ramón Berenguer V found himself after the death of his father in Aragón under the control of Pedro II (1209). In November 1216 he left the Templar Castle of Monzón for Provence. In 1219 his mother gave him the counties of Provence and Forcalquier. In 1226 he took advantage of the arrival of Louis VIII's troops to oppose the autonomy of the cities of the Rhône; in the aftermath of the fall of Avignon, he abolished the Consulate of Tarascon. He then conquered Grasse (1227) and Nice (1229), but failed to take Marseilles, which offered its government to Raimon VII, the ousted count of Toulouse (1230). From 1240, Raimon VII and the independent communes allied themselves with Frederick II, while Ramón Berenguer V persevered in his pro-French and pontifical policy (in May 1234, he had given his eldest daughter Marguerite to Louis IX in marriage). Success was not long in coming. The episcopal party triumphed at Avignon and Tarascon in 1242; Marseilles fell on 22 June 1243.

Ramón Berenguer V died in August 1245. It was natural, bearing in mind the alliances that he had defended throughout his life, for Romée of Villeneuve,

who had been his right-hand man, to arrange for Beatrice, his heir, to marry Charles of Anjou. Provence ceased to be Catalan and became French. During his reign, there was considerable centralization; the development of a central administration, the refining of the judicial system, and the creation of *vigueries* and *bail-lages* had allowed him to govern his country with efficiency.

RAMÓN OF FITERO

Ramón (1100?–1161?), abbot (1141–1161) of the Cistercian monastery of Santa María in Fitero, Navarre, was founder of the Order of Calatrava. In the years 1144–1157 Ramón substantially increased the monastery's holdings and received both royal and papal privileges. In 1157, amid rumors of a pending Almohad attack against the strategically important fortress at Calatrava, the Knights Templar, who had garrisoned Calatrava since 1147, asked Sancho III (1157–1158) for permission to withdraw. Ramón was the only person willing to assume the defense of Calatrava. Out of desperation Sancho agreed, and granted Calatrava to the monastery of Fitero and the Cistercian order in January 1158. Ramón then transferred the monastery of Fitero to Calatrava, leaving behind only the aged and sick. His efforts had the support of Juan, archbishop of Toledo, who promised absolution to anyone who joined Ramón in Calatrava. This and Ramón's example inspired volunteers to come or send provisions and supplies. The garrisoning of Calatrava averted the expected attack and created the Military Order of Calatrava. The origins of the order are obscure. It is by no means certain that Ramón intended to establish a religious military order, but the lay defenders of the fortress adopted the monastic habit and Ramón gave them the Rule of St. Benedict. During Ramón's lifetime the knights lived as Cistercians, but after his death differences between knights and monks were recognized. The abbey of Fitero apparently played no further role in the order's development. The order was recognized after Ramón's death by Pope Alexander III in 1164, and it was officially affiliated with the order of Cîteaux in 1187.

RAMOS DE PAREJA, BARTOLOMÉ

Spanish theorist (c.1435–c.1491). Initiated into music by the papal singer Juan de Monte, whom he considered the equal of Ockeghem, Busnois, and Dufay, Ramos lectured at Salamanca where he disputed with Pedro Martínez de Osma on the meaning of the diatonic, chromatic, and enharmonic genera. Among his friends he counted such royal maestros as Tristano de Silva and Johannes Urrede.

Before 1482 he lived in Italy, first perhaps at Florence but also at Bologna, where, however, the jealousy of the mathematical faculty prevented his obtaining the chair that Nicolas V had sought to create. After publishing at Bologna in 1482 *Musica practica*, the most important treatise in Latin by a Spaniard before Salinas (1577), he settled in Rome.

In the tuning system advocated by Ramos, he opted for vibration ratios permitting three 5:4 major triads and three 6:5 minor triads. Two major triads, C-E-G and F-A-C reached mathematical perfection denied them in the older Pythagorean tuning system. He also advocated solmization through the octave (equivalent to the modern fixed-do system). He permitted certain licenses, such as an occasional tritone and swiftly moving fifths, one perfect, the other imperfect. He was the first writer to mention the "short" octave at the bottom of keyboard instruments. However, his novel doctrines anticipating future musical developments went hand in hand with traditional contrapuntal rules and long venerated modal ethos doctrines.

All his original compositions except a perpetual four-voice canon are lost. This included a magnificat, requiem, and mass composed in Spain, and a motet *Tu lumen* in Bologna.

RAVAYA FAMILY

Many Jews rose to prominence in government service in Aragón-Catalonia as well as Castile. Among those in the former kingdom were the Ravayas. In the reign

of Jaime II, Jucef Ravaya was banker to the *infante* Pedro el Grande, eventually becoming treasurer and counselor to the future king. His brother Mossé (Moses) held a similar post in Catalonia as inspector of accounts. Jucef was also involved in the negotiations of the marriage of Jaime II, and took part in the Sicily expedition (1282). When Pedro, as king, was out of the country for a year (1283), Mossé was named as *procurador* to administer the kingdoms of Aragón, Catalonia, and Valencia (however, his authority was reduced to Catalonia alone). He was, however, briefly the *baile* (bailiff) of Valencia.

Astrug, another member of the family, was baile of Girona from 1276 to 1281, and as such issued laws and exemptions of taxes to the town of Palamós. These, and various economic regulations, were issued entirely in his own name and countersigned by various local Christians. Pedro III granted him similar privileges for the town of Borrassá, noting that Astrug's son Yucef had undertaken the repopulation of that town (1280). Astrug and his son also were granted the revenues of Girona and Besalú in payment of loans made to the king and Astrug was exempted from paying taxes to his cousin, Solomon ibn Šaddoq, *almoxarife* of Castile, after Astrug had moved from Toledo to Girona.

RAZÓN DE AMOR

The thirteenth-century lyric poem *Razón de amor*, along with *Denuestos del agua y del vino*, published first by Morel-Fatio in 1887, was edited by Menéndez Pidal; the text was further analyzed in Gardiner London's paleographic edition. Examined as a Christian allegory, it has even been viewed as an allusion to the Cathar heresy. Ley studied its debt to Provençal literature; Ferraresi dealt with its relationship to courtly love, and Antwerp showed its dependence on popular lyric. Whether the *Razón* and the *Denuestos* were ever intended to be a single poem is subject to debate. For Spitzer, the connective thread is thirst: for relief from the heat, for love, and finally for the soul's ease. A possible compromise is a proposal that an anonymous poet created a new seamless poem out of two distinct dream poems: a midday apparition and a debate vision. Thus the *Denuestos* is a final sequence in a dream narrative in which the wine and water of the first poem

are the protagonists of a raucous debate that breaks the amorous mood in a manner characteristic of dreams.

The poem begins with a *juglaresque* (minstrel-esque) invitation to the public to listen and to take solace from his performance. The cosmopolitan well-educated poet tells of the time when, hot and tired, he found himself in an orchard at midday. A *dueña* (lady) had placed a cup of wine, covered to protect it from the heat, high in a tree to refresh her lover. Above the wine he saw another cup filled with water drawn from a magical spring. Afraid to drink the water, the poet fell asleep in the shade. Up to this point, there is a certain correspondence with the explicit Christian allegory in Gonzalo de Berceo's *Milagros de Nuestra Señora* where the poet's thoughts turn to the Virgin, but in the *Razón* events susceptible of allegorical interpretation are, at least superficially, erotic.

The poet falls asleep and in a dream arrives at a *locus amoenus* with a spring that cools its surroundings magically, encircled by flowers whose fragrance will resuscitate the dead. His dream beloved, fused with the *dueña* of the orchard, interrupts his poetic musing, and they spend an amorous interlude, at the end of which she hurries away. The drowsy postcoital poet, still dreaming, sees a white dove that, afraid of the *fuelle perenal*, seeks relief from the heat in the cup of water in the tree and spills some water into the wine beneath it. This accidental spillage motivated by fear of the spring recalls the predream uneasiness about the water in the cup. Thus this second interruption becomes a creative bridge between the erotic content of the *Razón* and the traditional water/wine debate.

RECCARED

The younger son of Leovigild, Reccared (569–586) was made a nominal co-ruler with his father and elder brother, Hermenegild, in 573, but did not receive a separate area of authority. The city of Reccopolis (probably Zorita de los Canes near Alcalá de Henares), which Leovigild founded in 578, was named after him. A proposed marriage to the Frankish princess Rigunth, daughter of the Neustrian king Chilperic (561–584), was canceled when the bride's father died while she was still on the way to Spain. In 585, following the suppression of his brother's revolt, Reccared was sent successfully to repel a Frankish invasion of the province of Narbonensis. He succeeded his father without opposition in 586, and early in 587 at a meeting with the Arian episcopate he ordered them to reach a definitive solution of the theological disagreements between themselves and Catholics. His own conversion to Catholicism, in which Bishop Leander of Seville was said to have been influential, occurred that year, and those of most of the Visigothic clergy and nobility followed in the course of the next two years. The process of conversion was formalized by the holding of the great Third Council of Toledo in May 589, which was attended by Reccared and his queen, Baddo. He faced revolts in 588 and 589 in Mérida, Toledo, and Narbonne on the part of three Arian metropolitan bishops and a number of disaffected Gothic counts. All of these were quickly suppressed. For the last decade of Reccared's reign very little evidence survives. He died in 601, leaving the throne to a young son Liuva II (601–603), who was subsequently deposed and then murdered in an aristocratic coup, bringing the rule of this dynasty to an end.

RECCESVINTH

The son of Chindaswinth (642–653), Reccesvinth was associated with his father as joint king in 649. A letter advocating this decision survives in the epistolary collection of Bishop Braulio of Zaragoza. During the period of joint rule a new coinage in both kings' names was issued. After his father's death Reccesvinth ruled alone, and died without known heirs on 1 September 672. His wife's name appears to have been Recciberga. His reign is particularly notable for the promulgation

Visigothic, 7th cent, Crown of Reccesvinth, Visigoth king, from the treasure of Guarrazar, near Toledo. Copyright © Giraudon/Art Resource, NY. Museo Arqueológico Nacional, Madrid, Spain.

in 654 of the first version of the law code known as the *Forum Iudicum* or *Lex Visigothorum*. Although this may not be the first Visigothic code that was territorial in its application, that is to say provided the exclusive rule of law for all subjects of the king, its size and the attempted comprehensiveness of its contents make it the most substantial piece of legal codification in the West since the promulgation of the Theodosian Code in 438. The early years of Reccesvinth are also notable as a period of considerable conciliar activity, with the Eighth, Ninth, and Tenth Councils of Toledo (held in 653, 655, and 656, respectively). After these no further plenary or national assemblies were convened during the reign. This may in part be due to the very critical tone adopted by the bishops in their demands for reform of abuses and malpractices that had occurred under the apparently despotic regime of Chindaswinth. A tangible record of the reign of Reccesvinth comes in the form of the church of San Juan de Baños, south of Palencia, which, according to its extant dedicatory inscription, was built in 661 by the king in honor of St. John the Baptist. This probably relates to the pres-

ence close to the church of a spring enclosed by masonry of the same period. It is likely that the site was part of a royal estate.

RECEMUND

Bishop of Elvira and caliphal secretary (mid-tenth century). Known to the Arabs as Rabi ibn Sid al-Usqf, the Christian Recemund served as a secretary under the caliph ‘Abd al-Rahmān III (929–961). In 953 he was sent by the caliph as an ambassador to Otto I of Germany (936–973), where he managed to defuse a potentially volatile situation caused by a previous exchange of letters that were apparently less than sensitive to the religious inclinations of their recipients. The caliph rewarded Recemund for his services with the recently vacated see of Elvira. While in Germany, Recemund met Liutprand of Cremona, who subsequently dedicated his *Antapodosis* to him. Even as bishop, Recemund continued to serve as an ambassador for the caliph, traveling to Constantinople and Jerusalem. With the accession of Al-Ḥakam II in 961, Recemund dedicated to him a calendar written in Arabic which, interestingly enough, included references to Christian holy days, even some that commemorated a few of the martyrs of Córdoba. Recemund was a contemporary of Hasdai ibn Shaprut, the Jewish physician and intellectual who also served ‘Abd al-Rahmān III as ambassador.

RECONQUEST AND REPOPULATION

The Reconquest and the concomitant task of repopulation are the essential threads running through the history of medieval Spain. Spaniards have long believed that their forebears waged nearly continuous warfare over seven hundred years to expel the Muslim invaders

from North Africa who overthrew the Visigothic kingdom in 711. Modern historians have questioned the validity of this traditional concept, but Derek Lomax pointed out that the Reconquest was “an ideal invented by Spanish Christians soon after 711” and developed in the ninth-century kingdom of Asturias.

Given the failure of the Muslims to occupy the entire Iberian Peninsula, several tiny, independent kingdoms and counties emerged in the foothills of the Cantabrian and Pyrenees mountains, namely, Asturias, León, Castile, Navarre, Aragón, and Catalonia. The idea of reconquest originated in Asturias, where King Pelayo (718–737), the leader of a hardy band of mountaineers, proclaimed his intention to achieve the *salus Spanie*—the “salvation of Spain”—and the restoration of the Gothic people. His victory over the Muslims at Covadonga in 722 is traditionally taken as the beginning of the Reconquest. A ninth-century chronicler affirmed that the Christians would wage war against the Muslims by day and night “until divine predestination commands that they be driven cruelly thence. Amen!” Two ideas were linked here. First there was the determination to expel the Muslims considered as unlawful intruders who had seized land belonging by right to the Christians. Secondly, the task of restoring the Visigothic monarchy to its fullest extent was attributed to the kings of Asturias and their later successors in León and Castile who were hailed as heirs of the Visigoths. The reconquest was a war to recover territory, but it also had a religious character because of the fundamental opposition between two mutually exclusive societies.

Despite the bravado of the chroniclers, the Christian rulers were in no position to offer serious opposition to Muslim ascendancy during the three hundred years following the initial invasion. Almost every year the emirs and caliphs of Córdoba sent their armies to ravage Christian lands, though never to conquer them. A no-man’s-land extending along the Duero river from the Atlantic Ocean to the borders of Aragón separated Christian and Muslim territory, but many years elapsed before the Christians were emboldened to settle that region. Until the late eleventh century, Islamic rule in the northeast reached as far north as the foothills of the Pyrenees. In these circumstances one could hardly speak of reconquest.

Nevertheless, the breakup of the Caliphate of Córdoba early in the eleventh century and the emergence of the petty Muslim kingdoms known as *tā’ifas* enabled the Christian princes to make significant progress in the Reconquest. Alfonso VI of León-Castile (1065–1109) captured Toledo in 1085 and won control of a long stretch of the Tagus River. However, the Almoravids, a Muslim sect from Morocco, defeated

him at the battle of Sagrajas in 1086 and unified Islamic Spain by swallowing the *tā'ifas*. Christians once again found themselves on the defensive. As Almoravid power waned the Christians again achieved important gains when Alfonso I of Aragón (1104–1134) conquered Zaragoza on the Ebro River in 1118 and Afonso I of Portugal (1128–1185), with the aid of a fleet of northern crusaders on their way to the Holy Land, seized Lisbon at the mouth of the Tagus River in 1147.

From this point onward the Reconquest assumed the character of a crusade as numerous papal bulls equated the struggle against Islam in Spain with the wars in the Holy Land. The conflict intensified in the second half of the twelfth century when the Almohads, another Muslim sect from Morocco, halted the Christian advance and ravaged Christian territory. In 1195 the Almohads gained an extraordinary triumph at Alarcos over Alfonso VIII of Castile (1158–1214), but

in 1212, with the help of a papal bull of crusade, he redeemed himself and routed the Muslims at Las Navas de Tolosa. As a consequence the southern frontier of the kingdom of Toledo was secure and the road to Andalusia was opened. Moreover, the balance of power had now been tipped once and for all in favor of the Christians.

Pressing forward from the Guadiana to the Guadalquivir Rivers, Fernando III of Castile-León (1217–1252) captured Córdoba (1236), Jaén (1246), and Seville (1248) and also received the submission of the Muslim kingdom of Murcia. At the same time the Portuguese occupied the Alentejo and the Algarve thereby completing the territorial expansion of their kingdom. In the east Jaime I of Aragón (1213–1276) subjugated the Balearic Islands and conquered the kingdom of Valencia (1238). In that way the Crown of Aragón consisting of Aragón proper, Catalonia, and

13th Century Iberia

Valencia reached its fullest extent within the peninsula. Thus by the middle of the thirteenth century all of Islamic Spain, with the exception of the kingdom of Granada, was ruled by the Christians. The kings of Granada were forced to pay tribute as vassals of the kings of Castile-León.

Only Castile-León had a frontier contiguous to the kingdom of Granada and so had a realistic chance for further peninsular acquisitions. In the late thirteenth and fourteenth centuries the principal concern of the Castilian kings was to seize control of the ports on the Strait of Gibraltar in order to prevent further incursions from Morocco. In preparation for an African crusade, Alfonso X (1252–1284) developed the ports of Cádiz and El Puerto de Santa María, but his plans were thwarted by the revolt of the Muslims subject to his rule in 1264. Another wave of Moroccan invaders, the Banū Marin or Benimerines, put the Christians on the defensive once again. Sancho IV (1284–1295) cap-

tured the port of Tarifa in 1292 and his son Fernando IV (1295–1312) seized Gibraltar in 1309, though it was lost in 1333. Alfonso XI (1312–1340) stemmed the final Moroccan invasion at Salado in 1340 and gained Algeiras in 1344, but died during the siege of Gibraltar. For the next century and a half the reconquest was left in abeyance as the kingdom of Granada was not considered a serious threat and no further intrusions from Morocco took place.

As the Muslims withdrew before the Christian advance, reconquered territory had to be repopulated or colonized. The earliest stage in the process occurred when pioneers willing to take the risk of living on an exposed frontier began to settle in the unoccupied lands of the Duero River valley. In the eleventh and twelfth centuries while the Leonese, Castilians, and Portuguese crossed into Extremadura and then into the Tagus Valley, the Aragónese and Catalans moved south of the Ebro River. Fortified urban settlements

were established directly dependent upon the king and royal charters assuring personal freedom and other liberties were issued to attract settlers. The military orders founded in the twelfth century received lordships in the frontier region stretching from below the Tagus to the borders of Andalusia. When Andalusia, Valencia, Murcia, and the Algarve were occupied in the thirteenth century, the Muslims were usually evacuated from the principal cities and towns. Books of distribution or *Libros de repartimiento* drawn up on the king's orders distributed houses and lands among the victors. The repartimientos for Valencia and Seville are among the most comprehensive of these documents. A substantial Muslim population, known as Mudéjars, remained in the rural areas and were not fully incorporated into Christian society until the seventeenth century.

Fernando of Aragón (1479–1516) and Isabel of Castile (1474–1504) conquered Granada and brought the Reconquest to an end. Stating their expectation that “these infidels . . . will be ejected and expelled from Spain,” they asked the pope in 1485 for crusading indulgences. Then in 1492, they announced that “this kingdom of Granada, which was occupied for over seven hundred and eight years by the infidels . . . has been conquered.”

Medieval Spanish Christians, a people always living on a frontier, developed a pioneer psychology through the Reconquest and seemed prepared at any time to move from the more peaceful and settled areas of the north in the expectation of finding a better life in the south. After the conquest of Granada some tried

to press Spanish interests in Morocco in accordance with the notion that the Visigoths had once ruled there, but the opening of the New World diverted Spanish energy from that enterprise. Overseas exploration and colonization in the sixteenth and seventeenth centuries in some measure continued the process of reconquest and repopulation within the peninsula.

Although the Christians now dominated all of Spain and Portugal, the continued presence of large numbers of Muslims and Jews, who hitherto had enjoyed religious freedom and juridical autonomy, was seen by many as an impediment to national unity. On that account, the Jews in 1492 and the Muslims of Granada in 1502 were compelled to accept Christianity or to go into exile. In that way a façade of political, juridical, and religious unity was imposed.

In conclusion, though the ideal of reconquest found expression in the ninth-century chroniclers, the Reconquest itself did not really begin until the late eleventh century. Thereafter it was frequently interrupted by truces and sometimes neglected entirely, but it remained the ultimate goal of the Christian rulers of Spain.

REGIDOR *See* TOWNS

RELIGIOUS ORDERS

A religious order is a community of individuals, either male or female, who make a public vow and a religious consecration. It is an institute of perfection whose members subject themselves to the discipline of a rule recognized and approved by ecclesiastical authorities. Through their corporate life and service to the larger community of the church, these individuals seek spiritual growth and ultimately the attainment of salvation. The religious orders of medieval Europe, first appearing during the twelfth century, were an outgrowth of the Gregorian Reform Movement. They were less rural and contemplative than the older monastic communities and generally subscribed to some version of the Augustinian Rule. Their works tended to be evangelistic or caritative, well suited to the needs of emerging urban communities, from which they drew their re-

cruits and material support and which also served as the arena for their various apostolates. These orders fall roughly into three categories: military, evangelistic/mendicant, the hospitaler/caritative.

Medieval Iberia, for the most part, was not the originator of those forces that led to the creation of the new orders. Yet Spain, with its own crusade, developing urban centers, and proximity to France and the Mediterranean, was an early and logical arena of expansion for externally created orders. Hispanic society quickly responded to these examples by developing native variants.

The military orders were among the first to appear in Spain. The Knights of St. John and the Knights Templars had both arrived by 1131, but their reluctance to commit themselves fully to the Spanish reconquest led to the subsequent establishment of indigenous versions. Among these were the Spanish orders of Santiago, Alcántara, Calatrava, Montesa, and Alfama, and the Portuguese orders of Avis and Christ.

The principal mendicant orders active in medieval Iberia were the Franciscans, Dominicans, Carmelites, Sack Friars, Poor Catholics, and Augustinians. Of these, the Franciscans were the most numerous. Tradition has it that Francis of Assisi founded several houses in Castile and Aragón in 1213 and 1214. Spain became a province in 1217, and in 1232 this was subdivided into three. By 1400, these provinces contained twenty-three custodies (or districts) with 123 houses. The Second Order of St. Francis, or the Poor Clares, held some forty-nine convents in Spain at the end of the thirteenth century.

The Order of Preachers, or Black Friars, was established by the Castilian Domingo de Guzmán at Toulouse in 1215. In 1217 and 1218 Domingo and several Spanish friars established the order in Madrid, Segovia, Palencia, Burgos, Zaragoza, Zamora, Barcelona, and Compostela. These houses were organized into the province of the Spains in 1221; Aragón became a separate province in 1301, and Portugal in 1418. There were some twenty houses in the peninsula in 1250, thirty-five in 1275, and forty-two in 1298. While there was a community of Dominican nuns in Madrid as early as 1218, only six other convents were established within the peninsula by 1303, in contrast to the seventy-four in Germany and forty-one in Italy.

The Order of the Virgin Mary of Mount Carmel, better known as the Carmelites or White Friars, grew out of a community of hermits established in Palestine before 1206. Attacked by Muslims in 1238, members migrated to Europe and established themselves in England, France, Spain, and Italy. The loss of Mount Carmel in 1291 cut the order's last ties with Palestine. In 1254 the Englishman Simon Stock was elected general

and, with the approval of Pope Innocent IV, reorganized the community as a mendicant order, a status confirmed at the Council of Lyons in 1274. With a rule stricter than those of the Dominicans and Franciscans, the Carmelites established houses in towns and their suburbs; earlier disciplines were relaxed and the original habit with its vertically striped black and white mantle was replaced in 1287 by a white one. In 1291 lay brothers lost the right to vote at meetings of the chapter.

The Carmelite province of Spain was one of the last to be established, probably because few Spaniards had belonged to the original Palestinian community. The first residences were located in the Crown of Aragón, where houses at Lérida and Huesca existed by 1272. Others followed in Sangüesa, Valencia, Zaragoza, Barcelona, Perelada, Girona, and Mallorca. There were none in Castile until 1315 and these, with the exception of foundations in Toledo and Avila, had rural locales. In Andalusia there was a friary in Seville by 1358. The diocesan clergy resisted the Carmelite settlement in Barcelona, Girona, and Mallorca but this was negated in part by royal patronage and, in 1317, by a papal grant of episcopal exemption. Catalonia and the Balearics became a separate province in 1354 and in 1416 Castile and Aragón were divided administratively.

The Carmelites fostered devotion to the Virgin and to the Holy Scapular; its distinct Marian spirituality was developed in the writings of the Catalan friars Felip Ribot and Pere Riu. Houses of study were established at Barcelona (1333) and Valencia (1379); and Guy Terrena, a Perpignanais elected as Carmelite general in 1318, became bishop of Mallorca in 1321 and of Elne in 1332. Another Catalan, Bernat Oller, was elected general in 1375. To judge by the size of the Mallorcan house, Carmelite communities in the fourteenth century contained as many as forty friars. The order was divided by the Great Schism and experienced a much relaxed discipline in the fifteenth century. The observant reform was not introduced into Spain until the sixteenth century. In Portugal, however, the Carmelites prospered during the fifteenth century under the reform of Baltasar Limpo, who became archbishop of Braga in 1479. The first notice of Carmelite nuns dates from a royal act of 1346 granting them permission to seek alms in Barcelona, but their effort at a permanent establishment there seems to have failed.

Like the Carmelites, the Order of Hermits of St. Augustine (or Augustinians) abandoned the contemplative life for the active ministry of the mendicants. The order itself originated through the "Grand Union" of various preexisting Augustinian eremite foundations that was approved by Pope Alexander IV in 1256.

The Province of Spain emerged as one of its twelve regional groupings. These Spanish houses had already attempted confederation on a regional basis; those in Aragón, for example, may have had their own provincial as early as 1216. Much thirteenth-century Augustinian expansion followed the progress of the Reconquest. In Valencia, five houses were established between 1260 and 1300; Murcia's monastery of St. Ginés dates to 1247; and in Andalusia there were foundations in Córdoba (as early as 1236) and Seville (1248). Jaime I of Aragón established a house for them on Formentera in 1257 that endured until piracy forced its abandonment in 1350. Other centers appeared at Toledo (1260), Zaragoza (1286), Badajoz (1298), and Barcelona (1309). Augustinian recruits included former Sack friars and Poor Catholic Brothers. In the fourteenth century, there were Augustinian nuns in Toledo and Seville. Catalonia and Aragón became separate provinces at the end of the thirteenth century and Portugal, with almost twenty establishments, by the mid-fifteenth century. The Augustinian observant movement was inaugurated by Friar Juan de Alarcón near Valladolid in 1438 and by the end of the century most houses had accepted reform.

Least known of the major mendicant groups are the Brothers of the Penitence of Jesus Christ, or the Sack Friars, so called for the pilgrim's tunic worn by each friar. They were established around 1248 by a knight of Hyères in Provence. Despite their distinctly Franciscan spirituality, members adopted the Rule of St. Augustine in 1251. In the quarter century until its formal dissolution at the Council of Lyons (1274), the Order established seven provinces and some eighty houses from Scotland to Palestine. The brothers preached, heard confessions, distributed alms, and helped the poor. Their Spanish foundations were concentrated in the Crown of Aragón where King Jaime I was an important benefactor. After 1274, as the brothers died, their property was turned over to other orders, including the Dominicans, Carmelites, and Mercedarians.

Another little-known mendicant group is that of the Poor Catholics, established at Toulouse in 1207 by Durand of Huesca, a Waldensian reconciled to the church. Pope Innocent III approved this community of preaching clerics and laymen but evidently did not assign them a rule. In 1237, members in Occitania and Catalonia were placed under the spiritual supervision of Dominicans from Tarragona, but the evidence is contradictory as to whether they ever accepted the Augustinian Rule. Members appear to have been absorbed by the other mendicant orders. In Catalonia, many became Dominicans because in 1256 the latter sold to

the Mercedarians the Brothers' former house in Castellón de Ampurias.

While mendicants certainly performed works of charity, the care of lepers, foundlings, the aged, the sick and diseased, travelers, pilgrims, captives and prostitutes was the primary focus of a number of hospital and caritative orders. While various almshouses and hospices for the needy had already been established by bishops and cathedral chapters in Spain, demographic changes in the twelfth century led to increasing specialization.

New and more narrowly focused hospitals were founded by, among others, religious orders. Several were quite small. The Order of Roncesvalles, for example, was established around 1132 by the bishop of Pamplona and Alfonso I of Aragón to guard the famous pass and to provide shelter for travelers and pilgrims. In the thirteenth century, the order constructed a number of pilgrim hospices along the route to and from Roncesvalles, and another in the city of Valencia. The latter may have served the entirely different purpose of tending to wounded casualties of the Reconquest. Another Pyrenean hospital associated with a religious order was that of Somport, located in the pass of Somport north of Jaca. The hospital there, founded between 1100 and 1108, appears to have been entrusted to the Military Order of the Holy Sepulcher for the purpose of protecting the route from Béarn to Aragón. The latter was established in the early twelfth century as one of two orders, one of canons regular and the other of knights, under the direction of the Latin patriarch of Jerusalem. In 1134 it was one of the three military orders to whom Alfonso I of Aragón bequeathed his realm. Between 1190 and 1210, the ties between Somport and the Knights of the Holy Sepulcher were apparently severed, because the former then called itself the Order of Santa Cristina. This order possessed some thirteen hospitals located around Béarn as well as in Aragón, Navarre, and Castile in the thirteenth century. The other Order of the Holy Sepulcher, that of canons regular, served within the Crown of Aragón as administrators of property that had been willed to the Church of the Holy Sepulcher in Jerusalem. Its chief centers were located at Calatayud and Barcelona, where it administered the Church of St. Anne. Jaime I entrusted to it care of the parish of St. Bartholomew in Valencia. Another branch was established at Logroño. With the fall of Acre and the chapter's transferral to Perugia in the late thirteenth century, most of the order's regional districts, like that in Spain, separated themselves from the chapter's authority and, like the hospitalers of Somport, became independent.

There is a great deal of legend surrounding the establishment of the Order of St. Anthony, or the An-

tonines. Tradition relates its establishment around 1095 by Gaston of Dauphiné at La-Motte-Saint-Didier for the treatment of ergotism, an epidemic disease also known as "St. Anthony's Fire." The first members were laymen, although the grand master was a priest. In 1218 members took monastic vows and in 1297 became canons regular of St. Augustine. Their alms-house at La-Motte-Saint-Didier is documented from 1150 and the thirteenth-century order had four commanderies: France, Italy, Germany, and Spain. The first Spanish hospital was located at Cervera. Its commander founded another at Barcelona in 1157. There were also hospitals on Mallorca and at Lérida; in Valencia, Antonines were established at Fortaleny in 1276 and after 1333 at Oriols near the capital. In Castile, the Antonines had hospitals at Castrojeriz, possibly dating from the late twelfth century, and at Salamanca from around 1230; in Navarre, there was a hospital in Olite.

The Order of the Holy Spirit was established at Montpellier between 1160 and 1170 by Guy of Montpellier and approved in 1198 by Innocent III. The order, whose rule derived from that of the Hospitalers of St. John, established itself in France, Italy, Germany, Scandinavia, and Spain. Guy himself may have brought the Order to Lérida, where a hospital for foundlings, the sick, the insane, and former prostitutes was functioning after 1214. Two other Spanish hospitals were in existence in 1256 and by the century's end, there were seven. Some estimates, up to thirty in the fifteenth century, are considerably higher, the discrepancy arising out of the difficulty of distinguishing the order's hospitals from others of the same name operated by purely local chapters or confraternities.

It is equally difficult to identify which leper hospitals belonged to the Order of St. Lazarus. The latter was established in Jerusalem around 1142 as a military order of lepers. Until 1253 its grand master had to be a leper. The order, which followed the Rule of St. Augustine, was brought to France by Louis VII after the Second Crusade to run hospices for lepers. From there it spread to central Europe, Italy, Scotland, and Spain. It possessed lazarets in Lérida and Valencia by the mid-thirteenth century, but other hospices also under the invocation of St. Lazarus (for example, at Barcelona and throughout the Asturias) had no connection to the order. The affiliation of others (such as those at Girona and Zamora) remains uncertain.

Ransoming orders were established to purchase the freedom of Christians who had become captives in Muslim lands. The first of these to appear in Spain was that of the Holy Trinity, whose members were also known as Maturins and Donkey Brothers. The order was founded by Jean de Matha and, according

to legend, Felix of Valois late in the twelfth century. Its rule, which emulated the customs of St. Victor of Paris, was approved by Innocent III in 1198. While Matha himself was probably a native of Provence, the order's motherhouse was located at Cerfroid, a rural site northeast of Paris. Trinitarian leadership was clerical, but lay brothers were also admitted. Because revenues were divided equally among the poor, captives and the brothers' expenses, the order had two distinct apostolates: assistance to the poor, and the ransoming of Christians. While northern France was the primary sphere of its operation in the thirteenth century, the Islamic wars brought Trinitarians to Palestine and Spain.

Tradition credits Matha himself with the foundation of the first Trinitarian houses in Castile: hospices for captives in Toledo (1206) and Segovia (1208) and another for paupers in Burgos (c. 1207). There were two Portuguese houses in the thirteenth century: at Santarem (1208) and Lisbon (c.1286). In the Crown of Aragón, there was a hospital in Lérida by 1218 and another at nearby Anglesola as early as 1201. Trinitarians followed the Reconquest to Córdoba, Seville, and Valencia, where they were given a medical hospital by the justiciar of the new kingdom. The order's ransoming work, apart from that conducted by the early ransoming hospices, can only be inferred from privileges allowing the brothers to collect alms. Its hospital work is better known; indeed its activities at Valencia and on Mallorca, where it assumed control of an orphanage in 1270, were more demonstrably Hospitaler in nature than redemptionist. Other thirteenth-century houses were located in Valladolid (1256), Murcia (1272), and, less certainly, in Andújar, Tarifa, and Badajoz in the Crown of Castile; and in Avinyana, Tortosa, Monzón, Daroca, and Murviedro in the Crown of Aragón. Houses at Barcelona and Játiva followed in the fourteenth century. After 1221 these were constituted into the separate provinces of Castile and Aragón; Portugal received provincial status in 1312. A single community of Trinitarian nuns, at Avinyana, dates from 1236.

The Order of Our Lady of Mercy for the Ransoming of Captives (the Mercedarians) was established in Catalonia shortly before 1230 when its lay founder, Pere Nolasc, began collecting alms for Christian captives at Barcelona and on Mallorca. Nolasc's order received approval in 1235 from Gregory IX, who assigned it the Rule of St. Augustine. The first Mercedarians were mostly laymen and, until 1317, had a laic master general. Unlike the Trinitarians, the Mercedarians' only charitable work was ransoming. Members followed the advancing Christian armies of the thirteenth-century Reconquest and established themselves as ransomers in the Balearics, Valencia, Murcia,

and Andalusia. While returning crusaders and the order's own initiative led to the establishment of houses in Aragón, Catalonia, Roussillon, Navarre, and Occitania, Mercedarians had no significant presence in Castile, apart from Andalusia and Murcia. The order maintained close ties with the House of Barcelona and had a strong Catalan identity: Barcelona was the seat of its motherhouse. The Mercedarians possessed some fifteen houses in 1245, thirty in 1263, and forty-one in 1291. In the early fourteenth century, there were approximately two hundred active Mercedarians.

Because Mercedarians ransomed those unable to pay their own ransoms, much of the order's work was devoted to fund-raising. Brothers would seek alms, frequently accompanied by recently freed Christians who owed six months of such service as repayment for their ransoming. In places like Valencia or Perpignan, the order assembled rural patrimonies as endowments for captives. The funds so collected were customarily entrusted to two ransomers who would bargain for captives in Granada or North Africa late each spring. The Mercedarian fourth vow, which required brothers to offer themselves as ransom for captured Christians, seems to be of post-medieval origin. Estimates for the numbers actually freed vary greatly; it is likely that the annual average was closer to a few dozen than to the hundreds claimed in Mercedarian tradition.

RELIGIOUS PREJUDICE

If only because of the activities of the Inquisition at the end of the Middle Ages, intolerance or prejudice in religious matters is commonly regarded as the predominant feature of the religious life of Spain in earlier as well as later periods. The term *religious prejudice* presumably means a prejudged hostility to other people on the basis of a religious belief, held by the displayer of prejudice, which supposedly justifies such hostility. In the Spanish case, the history of the Middle Ages may be seen as a religious conflict between Christianity and Islam, together with spasmodic and increasing persecution of the Iberian Peninsula's Jews. The Christian Reconquest, as well as attacks on Jews and Jewish Christians between 1391 and 1500, might be adduced as evidence to support such a view. It should always be remembered, however, that religious prejudice, in the modern form of a refusal to tolerate the religious views of others, is quite a recent concept. Toleration, in the sense of official or individual permission to others to believe in and practice a contrary religion, cannot be said to have arisen in Europe before the seventeenth century, so what was the situation in medieval Spain?

Although the notion that there was a conscious and continuous plan among the Christian states that developed after 711 to oppose al-Andalus, and "reconquer" Iberia for Christendom, is hardly justified, conflict between the two faiths undoubtedly existed throughout the later Middle Ages. As far as the Spanish Christian Church was concerned, the presence, and in many cases the dominance, of Islam in the peninsula forced the institutional hierarchy to defend itself and its faithful against the attacks and restrictions of Muslim rulers. The Córdoba Martyrs episode under the emirate in the 850s well illustrates the tensions, which must have existed less spectacularly in many other centuries and circumstances, between the desire to keep and witness the faith on the one hand, and the need to cooperate with Islam and its structures on the other.

The basis on which Iberian Muslim and Christian majorities treated minorities from the "opposing" faith—as well as Jews, who were subject to one or other of the rival "faiths of Abraham" throughout this period—was fairly equivalent. The Christian Church regarded Judaism as an outmoded religion, whose adherents were not only in error but also potentially dangerous to the rest of society, such a perception being of the very essence of religious prejudice. Nevertheless, Jews were, up to the very eve of the 1492 expulsion (1497 in Portugal and 1498 in Navarre), allowed freedom of worship and a certain degree of community autonomy, even though their opportunities in general economic, social, and political life were quite narrowly circumscribed. Muslims under Christian rule were sub-

ject to a similar dispensation. Islamic treatment of subject Christians and Jews in Spain was governed by the seventh-century agreement (*dhimma*) credited to the Middle Eastern caliph 'Umar and laid down similar conditions for their treatment. In practice, though, the lives of religious minorities were governed as much by social and political conditions as by anything done by religious hierarchies. Institutional intolerance might be expressed by leaders of all three faiths from the pulpit and in written polemic, as well as in the laws passed by Muslim or Christian governments. But the stereotypes of other faiths that were included in written texts might be more directly and violently expressed in physical attacks on religious minorities—for example, the violence that drove the family of Moses Maimonides from Córdoba in the mid-twelfth century, and the pogroms against Jews and *conversos* in the fourteenth and fifteenth centuries.

What is more difficult to assess is the extent to which these official prejudices translated themselves to ordinary Iberians in this period. While soldiers clearly fought each other on religious grounds, Christian guilds deliberately excluded Jews, Muslims, and even *conversos*; and rioters and looters seem to have come from all social classes. It was the Spanish Inquisition that lifted the lid on the prejudices of ordinary Christians, if not on those of Jews or Muslims. The conclusion seems to be that official prejudice had indeed been transmitted to the general public, though not always in a form that corresponded to the more recently elaborated notions of religious elites.

REMENSA

The *remenses*, peasants of northeast Catalonia tied to the land in onerous serflike conditions, were the last vestiges of a quasi-feudal landholding system that was antiquated long before its institutional demise in the late fifteenth century. Their name refers to the Catalan term *remensa* (redemption), the monetary payment required to purchase their freedom from a secular or ecclesiastical lord.

The *cort*'s (Parliament) of Barcelona in 1283 codified existing practices by defining the legal status of

the *remenses* in terms of the *mals usos*, or bad customs. Some customs were strictly financial—payments of inheritance taxes and levies against a peasant's land whose wife had deserted him—but the most universally despised were those that not only restricted a peasant's freedom but were humiliating as well. For example, a lord could arbitrarily demand labor services, force a nursing woman to serve as a wetnurse, and subject a peasant to unwarranted physical abuse.

Such legally sanctioned routine mistreatment of roughly one-fifth of the population led to widespread peasant unrest that was further intensified in the wake of social and economic chaos caused by the devastations of the plague in the fourteenth century. Despite persistent noble opposition, Juan I made a tentative attempt in 1388 to abolish servile levies. In 1402 Martín I and Queen María de Luna appealed to the antipope Benedict XIII to issue an order to abolish servitude on ecclesiastical lands. Both attempts were temporarily thwarted, but the volatile combination of infuriated nobles and frustrated peasants was fueled by the vacillating policies of Alfonso V during the 1440s and 1450s. In the end, a devastating civil war tore Catalonia apart from 1462 to 1472. The solution to the problem of the *remenses* was eventually resolved by Fernando II in the 1486 Sentencia de Guadalupe. Although the Sentencia improved the peasant's legal status, it left more or less intact the skeleton of an archaic landholding system that would persist into the twentieth century.

RHETORIC

Although rhetoric in antiquity focused primarily on developing techniques for effective speaking in the courts, during the Middle Ages—with the notable exception of preaching—it focused primarily on written documents. Nevertheless, the classical tradition, usually in the form of Cicero's *De inventione* and the pseudo-Ciceronian *Rhetorica ad C. Herennium*, was dominant throughout the period, particularly in the schoolroom. The presence of these two texts, frequently called the *Rhetorica prima* or *vetus* and *Rhetorica*

rica secunda or *nova*, is first documented in the Iberian Peninsula in Barcelona in 1183 and in Santiago de Compostela around 1225. The more elaborate Ciceronian texts (*De oratore*, *Orator*, *Brutus*), Quintilian, and Aristotle do not exercise any influence until well into the fifteenth century, with the advent of Italian humanism.

While the general lines of the development of medieval rhetoric are well known, much work is still needed on regional variations, particularly for Spain, where most of the treatises have been neither edited nor studied and our knowledge of school and university curricula, especially prior to the fifteenth century, is sketchy at best. The earliest of the specifically medieval arts of discourse to arise was the *ars dictandi*, the art of letter writing, which originated in Italy in the late eleventh century in response to the increasing volume of correspondence emanating both from church and secular chanceries. It was apparently taught at the nascent university (*studium generale*) of Palencia around 1220 on the basis of the *Ars dictandi palentina*, a brief theoretical treatise followed by form letters (a standard configuration) probably written by a master trained at the University of Paris. The intellectual filiation of this text is of great interest because of the possible connection between the University of Palencia and the early authors of the *mester de clerecía*. This early French influence was swept away in the late thirteenth century by the flood of Italian dictaminal treatises, particularly those of Guido Faba (c.1196–c.1240) and Boncompagno da Signa (1165–1240). These exercised a major influence on two texts written during the reign of Alfonso X of Castile and León, the *Dictaminis epithalamium* (1277–1282) of Juan Gil de Zamora and the *Ars epistolaris ornatus* (c.1270) of Gaufridus de Everseley, an Englishman in Alfonso's service. Later texts probably follow the same tradition until well into the fifteenth century, although in the absence of editions confirmatory evidence is lacking. The works of the Valencian Joan Serra (mid-fifteenth century) and, especially, the *Flores rethoricae* (printed in Salamanca, c.1488) of Fernando Manzanares, a student of Elio Antonio de Nebrija, represent the triumph of Italian Humanism and a return to the classical Ciceronian tradition.

The *ars poetriae*, the application of rhetoric to the composition of literary texts, arose at the end of the twelfth century in the context of the medieval schoolroom, where one of the most widespread methods of teaching correct Latinity was for students to write pastiches imitating the classical and medieval *auctores* (the canon of texts accepted as models). The various *artes poetriae* were intended primarily to provide rules for such exercises, although they also influenced liter-

ary practice outside the schoolroom. The only one that appears to have been known in Spain was the *Poetria nova* (c.1208–1213) of the Englishman Geoffrey of Vinsauf. It is mentioned in library inventories in Catalonia as early as 1329 and as late as 1506, and in Salamanca from the early fifteenth century. There is one Spanish contribution to the genre, the *Breve compendium artis rethorice* attributed to a Martín of Córdoba (Martinus Cordubensis) (first half of the fourteenth century). Extant in two manuscripts, it attempts to mate the structural divisions of Ciceronian rhetoric (invention, disposition, style, delivery, memory) with precepts taken from the *Poetria nova* (natural versus artificial order, techniques for amplification and abbreviation, stylistic variety) in a structure that presages the return to classical principles characteristic of humanism.

The *artes praedicandi*, treatises for the organization of the thematic (because it takes as its theme a passage from Scripture) or university (because the first examples appeared in the University of Paris around 1230) sermon, developed in England and northern France in the first decades of the thirteenth century, rapidly gained currency, especially with the Franciscans, and remained enormously popular until the end of the Middle Ages. Despite this popularity there are no Spanish examples until the *Ars praedicandi populo* of the influential Catalan Franciscan Francesc Eiximenis (c.1340–1409); in its avoidance of overly technical methods in sermon construction and insistence on the moral character of the preacher as much as his rhetorical skills, it may well reflect not only Eiximenis's own experiences but also those of the foremost preacher of the age, St. Vincent Ferrer (1350–1419). An anonymous *Ars praedicandi aragonensis* (c. second quarter of the fifteenth century), probably written by a Spaniard at the University of Toulouse, is more representative of the preceptive tradition of the thematic sermon, although it ends with an atypical section on versification (used as a means of fixing the congregation's attention) of great interest for the study of fifteenth-century Spanish metrical terminology. The only text to originate in Castile is the *Ars praedicandi* of Martín Alfonso de Córdoba, also trained in Toulouse, who died in 1476 and is better known as the author of *Jardín de nobles doncellas*, dedicated to Isabel I the Catholic. The treatise is entirely traditional in its exposition of the basic doctrines of the thematic sermon.

The Catalan mystic Ramón Llull (Raimundo Lulio, c.1232–1316) stands completely outside the currents sketched above. Although his three rhetorical works deal with homiletics, they are based not on the *ars praedicandi* but rather on the application of his

great *ars* (the explanation of the created world and all human knowledge as reflections of the nine divine attributes) to the problems of preaching. The *Rhetorica nova* is a theoretical statement, which is then applied, in detail in the *Liber de praedicatione* and more summarily in the *Ars brevis praedicationis*, to the problem of finding materials for the sermon and organizing it.

Treatises on poetics in the vernacular languages (for example, Raimon Vidal de Besalú, *Razos de trobar*; Berenguer de Noya, *Mirall de trobar*; Enrique de Villena, *Arte de trobar*; Pero Guillén de Segovia, *Gaya ciencia*) are largely concerned with technical questions of metrics rather than with composition in the broader sense and must be studied within the context of vernacular versification.

We do not know whether the classical rhetorics or any of the medieval arts formed part of the grammar school or university curriculum in Spain. We may surmise that the *ars dictandi* was taught in the faculty of law, as in Italian universities, but there is no evidence for such teaching. The first documentary reference is found in Salamanca in 1403, in the form of an Italian *magister rhetoricae*, Bartolomeo Sanzio; from that time forward Salamanca had a chair of rhetoric, but we still do not know what was taught; we find similar references to Italian masters in Catalonia from the 1420s onward.

Nor do we know the extent to which rhetorical texts may have influenced contemporary writers. It seems clear that the early writers of the *mester de clerecía* (Gonzalo de Berceo, and the *Alexandre* poet), attuned to European intellectual trends, were familiar with contemporary rhetorical teaching in the first half of the thirteenth century. The prose introduction to the Archpriest of Hita's *Libro de buen amor* is quite evidently a parody of the thematic sermon, and it has also been suggested that sermon techniques underlie Alfonso Martínez de Toledo's *Arcipreste de Talavera* (*Corbacho*). Nevertheless, in the absence of reliable texts, comparisons are difficult to draw.

RHETORIC, ARABIC

In dealing with Arabic rhetoric (*balāgha*) it is necessary to keep in mind that we are dealing with literary theory and criticism; the art of oratory received little attention; that Arabic literary rhetoric was more interested in poetry than in prose (mostly epistolography); and that, as far as we know, there is little that can be qualified as representing an Iberian school of rhetoric and that there is good reason to consider scholars from the western part of North Africa and from Spain as belonging to one and the same group. It also appears reasonable to follow Soudan in distinguishing an eastern Arabic school and a Persian school, to which one could consider adding a somewhat isolated Aristotelian school based on translations and commentaries of Aristotle's *Poetics* and *Rhetoric*. Considerable oversimplification cannot be avoided in an article this size. Moreover it should be kept in mind that some texts are not yet available in print, have not been thoroughly studied, or are not even known to have survived in manuscript.

The origin of Arabic literary rhetoric can be traced to the Fertile Crescent. Numerous collections of poetry quote traditions relating debates on the merits of one poet weighed against the merits of another, plagiarism (a legitimate, even praiseworthy, form of plagiarism was recognized). Characteristic was the discussion of single lines of poetry to which the structure of Arabic poetry lends itself easily. These tendencies can be noticed even in later handbooks and monographs. Leaving aside one early treatise that was apparently completely forgotten, it was the *Kitāb al-Badi* (*Book of the Novel [in Style]*) of Ibn al-Mu'tazz and, somewhat later, the *Naqd al-Shi'r* (*Criticism of Poetry*) of ʿKudāma ibn Dja'far that laid the foundation for Arabic rhetoric. Though written, as the title indicates, to discuss a new style sometimes characterized by an excessive use of figures of speech, it was the terminology and exemplification of Ibn al-Mu'tazz's figures of speech that survived through the ages. The result was that *badi* (novel) came to be used as a collective for *figures of speech*. But this did not happen without significant and often confusing changes in the terminology of Ibn al-Mu'tazz, various systems of categorizing figures of speech, and so forth. The same happened to the terminology of ʿKudāma, whose curious arrangement of his

material (based on what he knew of Greek philosophy and logic) was soon forgotten.

A new approach was introduced by 'Abd al-Ḳāhir al-Djurdjāni in two books that are unique in the history of Islamic scholarship: his *Proofs of the Inimitability of the Koran*, according to Ritter a "very subtle theory of syntactic stylistics" and his *Secrets of Eloquence*, essentially his "teaching on simile, metaphor, and analogy" as well as "phantastic aetiology." These two books gave rise to the Persian school that henceforth divided literary theory into *'ilm al-ma'āni* (the theory of stylistics—that is, style in its relation to syntax), the *'ilm al-bayān* (the theory of imagery), and the *'ilm al-badi'* (the theory of the figures of speech—a choice from among the figures of speech not discussed under *ma'āni*). This school found, according to Ibn Khaldūn not much favor in the western half of the Islamic world, which instead, preferred to concentrate on the *badi'* following the old tradition of Ibn al-Mu'tazz and Ḳudāma and their many followers. It should be noted that the Western school showed a degree of interest in adaptations of Aristotle. Initially, however, they derived their interest mostly from an outstanding Tunisian representative of the Eastern school, Ibn Rashīk. Incidentally, Ibn Rashīk did not limit himself to an analysis of the figures of speech, but also gave attention to such matters as the history of poetry and its position in society, as well as to the technicalities of metre and rhyme. At least two authors show Aristotelian influence very clearly. Averroës (Ibn Rushd) tried, basing himself on a faulty translations and therefore with very little success, to discuss Arabic poetry and oratory in Aristotelian terms. Ḥāzim al-Qartād-janni (d.), parts of whose *Minhādj* (*Plain Road*) have been translated and very carefully analyzed by Heinrichs and Schoeler, reflects Aristotle using earlier and more careful interpretations by al-Fārābi and Avicenna (Ibn Sīnā) in dealing with such matters as technical terms, the difference between rhetoric and poetry, poetry that is useful and also pleasing, poetry's moral character, the typology of poets, as well as other matters that cannot be dealt with in the context of a brief survey. To the same school belongs the Moroccan al-Sidjilmāsī, whose *al-Manza' al-Badi'* has not yet been studied in detail. There is a probably unique work on prose, including oratory, by Ibn 'Abd al-Ghafūr al-Kalā'i that mainly follows the Eastern tradition. Tanasi lived in North Africa; his treatise, like that of Ḥāzim, shows a very detailed and careful arrangement, thereby disproving the often heard claim that many Arabic scholarly texts are incoherent. According to Soudan he belonged to the eastern Arabic as well as the Persian Schools, mainly through Ibn Jābir and al-Ru'ayni. Both

Ibn Jābir and al-Ru'ayni hailed from Spain, but lived some forty years in the East and died there; consequently it is not easy to determine whether they have to be considered as belonging to the Western school, the more so since a complete edition of their work is not available. Finally it should be mentioned that the Egyptian Ibn Abi 'l-Iṣba' lists among the texts he used some apparently of Spanish or North African origin.

RICOHOMBRE See NOBLES AND NOBILITY

RIDDLES

According to Dundes and Georges, "A riddle is a traditional verbal expression which contains one or more descriptive elements; the referent of the elements is to be guessed." Taylor argues that true riddles compare an object with an entirely different object; all other play questions are enigmas. Riddles and enigmas occur in interpersonal transactions in which power is transferred from poser to successful responder. The poser may even reject one correct answer and insist upon another, as in the tale of Saladin.

Often a relatively powerless person's survival depends on success in a riddle contest whose content is usually doctrinal, cosmological, or theological, for example, in *Donzella Teodor*, St. Catherine and the Infante Epitus confront and defeat officially appointed inquisitors. A clever bishop saves San Andrés from a devil in the guise of a seductive woman who posed cosmological riddles.

The *Libro de Apolonio* begins with a folkloric contest in which the referent is a shameful royal secret.

The reward for a correct response is the hand of the princess, and failure means death. In folktales, a suitor, imitating Samson (Judg. 14:12–19), brings a hermetic, unanswerable riddle to confound a princess famous for riddling skills. Another princess, Tarsiana, Apolonio's daughter, is an entertainer who engages in a playful riddle contest with a mock penalty and reward using popularizations of classical riddles.

RIPOLL SONGS

Since Lluís Nicolau d'Olwer's study in 1923, "Ripoll Songs" (*Carmina Rivipullensia*) has been used to refer to eighty-one Latin poems transmitted in seventeen manuscripts from the monastery of Ripoll (Catalonia, Girona), a ninth-century foundation, which from time to time had connections with Fleury and Marseilles. Among the poems that are panegyric, didactic, and liturgical, those written by Abbot Oliba (1008–1048), are of particular importance. Analysis of the many figures that adorn the facade of the church that Oliba built in Ripoll reveals numerous clues as to the meaning of the Ripoll collection. Many-sided in theme and form—with metrical and accentual—rhythmic verses, final rhyme, alphabetical and acrostic poems—this collection, taken as a whole, is testimony to the monastery's flourishing scholarship up to the thirteenth century. While most of the poems were produced in Ripoll itself, others were only copied there.

By the Ripoll Songs in the narrower sense we mean a collection comprising nineteen items of love poetry, entered onto folios 97v, 98r, and 102r of a tenth-century miscellany by a twelfth-century hand because those folios had remained unfilled due to their defective quality. (The miscellany is in Barcelona, Archivo de la Corona de Aragón, Ripoll 74). The unknown author of these love poems is described by Nicolau as an "anònim enamorat." Opinions differ as to whether the author of these poems is identical with their copyist; Dronke argues persuasively for the identification. Paleographical, formal, and internal grounds make a dating of the collection to the 1170s

probable. The poet is plainly familiar with Ovid's works, and imitates them. He appears to have known the works of the poets of the Loire circle—Marbod of Rennes, Hildebert of Lavardin, Baudri of Bourgueil. Echoes of the poem *Foebus abierat*, which was produced in northern Italy, and of *Surgens manerius*, which is dependent on it, are attested in both form and content; equally evident is an acquaintance with *Carmen Buranum* 117.

Evidence of links with France is provided by the inscription of poem 11, "Ad comitissam Frantie" and by the mention of the nunnery of Remiremont, which was known for its "Council of Love."

As general themes and topoi there are attested the "beginning with nature," the *locus amoenus*, hunting metaphors, descriptions of beauty, and the five stages of love; Venus, Amor/Cupido, Diana, Phoebus, nymphs and muses make their appearance from ancient mythology. There is a well-balanced mixture of different line forms, accentual-rhythmical and gathered into strophes, almost all of them rhyming, together with stichistic hexameters and elegiac distichs. Since one is to assume that the author has himself organized the poems in the sequence that has come down to us, variation should be regarded as a ludic motif; Dronke points to musical elements. The fancy of writing poems' inscriptions partly backward (for example, Macimada Ad amicam) is another indicator of this ludic aspect. When one considers the content of the collection, the poems are not juxtaposed as individual texts. Although they do not form a novella, there is a clear beginning and development of a love affair, followed by separation and abandonment. The beginning is signaled by the months of April (c.1) and May (c.2). Dreams and visions alternate with more realistic phases. Poems 1–11 center on a mistress called "Judit" (c.2); 12–17 on one named "Guilibergis." Both cycles are rounded off with an elsewhere attested misogynistic poem attributed to Marbod. On the third folio, which remained free from the gathering (102r), two more substantial poems are entered. They refer back to the mistress Judit. In assessing the poems pride of place should be given to 9 and 19 because of their unconventional, subtle style of argument. All in all, there is a division of opinion as to whether they are stereotypical school exercises or, in the high estimation of Dronke "one of the most original poets of his age."

RODERIC

The succession of the Visigothic king Roderic (Rodrigo) in 710 appears to have been contentious. He may have been the son of a Visigothic noble called Theodefred, and later sources associate his family with both Córdoba and Mérida. He was certainly no relation to his predecessor Wittiza (692/4–710), and the *Crónica mozárabe del año 754 (Chronicle of 754)* states that he was chosen as king by the “senate,” probably referring to the Visigothic palace nobility. The same chronicle makes it clear that his succession was opposed and some form of civil war was taking place in Spain when the Arabs invaded in 711. A further indication of this may be the lack of coins of Roderic issued by the mints of the towns of the Ebro Valley and Catalonia. Here power was in the hands of a king Achila (c.710–c.713). Regnal lists containing the name of Achila do not mention Roderic. According to some of the Arab sources, Roderic was in the north of the Iberian Peninsula fighting the Basques when the invasion took place. He was defeated by the Arab and Berber armies in the ensuing battle of Guadalete, and, although his death in that conflict is not certain, nothing more is known of him. His widow Egilona subsequently married the Arab governor ‘Abd al-Azīz ibn Mūsā (712–715). The reference to his funerary inscription being seen at Viseu, contained in both versions of the *Crónica de Alfonso III* is to be treated with caution. In the historiographical tradition of the Asturian kingdom, Roderic was made to be a heroic figure, in distinction to his predecessor. Southern traditions, as represented by the *Chronicle of 754*, reverse this verdict on the two kings.

RODRIGO DE LA GUITARRA

According to widowed Aragónese Queen Margarita de Prades's letter to Archimbaud of Foix, Rodrigo de la Guitarra (c. 1380–c.1422) had served Fernando I. Dated 30 December 1415, the letter contains this recommendation: “Out of regard and concern for me, I beg you to treat him with singular respect, for by so

doing you will please me greatly.” In Alfonso the Magnanimous's letter to Juan II of Castile dated 30 July 1417 (Archivo de la Corona de Aragón, Registro 2562, fols. 110^v–111), *el Magnánimo* states that he is sending “his faithful household string player, Rodrigo de la Guitarra, accompanied by Rodrigo's helper Diego, to Juan's court to do him reverence as Juan's vassal, and to serve him and entertain him with his art (el fiel ministrer de cuerda de nuestra camara Rodrigo de la Guitarra, con su criado Dieguiello, de nuestra licencia va asci a vuestra cort por fazer a vos servicio a plazer de au oficio).” When, after a delay, Rodrigo did make the trip in August 1418, he and his entourage went with Alfonso's safe conduct (*salvoconducto*) protecting them and their baggage train laden with gold, silver, money, and clothing. Upon returning to Alfonso's Neapolitan court, Rodrigo was rewarded, on 26 August 1421, with the lucrative post of Castilian consul at Palermo.

The Chantilly manuscript, Musée Condé 564 (olim 1047) contains a Latin ballade, *Angelorum psalat tripudium*, copied at folio 48^v, which according to Gilbert Reaney is “one of the most recent and most complex works in the manuscript.” The variety of note forms employed in the Cantus reaches extremes unparalleled even in the Chantilly Codex, and syncopation produces results which can hardly be transcribed in modern notation. Coloration [notes in red] is excessive, but particularly noteworthy is the modal transcription. A two-flat signature (E flat and A flat, B flat being understood) moves the mode Ionian from C to E flat, a unique case in this period.

In Gordon Kay Greene's Indiana University Ph.D. dissertation (1971) he took the inscription below the tenor, *Retro mordens ut fera pessima ante blandis ut faris in vocibus*, to indicate retrograde reading at some section or sections. Such backward reading would conform with the backward inscription of the composer's name above the cantus part: “S. Uciredor” = Rodericus.

To Nors Sigurd Josephson belongs the credit for having solved what to others before him seemed an insoluble riddle, transcription of Rodrigo's cryptic ballade—Rodrigo's sole extant work.

RODRIGO, LEGEND OF THE LAST VISIGOTHIC KING

Following the Arabic invasion of Spain in 711 and the subsequent collapse of the Visigothic monarchy, three principal myths with minor variants arose to explain the destruction of Christian Spain, each reflecting an interpretation of the events by a particular political faction anxious to propagate its own point of view. The original legend, first encountered in the contemporary *Crónica mozárabe del año 754* and later repeated by the *Chronica gothorum* (c.1050), is an expression of the convictions held by the conquered Mozarabic Christians and ascribes the loss of Spain to the indiscretions of the lecherous King Wittiza whose seduction of Count Olián's daughter led the disaffected vassal to seek vengeance by allying himself with an Arabic invasion to overthrow the Visigothic kingdom. Following the reconquest of Toledo in 1085, we find a second version of the legend by yet another Mozarabic Christian, author of the anonymous *Crónica silense* (c.1115), reflecting the perspective of the Arabs and their allies, the defeated Wittiza faction, with an interpretation calculated to cast blame upon the last Visigothic king, Rodrigo, who had overthrown Wittiza and his government. In this account, Rodrigo had promised to marry Count Julian's daughter but instead took her as his concubine. The count then sought revenge by abetting the Arabs in their invasion of Spain. The third version represents the position of the thirteenth-century Castilian-Leonese monarchy which was anxious to disassociate itself from the imagined depravity of the last Visigothic kings from which it was supposedly descended by portraying both Wittiza and Rodrigo as corrupt and lascivious rulers whose unscrupulous and immoral reigns, like Sodom and Gomorrah, were destroyed by divine wrath in the person of the Arabs, *flagellum dei*. This interpretation was promoted by Lucas de Túy in *Chronicon mundi* (1236), substantially embellished by the archbishop of Toledo, Rodrigo Jiménez de Rada in *De rebus Hispaniae* (1243), and repeated by Alfonso X el Sabio in the *Primera crónica general* (c.1275). The legend of Rodrigo as seducer of Count Julian's daughter then took its definitive novelistic shape in the *Crónica de 1344*, which drew substantially upon the so-called *Crónica del moro Rasis* by the Córdoba historian Ahmad al-Rāzī (888–955), who incorporated a number of fictitious episodes. The legend was extensively enlarged by Pedro del Corral in the *Crónica sarracina* (c.1430) and

later assimilated as a historical source by the archpriest of Talavera in *Atalaya de las crónicas* (c.1453) and Diego Rodrigo de Almella in *Compilación de las crónicas et estorias de España* (1491), reaching its most factitious extreme in the fantastic reworking by Miguel de Luna, *La verdadera historia del rey don Rodrigo compuesta por Abulcáxim Tárif Abentarique* (1592).

RODRÍGUEZ DE LA CÁMARA See RODRÍGUEZ DEL PADRÓN, JUAN

RODRÍGUEZ DEL PADRÓN, JUAN (JUAN RODRÍGUEZ DE LA CÁMARA)

Poet and prose writer of Galician origin who flourished around the mid-fifteenth century. Few details are available on the life of Juan Rodríguez del Padrón. From the scant information available, we know that he served in the household of Juan Cervantes, Cardinal of San Pedro and Provincial General of the Franciscans, along with Aeneas Silvius Piccolomini and Alfonso de Madrigal. In 1430 he most likely accompanied the cardinal to Assisi and was with him at the Council of Basle in 1438. By 1441, Rodríguez del Padrón had taken Franciscan orders in Jerusalem. He probably belonged to that group of civil, ecclesiastical, and court officials known as *letrados* and, from the range of his writings, was quite cultivated.

Rodríguez del Padrón's surviving works center on three themes, love, worthy women, and nobility. His *Triunfo de las donas* is his response to the complaint against women (*demanda de las mugeres*) touched off by Boccaccio's antifeminist *Corbaccio* and Alfonso Martínez de Toledo's *Arcipreste de Talavera*. The work is comprised of a prologue followed by a series of exemplary portraits of praiseworthy women. Rodríguez del Padrón's *Cadira de Honor* is an extended treatise of nobility that ties into the debate on this subject in the works of Alfonso de Cartagena, Diego de Valera, and others. His *Bursario* is in part a translation and amplification of Ovid's *Heroides*. Rodríguez del Padrón's poetry circulated widely

throughout the fifteenth century and is collected in many *cancioneros* (song books).

Rodríguez del Padrón's best known and most important work is *Siervo libre de amor*, which is preserved in a unique manuscript that is possibly incomplete. Couched as an autobiographical epistle, it relates the narrator's unhappy love affair and dream vision of his journey to the other world, a journey based on Guillaume de Deguillville's *Romant des Trois Pèlerins*. Composed in both prose and verse, in its midst, the autobiographical narrative is punctuated by the introduction of the *Estoria de dos amadores*, a chivalric-sentimental tale of love and death that the narrator invokes and serves as a dire reminder of love's cruelty. The work is important for the deliberate introduction of shifting points of view and its portrayal, discussion, and analysis of emotions and close experience. It is generally considered to be the first Spanish sentimental romance, a type of fiction that played an important role in laying the groundwork for modern novelistic discourse.

ROÍS DE CORELLA, JOAN

Poet and learned Catalan prose writer (1433/43–1497). Although as heir of a noble family he was expected to become a knight, in 1471 Corella obtained the degree of master of theology. Corella, the last Catalan poet of the Middle Ages, both complains about the treason of a certain Caldesa and longs for the impossible love of other honest ladies, like in his *Balada de la garsa i l'esmerla*. He also wrote some poems to the Mother of God, like the powerful *Oració de la Verge*, as well as some lives of saints, such as *Vida de Santa Anna*, *Història de la Magdalena*, and *Història de Josep*. Some of these, along with his translations into Catalan of Ludolf of Saxony's *Vita Christi* and the *Psalter*, are the religious works that Corella himself wanted to have printed. The minor works of Corella (*Triunfo de les dones* or the letters he interchanged with Prince Carlos de Viana) are written in the same strongly rhetorical fashion as his most famous profane work, the *Tragèdia de Caldesa*. Here, the first-person narrator, clearly meant to be identified with the author himself, briefly recounts in prose and verse how a lady

of Valencia deceived her ingenuous and sincere lover by behaving like a courtesan. Corella's disillusionment with human love is also the main subject of his splendid versions of Ovid's tragic love stories: *Història de Jason e Medea*, *Història de Leànder y Hero*, *Parlament en casa de Berenguer Mercader*. The Trojan War provides the setting for his retelling of the *Lo joi de Paris*, which shows how a man is misled by passionate love, of the *Raconament de Telamó e de Ulixes*, and of Corella's finest Senecan achievement, *Plant dolorós de la reina Hècuba*, in which decasyllabic verses are skillfully meshed with a rich prose embellished by rhythmic clausulae.

ROIG, JAUME

Catalan moral writer (1400/10–1478). Starting in 1434 we find Roig documented as a master of medicine in Valencia, in 1456 as doctor to the queen of Aragón, María of Castile, and between 1450 and 1462 as administrator of the Valencian Hospital d'En Clapers. In 1474, a poem of his in honor of the Virgin was published in the first Catalan incunabulum, *Les trobes en laors de la Verge Maria*. Roig produced a long misogynous treatise written in quadrisyllabic verse that contains a pseudo-autobiography: *L'espill*, or, *El llibre de les dones*. If written in prose, *L'espill* would probably have become a great novel since its plot is exciting and it presents a wide range of characters. The misfortunes of a young boy, who is expelled from home after his father's death by a wicked mother, provide, in fact, a shockingly realistic picture of everyday life. Despite the continuous aggressions of perverse women, the hero becomes quite well off by joining a mercenary army in France. Upon his return to Valencia four consecutive attempts at marriage come to disastrous ends because of the unbearably evil nature of women. He tries to marry a young girl, a beguine, a widow, and finally a novice with increasingly bad results. Finally King Solomon advises the hero in dreams. Solomon's long theological lesson is a vindication of the ideals of monastic asceticism. By accepting this advice, Roig manages to end his life peacefully, far from worldly wickedness and chiefly far from women. In the meanwhile we have been given glimpses into hospitals, nunneries, pilgrimages, the private rooms of bourgeois women, public bathhouses, and picturesque market-

places, among others. Roig was a very gifted social observer and his profession as a doctor certainly helped him. He also created a very personal literary style full of rhymes and with a strange elliptical syntax.

ROMANCES, ARTHURIAN

While there exists no evidence that the romances of Thomas, Béroul, or Chrétien de Troyes were translated into any Iberian language, the Arthurian legend nevertheless made its way into the Iberian Peninsula via France and exercised a significant cultural influence during the late Middle Ages. Throughout the Middle Ages allusions to the legend appear in all parts of Iberia and there is strong evidence to believe that it even served as a model for aristocratic conduct. The earliest mention of the legend dates from 1170, while material from Wace's *Roman de Brut* is known to have formed part of a now lost early thirteenth-century Navarese redaction of the *Liber Regum*. At the other end of the chronological spectrum there is a late fifteenth-century sermon composed in Castilian that uses material from Geoffrey of Monmouth's *Historia regum Britanniae* in order to explain and elaborate upon the doctrine of transubstantiation. These witnesses attest to general public knowledge about Arthurian material over a very broad period of time. The Vulgate Cycle, the prose *Tristan*, and the Post-Vulgate *Roman du Graal* appear to be the major sources for the transmission of the Arthurian legend in medieval Iberia. Translations and transformations of the latter texts exist in some twenty-six extant manuscripts and printed books (some of them fragmentary) ranging chronologically from the first part of the fourteenth to the middle of the sixteenth centuries. The derring-do adventure depicted in this last group of romances appears to have held special appeal in the Iberian Peninsula.

Evidence of the circulation of Arthurian legends can be found in the western part of the peninsula as early as 1190, where the name Merlinus is attested to

in Portugal, followed by Galván in 1208. In 1200 the name Arturus was used by someone in Salamanca, and throughout the thirteenth and fourteenth centuries the Galaico-Portuguese troubadours frequently alluded to Arthurian subjects, drawing principally from the cyclical prose romances. The cleric João Bivas translated the Post-Vulgate *Roman du Graal* around the year 1313 and testimonials of all three branches of the cycle survive in Galician and Portuguese as well as Castilian. The Conde de Barcelos' fourteenth-century *Livro de Linhagens* adapts material from Wace via the lost Navarese *Liber Regum* mentioned above, and information of a similar type can be found in the *Crónica de 1404* and a fifteenth-century copy of the *Libro de las generaciones* of Martín de Larraya. Fernão Lopes' *Cronica de d. João I*, the Portuguese king who reigned from 1385–1433, demonstrates that the romances were both well known and well read at court. Attestations to knowledge of the Matter of Britain continue to be found in the western part of the Iberian Peninsula well into the sixteenth century, notably in the courtly lyric collected by Garcia de Resende in his *Cancioneiro geral* in 1516.

In the northern and central parts of the peninsula, in a document attached to a manuscript of the Navarro-Aragóense *Fuero general de Navarra* (1196–1212), and in the *Anales Toledanos* (1217), mention is made of Arthur's deadly battle with Mordred. Further references to Arthurian material can be found in the *Libro del cavallero Zifar*, the first known Spanish romance of chivalry (ca. 1300). Later, there are mentions of Arthur and members of his court in Castilian court poetry, and a long version of the *Lancelot* was translated into Castilian around 1414. The latter is extant in a mid-sixteenth-century copy with an addition that connects it with the story of Tristan. In the late fifteenth century the *Libro de las bienandanzas y fortunas* of Lope García de Salazar, a chronicler from Vizcaya, condenses material from several branches of the *Roman du Graal* and is a mine of Arthurian matter, while the *Baladro del sabio Merlin* (Burgs, 1498) and the *Demanda del sancto Grial* (Toledo, 1515) also incorporate a significant amount of material from the last two branches of that romance. A great many other Arthurian allusions are recorded in Castile and the northern center of the Iberian Peninsula, incorporated directly or indirectly into texts from the end of the fourteenth century forward. By their prevalence there and in the ballad tradition they reflect the continuing presence and interest in Arthurian material in Castile well into, and beyond, the sixteenth century.

Finally, in Catalonia, the legend was adapted with appreciable originality during the Middle Ages in works like *Jaufré* and *Baldín de Cornualha*, which evoke Cornish settings and emphasize action over sen-

timental themes. Cervantes at the beginning of the seventeenth century in his *Don Quijote* mentions an adaptation of the *Jaufré* composed in Castilian under the title *Tablante de Ricamonte* (first printed in 1513). Allusions to Arthurian names and themes in Catalan literature can be found starting in the twelfth century with the lyrics of Guillem de Berguedà and other troubadours. They continue to be appear in Catalan and Valencian poetry and prose throughout the rest of the Middle Ages, while some parish records even indicate that Arthurian names were often given to actual people. The circulation of *Cuiron le Courtois*, *Palamedes*, *Meliadus*, and the *Prophécies de Merlin*, as well as the cyclical romances, is confirmed by allusions to them in Catalan and Aragóne documents. The existence of tapestries and paintings in the medieval Crown of Aragón at the end of the Middle Ages can also be corroborated.

The enormous popularity and intimate knowledge of Arthurian material in the peninsula during the late Middle Ages is confirmed by its pervasive mention in aristocratic milieus, especially in courtly circles, and by the widely used practice of giving Arthurian names to children and even pets in society at large. With the spread of lay literacy throughout the fourteenth and fifteenth centuries, the Matter of Britain gradually became accessible to all strata of society, capturing a broad range of imaginations and leading to the revival, creation, and commercial success of autochthonous Iberian chivalric romances like *Amadís de Gaula*, first printed in 1510 after being amplified by Garci Rodríguez de Montalvo.

ROMANCE, CAROLINGIAN

Carolingian romances are related to that cycle of stories that were given the name *matière de France* by Jean Bodel in the famous couplet

Ne sont que trois matières à nul homme attendant,
 De France et de Bretagne et de Rome le grant.
 (There are only three matters for one to know, / that of France and of Britain and great Rome.)

The plots of these romances take Charlemagne and his relatives as their primary characters. For instance, the

romance of *Flores and Blancaflor* is considered to be Carolingian since these two characters are the parents of Berta, who is the wife of Pepin and the mother of Charlemagne. In fact, the connection with Charlemagne and France is often tenuous, thus vitiating to some extent the usefulness of Bodel's classification and the category of Carolingian romance in general. Nevertheless, it is traditional in scholarship to speak of such a category.

All these romances in their Spanish versions are translations from originals in other languages, mostly French, and most have their origin in French epic cycles dealing with the same material. Charlemagne has always been of special interest to Spaniards since he is the legendary founder of the pilgrimage to Santiago de Compostela and because of his heroic struggle against the Moors. In addition to the romance cycle there is a very productive ballad cycle, including such works as *El conde Dirlos*. Some hagiographic traditions are also associated with this material. Indeed, given the popularity of the theme, one wonders at the relative paucity of romance texts.

The following legends have been mentioned as Carolingian:

1. *Flores y Blancaflor* (The story of a couple sometimes identified as the monarchs of Almería, parents of Berta, the mother of Charlemagne.)
2. *Berta* (The story of Berta's betrayal by a chambermaid and of Berta's eventual reinstatement as queen.)
3. *Mainete* (The story of the early adventures of Charlemagne in Spain.)
4. *Historia de los amores de París y Viana* (The amorous adventures of two socially unequal lovers.)
5. *Historia de Enrique Fi de Oliva* (The story of a false accusation of adultery and military expeditions to the Levant.)
6. *Noble cuento del enperador Carlos Maynes e de la buena enperatris, Sevilla, su mugier* (*Hystoria de la reyna Sevilla* in later printings; the story of the falsely accused Sevilla, wife of Charlemagne, and of her eventual reconciliation with the emperor.)

It must be stressed that some of these tales are classified as "oriental" by various scholars, whereas other critics prefer to classify them by themes. Often there exist in these texts little more than references and allusions to the Carolingian legends. Some of the texts are embedded in other works, principally the *Gran conquista de Ultramar* and *Primera crónica general* (*Estoria de España*) of Alfonso X el Sabio. Others, such as the *Noble cuento*, the last tale in a collection of saints' lives and romances, became quite popular and

circulated in various versions and printings as an independent text.

The stories deal with amorous adventures, mistaken identities, false accusations of adultery, soap opera cunning, deception, Byzantine-type travels and family separations, treachery, and so forth. Folkloric elements, such as dogs and asses far wiser than the human characters, are plentiful in these tales. There is also quite a bit of interest in matters of lineage and family origin, which probably explains why several of the legends appear in the *Gran conquista de Ultramar*, a work that deals with the exploits of famous crusaders and their (often fantastic) family origins. The importance given to female characters in these texts is worthy of note as is the relatively negative presentation of a gullible, easily deceived Charlemagne (when he appears as a character at all). Many critics have scant patience for this kind of imaginative fiction and have judged the stories to be absurd works of a degenerate genre. Still other scholars consider them to be works that function on a symbolic or archetypal level and suggest that they are more akin to dreams than to wakeful consciousness, real life, or realistic fiction. Scholars and literary critics in Spain have been slow to recognize these romances as forming a separate genre, and strong biases in favor of realism and so-called historical accuracy have kept these texts from forming part of the canon of medieval Spanish literature.

ROMANCES, CHIVALRIC

Just what might determine the specific criteria for material to be covered in an entry on Chivalric Romance in medieval Iberia is difficult to define, but perhaps this difficulty reflects the complexity of the problem posed by the subject. The evidence for the production

of autochthonous chivalric romances in the Iberian Peninsula prior to 1508 is slim. Much of what has come down to us is incomplete when not ephemeral, but precisely because of its fragmentary, elusive nature it is of great interest. In some aspects, a part of what remains represents adaptations or rewritings—as opposed to direct translations—of stories that have English, French, Anglo-Norman, or Franco-Italian origins.

Certainly when dealing with chivalric romance in medieval Iberia one must begin with the *Libro de Alexandre*, a reworking and acclimation of the French *Roman d'Alexandre*, which accommodates themes taken from classical antiquity to a thirteenth-century Hispanic chivalric context. If an important dimension of chivalric fiction is the affirmation of a politics that advocates the combination of chivalry with monarchy, then one must of necessity take special note of the *Alexandre* both for its contribution to the evolution of the theme as well as for having been composed just at the time that these ideas were beginning to come into close contact in Castilian civic life, i.e., during the reign of Alfonso VIII, as recently demonstrated by Amaia Arizaleta.

The *Libro de Alexandre* is not the only work to incorporate heroic chivalric values and motifs. At about the middle of the thirteenth century, many chivalric themes and ideas begin to surface in historiography, which attests to the political significance of chivalry and of chivalric fiction in general, although it draws us away from a strictly fictional European novelistic universe per se, especially that of works composed in French and Middle High German. By the end of the thirteenth century in Spain, classical, and most especially Carolingian, chivalric material was often incorporated in its entirety into historical narratives, above all in the *Gran Conquista de Ultramar* and the various versions of the *Estoria de España* composed during the reigns of Alfonso X and Sancho IV.

That said, however, what is generally recognized as genuinely chivalric material—fabulous tales populated with virtuous damsels, sorcerers, and monsters and comprised of the derring-do adventures of storied medieval knights—only begins to appear in Castile during the reign of Alfonso XI. The composition of two of the great Castilian chivalric romances belong to this period, the *Libro del caballero Zifar* and *Amadís de Gaula*. The *Zifar* is a complicated work composed from a perspective that fails to fit neatly into any European cultural paradigm. In it many literary and generic traditions of different, even Eastern, origins merge, but the work's central core remains the tale of gallant adventure that leads to an affirmation of monarchy and the display of the advantages of a knightly education,

themes central to all chivalric fiction. The *Amadís* that was in circulation at this time, known only through fragments, was doubtless a work comprised of three books, as opposed to its later sixteenth-century incarnation in four. Its structure closely reflected that of the *Lancelot* of the French Vulgate Cycle. In addition, the short narratives known as *Otás de Roma*, *El Caballero Plácidas*, *La Emperatriz de Roma*, *Carlos Maynes*, *El Rey Guillermo*, plus various saints' lives contained in an important manuscript commonly referred to as the *Flos Sanctorum* (Escorial H-I-13), are also from this same period. As Francisco Rico has demonstrated, both the *Zifar* and the manuscript of the *Flos Sanctorum* share qualities that are essential to chivalric narrative fiction: Despite the heterogeneity of their action and composition, they are both tightly unified by themes closely allied to questions of religious, political, and moral education. Something very similar can be discerned in another manuscript miscellany from the fifteenth century (MS 1837 of the Biblioteca Universitaria de Salamanca), which contains adaptations from the Arthurian Post-Vulgate Cycle, in particular a version of *Merlin* and *Lancelot*, along with an account of *Barlaam e Josafat*, plus several lesser texts of a pious nature. The *Amadís* and the works collected in the two manuscripts mentioned above all reflect the configuration of a cultural politics based on the advocacy of chivalry that began to be promulgated during the reign of Alfonso XI, a period that runs roughly between 1330 and 1350.

Around this same time or shortly thereafter, Catalan, Castilian, and Portuguese versions of the post-Vulgate cycle began to appear. These may be characterized as interpretive rewritings that tend toward a more pious and religiously orthodox interpretation of the French Arthurian material they draw on. The majority of the latter texts can be sorted into three main categories distinguished by the *Baladro del sabio Merlín*, *Lanzarote*, and the *Demanda del Santo Grial*. Both the *Baladro* and the *Demanda* appeared in incunable editions. Only manuscript fragments of the *Lanzarote*, however, remain.

The most original contributions to chivalric romance in the fifteenth century, the golden age of medieval Iberian chivalry, are of diverse types. On the one hand, one model constituted principally as a political allegory, and one that deserves much further study, is represented by the Catalan *Curial e Güelfa*. In it Italian intellectual interests are artfully combined with courtly themes of French origin to embody a sensibility that could best be categorized as chivalric humanism. On the other, there is the unique work called *Tirant lo Blanc* that represents a union of everything chivalric from the theoretical treatise on chivalry to observations

against it, to specific echoes and recollections of the *Matière de Bretagne*, to gallant poetry and courtly spectacle, that circulated under the authorship of Joanot Martorell and was published at the instance of the printer Martí Joan de Galba, who was to Martorell what William Caxton was to Thomas Malory.

Other fifteenth-century Castilian narrative traditions that embrace chivalric material are also notable for their originality. The earlier synthesis of chivalric fiction and historical narrative that has already been noted persisted in Castile and León but now on a much more individual level, in the biographies of notable personages. Many of the heroic life narratives of the period, like Gonzalo de Chacón's chronicle of the deeds of don Álvaro de Luna and another work on Alonso de Monroy, or even the *Hechos de Alonso Carrillo* composed by Pero Guillén de Segovia (preserved now only in fragments), make ample use of classic chivalric paradigms to relate the lives of their protagonists. Predominant among these biographies is *El Victorial*, or the celebrated *Crónica de don Pero Niño*, *Conde de Buelna*, by Gutierre Díaz de Games, which gives free rein to chivalric motifs and exploits them in order to draw the portrait of the man who is the subject of the narrative. In consonance with the didactic tendency of many chivalric narratives, *El Victorial* also confers a great deal of space to the discursive development of ideas and to specific teaching, usually in the form of a debate centering on a significant topic. Like the vast majority of chivalric romances, *El Victorial* rests on a thematic core that underscores the importance of the education of the hero, the recuperation of lost honor or diminished family name, and the attainment of social recognition and success based on the hero's personal virtue and loyalty to the institution of monarchy.

The very last examples of medieval Iberian chivalric fiction materialized during the advent of printing in the peninsula. In the last decade of the fifteenth century in particular, various brief chivalric romances appeared in print, although the majority of them did not see widespread circulation and broad acceptance until later in the sixteenth century. The first known edition of *Amadís de Gaula* in four books by Garci Rodríguez de Montalvo (now lost and probably from 1496) marks the transition from medieval chivalric romance to the great torrent of works that would emulate it and be published in the sixteenth century.

ROMANCES, SENTIMENTAL

The literary genre in the Iberian Peninsula called "sentimental romance" or "sentimental fiction" is composed of some thirty works written between about 1400 and about 1550. The canonical list of sentimental romances as first established by Whinnom includes the following titles:

- 1) *Siervo libre de amor* by Juan Rodríguez del Padrón
- 2) *Tratado e despidio a una dama de religión* by Fernando de la Torre;
- 3) *Sátira de infelice e felice vida* by Dom Pedro de Portugal
- 4) *Triste deleytación*, anonymous (although written by a Catalan author)
- 5) *Arnalte y Lucenda* by Diego de San Pedro
- 6) *Cárcel de Amor* by Diego de San Pedro
- 7) *Triunfo de Amor* by Juan de Flores
- 8) *Grisel y Mirabella* by Juan de Flores
- 9) *Grimalte y Gradissa* by Juan de Flores
- 10) *Repetición de amores* by Luis de Lucena
- 11) *Cárcel de Amor* by Nicolás Núñez
- 12) *Tratado de amores*, anonymous
- 13) *La coronación de la señora Gracisla*, anonymous
- 14) *Qüestión de Amor*, anonymous
- 15) *Penitencia de amor* by Pedro Manuel Jiménez de Urrea
- 16) *Quexa ante el dios de amor* by the Comendador Escrivá
- 17) *Cartas y coplas para requerir nuevos amores*, anonymous
- 18) *Veneris tribunal* by Ludovico Scrivà
- 19) *Tratado llamado notable de amor* by Juan de Cardona
- 20) *Proceso de cartas de amores* by Juan de Segura
- 21) *Quexa y aviso contra amor* by Juan de Segura

Although scholars have long considered this genre as exclusively Castilian, recent criticism suggests that some Catalan and Portuguese works should be considered sentimental fictions as well. Thus, while the first canonical sentimental romance written in Castilian dates from about 1440 (*Siervo libre de amor* by Juan

Rodríguez del Padrón), several critics have defended that *Fronchino i Brisona* (a bilingual work written in Catalan and French about 1400) is already a developed sentimental fiction. As well, the Portuguese *Confissão do Amante* (c. 1430), *Menina e Moça*, and *Naceo e Amperidónia*, among others, and the fifteenth-century Catalan novel, *Les amoroses i sentimentals*, should be included as part of the genre. Among the main literary sources of sentimental fiction, we could mention the Arthurian romance, the French *voir-dit*, Boccaccio's *novelle*, medieval literature of *de regimine principum*, Biblical texts, *cancionero* literature, university *tractatus*, homiletic literature, *relaciones* (descriptions of courtly events), theatrical texts (eclogue, humanistic comedy), and so on.

Critics have long debated the main characteristics of sentimental fiction. Although there is no complete agreement (recent scholars have established that there is *unity* within this genre), some of the most accepted features of the genre include:

- A love story between lovers whose love affair is seldom consummated. In most cases the result of their love affair is tragic, including the death (mostly by suicide) of the male lover. Love is analyzed as a frustrating and frustrated passion and is usually envisioned within both a personal and social framework.
- (Pseudo) Autobiography. Many sentimental stories adopt the first person as the favorite narratological voice to explore the anguish of a tragic love journey. Nevertheless, this first person is usually accompanied by other rhetorical *genera dicendi* which present the love-problem as having a dialectical nature.
- Epistolary technique. Many sentimental fictions include a lengthy exchange of letters between lovers. The use of letters has been linked to the development of the *ars dictandi* both at the university and the nobility and royal *milieux* during the fifteenth century. The *Proceso de cartas de amores* by Juan de Segura is written entirely in this epistolary fashion.
- Critique of courtly love. Most sentimental fictions include a lengthy and developed criticism of the behavioral code of courtly love. Courtly love is usually seen as frustrating, unproductive, and useless in granting lovers a complete satisfaction of their social and physical needs and desires.
- Female voice. Women attain an extremely important role as characters and readers in sentimental fictions. First, it should be noted that women have in this genre—for the first time in literary history—as much importance if not more as male characters. In addition, women are in charge of pointing out the

incoherence and inconsistency of the discourse of courtly love. As a result, they frequently appear as mocking and criticizing their male counterparts as love fools.

- Love debate. Together with the adoption of a female point of view, there is an increasing number of voices that can be heard in sentimental fictions. As well, characters usually debate about the essence of love, thus offering a multiplicity of voices and points of view regarding love (personal and social relations) as a personal and social phenomenon. In addition, there are within these works numerous chapters which belong to the genre of *pro feminaladversus mulieres* literature. There is also a presence of literary subgenres such as *consejos/consells/conselhos* and *de regimine principum*.
- Equality. Strikingly, the debate on love, together with the adoption of a multifaceted range of opinions on love, promotes the idea of love as a somewhat egalitarian force. That is to say, participants in the love-game have a right to express their opinions inasmuch as they are equally subjects of the love-game.
- Sentimental fiction and *Celestina*. Critics have increasingly related sentimental fictions to *Celestina* and many *Celestina*-like works written about 1490–1530. To this extent *Celestina* has been considered a sentimental fiction. Some critics have suggested that *Celestina* is a literary response to *Cárcel de Amor* by Diego de San Pedro.
- Dialogical nature of love plots. The increasing presence of dialogue, letters (*dialogus in absentia*) and debates on love tends to overshadow the role of simple narrative in third person. Love is seen as a topic to be discussed in dialogical fashion, thus prompting an ego-tu dialectics which is at the core of the modern novel.
- Fiction-Realism. As the genre evolves, there is a tendency towards more realistic plots. Thus, some of the Arthurian-like features of the early works give way to a more realistic portrayal of late-fifteenth- and early-sixteenth-century society.
- Sentimental fiction and the eclogue. Critics have linked the genre of sentimental fiction to the development of eclogue as a theatrical genre. From Juan del Enzina to Garcilaso and Bernardim Ribeiro, many eclogues build their plots upon debates on love, tragic love stories, and so on, in a similar fashion to the sentimental romance. Even some sentimental novels include eclogues as part of their plots (*Égloga de Torino*).
- Matrimony. Many female characters of sentimental fictions tend to view matrimony as a valid social solution for the ethical problem of courtly love.

“Marry me”, they seem to say, “and we will be able to live our love affair to the fullest”, thus setting the love-problem within a clear social context.

- Lyric and narrative. Many critics view sentimental fiction as the result of the prosification or narrativization of love lyric poetry (*cancionero* lyric). In fact, many sentimental fictions could be seen as prose developments of lyric *cancionero* poems. In addition, numerous sentimental romances insert lyric compositions in their narrative (*prosimetra*).
- Portrayal of a crisis. Sentimental fiction is neither a medieval nor a Renaissance genre. At the threshold of the Renaissance, sentimental romance is representative of the notion of crisis that defines this period. When talking about love affairs (at first in a very similar fashion to that of the Arthurian novel and *cancionero* poetry), sentimental fictions tend to *narrate* love within a more developed (and realistic) social frame. In doing so, they usually commence where *cancionero* poetry ends. As well, they show a tendency less toward deeds and action (as in the Arthurian novel) and more toward analyzing the essence of the love crisis, both in individual and social terms.

Sentimental fiction, an enormously successful genre, seems to have faded around 1550. New literary genres, such as the pastoral romance, the Byzantine novel and the chivalric romance became the new fashionable genres of the Renaissance. Traces of the influence of sentimental fiction can be perceived in all of them. From Arthurian literature and *chançonniere* poetry to *Don Quijote*, sentimental fiction stands in the frontier of the creation of modern romance. By focusing on love both as a personal and social feeling and by mixing several narratological techniques (*narratio*, dialogue, debate, letters, etc.) which further complicated the status of the narrator and his/her position in the narrative, sentimental fictions gave birth to a new dialogical interest in the individual in communication (debate) with the society that fostered him/her. The social and personal desiderata of the new society (Renaissance) were later explored in novels that focused on the exoticism of travel, the material deeds of adventure and/or the escape toward social utopias.

As for the social milieu that fostered sentimental fiction, it seems to have originated in the literary courts of the fifteenth-century nobility. Nevertheless, the presence of numerous voices interspersed in the narratives (female voices, scholarly and university elements, bourgeois characters, etc.) as well as the portrayal of a crisis (both personal and social) point toward a milieu more complicated than that of the simple upper nobility. In this sense, some critics have even

observed the presence of *converso* (Christian convert) voices and structures as well as the presence of incipient bourgeois elements within the genre.

ROMANCES, TROY AND ADVENTURE

The tales of the siege and destruction of Troy, with their evocation of the loss of grandeur amidst tragic love, played a special role in stimulating the medieval European imagination. The doomed love of Paris and Helen, plus the courtship of Troilus and Cressida, which emerged from an anecdote in the original story, were turned into paradigmatic legends of love's suffering, chivalry, and sentimentality. The story of Troy circulated widely via several Latin versions: The *Ilias latina*, an inferior Latin summary of Homer's original, and the more influential *Excidium Troiae*. Two spurious eyewitness accounts, the *De excidio Troiae historia*, said to have been written by Dares the Phrygian, a soldier who fought with the Trojans, and the *Ephemerides belli Troiani*, attributed to a combatant in the Greek army called Dictys of Crete, were also well known. The *Roman de Troie* by Benoît de Sainte-Maure, the most widely circulated vernacular version of the story in medieval Europe, is derived from the latter two works. Benoît is, in turn, the source of the thirteenth-century *Historia destructionis Troiae* by Guido delle Colonne, which saw widespread circulation.

Numerous vernacular romances of the story of Troy circulated in the Iberian Peninsula during the late Middle Ages yet little scholarly attention has been given them. A Castilian text written in both prose and

poetry from between 1275 and 1300, the *Historia troyana polimétrica*, is probably derived from the French *Roman de Troie en prose* and greatly elaborates the story in the verse passages, inspired in the most emotionally stirring parts of the *Roman*. The poetry in the *Historia troyana* merits special attention: it exhibits great metrical variety, shows a close interest in the love of Troilus and Cressida, and presents a detailed, anachronistic elaboration of the armed conflict between Greeks and Trojans in terms of medieval warfare. However, the story of Troy first appeared in Iberia redacted solely in prose, in Alfonso X's *General estoria* (begun in 1272), which combines material from Benoît, the *Ephemerides* and the *De excidio Troiae historia* attributed to Dares. There are two other known prose versions, both from the fourteenth century. These are a translation of the *Roman de Troie* commissioned in 1350 by Alfonso XI of Castile, and a Galaico-Portuguese version, also based on Benoît, composed before 1373. Also from the fourteenth century is a work by Leomarte, of whom virtually nothing is known. This is the *Sumas de historia de Troya*, based on Alfonso's *General estoria*, Guido delle Colonne's *Historia destructionis Troiae*, and other sources. The *Sumas* appears to be a highly original conflation of Trojan and historiographical materials. Despite his near anonymity, Leomarte was well known and influential in establishing a "Trojan palimpsest" that would emerge allusively in Castilian poetry and prose, particularly in courtly circles during the next century.

Finally, there is an incomplete *Corónica troyana* that derives from the *Historia destructionis Troiae*, as well as complete versions of the story also based on Guido delle Collone in Aragónese and Castilian. During the last quarter of the fifteenth century, Pedro González de Mendoza, el Gran Cardenal, translated the *Iliad* itself from a Latin version by Pier Candido Decembrio.

Numerous romances of adventure, chivalry, and love that did not derive from the story of Troy also circulated in Iberia during the late Middle Ages. Aside from two autochthonous romances of chivalry, *Amadís de Gaula* and the *Libro del caballero Zifar*, the latter were largely adaptations or translations of texts with a foreign provenance and are drawn from various sources: the *Cuento del emperador Carlos Maynes*, a story with a Carolingian theme; the *Historia de Enrique fi de Oliva*, and the *Cuento del enperador Otas*, are all of French epic origin. Several other romances, like the *Fermoso cuento de una santa enperatiz* and *De un cavallero Plácidas*, the *Chronica del rey don Guillermo de Ynglaterra* and the *Estoria del rey Guillelme* all trace their origins to hagiography and saints' legends, especially the legend of St. Eustace.

The *Historia de la linda Melusina*, a tragic tale about a woman who is transformed into a serpent from below the waist once per week, and tries to keep her secret from her husband is a free translation of the French *Mélusine* by Jean d'Arras. *Flores y Blancaflor*, the *Historia del muy valiente Clamades y de la linda Clarmonda*, and the *Libro del esforçado cavallero Partinuplés*, all also trace their origins to beyond the Pyrenees.

RONCESVALLES, CANTAR DE

The *Cantar de Roncesvalles* is a one-hundred-verse fragment of a lost Spanish epic about the defeat of the rear guard of the French army under Roland by the Saracens at the pass of Roncesvalles in the Pyrenees. The two badly worn folios were discovered inside a fourteenth-century census register from Navarre. The writing on the folios has been identified as Navarrese from the first years of that century. The text itself, according to Menéndez Pidal, was composed in Castile in the early thirteenth century; Horrent dates it somewhat later.

The fragment tells of Charlemagne's search for Roland's body on the battlefield, where he comes upon the corpses of Bishop Turpin and of Oliver before finally encountering his nephew. Thereupon he utters a long lament and falls unconscious. At the same time Aymón seeks, finds, and mourns over his dead son, Reinaldos de Montalbán. The account is in essence similar to that of the *Chanson de Roland* but with many different details that reveal a peninsular version of the Charlemagne/Roland story founded on an earlier epic tradition (the *Nota Emilianense*) and subsequently carried over into the ballads (*romances*).

The verse form and the diction of *Roncesvalles* are the same as those of *Cantar de Mio Cid* except for the consistent use of the paragodic *e* at line end. The two-hemistich verse with end assonance is irregular in length. Seven-syllable hemistichs dominate, followed by those of eight, six, and nine. The verses are grouped into series of like assonance, *á–e* being favored.

Roncesvalles is of great value for the history of the Spanish epic in that it offers concrete evidence of a long-standing epic tradition in the peninsula and supports the theory of the loss of many texts. It also attests to the independence of the Spanish epic tradition from the French despite considerable borrowing from it.

SAINTS

In Iberia, as in all western Europe during the Middle Ages, the cult of saints and of the Virgin reached its high point, so that they became the main means of expression of popular religiosity. Learned and popular elements were involved in the origin of the devotion to saints; although the concept of sanctity was defined by the church, in a parallel way, but not always hand in hand, people worshipped some saints they believed able to work miracles. The strength of the devotion was so great that it appeared in every aspect of medieval culture, either in theologians' abstractions or in legends, graphically on images or materially in the accumulation of alleged relics. Nevertheless, the main source for the study of the saints worshipped in the Middle Ages, individually and as a general phenomenon, are hagiographic texts. Using this material, it is possible to appreciate the evolution of the cult of saints during the Middle Ages in Iberia.

The Eighth to Eleventh Centuries

As in the rest of the Romance language areas, the stories of martyrs prevail in the writings of this period, with the Hispanic peculiarity of belonging to the Mozarabic rite. The Muslim invasion did not interrupt either the worship of saints or hagiographic production that had reached an important level in the seventh century. In the ninth century the hagiographic literature did not decrease, thanks to the Mozarabic community of Córdoba, and above all to Speraindeo and his disciples Eulogio and Alvaro, but perhaps more texts would have appeared after the large number of martyrs in the persecution of 'Abd al-Rḥmān II in 850–852. In the tenth and eleventh centuries a remarkable increase of hagiographic production occurred, even when the per-

secutions suffocated the Mozarabic tradition, because the renewal seems to start in certain northern centers, such as Ripoll, Cardena, and Silos. For the first time, the stories devoted to martyrs (*passiones*) are not greater in number than those devoted to confessors (*vitae*).

The Twelfth to Thirteenth Centuries

A vigorous cultural activity developed in Santiago, Toledo, and Catalonia. The *Liber Sancti Iacobi* or *Codex Calixtinus* is perhaps the best proof of the role that hagiographic literature had in that activity, as it is the expression of the beginning of a specialized worship of saints. As patrons of the pilgrims to Santiago, for instance, the devotion to Sto. Domingo of the Calzada, St. John of Ortega, St. Marina, and St. Julian the Hospitaler, was extended to St. Christopher. Also a decline of the martyrial subject can be appreciated, since the *passiones* represent only a quarter of the hagiographic texts, giving way to "lives and miracles." As the hagiographic literature reveals, in the thirteenth century an important qualitative change occurred in the cult of saints, one that could be linked with the religious reforms, one of whose manifestations was the founding of mendicant and ransoming orders, and their struggle against the heretics. Parallel to the increase in Latin literature, this new atmosphere, with a clear will of divulgation, favored the flowering of Romance languages. Thus we find stories in Castilian and in Catalan that extol the founders of the new orders and warn against heretics. Although the thirteenth century was an actual "century of saints," above all Dominicans and Mercedarians (Franciscans did not partake of this profusion, probably because of their critical attitude), a new restrictive factor must be taken into account: since 1170, when Pope Alexander III reserved for the Holy See the faculty of recognizing the sanctity of the faithful, the number of canonizations decreased. However, this arrangement was not able to control the dimensions and diversification that the cult of saints had already acquired.

The Fourteenth to Fifteenth Centuries

In the fourteenth century sanctoral, Hispanic saints scarcely can be found, which could be connected with the decline of the church in that period. In hagiographic production, the Dominicans were the only ones to increase it, and that could be explained by the rise of Scholasticism and their rise in the inquisitorial ranks. The martyrial writings at that time were real exceptions, and that was so because the evangelic pattern of sanctity (martyrdom, asceticism, poverty) was in the late Middle Ages giving way to concepts like culture and mysticism. The fifteenth-century individual texts were usually devoted to Hispanic saints, while the compilations followed after Jacobus de Voragine's collection, the *Legenda Aurea*.

The Figure of the Saint

Because of the period in which it developed, medieval Castilian hagiography already integrated the different types of saints that appeared in the history of Christianity, whether they were models deriving from the Bible or from Latin religious literature. All of them in the end refer to Christ, or to the Virgin Mary, in the case of feminine hagiography. Basically the concept of sanctity implies the attribution of theological and cardinal virtues, but medieval texts especially insist on humility: perhaps because at that time pride was considered one of the worst sins. An essential aspect of the medieval archetype of saint, common in every model, is thaumaturgy. Even the martyrs, whose sanctity needed no verification by prodigies as it was evident by their voluntary sacrifice, are finally empowered to propitiate miracles. The most usual prodigies are prophecies, visions, and miraculous cures of every kind of illness, and even exorcisms. More peculiar to Hispanic saints are their apparitions against the Moors (St. James or St. Millán) or the freeing of captives (Sto. Domingo of Silos).

The conventions of the genre already appear in the circumstances of a saint's birth: the parents, usually members of a distinguished family, pray to God for a child (St. Ildefonso, Sta. Oria, S. Juan of Sahagún). In the case of masculine hagiography the wish for sanctity is manifested early in the application to study, so that, following the *puer senex* topic, children show more wisdom than their own teachers, and look down on jokes and laughter. Then Hispanic medieval hagiography presents the saint in several scenes that are sometimes superimposed, combined with some other strange ones, or even contrary to the very concept of sanctity:

Ploughman or Worker-saint. In the *Vida de San Millán* by Gonzalo de Berceo, we can find frequent mentions

of the toil of the protagonist in order to gain Paradise, comparing it with the remuneration of workers. Another good example is St. Dominic of Silos.

Penitent. Already the Bible included models of this type, masculine (St. Paul) as well as feminine (Mary Magdalen). The legend most extended by peninsular hagiography, although of foreign origin, is perhaps that of St. Mary of Egypt.

Hero-saint. St. Millán is often presented as a warrior who shines especially in the famous episode of Fernán González's votive offerings, when he and St. James terrify the Saracens. One real warrior was Fernando III, a curious case of saint and king, as was also St. Elizabeth, queen of Portugal.

Martyr. Although in the late Middle Ages saints usually died peacefully, and were not executed, the cult of ancient and early medieval martyrs was still strong. Probably that was because of the analogy with the supreme model of Christ's Passion, that presents the martyr as the sacred-form hero par excellence. St. Lawrence is one of the most celebrated ones, but even confessors are considered "martyrs in will."

Ascetic. According to the previous discussion, when saints are no longer martyred by the enemies of Christianity, they have to mortify themselves by means of every kind of sacrifice. Besides the anchorite life of St. Mary of Egypt, many Hispanic saints lived for a time as hermits (St. Millán, Sto. Domingo of Silos, Sto. Vitores), or severely cloistered (Sta. Oria, for example).

Good Shepherd. In the case of masculine saints, pastoral labor is an important part of their merits, either as monks (Sto. Domingo of Silos, Sto. Domingo of Guzmán, St. Juan of Sahagún) or as secular clerks (St. Millán, St. Lawrence, St. Ildefonso, St. Isidore).

Founder. St. Millán, but more clearly Sto. Domingo of Silos, Sto. Domingo of Guzmán, or St. Peter Nolasco have the image of a saint able to raise or restore ecclesiastical institutions.

Learned Saint. During the late Middle Ages, in the Iberian Peninsula, as in the rest of western Europe, we can appreciate the importance that culture acquired in the pattern of sanctity. Vital for the defense of doctrinal orthodoxy, especially against the danger of the heretics, the church and the people extolled their ancient (St. Isidore, St. Ildefonso) or contemporary doctors (Sto. Domingo of Guzmán, St. Vicente Ferrer).

SALADO, BATTLE OF

The Battle of Salado (30 October 1340) lifted the siege of Tarifa and was the last great battle of the Reconquest. On one side was Abū al-Ḥasan (sultan of the Benimerines, 1331–1351) of Morocco and Yūsuf I of Granada (1333–1354); on the other were the combined forces of Castile-León, Portugal, Aragón, and France, led by Alfonso XI of Castile-León (1312–1350) and Afonso IV of Portugal (1325–1357). The Benimerines had mounted a series of campaigns in the southern part of the Iberian Peninsula since 1333, when they recaptured Gibraltar. From 1333 to 1339 Castilian forces besieged Gibraltar while Muslim troops harassed them. By 1339 Abū al-Ḥasan planned an all-out war against the Castilians. He destroyed most of the Castilian fleet in the Straits of Gibraltar in April 1340 and transferred the bulk of his troops to Algeciras and Gibraltar. After meeting Yūsuf at Algeciras in August they began the siege of Tarifa in September. The Castilians recognized the risk to their holdings and Alfonso XI convinced the kings of Portugal, Aragón, and France that the Benimerines posed a threat to the entire peninsula. Alfonso obtained a crusading tithe from Pope Benedict XII, but even so he had problems financing the campaign.

The size of medieval armies is notoriously inflated in the records of any encounter, although the sources indicate that the Muslim army was larger than the Christian army. Some of Alfonso XI's advisers suggested surrendering Tarifa, but Alfonso refused. By October a new Castilian fleet arrived off Tarifa. Alfonso XI and Afonso IV advanced on Tarifa by land, accompanied by militias from the southern towns as well as Basque, Leonese, and Asturian troops. The battle took place at the Salado River outside of Tarifa. The Castilians were able to smuggle some troops into Tarifa without the knowledge of the enemy the night

before the battle. The Castilians took the ford of Salado and the main guard, but dispersed to loot the camp; the forces from Tarifa foiled a Muslim attack upon the Castilian rear. The Portuguese defeated the Granadan troops. Both Yūsuf and Abū al-Ḥasan retreated, but Alfonso XI lacked the provisions to pursue them to Algeciras. The booty from the battle was considerable; the amount of gold and silver captured readjusted the prices of the two metals in Europe. The victory at Salado not only relieved Tarifa but also prevented the Benimerines from penetrating into the peninsula.

SALAMANCA, CITY OF

Salamanca is on the north plateau of the Iberian Peninsula, with a Roman bridge that spans the Tormes River. By the sixth century the city was integrated into the Visigoth Kingdom of Toledo and had an episcopal see. After the Muslim conquest in 711, the Asturian kings transferred part of the southern population to the north. In the middle of the ninth century, King Ordoño I attacked the Muslim residents of the city and so contributed to the scattering of the small, disorganized Muslim population. In the tenth century Ramiro II tried to repopulate the city, but the final repopulation was directed by Raimundo of Burgundy in 1102. The settlers who came were mainly Franks, Portuguese, Highlanders, Mozarabs, and Castilians. The presence of Jews and Muslims was documented soon after. Bishop Jerome, mentioned in the *Cantar de Mio Cid*, was the first prelate, and by the middle of the twelfth century the construction of the cathedral was well underway. During the thirteenth century the city grew under the reign of Alfonso IX and it was through his initiative that the university came into being around 1218 from the conversion of the old cathedral school. However, the consolidation of the Salamanca *studium* did not take place until the middle of the thirteenth century, when Alfonso X endowed its faculties of civil law and canon law, arts, and medicine. Pope Alexander IV conferred on its graduates a *licentia ubique docendi*. The conflict for control of the city council and power over the land, and the repercussions from the general problems of the crown resulted in the division into two bands or factions, which were the cause of frequent fighting. By the end of the Middle Ages the city had a population of eighteen thousand inhabitants, and the university enrolled more than two thousand students.

At that time plans were being made for the construction of the new cathedral.

SALIC LAW

Salic law was derived from a phrase extracted from the *Lex Salica*, a fifth-century code of the Salian Franks, which excluded women from the ownership of property: *De terra Salica nulla portio ad fœminam*. This tradition is also referred to as the Salic law of succession, to distinguish it from the law code from whence it took its name. It was adopted as the tradition of royal succession by several European kingdoms, most notably France, who used it to exclude all females from the throne and later, those males whose claim to rule was based on descent through a female. Until the sixteenth century, Salic law was not named as such, and was not discussed in law texts. Instead it existed as a part of royal tradition invoked during succession disputes at the end of the French Capetian dynasty in the early fourteenth century, and again at the end of the Valois dynasty in the late sixteenth century. Salic law was used to justify exclusion of Edward III of England from the French throne in 1328, thus prompting the Hundred Years' War.

In the Iberian Peninsula, Salic law played its most prominent role during the uniting of Castile and Aragón under the Catholic Monarchs (1474–1504). The succession tradition of Aragón followed the Salic law pattern, while that of Castile—whose history included many examples of female accession to the throne when a male heir was lacking—did not. In practical terms, the Salic law tradition of Aragón meant that, lacking a direct male heir to the throne, the brother of the king was preferred for succession over the daughter of the king. This trend was the opposite in Castile, where the king's direct descendant—regardless of sex—inherited above the claims of the collateral branch. During the negotiations for union of the two realms after the accession of Isabel and Fernando in 1474 at Segovia, the Aragónese claimed that Fernando, as male and husband, should be lord of Castile. Instead, Isabel was named *reina propietaria*, or Queen Proprietess, of Castile, and a compromise was reached whereby the governance of the united kingdoms would be shared. Afterward, during the reign of the Catholic Monarchs

this same Salic law dispute came to the fore in the 1498 refusal of the Aragónese *cortes* (Parliament) to approve Isabel of Portugal as heir because of her sex. Extraterritorially, in 1483 and again in 1488 the struggle between the Spanish and French over control of Navarre revolved around the claims of a female heir, Catalina de Foix. Accession of a woman to the crown reappeared at the center of peninsular conflict in the nineteenth century, when Fernando VII repealed the promulgation of Salic law in Spain under the French Bourbon monarchs and proclaimed his daughter, the astutely named Isabel II, as his successor, thus creating the conflict that resulted in the Carlist wars after Fernando's death in 1833.

According to research in the history of French jurisprudence, Salic law was not originally based on the idea that women were unfit to rule. Instead, it was meant to ensure that during the minority of a king's son, or in the absence of a male heir, the females of the royal family would not compete for the crown and a more stable transition could be achieved. It was only in later interpretations of French tradition in the seventeenth century that the debate centered around womens' abilities. In foreign relations, Salic law was designed from the outset to protect local sovereignty from foreign investiture. Given the intermarriage between European royal families that was standard practice, exclusion of females from the throne was a method of preventing a loss of sovereignty to a foreign power. It was assumed that, once married, the native princess would be subject to her foreign husband's commands. This connection between sovereignty and female accession was explicitly recognized in Fernando del Pulgar's account of the Segovia Compromise of 1474. In his account, Isabel argues that her right to inherit the crown must be recognized so that future female heirs will not be in danger of losing control of the crown to a foreign prince.

In contrast to the original intention of Salic law in France, in the Iberian Peninsula the conflict over Salic law under the Catholic kings *can* be connected to the question of whether women were fit to rule. The Salic law conflict gives historical underpinning to the late fifteenth-century prominence of literature that employed the formulas of courtly love and misogyny, and the debate over gender roles, which became a constituent feature of such works as *Celestina* or the *novelas sentimentales*. Direct reference to succession tradition as a part of the gender debate was usually only made by historians. On the Aragónese side, Guaberte Fabricio de Vagad's *Corónica de Aragón* (1499) provided a defense of Salic law tradition, while Diego Rodríguez de Almela, in various *tratados* directed to members of the Isabelline court, defended the idea of female

accession as fundamental to Castilian identity (1483–1484).

In English literature, the defense of French sovereignty by means of Salic law plays its most famous role in Shakespeare's *Henry V*, where the Archbishop of Canterbury justifies Henry's claim to the French throne by arguing that the Salic law does not apply to French territory, and that many French kings have founded their claim to the throne on the distaff side, as Henry V will attempt to do (I, ii, 33–95).

SAMPIRO, BISHOP OF ASTORGA

Named to that position in 1034 by Sancho III Garcés, el Mayor (1000–1035) of Navarre, then temporarily master of the kingdom of León as well. Sampiro continued in the see until November 1042. He is probably the same person as the eponymous minor court figure and sometime royal notary of the courts of Vermudo II (984–999), Alfonso V (999–1028), and Vermudo III (1028–1037), all of León. It is also likely that he was native to the district of Bierzo, a part of the diocese of Astorga.

Sampiro is chiefly revealed to us in his sole known work rather than in his deeds. He stood in the chronicle tradition and continued the work of earlier compilers of the history of the kings of Asturias and León, adding accounts of those beginning with the reign of Alfonso III (866–910) and ending with the initiation of that of Alfonso V. There are no independent manuscripts of his work known but his account was included in the early twelfth-century *Historia Silense* and also in the collection of earlier chronicles compiled by Bishop Pelayo of Oviedo about the same time.

SAMSON, ABBOT OF CÓRDOBA

Samson (d. 890) was appointed as abbot of Pinna Mel-laria, a monastery on the outskirts of Córdoba, in 858. At this same time, two monks from Paris came to him looking for relics. Samson offered them the remains of some of the martyrs of Córdoba who had been buried at the monastery. Aside from the account of this translation of relics authored by the Parisian monk Aimoin, the only source for Samson's life is the *Apologeticus*, a treatise that he wrote in 864 to defend himself against the accusations of Bishop Hostigesius of Málaga and Count Servandus of Córdoba. The events that elicited this response can be reconstructed from the lengthy preface to the second book. Apparently Hostigesius had cajoled the bishops attending a council in 862 into condemning Samson for his views on the Trinity and Incarnation. He was exonerated a short time later and was named abbot of the church of St. Zoilus in Córdoba. In 863 the emir Muḥammad I drafted him to translate into Latin a letter directed to the Carolingian king, Charles the Bald. Count Servandus accused him of making the contents of the letter known to enemies of the government. Hostigesius and Servandus also accused Samson and the Córdoba bishop Valentius of encouraging Christians to blaspheme Muḥammad. They managed to organize another episcopal council in Córdoba at which Valentius was deposed and Samson denounced for holding an extreme view of divine omnipresence. Samson fled to Martos, near Jaén, where he composed the *Apologeticus*, which not only offered a statement of his own faith, but also took the offensive against Hostigesius and Servandus. He accused them of working closely with the emir to the detriment of the Christian community, on which they imposed tax increases. In addition, Samson attacked Hostigesius's own profession of faith as heretical in its own right.

SAN JUAN DE LA PEÑA

Situated in the mountains some ten kilometers southwest of Jaca, San Juan de la Peña was for centuries the most renowned monastic center of Aragón. Upon

his conquest of the Aragón valley in 920, Count Galindo Aznárez II established the monastery of Sts. Julián and Basilisa on a site long favored by local hermits. This community apparently declined as a result of the Muslim attacks of al-Manṣūr and ‘Abd al-Mālik, and was revived by King Ramiro I of Aragón shortly after 1054 as an almonry of the nearby monastery of San Juan of Ruesta.

In 1071 King Sancho Ramírez established the monastery of San Juan de la Peña on the site, populating it with Cluniac monks, and richly endowing what he planned as the royal pantheon of Aragón. On 22 March of that year the Roman liturgy was introduced into Spain at San Juan, replacing the traditional Mozarabic liturgy. The monastery was expanded, and the new church built atop the tenth-century Mozarabic structure was consecrated on 4 December 1094 in the presence of King Pedro I. San Juan lost much of its royal patronage with the transfer of the Aragóñese capital to Huesca after 1096, and was forced thereafter to struggle to defend its patrimony and privileges against the bishops of Huesca, Zaragoza, and Pamplona.

Legend making and forged documents played a large role in this conflict, and San Juan long claimed an antiquity and importance that it had not in fact possessed. The *Vitae* of San Juan of Atarés, St. Voto and St. Felix; the “Donation of Abetito”; numerous charters; and the Aragóñese portions of the fourteenth-century *Crónica de San Juan de la Peña* were composed by the monks of San Juan toward this end, but to no avail. The struggle ended in 1571, when the newly established independent diocese of Jaca was endowed with much of San Juan’s property. On 21 February 1675 a disastrous fire destroyed much of the monastery, including its rich archives. The monks abandoned the ruins, and moved the community to a new monastery on the plains above the site. There they remained until the disestablishment of the monastery in 1835.

San Juan de la Peña is remarkable in a number of respects, not the least of which is its impressive location, as it is built into the side of a cliff. The old monastery, declared a national monument in 1889, presents a rich mixture of Mozarabic, Romanesque, Gothic, and neoclassic styles. Its Romanesque cloister preserves the sculptures of the so-called Master of Jaca; its numerous inscriptions provide excellent examples of medieval epigraphy; and its Pantheon of the Nobles is the most extensive such monument in Spain. Its movable treasures have been dispersed: its cartularies are found in the library of the faculty of law of the University of Zaragoza, and other documents of its archives are in the Archivo Histórico Nacional; its illuminated Mozarabic Bible is in the Biblioteca Nacional of Madrid;

and the Holy Grail, claimed by the monks to have been guarded for centuries in the monastery, is now in the Cathedral of Valencia.

See MILITARY ORDERS

SAN PEDRO, DIEGO DE

The best-known writer of sentimental romance in Spain, Diego de San Pedro, ironically, exercised far more influence on the development of fictional genres outside the Iberian Peninsula than within. His expert development of the epistolary form found little resonance in Spain with the exception of one or two novelettes of the early sixteenth-century, but his two sentimental romances, *Tratado de amores de Arnalte y Lucenda* (1491) and *Cárcel de Amor* (1492), were translated into several languages and circulated widely, playing a part in the development of epistolary sentimental fiction in France, England, and Italy.

Diego de San Pedro’s own life is clouded in some mystery. Whinnom has shown that he is unlikely to be the mid-fifteenth-century “teniente de Peñafiel” postulated by Emilio Cotarelo y Mori, but he may well have been another contemporary named Diego de San Pedro who appears in later documents, perhaps a younger relative who inherited the older man’s position as well. Whinnom also challenged Cotarelo’s documented evidence that San Pedro was a *converso* (convert from Judaism) although on balance this seems likely. He certainly was a courtier in the court of Queen Isabel and a vassal of the Telles Girón family, who fell out of favor when they backed Juana la Beltraneja in the civil wars. Some of San Pedro’s writings seem to have been attempts to curry favor with the ladies of the new court; he was a deft practitioner of courtly verse. His earliest work is a long religious poem on the death of Christ, *La pasión trobada* (1470s), which was his most popular work in the peninsula, reprinted in inexpensive chapbooks until the nineteenth century. He also wrote a verse, *Desprecio de Fortuna* in old age, perhaps at the turn of the fifteenth century, in which he renounced the writings of his youth. It is however his sentimental romance *Cárcel de Amor* that has established his reputation as an important precursor

both of *Celestina* and of the seventeenth-century novel in Spain. This is by no means a direct line of descent. *Celestina* parodies *Cárcel*'s courtly lover Leriano in the figure of Calisto, the young lover who has been driven mad by reading sentimental romance and courtly verse. The character of Don Quixote will similarly be driven mad by reading chivalresque romance, fiction that is contemporary to the sentimental romance but a different genre. *Don Quixote* will incorporate some material that can be considered to be descended from sentimental romance, but again the genre is marginalized and the epistolary form exerts no influence.

Tratado de amores de Arnalte y Lucenda is seen by Whinnom as a first draft of *Cárcel* and he has shown convincingly how San Pedro's rhetorical style, overdone in this earlier book, matured and was refined for *Cárcel*. Arnalte, however, is an astonishingly original piece when one considers its peninsular antecedents, Juan Rodríguez del Padrón's *Siervo libre de Amor* and Condestable Don Pedro de Portugal's *Sátira de felice e infelice vida*. San Pedro borrows the pseudo-autobiographical frame and tragic story from these antecedents but must conform to Padrón's translation of Ovid's *Epistles* in the *Bursario*, for it is the epistolary form that is the important, although not the unique method of telling the story. Aeneas Sylvius's *Historia de dos amantes* (*De duobus amantibus*) was probably also influential in what is essentially a bourgeois tale of unrequited love. Arnalte is, however, a thoroughly bad courtly lover who breaks all the most important tenets of the code, particularly secrecy, and goes through extraordinary machinations, including disguising himself as a woman, to importune Lucenda. Some critics have seen parody in this version of the courtly lover. Certainly Lucenda's ultimate rejection of Arnalte seems reasonable enough, in view of his having killed his best friend Ilierso in a duel because Ilierso took advantage of Arnalte's absence to marry Lucenda.

If Arnalte is a portrait of the inept courtly lover, then Leriano of *Cárcel* represents the extreme of courtly virtue, the lover as a Christ-figure whose martyrdom for his impossible love leads finally to death from hunger. In *Cárcel* we are back in the world of the chivalresque romance and Laureola is a princess, thus rendering Leriano's suit an impossible dream. Beside the amatory epistle, San Pedro provides a fine assortment of rhetorical tricks to tell his tale—allegory (the jail of love), letters of challenge, the judicial charge and its defense, the defense of women, the planctus or lament. His narrator is again himself as author, but he becomes integrated into the action carrying the love letters himself (in Arnalte the author had merely listened to the sad tale, and the go-between was the protagonist's sister). Leriano, imprisoned in the alle-

gorical jail of love, has been freed by Laureola's favor, but this in turn has meant her captivity and condemnation. Leriano frees her but in the end, Leriano's love has hopelessly compromised Laureola's honor and she does not dare show him any favor, or the cycle of imprisonment and freedom may begin again.

Leriano has no choice but to die of unrequited love, but not without first heatedly defending the virtue of women against his misogynist friend Tefeo. Leriano's mother is left to utter the planctus, which is one of a number of important precedents for *Celestina*. Rojas will use this lamentation as a model for Pleberio's lament for the dead Melibea. The direct influence of *Cárcel* on *Celestina*, the only Spanish text quoted verbatim by Rojas, cannot be underestimated. Although the sentimental romance would soon run its course as a genre, its intertextual legacy would continue throughout the sixteenth century.

SANZ, COUNT OF ROUSSILLON

Born around 1155, Sanz was named the count of Provence in place of his brother Alfonso I, count of Barcelona, in 1181. In 1185 he revolted against Alfonso, and made a pact with Genoa and the counts of Toulouse and Forcalquier. Sent back to the counties of Millau and Roussillon, he still laid claim to his former throne, as is shown by the help he gave to Guillaume IV of Forcalquier against Count Alfonso II of Provence in 1204. As early as 1209, on the death of the latter, he governed Provence with the agreement of Pedro II. This was his indemnity for having abandoned his Rouergate principalities in favor of Ramon VI of Toulouse, as surety for the crown's many debts in Aragón. Immediately after the Battle of Muret (1213), he was given the function of *procurador* of Aragón and Catalonia. He attempted to get the constitutions of peace and truce accepted by those factions of the Aragónese nobility who were in revolt; he also had to combat his nephew Fernando, Abbot of Montearagón. His men fought with Ramon VI in the retaking of Toulouse (1217), but against Simon of Montfort he failed to preserve the county of Bigorre from Catalan influence. The threat of excommunication made by Pope Hon-

orius III made him withdraw from the Occitan political theater. In September 1218, he renounced his regency in favor of Jaime I at the *cortes* (parliament) of Lleida (Lérida). He died sometime between 1223 and 1225; he was probably buried at the house of the Hospitalers at Cavaillon.

SANCHEZ DE ARÉVALO, RODRIGO

Rodrigo Sánchez de Arévalo (1404–1470) achieved prominence as a jurist, diplomat, and man of letters. Born in Castile, possibly in the diocese of Segovia, he attributed his chance at a university education to Catherine of Lancaster, the mother of King Juan II. Arévalo studied arts, theology, and particularly law at the University of Salamanca. By 1431 he had become a servant of the crown. Sent to the Council of Basel to represent Castile, Arévalo faithfully reflected in the 1430s the proconciliar stance of Juan II and his ally, Charles VII of France. In 1438 Arévalo accompanied Alfonso of Cartagena on his mission to profer Juan's greetings to the new Holy Roman Emperor, Albert II of Habsburg.

By 1439 Juan II had grown unhappy with the Council of Basel and Arévalo became an active promoter of the interests of that assembly's foe, Pope Eugenius IV. Thus, in 1440, while Castile's ambassador to yet another Habsburg Holy Roman Emperor, Frederick III, Arévalo received a letter from Nicholas of Cusa expounding the issues of the day in the light of his doctrine of "learned ignorance." In the winter of 1440 Arévalo was sent to Italy, where most of his remaining years would be spent.

Most of that period, Arévalo lived in Rome, where he alternately served Castile as an ambassador and the papacy as an official. Thus, when Pope Paul II arrested the members of the Roman Academy in 1468, Arévalo, as keeper of Castel Sant'Angelo, became their jailer.

Arévalo had begun writing papist treatises while he was Castile's representative in the north. These he continued to produce into his last years, employing his legal erudition on behalf of Rome and its crusade against the Turks. He also wrote political treatises, a geography of Spain, a history of Spain, a *Speculum humanae vitae*, and a work on the education of children.

SÁNCHEZ DE VERCIAL, CLEMENTE

Archdeacon Clemente Sánchez of the diocese of León finished his *Libro de los exenplos por a.b.c.* between 1400 and 1421. It is the most copious collection of exempla in prose in the Spanish language, containing 548 such brief narratives. Even though it is divided into 438 sections, each headed by a maxim in Latin and all alphabetically arranged, some of the sections contain more than one story, hence the higher number given. After each maxim in Latin appears a couplet that translates the Latin into full rhyme. The stories range from a few lines to several pages in length and the longer ones are almost literal translations of Latin sources. Since Sánchez cited not only titles of Latin works, but often book and chapter, he provides a remarkably complete listing of works available. Careful comparison between the original Latin and Sánchez's translation proves that he used primary sources and did not rely upon secondary material.

Two manuscripts are extant—that of the Bibliothèque Nationale, Paris (MS 432), partially edited by F. Morel-Fatio in 1898; and that of the Biblioteca Nacional de Madrid (MS 1182), a truncated text in that its first 71 exempla are missing, edited by Pascual de Gayangos in 1800. A complete edition, containing all the exempla is that of John E. Keller, Madrid, 1961, whose Introduction contains virtually all that has been published about this *Libro*.

Sánchez dedicated the *Libro* to his son in baptism, Johan Alfonso de la Barbolla, canon of Sigüenza. In addressing the canon he gave the *Libro's* title as well as an unusual statement of intent at variance with his more obvious didactic intent: "te escrivi que proponia de copilar un libro de exenplos por a.b.c. e despues rreduzirle en rromance, por que non solamente a ti mas ahun a los que non saben latin fuese solaz." ["I wrote to you that I proposed to compile a book of exempla arranged by a.b.c. and then translate it into Romance, so that not only for you but for all who do not know Latin it would be enjoyable"]. He seems to reflect similar ideas, included by Alfonso el Sabio in his *Siete Partidas*, in which for the sake of mental health, and by extension physical, people are advised to read romances (romance novels), fables, and other fictions and should listen to songs and play games. Recrea-

tional and hygienic intents, then, should accompany didactic intent.

Sánchez's style is lucid and as good or better than any found in Spanish prose before his time. It reads clearly and well and excels even that of Don Juan Manuel's *El conde Lucanor*.

Sánchez's sources are myriad and among them are some of the world's best-known tales. He translated nearly all of Pedro Alfonso's *Disciplina clericalis*, the first known translation into Spanish; he translated some of the best tales of Valerius Maximus, Seneca, Augustine, and Bede, of the *Historia tripartita*, and Gregory the Great, of the *Vitae Patrum*, and of the miracles of the Virgin, to name but a few. Some of the stories have not been traced to literary origins and must be considered as borrowing from the oral lore of the times.

The composition of alphabeta had gone out of fashion long before Sánchez composed his anthology, revealing once again Ernst Robert Curtius's remarks about Spain's cultural belatedness.

SANCHO I, KING OF LEÓN

The second son of Ramiro II (930–51), Sancho I ruled the kingdom of León during a period of such turbulent dynastic politics that he spent most of his reign just trying to hold on to the lands he inherited. The civil discord that marked Sancho's reign seriously weakened Leonese defenses and left the king struggling between two powerful opposing forces: Fernán González, count of Castile, and 'Abd-al Raḥmān III, the Umayyad caliph of Córdoba.

Even though Ramiro left two adult sons at the time of his death, the royal succession in León in the early Middle Ages was not yet clearly established and his death left the kingdom vulnerable to outside interference. Sancho's elder brother Ordoño III succeeded to the throne, but his father-in-law, Fernán González, joined in a conspiracy with King García I Sánchez of Pamplona to replace Ordoño with Sancho. The attempt failed, Fernán González was forced into exile in Castile, and his daughter was repudiated by Ordoño. When Ordoño died prematurely four years later, Sancho succeeded him.

Sancho, known as "the Fat" due to the obesity that made it difficult for him to walk, much less mount a horse to ride to battle, renounced the truce with 'Abd

al-Raḥmān made by Ordoño in 955. This led the nobles, guided by Sancho's erstwhile advocate Fernán González, to depose him and elect Ordoño IV, "the Bad," who ruled from 957 to 960.

In order to regain his throne, Sancho sought assistance from the Umayyads, who saw in the dynastic dispute an opportunity to strengthen their position with respect to the Christian kingdoms. Sancho lost weight with the assistance of 'Abd al-Raḥmān's Jewish physician, Hasdai ibn Shaprut, but to conclude the military arrangements, Sancho and his grandmother, the queen of Navarre, had to make a humiliating journey to Córdoba. Newly slender and accompanied by a large Muslim army, Sancho returned to León in 960 and successfully recovered his kingdom.

Sancho's pact with 'Abd al-Raḥmān made it impossible for him to raid Umayyad territory, so he focused instead on building an alliance with his Christian neighbors, García I of Navarre, Fernán González, and Borell II and Miró, the counts of Barcelona. Fortified by this alliance, Sancho refused to fulfill one of the conditions of his alliance with Córdoba, namely the cession of ten fortresses along the Duero River. The caliph retaliated and threw his support to Sancho's rival Ordoño IV, who had taken refuge in Córdoba. This second attempt to unseat Sancho failed when Ordoño died in 962. The caliph, undeterred, sent armies to León, Castile, and Navarre to persuade Sancho to fulfill his side of the bargain.

His ambitions thwarted in the south and northeast, Sancho turned his attentions to Galicia, where he attempted to restore his royal authority. In the course of negotiations there in 967 he was poisoned by Gonzalo, duke of Galicia, and left his kingdom in the hands of his five-year-old son Ramiro III (966–984) with Sancho's sister, Elvira, acting as regent.

SANCHO II, KING OF CASTILE

Sancho II (ca. 1038–1072), eldest son of Fernando I (r. 1035–1065), was a forceful and energetic prince who spent much of his reign in battle, but not against foreign armies. Rather, he fought his own brothers in an attempt to rectify what he considered a grave injustice—the provision of his father's will that left him with a truncated inheritance.

Fernando's will, announced at an assembly at León two years before his death, divided his dominions among his three sons: to Sancho would go the lands of Castile as far west as the Pisuerga River and the tributes owed by the king of Zaragoza; Alfonso would receive León and the tributes of Toledo; and García would inherit Galicia, Portugal, and the tributes of Badajoz and Seville. Sancho lodged a formal protest, arguing that his ancestors had agreed among themselves that the land should always be under one lord. His words went unheeded, and so he set out to defy his father's will and deprive his brothers of their share of the inheritance.

The three brothers maintained an uneasy truce until the death of their mother, Sancha, in 1067. In 1068 Alfonso campaigned near Badajoz, territory that was part of García's inheritance, and forced the local ruler to become his tributary. Alfonso's actions made it clear that he, too, refused to abide by his father's will and he thus provided Sancho with a convenient excuse for his later aggressions.

Sancho responded quickly. In 1068 he defeated Alfonso at Llantada, but gained no territory. When García had further troubles in Galicia—a revolt of the Galician nobles and the murder of the bishop of Santiago de Compostela during Lent in 1069—Alfonso, supported by García's rebellious nobles, invaded Galicia. To placate an irate Sancho, Alfonso offered him unchallenged dominion over Galicia. Sancho, realizing that his two kingdoms would be separated by Alfonso's, refused the offer.

In January 1072 Sancho attacked León, captured Alfonso at the battle of Golpejera, and crowned himself in León on 12 January 1072, thus reuniting León and Castile for the third, albeit very brief, time in less than a century. From León, he marched into García's old territories of Galicia and Portugal, and defeated García near Santarém.

Despite his military triumphs, Sancho could not negotiate a satisfactory political settlement. Opposition from both the nobles and clergy was so fierce that he was forced to crown himself because the bishop of León refused to do so. Sancho's reign as king of Castile, León, and Galicia was brief: he was assassinated in Zamora on 6 October 1072 by someone thought to be in the employ of his sister Urraca, who conspired to help Alfonso. García, too, fell victim to the extraordinarily bitter familial animosity. He fled to Seville, and in 1073 he was imprisoned for life by Alfonso and Urraca. Alfonso inherited the kingdom of León-Castile and ruled it until his death in 1109.

The murder of Sancho II has become the stuff of legend, in part due to the military exploits of his loyal standard-bearer, Rodrigo Díaz de Vivar, known as "el

Cid." But Sancho's most enduring legacy was his assertion of his right to inherit intact the kingdom of his father. Whether or not he understood the theoretical notions implicit in his protest of his father's will, his fight to restore what he perceived to be the historical unity of Castile and León was in fact a clear rejection of older patrimonial notions of inheritance in favor of primogeniture as a basis for kingship.

SANCHO III, KING OF NAVARRE

The reign of Sancho III Garcés, known as "el Mayor" (1000–1035) was a pivotal one, not only for Navarre but for all of Christian Spain. Possessed with prodigious political talents, he brought his small kingdom of Navarre to its apogee in the Middle Ages. Because the decline of Muslim influence in the region left him relatively free to focus his attentions elsewhere, he made no serious efforts to continue the Reconquest. Instead, he set about unifying all the Christian states except Castile under his rule. His cultural and political influences were French, and by his outlook and his actions he helped draw Spain out of its isolation and incorporate it into the rest of Western Christendom.

His inheritance was small—little more than a string of tiny counties in the foothills of the Pyrenees—but by skillful manipulation of marriage alliances, Sancho was able to widen his domains by acquiring adjacent territories. An important factor in his success was the marriage of his sister Urraca to King Alfonso V of León. Through Urraca, Sancho III continued to be a real power in that kingdom even after Alfonso's death. While Urraca served as regent for her son, Vermudo, Sancho gained control of Aragón and the old Marches counties of Sobrarbe and Ribagorza to the east of Aragón.

From his base in León, Sancho extended his influence to Castilian affairs through his brother-in-law García Sanchez, the count of Castile. When García Sanchez was murdered in 1029, Sancho took possession of Castile in his sister's name and designated his own son, Fernando, as heir. The Navarrese dynasty was firmly established in Castile in 1032 when Fernando married his first cousin Sancha, sister of Vermudo III, whose dowry brought to Navarre the disputed lands between the Cea and Pisuerga rivers.

Not all of Sancho's attempts to bring the Pyrenean states under Navarrese hegemony were so fruitful. By holding out the prospect of a military alliance against the Muslims in the central Ebro basin, he forced the count of Barcelona, Ramón Berenguer I (1018–1035), to become his vassal, although neither party would benefit much from this coalition. He tried to press his rights to succession in the duchy of Gascony, but his attempt to link the two Basque-speaking regions under one banner ultimately failed.

His political strength remained in Spain, however, and the high point of his career took place in 1034 when he occupied the city of León, unseating his nephew Vermudo. Finally, possessing a political authority that encompassed Navarre, León, Aragón, and Castile, he styled himself Emperor of Hispania ("rex Dei gratia Hispaniarum") and coined money in affirmation of his new imperial dignity, thereby laying claim to a peninsular supremacy that had previously been attributed to the king of León.

His imperial career was short-lived, however. He died suddenly the next year, and Vermudo III regained León, ruling it until 1037. Although he governed a unified kingdom, Sancho's adherence to the patrimonial concept of kingship, as was the custom in France, which declared royal domains heritable and divisible among his heirs, made any permanent union of these states impossible. In his will Sancho stipulated that his several realms be divided among his sons, all of whom eventually bore the title of king: Navarre was granted to García III Sánchez (1035–1054); Castile, to Fernando I (1035–1065); and Aragón, to Ramiro I (1035–1063). As a result, the new frontier kingdoms of Castile and Aragón attained the status of kingdoms, and ultimately would overshadow Navarre and León.

His permanent influence on medieval Spanish culture extended far beyond territorial expansion and royal inheritances, however. During his reign, feudal concepts of law and landholding current in France penetrated into the peninsula. Under his aegis, Romanesque artistic styles, especially in architecture, became well established in Spain. He encouraged the pilgrimage to Santiago de Compostela, a principle vehicle for transmission of French ideas. For the convenience of the pilgrims, he modified and improved the difficult route through Álava and the Cantabrian Mountains. And during his reign Cluniac reform was introduced into the monasteries of Oña, Lerie, and San Juan de la Peña.

SANCHO IV, KING OF CASTILE

Sancho IV, the second son of Alfonso X and Queen Violante, was born on 12 May 1258 in Valladolid. His sobriquet, "el Bravo," referred to his strength of will and determination. After the sudden death of his older brother Fernando de la Cerda in 1275, Sancho, rejecting the claims of his nephew, Alfonso de la Cerda, and demanded recognition as heir to the throne. Although Alfonso X acknowledged him, continual pressure from France and the papacy led the king to propose giving a portion of his dominions to his grandsons, Alfonso and Fernando, known collectively as the Infantes de la Cerda. Breaking with his father, Sancho, with the consent of the estates of the realm assembled at Valladolid in 1282, assumed royal authority, though he did not take the crown. A desultory civil war followed until the death of Alfonso X on 4 April 1284. Unreconciled and disinherited by his father, Sancho IV, nevertheless, was acclaimed as king and crowned at Toledo.

His situation was exceedingly precarious. Not only did Alfonso de la Cerda, supported by France, dispute his claim to the throne, but the pope had excommunicated Sancho and placed an interdict on his kingdom. The pope also denied the legitimacy of his marriage to his cousin, María de Molina; thus, their children would be considered illegitimate and lack any claim to inherit the throne. By challenging his father and by making many promises that he was unable to carry out, Sancho IV also weakened the authority of the crown.

Throughout his reign he was engaged in an intense struggle to gain control of the straits of Gibraltar in order to prevent any Moroccan invasion in the future. Immediately after his accession he had to provide for the defense of the southern frontier against a new challenge by Abū Yūsuf, the Merinid emir, Alfonso X's last ally. Landing at Tarifa in April 1285, he besieged Jerez while his troops devastated a broad zone from Medina Sidonia to Carmona, Écija, and Seville. While Sancho IV sent his Genoese admiral, Benedetto Zaccaria, to protect the mouth of the Guadalquivir, a Castilian fleet of about one hundred ships waited in the straits to relieve Jerez or to disrupt the emir's communications with Morocco. When Sancho IV marched southward from Seville to Jerez, Abū Yūsuf decided not to test his fortunes in battle, and retreated to the safety of Algeciras in August. Two months later Sancho IV made peace with the emir.

Meanwhile, after the failure of the French crusade against Aragón, Sancho IV, because of continuing concern over the claims of Alfonso de la Cerda, was under pressure to enter an alliance with either kingdom. On the one hand, Philippe IV of France was Alfonso's cousin while Alfonso III of Aragón had custody of the two Infantes de la Cerda. Lope Díaz de Haro, lord of Vizcaya, who had much to do with securing Sancho IV's recognition as heir to the Castilian throne, preferred the alliance with Aragón as a guarantee that Alfonso de la Cerda would not be free to press his claims. Lope was the most influential person in the realm because the king had given him control over the royal household and finances as well as custody of all royal strongholds. Other members of the royal council eventually convinced Sancho IV that he had entrusted Lope with far too much authority. Thus the king turned against him in 1288 and caused his death in a violent scene.

Now free to decide for himself, Sancho IV broke with Aragón and allied with France. He expected that the continual threat of French intervention on behalf of the Infantes de la Cerda and papal opposition to the legitimation of his marriage and his children would be eliminated. He also promised to give the Infantes joint rule over Murcia and Ciudad Real as an independent realm, provided they renounced all claims to Castile. At that, Alfonso III of Aragón liberated the Infantes and proclaimed Alfonso de la Cerda as king of Castile. Inconclusive border warfare followed until 1291, when the new king of Aragón, Jaime II, concerned about his capacity to retain the kingdom of Sicily against papal opposition, decided to make peace. Jaime II left the Infantes de la Cerda to fend for themselves and agreed with Sancho IV on zones of future exploitation and conquest in North Africa.

The conclusion of this treaty came at an opportune moment because the Merinids were preparing to resume hostilities as soon as the truce with Castile ran out. Although Benedetto Zaccaria, again in Castilian service, defeated the Moroccan fleet in August 1291, Abū Ya'qūb, the Merinid emir, invaded Spain soon after. In the spring of 1292, Sancho IV, aided by Muḥammad II of Granada (who feared the Merinids), besieged Tarifa, a port often used by Moroccan forces entering Spain. Sancho IV entered the town in triumph on 13 October 1292. The king of Granada, who had expected that Tarifa would be restored to him, now broke with Castile and joined the Moroccans in a new siege of Tarifa in 1294. Nevertheless, Alfonso Pérez de Guzmán, known thereafter as "el bueno," successfully defended Tarifa until a Castilian and Catalan fleet compelled the enemy to withdraw. The capture and subsequent defense of Tarifa was the first stage in clos-

ing the gates of the peninsula to future Moroccan invasions.

Not long after Sancho IV died on 25 April 1295, his wife María de Molina, whom he married at Toledo in July 1282, became regent for their son, Fernando IV. Sancho wrote a book of counsel titled *Castigos e documentos* for Fernando.

SANT JORDI, JORDI DE

Valencian knight and poet. His short life coincided with the early years of King Alfonso the Magnanimous's court, among whose members we find Andreu Febrer, and Íñigo López de Mendoza, the marqués of Santillana. As a personal servant, he benefited from his young lord's confidence and devotion to poetry, and fought bravely in Alfonso's expeditions to Corsica and Sardinia (1420) and the south of Italy. There, while imprisoned in Naples (1423), he addressed to the king a realistic but dignified poem claiming freedom on the grounds of the chivalric ethic (*Presoner*). On the whole, Sant Jordi's poetry, though having slighter Occitan features than his predecessors', is the brilliant result of the last stage of the troubadour revival: according to Santillana's admired recollections, Sant Jordi embodied the best of an ancient but lively tradition (he even used to compose the music) that deserved the same literary glory as Dante. His thirteen love poems focus on the element of suffering in *fin' amor*, yet strikingly relating true love to an honorable condition (mainly in his allegorical *Passio amoris secundum Ovidium*) and even chastity. Two of them, which evoke with some intimate love for a certain Isabel, contrast with the other nine addressed to the widow queen Margarida de Prades, a real *midons* who held a sort of literary court. In these, Sant Jordi used his rhetorical skill to best effect for the highest expression of his love (*Stramps*). Moreover, Sant Jordi wrote four satirical complaints mainly against the upside-down world. His witty sense of humor as well as his virtuosity remind us of Cerverí de Girona and account for his ability to draw both on literature (the *enueg*, the prestigious metrics of *lai*, Petrarch's *adynata*) and reality, while offering another view of courtly principles.

SANTA CRUZ, ALONSO DE

A prominent figure in the intellectual life of sixteenth-century Spain, Alonso de Santa Cruz contributed to the study of its medieval history in his *Chronicle of the Catholic Monarchs*. Born in Seville around 1505, he seems to have received his education while resident in the city's Alcazar: it is not known whether he ever attended a university. By the time of his death, on 6 November 1567, he had been *cosmógrafo mayor* to both Charles V and Philip II and had achieved a massive production of work on cartography, cosmography, astronomy, geography, genealogy and heraldry, economics and politics, philosophy and history. Unusually, in comparison with his scholarly compatriots in the Siglo de Oro, he apparently eschewed religion as a subject, being fired from his early years, spent in and near the Casa de Contratación in Seville, by enthusiasm for the discoveries then being made in the New World. His long years of academic preparation were developed into practical experience when he accompanied Sebastian Cabot on his expedition, supposedly to the Moluccas but arriving in New Spain, or Mexico, between 1526 and 1530. Even if Santa Cruz had never been a historian of Fernando and Isabel, he would still have been notable for his cosmographical works, such as his *Islario general*, a description, heavily influenced by classical sources, of the islands of the Mediterranean. His chronicle of the Catholic Monarchs (ca.1550) inevitably relies on earlier writers, such as Andrés Bernáldez, Fernando del Pulgar, and Lorenzo Galíndez de Carvajal, but it also includes documentary sources. He also wrote a history of the reign of Charles V.

SANTA FE, JERÓNIMO DE

Joshua ben Joseph ibn Vives al-Lorqi was a Jewish scholar of some renown, possibly the son of Joseph al-Lorqui, an important scientist. The family originated perhaps, from Murcia, but Joshua lived in Aragón. There is no evidence he was a "student" of Rabbi Solomon ha-Levy of Burgos, but when Solomon (Pablo de Santa María) converted (ca.1390), Joshua heard about it and wrote him a Hebrew letter asking the reasons for his conversion (part of Pablo's reply survives). Sometime thereafter, Joshua himself converted, taking

the name Jerónimo de Santa Fe. He was baptized by Vicente Ferrer, the Dominican missionary who converted perhaps thousands of Jews (his later canonization was due in large part to his baptism of this important Jewish scholar). The zealous new convert played a major role in the Tortosa disputation and composed his major work, an anti-Jewish polemic, in Latin shortly after this (*Hebraeomastyx*). A Hebrew translation was made and circulated widely, arousing numerous Jewish responses. The work was largely based on Ramón Martí's *Pugio fidei*.

SANTA MARÍA DE CARTAGENA, ORDER OF
See MILITARY ORDERS**SANTIAGO DE COMPOSTELA**

The major urban center of the province of Galicia in the northwest of Iberia during the Middle Ages, Santiago de Compostela is located between the Tambre and Ulla Rivers about thirty miles inland from the Atlantic Ocean. There is no evidence for a town there during the Roman period but archaeological remains indicate the existence of some sort of Christian shrine and cemetery that continued in use into the subsequent Suevic and Visigothic periods. Both the failure of the archaeological record and the subsequent history of the site suggest its abandonment during the late Visigothic period, the time of the Muslim occupation of Galicia in the first half of the eighth century, and the earliest period of the Christian recovery of the province.

The history of the town proper may be said to have begun with the purported discovery there of the relics of St. James the Great by Bishop Theodomir of Iria Flavia sometime around the year 830. Iria Flavia (modern Padrón) was a Roman port and bishopric by the Ulla River not far from where the latter flows into the Ria de Arosa and thence into the Atlantic. The discovery of the remains of the apostle was quickly reported to Alfonso II (791–842) of Asturias who had the first shrine-church built on the site. The bishops of Iria Flavia soon began to reside in Compostela at least periodically, a community of clerics was formed to serve at the shrine, and two monastic communities, San Pelayo de Antealtares and San Martín Pinario, also

SANTIAGO DE COMPOSTELA

Pilgrimage Routes to Santiago de Compostela

came to cluster about the church. These clerical communities, and those who provisioned and waited on them, formed the first nucleus of the town.

The next major stage in the growth of the town resulted from the development of an international pilgrimage to Santiago de Compostela, after Rome itself the sole resting place of an apostle in the western European world. During the ninth century Compostela seems to have been the object of a purely regional cult, gradually growing in importance. Alfonso III (866–910) of Asturias had the old church of Santiago torn down and rebuilt in a much grander style.

It is in the tenth century that the shrine began to attract pilgrims from beyond the Pyrenees and to figure occasionally in the records and letters of those who had visited the church or had at least heard of it. Compostela was of sufficient importance by the end of that time to merit the attentions of the great Muslim ruler

of the south, Al-Manṣūr, who overran the town, sacking and burning it, in 997.

But Santiago de Compostela, like the remainder of Christian Iberia, seems to have recovered rapidly from the depredations of the Muslim chieftain. The pilgrimage from beyond the peninsula was swelling and the Christian rulers of León-Castile, into which the old kingdom of Asturias had grown, began to regard it in an ever more favorable light. The capture of Muslim Coimbra in 1064 by Fernando I (1037–1065) was credited to the favor of its saint who now began his long metamorphosis into “Santiago Matamoros,” patron of the Reconquest and of Christian Spain. Bishop Diego Peláez (1071–1088) of Iria Flavia began, in 1076, the construction of a grand, new Romanesque church at the shrine. In 1095 Bishop Dalmatius of Iria Flavia returned to his native France to attend a papal council at Clermont. There he secured a bull from his

fellow Frenchman, Pope Urban II, translating the see of Iria Flavia itself to Santiago de Compostela and exempting the translated see from its old subjection to the metropolitan of Braga and making it immediately dependent on Rome.

More directly than before the bishops now became, under the king, the civil as well as the ecclesiastical rulers of Santiago de Compostela. Under episcopal patronage and their management of the pilgrimage, the town prospered as the devout from as far away as Germany, Italy, France, England, and even the Scandinavians, traveled there to venerate the saint and incidentally to enrich the town's businessmen. In 1107 Alfonso VI (1065–1109) granted the bishops of Compostela the regalian right to mint coins in the town.

But the prosperity of the town and the authority of its bishops did not always sit well together. In 1116–1117 and 1135–1136 there were conspiracies eventuating in communal movements whose aim was to establish elected civil officials independent of their prelate to conduct the judicial and commercial business of the town. These conspirators were sufficiently influential to gain the ear of the the crown itself and both Queen Urraca (1109–1126) and Alfonso VII

(1126–1157) were at times willing to cooperate with them for reasons both of politics and profit. These insurrections failed in their immediate objectives largely by reason of the violence to which they resorted. In 1117 an attempt to burn their prelate to death in a tower of his own cathedral narrowly failed and directly imperiled the life of Queen Urraca who was visiting with him at the time. Again in 1136 another attempt culminated in the stoning of their ordinary within the precincts of his own cathedral but again he escaped with his life and the perpetrators had to be disavowed by the crown.

Ironically these events coincided with the greatest period in the history of the town and of its church. In 1100 Diego Gelmírez, the scion of a local noble, became bishop. Under his direction the construction of the great Romanesque cathedral begun by Bishop Diego Peláez was carried much closer to completion. In 1120 Gelmírez was able to influence Pope Calixtus II to transfer the vacant metropolitan jurisdiction of Muslim-held Mérida to the shrine of the apostle and to concede to it the suffragan sees of Salamanca, Avila, and Coimbra. The now Archbishop Gelmírez was also to become papal legate for the ecclesiastical provinces of Santiago de Compostela and of Braga. He even attempted to move the papacy to transfer the primatial jurisdiction of the archbishopric of Toledo over the Iberian church to Compostela but was thwarted by the strong objections of the crown.

At the same time the prelate of Santiago was one of the greatest political figures of the realm. In 1107 he had become the guardian, along with Count Pedro Froílaz of the Galician line of the Trastámara, of the child who would become Alfonso VII in 1126. The guardianship made Gelmírez one of the most important allies and sometimes one of the most important opponents of the boy's mother, Queen Urraca, throughout her reign. During the early years of the reign of Alfonso VII, he was one of the major advisers of his erstwhile ward, but after 1134 his influence waned and by his death in 1140 he was but a minor figure politically. No other archbishop of Santiago would loom so large in the politics of the Iberian Peninsula, for León-Castile was marching steadily southward as the Reconquest proceeded and the old primatial see of Toledo eclipsed Compostela in importance in the late twelfth century, as would Seville in the thirteenth. This process was delayed for a time when León-Castile was divided into two distinct realms after the death of Alfonso VII. That event magnified the importance of Compostela to Fernando II (1157–1188) and Alfonso IX (1188–1230), both of whom chose to be interred in the church of the Apostle. But the partial eclipse of

the town resumed with the permanent reunion of the two kingdoms under Fernando III (1230–1252).

The enduring growth of the pilgrimage continued to underwrite the prosperity and growth of the town nevertheless. In 1181 Pope Alexander III conceded the privilege of a Holy Year to the shrine in every year in which the feast-day of the apostle, 25 July, fell on a Sunday. During such a year the pilgrim to Compostela could secure the identical spiritual benefits as he might by a pilgrimage to Rome or to the Holy Land itself. Among a host of others, no less a personage than the great St. Francis of Assisi would make the journey to worship at this shrine. The potency of the apostle continued to swell the credit of Compostela with the popes of Rome as well and allowed it to build an ecclesiastical empire in the peninsula despite the opposition and claims of the archbishops of Braga and Toledo. Finally the suffragan bishops of Santiago came to number all of the Galician sees, once the suffragans of Braga; Lugo, Mondoñedo, Orense, and Túa, and then a series of bishoprics stretching south from Astorga through Zamora, Salamanca, Avila, Placentia, Ciudad Rodrigo, and Coria, even to Badajoz in the Guadiana River valley where it confronted the newly erected archbishopric of Seville.

The town continued to batten on the pilgrim trade. In particular the shops of its silversmiths just outside the cathedral itself became famous. But the patronage of the shrine supplied funds for the various building campaigns in and around its precincts that gave regular employment to the artisans and laborers of Compostela as well. Gelmírez had erected a new episcopal palace directly adjacent to the church in addition to carrying the cathedral itself as near to completion as medieval cathedrals ever were. The late twelfth century saw the construction of a new facade for the church, the famous Portico of Glory. In the early fourteenth century what later became the present clock tower was added. The fifteenth century saw major additions to the monastery of San Martín Pinario.

In law as well as in the economy Santiago de Compostela continued to be an ecclesiastical town. But the burghers of the city enjoyed a limited autonomy under the aegis of their own council, or *concejo*. Disputes continued to be frequent and, as before, involved appeals to the crown for support by one or the other party. Under Kings Fernando III and Alfonso X (1252–1284) they concerned the obligations of lands held by the townsmen in the countryside to episcopal officers, the rights of churchmen to dispose of the agricultural products of their rural properties in the city, the method of selection of the judges of the *concejo*, and of course the relative jurisdictions of these judges and the archiepiscopal judges in criminal and civil cases. Such dis-

putes were complicated by the fact that the chief executive instrument of the archbishops themselves, the cathedral chapter, was composed largely of canons linked by birth to the burgher class of the town and to the local nobility of the countryside.

The fortunes of the town and its population were also affected, at least indirectly, by the success or failure of their prelate to collect Los Votos de Santiago. This annual tribute owed by each Christian household in the peninsula to the church of the Apostle was supposedly granted by Ramiro I (842–850) in gratitude for the assistance of Santiago in the defeat of the Muslims at the battle of Clavijo. The charter of Ramiro is actually a forgery of the early twelfth century. There may have been an earlier, more humble, local tribute paid to the shrine and its apostolic protector but the increasing attempts of its archbishops to widen its collection gave rise to strong resistance everywhere. Although the tribute was supposedly due from every Iberian Christian household, such attempts were concentrated in the growing ecclesiastical jurisdictions of the Compostelan archbishops in Galicia and their new suffragan sees of Extremadura. Usually such claims were settled by compromise that produced a lesser income from discrete properties in the area affected. The disputes engendered by the claim to Los Votos continued well into the modern period.

During the latter two centuries of the Middle Ages, Santiago de Compostela and its church shared in the congenital disorder and violence universal in western Europe. The Black Death and the Avignonese papacy of the fourteenth century, the Great Schism of the fifteenth, all had their toll in terms of absentee clerics and the growing importance of curial reservation and curial taxation in the governance of the local churches. In the secular sphere the spectacular collapse of the dynasty of Alfonso X (1252–1284) during the latter portion of his reign and the almost endemic civil war it engendered over the next two centuries brought the bloody disputes of the realm at large to sanction and embittered the old staples of Galician and Compostelan rivalries. The substantial growth of both papal and royal authority during the twelfth and thirteenth centuries and the consequent ability to project their power into hitherto relatively isolated areas of church and realm guaranteed that local problems would be linked to wider ones.

In 1317 Pope John XXII from Avignon appointed the French Berenguer of Landor, a general of the Dominican Order, as archbishop of Compostela in reaction to a contested election there. It took some four years of threats of war, diplomacy, and actual fighting before Berenguer was able to enter and rule his pontifical city in 1321. On 29 June 1366, Archbishop Suero Gómez was murdered in the streets of Compostela by

royal agents while on his way to an interview with King Pedro I the Cruel (1350–1369) of Castile. Fully two-thirds of the archbishops of Santiago de Compostela during these centuries were strangers, imposed upon the city and church by the crown and the papacy. Frequently they were members of the great lineages of the realm such as the Lara archbishop Juan García Manrique (1383–1398) or Alfonso de Fonseca (1460–1506). Such prelates were often likely to reside at court for long periods, far from their city, and sometimes to die in the royal service while on campaign with their kings in the Muslim south.

What is most remarkable is that the pilgrimage, the foundation of the town's prosperity and even its existence seems to have endured with its attraction and reputation largely undiminished. Nevertheless the town could not escape the effects of that age in Iberia. From a population of perhaps fifteen hundred by the year 1000 it had reached an apogee by 1300 of roughly six thousand. As a result of the Black Death and the troubles, one suspects that its population dipped by at least a third and then, as was the usual European and Iberian experience, rebounded to something like its 1300 figure by 1500, when stability and prosperity returned under the Catholic Monarchs. But by that time the impending Protestant Reformation in northern Europe was about to deal a major blow to the veneration of saints generally and to the pious practice of pilgrimage in particular, and thereby to a town whose development had always depended more on religious factors than on geographical or economic ones.

SÃO JORGE DA MINA

Castle, city, and important trading post established in 1482 by João II in Guinea, present-day Ghana. Its foundation followed closely the signing of the Treaty of Alcáçovas with Castile in 1479, which gave the Portuguese crown a free hand on the mainland of Africa (even though it recognized the Spanish as sovereign in the Canary Islands). Until its loss to the Dutch of the West India Company in 1637, it served as com-

mercial center of trade with the entire region embracing the Malagueta, Gold, Ivory, and Slave Coasts, plus the islands of São Tomé and Príncipe. Undoubtedly the main reason for the castle itself was to ward off interlopers and protect the gold trade.

Its creation was remarkable for the time, for the castle, the most imposing trading fort ever constructed on the African mainland, was prefabricated in Portugal and shipped down in two *urcas*, or cargo vessels, along with one hundred workmen, all under the command of João II's councillor, Diogo de Azambuja. The date of departure from Lisbon is known: 12 December 1481, and the fleet consisted besides of ten caravels and five-hundred soldiers. Upon arrival, Azambuja first negotiated a location for his settlement with the local potentate, Caramansa—a village called *Duas Partes*. Thereafter, he lost no time in building a foundation and assembling the castle, the speed no doubt accelerated by local skirmishes with Caramansa's rivals. In 1486 João II accorded it the status of city. Its captains resided in the castle itself and served the usual three-year terms. Among them were Duarte Pacheco Pereira, Diego Lopes de Sequeira, Brás, the son of Afonso de Albuquerque, the chronicler João de Barros, and the heroic soldier of the Ethiopian campaign, Estevão da Gama.

Mina (also called Elmina) played an important part in the evolution of the Portuguese commercial system as well. Under Henrique, a customs, outfitting and warehousing establishment called the *Casa de Guiné*, had been created at Lagos to outfit and receive caravels on voyages to Africa and to collect the percentages of profits agreed upon in deals with authorized merchants. After the settlement at Mina, however, João II moved the operation at Lagos to Lisbon and paired it with the older *feitoria* at Arguin Island and the new and bigger one at Mina; it was then known as the *Casa de Guiné e Mina*. Until 1506 private and foreign merchants were allowed to invest their moneys in the African trade through its offices; its officials invested their moneys for them and distributed the profits.

SARAGOSSA, KINGDOM OF *See* BANŪ HŪD

SARMIENTO, PERO

Of minor nobility by origin, Pero Sarmiento was the chief butler (the honorary post of *repostero mayor*) to Juan II of Castile, and also became the king's *asistente* and *alcaide* in Toledo. His main claim to fame was the fact that he joined the rebel uprising in Toledo in 1449 and became its leader, widening popular grievances into a general attack on the court. The rebellion had begun as a popular reaction against tax collectors and *conversos*, (converts to Christianity), but Sarmiento redirected the movement into a broad-based attack on Alvaro de Luna, who was accused of subverting royal authority, fomenting corruption in municipal government, and being responsible for a decline in the economic fortunes of the greater and lesser nobility.

Of even greater significance, however, was the so-called *sentencia-estatuto*, which the Toledan rebels promulgated under Sarmiento's leadership on 5 June at the height of the uprising. This was specifically directed against the *conversos* who held office in Toledo and decreed their expulsion from their posts. It has generally been accepted that Sarmiento's *sentencia-estatuto* marked the first decisive step in the formulation of the doctrine of *limpieza de sangre*. In theory the impediments and limitations imposed on the Jews had traditionally been based on religious grounds. The Jew as potential convert, therefore, was not irremediably wicked, and baptism, which made the Jew a New Christian or *converso*, was the crucial rite of transition that altered everything. This view was enshrined in the *Siete Partidas* of Alfonso X, and it was repeated during the Toledan crisis of 1449 by the *converso* and royal secretary Fernán Díaz de Toledo when he argued in his *Instrucción del Relator* that baptism turned the *converso* into a new person, and eliminated all previous sins and impediments. The *conversos*, therefore, could aspire to hold public offices in exactly the same way as the Old Christians, and many did so successfully. The view adopted by Sarmiento in his *Sentencia* was brutally simple: the *converso* remained a Jew despite his conversion and should therefore be barred from holding any public office.

Although the uprising failed, Sarmiento was allowed to leave Toledo and disappeared into obscurity into his northern seignorial lands. Yet despite the fact that influential *conversos* like Fernán Díaz de Toledo and Bishop Alonso de Cartagena had openly written in defense of the *conversos* and against the absurd accusations of Sarmiento and the Toledan insurgents, the setting up of the Spanish Inquisition in 1478 in many ways confirmed that some of the views expressed in the *sentencia-estatuto* had been assimilated by official thinking.

SAYAGÜÉS

Sayagüés was the name given to the speech of less articulate country folk as depicted mainly in sixteenth- and seventeenth-century Spanish plays. Misidentified with the town of Sayago in southwestern Zamora province, it was in reality based on *charro* (or *charruno*), the rustic Leonese dialect of the region around Salamanca. It was used most skillfully (and most authentically) by Juan del Encina (1468–1529) and, especially, Lucas Fernández (1474–1542), and less effectively by Gil Vicente and Bartolomé de Torres Naharro. Such later writers, as Quevedo, Lope de Vega, and Tirso de Molina, added Castilian archaisms and vulgarisms, pseudo-Latinisms, and apparent Lusisms to create a stylized and comical rustic parlance not traceable to any particular region. Cervantes, in the voice of Sancho Panza, opposed coarse *sayagüés* to refined Toledan speech.

Among characteristic features of *sayagüés* are (1) the palatalization of *l-* and *n-* (for example, *lladrón* "thief," *lluego* "then"; *ño* "no," and *ñuestro* "our"); (2) *r* for *l* in postconsonantal position (for example, *habrar* "to speak," *praze* "it pleases"); (3) aspiration of *f-* followed by *ue* (for example, *hu(e)* "he was," *huerte* "strong"); (4) monophthongal second-person plural endings (for example, *mandás* "you send," *traés* "you bring"); (5) second-person plural imperatives in *-ail-ay* (for example, *miray* "look!"); (6) abundant apocope in verb forms (for example, *diz* "he says," *vien* "he comes"); (7) abuse of the prefix *per-* (for example, *percoger* "to gather," *pernotar* "to observe").

The term *sayagüés* ultimately came to designate not only rustic speech, but also uncouth behavior and customs of all sorts.

SCHOOLS, CATHEDRAL See EDUCATION, CHRISTIAN

SCIENCE, ANDALUSIAN

The period of Muslim occupation of the whole or a part of the Iberian Peninsula, which lasted between 711 and 1492, produced an important scientific devel-

opment that did not have an equivalent in Christian Spain. This development affected, above all, astronomy, medicine, and pharmacology, agronomy (*Filāḥa*), and, to a lesser extent, mathematics, physics, and alchemy.

The Muslim conquerors of 711 were not cultivated people and the scientific knowledge they brought with them was limited to folk astronomy, practical rules concerning the orientation of mosques and the determination of the times of prayer, irrigation technologies for the construction of *qanāts*, and, perhaps, a kind of folk and religious medicine (*tibb al-Nabī*, “medicine of the Prophet”). This is why there is some evidence of the survival of a Latin scientific tradition in al-Andalus, especially until around 821 (beginning of the reign of ‘Abd al-Raḥmān II). The oldest extant astrological text (ca. 800) seems to be a translation of a lost Latin original and the Córdoba physician Ibn Juljul (b. 943), in his history of medicine, mentions six doctors for the period 852–912, of which five are Christians and practice medicine according to one of the books written by the Christians that had been translated into Arabic. This Latin tradition also affected agronomy: even if traditional theories concerning a direct transmission of the agronomical work of Iunius Moderatus Columella in al-Andalus seem to be discredited, scholars like Attié still defend the existence of Latin-Arabic translations of agronomical works and consider that the anonymous author of the *Kitāb tartīb awqāt al-ghirāsa wa-l-maḡhrūsāt* was a Christian. This should be combined with a very early development of an Islamic agronomy: ‘Abd al-Raḥmān I (756–788), the first Umayyad emir, founded the first botanical garden in the Ruṣāfa, near Córdoba, and made there the first attempts to grow plants brought from the Near East.

The period between the beginning of the reign of ‘Abd al-Raḥmān II (821–852) and the fall of the Umayyad Caliphate (1031) is characterized by the introduction of a new scientific culture developed in eastern Islam, since about 750, through the assimilation of the “sciences of the Ancients” (*‘ulūm al-awā’il*)—exact sciences, biology, medicine and pharmacology, physics, alchemy, mechanical technology, and philosophy—inherited from India, Iran, and especially, Greece. These new sciences reached al-Andalus as a result of *riḥla* (travel) made by young students in search of a higher education in Eastern capitals; the arrival in al-Andalus of the most important books published in the East due to the fact that the Umayyad emirs, since ‘Abd al-Raḥmān II, collected an important royal library, sent ambassadors to the East and developed a network of commercial agents in order to acquire new publications; and in a few instances the arrival to Córdoba of Eastern scientists. Royal patronage

fostered the development of two applied sciences that had practical applications for the emir: astrology—and this had an obvious influence in astronomy—and medicine. It is extremely difficult, due to the lack of sources, to follow the development of these sciences between about 821 and 950, although it seems that the introduction of Arabic versions of the works of Hippocrates and Galen started under ‘Abd al-Raḥmān II with the arrival of the Eastern physician Al-Ḥarrānī.

The situation changes toward the middle of the tenth century: the apparition of the mathematical and astronomical school of Maslama al-Majrīṭī (d. 1007) proves that Euclidean geometry, an arithmetic based on a mixture of Indian and Hellenistic methods, a new algebra, the Indian astronomy of the *Sindhind* tradition (introduced in al-Andalus around 850) and Ptolemaic astronomy had been fully introduced and maturely assimilated. During the reign of ‘Abd al-Raḥmān III (912–961) the physician Yaḥyā ibn Ishāq, whose father was a Christian doctor, combines the Latin medical tradition with the writing of a book in which he summarizes all the Greek medicine known in his time. The works of Sa‘īd ibn ‘Abd Rabbihi (d. 953 or 966), ‘Arīb ibn Sa‘īd (ca. 912–ca. 980)—the author of the first known handbook on gynecology and pediatrics—and Ibn Juljul show that the whole corpus of Hellenistic medicine has been fully assimilated and, thus, the situation is ready for the brilliant medical and surgical work of Abū al-Qāsim al-Zahrāwī (d. 1013). This is also the period in which we can place the birth of the Andalusian school of botany and pharmacology usually associated to the Córdoba revision of the Eastern Arabic translation, by Iṣṭifān ibn Basīl, of Dioscorides’s *Materia medica*. This was the standard Hellenistic compilation of “simple” drugs (mostly vegetal) but the Eastern translation had not identified most of the Greek names of the plants. Good diplomatic relations between Córdoba and Byzantium permitted the arrival in al-Andalus (ca. 948–ca. 951) of a good illustrated Greek codex of Dioscorides’s work as well as of Nicholas, a Byzantine monk who was a good botanist. Nicholas was soon surrounded by a group of Córdoba physicians—among whom we find Ibn Juljul and the famous Jew Ḥasdai ibn Shaprūt—who revised the translation and identified most of the simples described in it. In order to avoid further confusions the names of simples were given, since then, in all the languages in use at the time (Greek, classical and colloquial Arabic, Latin, and, often, several Romance dialects). Ibn Juljul, who seems to have played a central role in this job, formulated the program of research to be developed hereafter by Andalusian botanists: the identification of Dioscorides’s simples had to be complemented with the identification, description, and

classification of simples not mentioned by the Greek author and which could be found in both al-Andalus and the rest of the known world.

The fall of the caliphate in 1031 and the fragmentation of al-Andalus into multiple “petty kingdoms” (*mulūk al-tawā’if*) did not imply a scientific decay but rather the eclosion of a period of some fifty years (1031–1086) which could be considered “golden,” during which Andalusian science reached its summit. The apparition of multiple centers of power had two important and contradictory consequences: on the one side these *tā’ifa* kings wanted to be surrounded by scientists in the same way as they also enjoyed the company of poets; on the other, none of them seems to have had enough economic capacity to continue the policy of a systematic acquisition of Oriental books that had been followed by the Umayyads. To this one should add that the high level reached by Andalusian scientists at that period implied that young students no longer needed travel to the East in order to complete their education. As a consequence the *tā’ifa* period marks a slowing down in the cultural relations with the Muslim East, the development of Andalusian science on its own basis, and, consequently, the fact that it reaches a high degree of originality in relation to its Eastern counterpart. The final result will be, however, that the end of this period also implies the beginning of the decay of an isolated Andalusian science.

During the *tā’ifa* period science is scattered in different centers that develop a certain degree of specialization: mathematics in Zaragoza, astronomy in Toledo, agronomy in Toledo and Seville. The development of the exact sciences can be followed. As for the rest one should remark the apparition of two important books on magic (*Ghāyat al-ḥakīm*, known as *Picatrix*) and alchemy (*Rutbat al-ḥakīm*) by the same author incorrectly identified with Maslama al-Majrīṭī. The *Rutbat* is one of the very rare alchemical Andalusian texts and it has the obvious interest of its careful descriptions of experiences done in the laboratory. The *Ghāya* is a treatise on talismanic magic, a discipline with obvious connections with astrology, and it insists on the role of the magician as a man who does not pretend—like the astrologer—to predict the future but who wants to alter and control nature. In other words, the magician appears as a predecessor of the engineer. This leads us to the very interesting recent (1977) discovery of the *Kitāb al-asrār fī natā’ij al-afkār* (Secrets of the Results of Thoughts), written by an otherwise unknown (Aḥma)d or (Muḥamma)d ibn Khalaf al-Murādī (fl. probably in Toledo, eleventh century), extant in a manuscript copied in Toledo during the reign of Alfonso X and in which we find the handwritten notes of Rabbi Ishāq ben Sīd (*Rabiçag*), the most im-

portant of the Alfonsine scientists. This book is a treatise on mechanical engineering that includes descriptions of clepsidras with moving automats, toys, and war machines and it corresponds to a tradition completely different from the Eastern one.

Quite surprisingly, after the brilliant results obtained by medicine in the second half of the tenth century, we do not have medical texts of the *tā’ifa* period although pharmacology and botany continue along the lines marked by Ibn Juljul in the work of authors such as Ibn Wāfid (d. Toledo, 1075), Ibn Buklārish (d. beginning of the twelfth century) and others. With Ibn Buklārish a new subject of theoretical research appears: the determination of the degree of heat/cold, dryness/humidity of a compounded drug as a function of the degree of such qualities in the simples used to prepare it. Medicine and pharmacology have, on the other hand, an important influence in the development of a new scientific discipline, agronomy, the origins of which can be found, as we have seen, in the botanical garden founded in Córdoba in the eighth century. New botanical gardens appear in this period in Toledo, Seville, and Almería and a group of authors leave an important corpus of agronomical works in which we can discover the echoes of the best agronomical literature available (Greek, Latin, and Arabic) together with an interest for experimentation and observation of the techniques used by Andalusian peasants. The names to be quoted are Abū al-Khayr al-Ishbīlī (Seville), Ibn Baṣṣāl (Toledo and Seville), Ibn Ḥajjāj (fl. 1073, Seville), and Al-Ṭignarī (fl. 1075–1100, Seville and Almería). To the aforementioned list one should add the anonymous author of the *Kitāb tartīb awqāt al-ghirāsa wa-l-maghrūsāt*, whose chronology is not clear, and the agronomical work ascribed either to Ibn Wāfid or to the famous physician and surgeon Abū al-Qāsim al-Zahrāwī. Something should be remarked: most of these authors seem to have been physicians and/or pharmacologists and the Andalusian agronomical school is characterized by the creation of an agronomical theory and, consequently, an attempt to create a new science from agricultural practice. Such a theory is, basically, a transposition of the principles of Hippocratic and Galenic medicine in such a way that there is a perfect correspondence between the four elements of Empedocles, the four humours of the human body, and the four elements (‘*anāṣir*’) of agriculture: air, earth, water, and fertilizers (which occupy the place of fire).

After the brilliant period of the *mulūk al-tawā’if* al-Andalus—the extension of which had been considerably reduced due to the advance of the Christian conquests—would become, during a century and a half, a province of the Almoravid (1086–1145) and Almohad

(1145–1232) Maghribī empires. This obviously implies that the centers of power were beyond the straits of Gibraltar and, consequently, we begin to see migrations of Andalusian scientists toward North Africa. The intolerant character of the Almoravids did not favor the development of science and it probably explains why some scientists (Maimonides is a good example) abandoned al-Andalus and established themselves in the East: this is, perhaps, the moment in which some of the results of scientific research done in al-Andalus in the previous century became known in the Near and Middle East. The situation changes with the Almohads, who extended a certain patronage to physicians and, perhaps, astronomers. Concerning astronomy, the tradition of the schools of Maslama and Azarquiel continued in the work of Abū al-Ṣalt al-Dānī (ca. 1067–1134), Ibn al-Kammād (fl. ca. 1100–1150), and Ibn al-Hʿim (fl. 1205), but there also appears a current of criticism of Ptolemaic astronomy in the works of Jābir ibn Aflaḥ (fl. 1250) and the members of the Aristotelian school of philosophers, especially Al-Bīṭrājī (fl. 1185–1192). This is also the only period in which we find a certain activity in the field of physics due to the work done by Abū Bakr ibn Zakarīyā (Avempace) (1070?–1138) whose research on Neoplatonic dynamics reappears in Italy in the sixteenth century and has an obvious influence on the work of Galileo in his Pisan period (1589–1591).

Pharmacology and botany seem to have reached a level of maturity requiring the compilation of new encyclopedias which would occupy the place of Dioscorides's *Materia medica* and such is the work of Aḥmad ibn Muḥammad al-Ghāfiqī (d. c. 1150) and, especially, of ʿAbd Allāh ibn Aḥmad ibn al-Bayṭār (c. 1190–1248), whose role as the author of the greatest Andalusian botanical compilation is equivalent to that of Ibn al-ʿAwwām (fl. 1170–1200) who wrote *Kitāb al-filāḥa* (On Agriculture), which summarizes all the efforts of his predecessors in agronomical research. These encyclopedic attempts are not, however, the only characteristic in the development of natural sciences in this period and we can also observe a very keen interest in botanical theory in an extremely important anonymous book, *ʿUmdat al-ṭabīb fī maʿrifat al-nabāt li-kull labīb* (Physician's Aid for the Knowledge of Plants that Can Be Used by Any Intelligent Person) which contains the first known attempt to classify plants into genera, species, and varieties before Andrea Cesalpino (1519–1603) and Georges Cuvier (1769–1832). A recent edition of this work (Rabat, 1990) ascribes it to the agronomer Abū al-Khayr al-Ishbīlī, mentioned above in the *tāʾifa* period.

Finally, the Almohad empire also saw a very important development of medicine that reaches, now, its

second highest peak in the history of al-Andalus: the names to remember, here, are those of Abū Marwān ʿAbd al-Malik ibn Zuhr (Avenzoar) (ca. 1092–1161) and that of the famous philosopher Abū al-Walīd ibn Rushd (Averroës) (1126–1198). Their attitudes toward medicine were entirely different: while Ibn Zuhr was a physician with an eminently practical spirit who aspired to give a solid background to the literature of the *kunnāsh* (collections of recipes often used by doctors that lacked a good theoretical preparation), Ibn Rushd appeared as the prototype of the *ḥakīm* (physician-philosopher) who—in his famous *Kulliyāt fī-l-tibb* (*Colliget, Generalities on Medicine*)—pretended to integrate medicine into the general system of his thought, summarized Galen's works, and commented on them using the same methods he had applied to Aristotle while trying to reconcile his two authorities whenever he found a contradiction between them.

With the fall of the Almohad caliphate in 1232, al-Andalus had a long period (1232–1492) of pure agony. Its geographical extension was limited to the small Naṣrid kingdom of Granada. Contacts with Eastern Islam were rare and students usually completed their education in the Maghrib, where science had grown as a result of Andalusian seeds planted in the twelfth century. There was very little research done, and summaries and compilations were often the only scientific literature written. It is interesting, however, to remark that this period created two scientific institutions that were unknown until then in al-Andalus: the *madrasa* (the only institution of higher learning known in Islam, mainly dedicated to teaching law, but in which medicine and, perhaps, astronomy were occasionally taught), founded by Yūsuf I in Granada in 1349; the second institution is the *māristān* built in 1365–1367 by Muḥammad V, about which there is discussion on whether it was a hospital or an asylum for mentally ill patients.

On the whole there was a certain amount of uninterrupted scientific activity during the whole Naṣrid period that even affects mathematics: al-Qalaṣādī (c. 1412–1486 or 1506) plays an important local role in arithmetic and algebra. Astronomy is well represented by Ibn al-Raqqām (d. 1315)—author of an important book on the theory of sundials and of two sets of astronomical tables in the Zarqāllian tradition—and Ibn Bāṣo (d. 1316), who designed the last Andalusian universal astrolabe. There is reason to believe that there was astronomical activity until the very end: an astrolabe, with only one plate for the latitude of Granada, dated in 1481 has been recently published. The decay seems to be much stronger in the fields of botany, pharmacology, and agronomy: only the *urjūza* (a poem in *rajaz* meter) on agriculture written by Ibn Luyūn of

Almería (1282–1349) offers, once more, a compendium of Andalusian agronomy. A novelty in the period seems to be the interest in horses: five treatises dealing with hippology or hippiatrics are known. This is mainly due to the importance of these animals in warfare, a subject that, no doubt, interested the Naṣrids in Granada who used, in the siege of Huéscar (1324), a sort of gun loaded with gunpowder, probably for the first time in the history of medieval Spain.

Something should, finally, be said on the development of medicine, which was, without any doubt, the scientific discipline most cultivated in Granada. There are three names that deserve specific mention in this field: Muḥammad al-Shafrā (d. 1360), Muḥammad al-Shaḡūrī (b. 1327), and the famous polymath and politician Ibn al-Khaṭīb (1313–1375). Al-Shafrā and al-Shaḡūrī were practicing physicians whose works are full of references to their own experience especially in the case of the former, born in Crevillente, who studied surgery in Christian Valencia with a certain master Baznad (Bernat?) and who is never called *ṭabīb* (physician with a standard academic preparation) but rather *mutaṭabbib* (empirical professional of medicine). Ibn al-Khaṭīb, on the contrary, is a pure scholar who probably never practiced medicine but who had read all the medical literature available to him and resumed it in his books on hygiene, embryology, and pathology. Ibn al-Khaṭīb was also one of the four Naṣrid authors who wrote on the famous Black Death of 1348 (Al-Shaḡūrī was another), trying to establish its causes and the ways to prevent it: it is interesting to remark that the four of them agreed on contagion as the main cause for the spread of the epidemic. It is perhaps one of the last instances in which Andalusian science proved to be original.

SCIENCE, CHRISTIAN

Guy Beaujouan once made the penetrating observation that science in medieval Spain was distinguished by four factors: its Muslim presence; the weakness of its universities; the early maturity of its languages; and the contribution of its Jews. This continues to remain a valuable characterization, though perhaps one might add a fifth factor he left implicit, the supportive role of its monarchs.

The coexistence of Muslim and Christian societies in the Iberian Peninsula made it a natural locus for intellectual transmission from very early times. From the second half of the tenth century, when Gerbert of Aurillac studied at Ripoll (whose MS 225 suggests the material available there) and brought back to France treatises on mathematics and astronomy, Spain was the principal center of Arabic-Latin translation; but the heyday of the translations was the twelfth century. Some of the translators (who often made use of a Jewish collaborator's knowledge of Arabic) were Spaniards—John of Seville (fl. 1140), for example, and Hugh of Santalla (fl. 1145). Others, like Hermann of Dalmatia or Robert of Chester, came from all over Europe and converged on the peninsula to engage in translation, as the fame of Arabic science grew. In the second half of the twelfth century translational activity centered on Toledo, where the Italian Gerard of Cremona was the most prolific figure: besides more than two dozen works on mathematics and astronomy (including the Toledan Tables of Azarquiel), Gerard rendered much of Aristotle's natural philosophical corpus into Latin, as well as medical writings of Galen, Rhazes, and Avicenna (the *Canon*). Michael Scot (Aristotle's *De animalibus*) in the first half of the thirteenth century and Arnau de Vilanova (works by Galen and Avicenna) in the second show how Spain continued to be a center of scientific translations for at least another century, though the rate of productivity fell off.

The new translations of Aristotle and Galen became the basis for scientific study in the new European universities of the thirteenth century—at Paris, Oxford, Bologna, and Montpellier, all of which were active intellectual centers before 1250. In contrast, Spain had only one important university in the thirteenth century: Salamanca, founded in 1227, which despite the two chairs in medicine given it by Alfonso X el Sabio of Castile remained primarily a school of law for its first two centuries of existence. The peninsula did give rise to some outstanding figures in thirteenth-century scientific thought, notably Peter of Spain (d. 1277) and Arnau de Vilanova (ca. 1250–1311), but both taught at foreign schools (Paris/Siena and Montpellier, respectively). The distinctive scientific philosophy or *ars* of Ramón Llull had a limited vogue in the later fourteenth century, but it was so peculiarly personal as to be incapable of full integration into European scholasticism. Lérida, the first university founded in the Crown of Aragón (1300), produced no scientific literature until a hundred years later, when Antoni Ricart developed some of Arnau's theories. Elsewhere in Spain cathedral schools did not soon develop into universities; their libraries show that the cathedrals found

a practical use for scientific (particularly medical) knowledge but had no interest in elaborating or adding to it. The *Historia naturalis* of Juan Gil of Zamora (ca. 1275) at least proves that a Castilian Dominican could compile a scientific encyclopedia comparable to that of Thomas of Cantimpré or Vincent of Beauvais.

Rather than the university, the royal court would serve as a locus for scientific activity. In the third quarter of the thirteenth century Alfonso el Sabio instituted and supported a remarkable program of translation of Arabic works into Castilian, many united in the collection known as the *Libros del saber de astronomía*: it marks the first time that a Romance vernacular served as a medium for scientific thought. The Castilian texts had no circulation outside of Spain, however. One of them, the astronomical tables whose preparation the king had commanded—developed from the Toledan Tables but recalculated in 1272 on the basis of new observations—has long been supposed to have been the basis for the Latin Alfonsine Tables drawn up about 1327, but even this has recently been called into question.

It was the kings of Aragón-Catalonia who were the important patrons of Spanish science in the fourteenth century—most significantly Pedro IV the Ceremonious (r. 1336–1387). Pedro consciously emulated the achievements of Alfonso X in a variety of ways, and commissioned first Pere Gilbert and then Gilbert's disciple Dalmau ses Planes to make astronomical observations from 1361 to 1366, on the basis of which a set of tables for the meridian of Barcelona was finally completed by Jacob Corsino.

The work of Corsino, a Castilian Jew, is only one example of the contributions made to medieval science by the Spanish Jews, to an extent out of all proportion to their numerical presence in the population. They had often been indispensable linguistic mediators between Arabic scientific texts and Latin or Romance translations since the twelfth century, but they had an independent tradition of creative philosophical thought as well—as writers from Maimonides (born in Córdoba ca. 1135 and formed intellectually in Andalusia) to Hasdai Crescas (likely born in Barcelona, ca. 1340) reveal—that was definitively disrupted only with the Spanish pogroms of 1391. Patronized by the Christian monarchs, to whom they had more than linguistic skills to offer, it would be inappropriate to exclude them from an account of science within Christian society. Pedro IV's conquest of Mallorca (1343) brought the scientific accomplishments of the island's Jews to his attention: from the late 1350s men like Isaac Nafuci and Vidal and Bellshom Efraim produced for him not only treatises on astronomy and astrology but astronomical instruments (astrolabes, quadrants, com-

passes) and maps (as distinct from portolans), and the "Mallorcan school" of cartography helped provide the technical basis that made possible the fifteenth-century Age of Discovery.

SCIENCE, JEWISH

Synopsis

Medieval Spain was the setting for an intense Jewish involvement in the scientific enterprise. Jews were active in just about every branch of science. Original scientific texts were composed in Hebrew and Arabic, and others were transcribed or translated into Hebrew. Scientific ideas penetrated into almost every branch of Jewish literature. Jews participated in several major projects sponsored by non-Jews, particularly the preparation of the astronomical tables associated with the names Al-Zarqāl, Alfonso X of Castille, and Pedro IV of Aragón. Hasdai ibn Shaprut minister to 'Abd al-Raḥmān III (912–961), was instrumental in the translation into Arabic of Dioscorides's book on botany; in subsequent centuries, right up to the expulsion of 1492, many Jews served at the courts of Christian and Muslim rulers as physicians and astronomers. All in all, science seems to have been held in high esteem by Jews, and an acquaintance with its principal doctrines, if not a rather intimate knowledge, was requisite for anyone who desired intellectual recognition. Just about every philosophical treatise, including the mystical *Al-Hidāyah ilā farā'id al-qalūb* (*Duties of the Heart*) of

Bahya ibn Paqudah as well as the Aristotelian *Emuna rama* (*High Faith*) of Abraham ibn Daūd, contain rather detailed, usually up-to-date and accurate, discussions of scientific import. Some works of poetry contain whole sections of exclusively scientific material; Ibn Gabirol's *Keter Malkhut* and Ibn Sahula's *Meshal ha-Qadmoni* are two examples. Many shorter poems, including liturgical hymns, take their theme from the sciences, especially astronomy. Exegetical writers frequently appealed to current scientific knowledge; the works of Moses Nahmanides and Bahya ben Asher, for instance, draw on a variety of sources in the sciences and pseudosciences. Abraham ibn Ezra criticized those who utilized biblical commentary as a forum for the display of scientific erudition. However, his own commentaries (which were composed after he left Spain) are not free of lengthy, cryptic excurses, and, in any event, the supercommentaries to his text, many of which were written in Spain in the fourteenth century, are a storehouse of medieval scientific and pseudoscientific lore.

The science that we are speaking of comprises, in general, the Aristotelian and Ptolemaic systems, whose ultimate harmonization with Judaism is the achievement of Maimonides, born in Spain but forced to flee at an early age. Certainly, however, Spanish Jews were exposed to a wide spectrum of scientific theories. Magic and pseudoscience were widely accepted, at least in theory. Some figures were attracted to far-out notions (for example, Ḥayyim Israeli, cousin of the famous fourteenth-century astronomer, who maintained that three-quarters of the earth's surface remains in primordial chaos).

On the other hand, Spain also witnessed the crystallization of sophisticated, fundamentally antiscientific religious perspectives that remain influential to the present day. The development of these quite complex viewpoints seems to be intimately related to the successful assimilation of science on the part of other Jewish thinkers and, in particular, to the perceived commonality of interest on the part of Jewish and non-Jewish intellectuals, something which at times proved stronger than the socioreligious barriers of that period and hence threatened the distinctiveness of the Jewish minority. Tensions are evident even before the Maimonidean controversies of the thirteenth and fourteenth centuries. Judah Halevi paid a good deal of attention to issues of science and Judaism in his *Kuzari*. His overriding concern is the uniqueness of the Jewish experience, and, in general, he has no objection to scientific investigations so long as they do not challenge the essential distinctiveness of the Jewish people. More complicated is the stance taken by Moses Nahmanides of Girona (1194–1270). Although he espouses one half

of the well-known *kalām* occasionalist doctrine—namely, the denial of any causality other than God's immediate will—he does not profess the other half (that is, atomism). The mixture of Aristotelianism, magic, and medicine that he accepts is indispensable for his biblical exegesis; and in his halakhic writings he decries the lack of anatomical observations on the part of his predecessors and offers some of his own. In short, Nahmanides is rather eager to make use of the scientific knowledge of his day, but only after he has stripped science of any claim to be a self-sufficient explanatory system.

Survey

Several Jews composed encyclopedias. Abraham bar Ḥiyya's *Vesodei ha-Tevunah*, which survives only in part is a short work and concise. On the other hand, Judah ibn Mattka's *Midrash Hokhmah*, written in 1247, is a lengthy and comprehensive undertaking. Both these works emphasize the mathematical sciences, especially geometry and astronomy. By contrast, later endeavors contain little in the way of mathematics, highlighting instead natural philosophy, meteorology, and the description of terrestrial phenomena. Specimens are the *De'ot ha-Filosofim* of Shem Tov ibn Falaquera (d. ca. 1291), the *Shevilei Emunah* of Meir Aldabi (written in 1360), and a number of shorter works dating to the fourteenth century, such as *Ta'alumot Hokhmah* of Solomon ibn Gabbai and *Safer ha-Yesodot* of Joseph ben Joshua al-Lorqi.

The contribution of Jews to astronomy has been described elsewhere in this volume; it may be added that, in the medieval scheme, mathematical geography found its place in the astronomical literature, as did some mathematical topics, especially trigonometry. Turning to other branches of mathematics, we note Bar Ḥiyya's *Hibbur ha-Meshihah we-ha-Tishboret*, which contains an interesting derivation of the formula for the area of the circle; Plato of Tivoli's Latin translation of that work, *Liber embadorum*, was very influential. *Meyashsher 'Aqov*, which may have been written by the fourteenth-century apostate Abner of Burgos, contains an assortment of interesting material, for example, a construction of the asymptote to the conchoid. Isaac ben Moshe of Orihuela has left us a book on arithmetic. Finally, we must mention the valuable, as yet unstudied, compendium of one Aaron (fifteenth century); the unique copy is at Turin (MS A. V. 15). Medieval Jews do not display any keen interest in optics. A small section of Bar Ḥiyya's encyclopaedia treats this topic. The Arabic treatise of Aḥmad bin 'Isa was transcribed into the Hebrew alphabet. The anatomy of the eye was discussed in the medical literature,

and the psychology of perception was taken up in philosophical works.

We possess a very long list of Jewish physicians who served throughout the Iberian Peninsula in the service of both Muslim and Christian rulers; only a few may be mentioned here. Isaac ibn Yashush, known also as Ibn Kastār (d. 1056), at Denia; Moses ha-Levy Abulafia (d. 1235) at Seville; in the service of the kings of Castile, Joseph ben Judah ibn Ezra, to Alfonso VII (1126–1257), Judah al-Fakhar (ca. 1235); Isaac and Abraham ibn Waqār to Sancho IV (1284–1295); and Moses ibn Zarzal and Meir Alguadix to Juan I (1371–1390); Isaac Hamon, who served at Granada, in 1375; and Crescas, the Jewish oculist who successfully treated the cataracts of Juan II of Aragón (1458–1479). Queen Juana of Navarre, on a visit to France in 1349, went to some effort to summon there her personal physician, Salomon of Tudela. Solomon Bytol received a remuneration from Queen Isabel in 1476.

Jewish physicians engaged also in private practice. Indeed, many if not most savants supported themselves from medicine. This is true not just of philosophers, poets, and astronomers, but also the early cabalist Isaac ibn Laṭif (d. ca. 1290), and many rabbis as well. Jews untrained in the standard curriculum also engaged in the healing arts; in 1337, a Jewish woman, convicted of being an untrained practitioner, was pardoned by Pedro IV of Aragón.

The church was not indifferent to the widespread penetration of Jews into medicine. Several councils (for example, Zamora, 1313; Valladolid, 1322; Salamanca, 1335) forbade Christians from seeking treatment at the hands of Jews, and Spanish monarchs were reproached by the pope for the same offense, for example, Alfonso VIII in 1205. On the other hand, a papal bull of 1422 confirmed the right of Spanish Jews to practice medicine. The popular perception that Jews dominated the medical profession was exploited by some preachers, including Ramon Llull (1235–1315).

Toward the end of the eleventh century, Ibn Buklarish of Almería composed a work on simple remedies, listing the technical terms in Arabic, Syriac, Persian, Greek, Spanish, and Berber; his book is known only through quotations by a later author. In the next century, the Barcelonan Joseph ben Meir ibn Zabara set down the facts of anatomy in a poem, *Battei ha-Nefesh*; and his *Sefer ha-Sha'ashuim*, though not a scientific work, contains much medical and ancillary material. In the second half of the thirteenth century, Natan ben Joel ibn Falaquera published a large compendium, *Zori la-Guf*. Avicenna's *Canon* seems to have been a particularly popular text. Joseph ben Joshua al-Lorqi translated and commented on part of

that huge book sometime before 1402. Solomon ben Ya'ish of Seville (ca. 1280) Isaiah ben Isaac of Córdoba (ca. 1350), and Shem Tov ben Isaac ibn Shaprut of Tudela (ca. 1380–1400) also wrote commentaries to Avicenna. The apostate Johannes Hispalensis is perhaps the best known among the translators of medical works. Solomon ben David ibn Daūd, who translated Averroës *Canon* into Hebrew, was probably a Spaniard.

SCULPTURE, GOTHIC, PORTUGAL

Gothic sculpture in Portugal spans the period from the mid-thirteenth century to the end of the fifteenth century. It incorporates, in order of importance, funerary art, devotional statues, and monumental sculpture, and displays influences from Spain, France, England, and to a lesser extent, Italy. The materials employed are directly related to the locale; thus, marble is used in Evora and Alemtejo, limestone in Coimbra and the surrounding areas, and granite in the north, where there were convenient connections with Galicia.

Three phases of funerary art can be discerned, the first of which corresponds to the latter part of the thirteenth century, with especially strong presence in Coimbra, Santarém, Lisbon, and Évora. The earliest preserved recumbent funerary monument is that of Rodrigo Sanches (d. 1245), created immediately following his death. In the Cathedral of Coimbra three interesting sepulchers of other bishops are preserved; particularly notable are the tombs of Tiburcio (d. 1246) and Egas Fafes (d. 1268), both especially dramatic expressions of the recumbent figure. After the mid-thirteenth century, the use of noble shields in the front part of the sarcophagus becomes popular.

The golden age of funerary sculpture covers the reigns of Dinis, Alfonso IV, Pedro I, and Fernando I, roughly from 1279 to 1383. The first of these rulers is buried in Odivelas. His tomb dates from about 1324 and displays the recumbent king on top of the sarcophagus, which is decorated with trilobate arches framed by gables, and with pairs of personages that participated in the king's funerary rites. In the same church,

the empty tomb of María Alfonso (Dinis's illegitimate daughter) is preserved. The tomb of Leonor Alfonso, from around 1325, displays pairs of conversing figures beneath trilobate arches that evoke the Catalan sculpture of the time. In Évora, the cathedral is the center of funerary sculpture production, and the marble from Estremoz lends particular elegance to the works. One of the most outstanding is the tomb of Bishop Pedro (d. 1340), builder of the cloister and the funerary chapel.

Coimbra, however, was the most prosperous center of funerary art, beginning with the superb tomb of the queen, St. Isabel, wife of Dinis. Now located in the Convent of Santa Clara la Nueva, the work—like the tomb of the queen's granddaughter Isabel—originally resided in the Monastery of Santa Clara la Vieja, where Isabel requested to be buried. The sepulcher was carved before Isabel's death in 1336, and six lions serve as a foundation for the free-standing tomb. The four faces of the tomb are occupied by trilobate arches framed by gables, with figures of saints, martyrs, and bishops individually placed beneath each arch. Presiding over the ensemble are the Crucifixion and the Virgin, accompanied by angels and saints. The recumbent figure is extraordinary beneath a canopy, she is dressed as a queen and in the Franciscan habit commonly used for royal burial. At the head are two angels, with a small dog at the feet; below are several additional dogs, alternating with several shields. Stylistically, the work is related to Catalan sculpture, specifically to the royal tombs in Santes Creus, where Isabel's father Pedro III was buried.

Isabel's monument displays several similarities in both style and layout to the beautiful tomb of Bishop Gonzalo Pereira in the chapel of la Gloria, built in 1332 by Pereira himself for his burial in the cathedral of Braga. The master sculptors, Pedro de Coimbra and Tello García de Lisboa, contracted the work on 11 June 1334. It is a free-standing tomb, with figures of the Apostles and twelve deacons on the long sides, the Crucifixion and the lion and bull of St. Mark and St. Luke at the head, and the Virgin with Child at the feet. It is believed that the tomb is the work of Tello García and that the more accomplished recumbent statue, dressed in pontifical robes, is the work of Pedro, who has been considered a renovator of Portuguese Gothic sculpture, lending his figures a realistic touch, with faces imbued with a sense of tranquility. Contemporary works include the tombs of Juan Gordo (1340–1350) in the cathedral of Oporto, Domingo Joanes and his wife in the chapel of the Ferreiros de Oliveira do Hospital, and doña Vataça in the cathedral of Coimbra.

In the region of upper Beira, a considerable number of granite sepulchers with hunting scenes were cre-

ated; these are similar to Galician works of funerary sculpture like the tomb of Fernan Pérez de Andrade (finished before 1387), who built a large sepulchral chapel for his family in San Francisco de Betanzos.

The two most beautiful tombs of the Portuguese Gothic are clearly those of Pedro I and Inés de Castro, now found in the transept but originally in the hall of tombs at the Monastery of Alcobaça. Carved in limestone, the tombs were created in 1360 by unknown masters. They are free-standing works, with the king's tomb mounted on figures of lions, and that of doña Inés on sphinxes. The faces of each tomb is occupied by different figures, but the style and composition are similar, with the scenes of each tomb displayed beneath trilobate arches with small rose windows under gables. In the uppermost part the shields of each monarch alternate. The dimension and structure of the work, as well as the rose window that dominates the head of Pedro's tomb and the image of the Final Judgment at the head of Inés's tomb, all show a general dependence on architecture. The rose window, with scenes that are hard to interpret, seems to be identified with the Wheel of Fortune, an image frequently used in Gothic art and in the literature of the time. It also portrays the terrible history of the young Pedro, later king, and his wife Inés who, assassinated, will reign after death. The inscription A.E.A. FIM DO MUNDO refers to the anticipation of the end of the world, a theme that continues with the representation of the Final Judgment on Inés's tomb. Her sepulcher is a very detailed work, though it never loses its monumental character. The decoration of the tomb is filled with scenes from the life of Christ, with the Calvary at the head. Pedro's tomb is dedicated to the life of St. Bartholomew, his patron. The recumbent figures, particularly that of Inés, are handsome: both rest on pillows and are under the watch of groups of six angels, with a dog at the feet. This period of funerary sculpture concludes with the tomb of Fernando I (d. 1383), buried in the church of San Francisco de Santarém, where he executed important reforms in order to display his sepulcher in the new choir of the convent. The stigmatization of St. Francis connects the work with royal Neapolitan tombs of the same century, such as that of Catherine of Austria in S. Lorenzo Maggiore.

The last period, which brings about important sculptural renovations, begins with the Avís dynasty in 1385 and concludes with the reign of Manuel. Juan I and his wife Felipa of Lancaster were the founders of the Monastery of Batalha, and asked to be buried in a funerary chapel. The double tomb, which would give rise to a school of funerary sculpture including the tombs of Pedro de Meneses (ca. 1437), Fernando de Meneses and his wife doña Brites, and Pedro Es-

teves de Cogominho, was created before the king's death (1433). The significant English influence in the work came to Portugal through two channels: the queen, and the master builder of the monastery, Huguet, who worked at Batalha between 1402 and 1432. Both figures are sheltered by canopies. This layout will be repeated in the extraordinary tomb of Duarte Meneses, commissioned shortly after 1464 to contain the only remains—a tooth—of the deceased, killed in the battle of Alcácer Seghr. He was buried in San Francisco de Santarém and his tomb displays an appropriate heroic symbology.

Juan Alfonso's signature appears on the tomb of Fernán Gomes de Gois. The work employs a traditional structure repeated insistently throughout the fifteenth century, and is located in the church of Oliveira do Conde.

Several works of the last quarter of the fifteenth century are attributed to Diego Pires o Velho, including the tombs of Fernando Tellez de Meneses and the count of Ourem. The first work, located in the Convent of San Marcos de Coimbra, dates from 1481 and employs Venetian patterns in the sumptuous curtainry, and Castilian forms in the crowning of the arcosolio.

Another genre of interest is the devotional statue, which was particularly remarkable during the fourteenth and fifteenth centuries. These sculptures typically portray Christ, the Virgin, and the Saints. There are three notable crucifixes, of which the most important is the one found in the Museo Machado de Castro in Coimbra. This work is of the Gothic *doloroso* type, and is related to the Aragónese crucifixes of the fourteenth century. Like the Aragónese works, the Portuguese crucifix is of considerable size with a wide tunic typical of German-derived works.

Representations of the Virgin are the most numerous. Pedro de Coimbra, creator of the tomb of Gonzalo Pereira, was most likely the craftsman of a significant group of Virgin statues that are incorporated into Gonzalo's monument. These works display a softly curved body, and an oval face framed by wavy hair and almond eyes. The Virgin de la O in the Museo Machado de Castro, with a melancholic gaze, is particularly beautiful. This iconography may have extended into Galicia along with the angel of the Annunciation, which was highly esteemed in Spain: its first appearance is in the cathedral of León around 1300. A French influence with Hispanic elements is detected in a group of Virgins whose prototype is found in the cathedral of Braga: the later versions are in the chapel of the Ferreiros de Oliveira do Hospital, Nuestra Señora de las Nieves in the sanctuary of the Flor de Rosa in Crato, Seo de Oporto, and one in the Vilhena collection. The Virgin of the cloister of the cathedral of Évora, on a

mensula (table) with two angels, recalls the same subject as it was interpreted in the Parisian workshops of the thirteenth century. It is one of the most beautiful works of Portuguese devotional imagery.

There are also interesting representations of saints, like that of Santa Agueda in the museum of Coimbra; and San Nicolás, Santiago, and San Pedro from the old Vilhena collection of Lisbon (now in the Museo de Arte Antiga). There is a Santa Clara in the same collection, and another in the Museo de Oporto. Other pieces of interest are the statue of St. George killing the dragon, in the hermitage of São Jorge de Aljubarrota in Calvaria de Cima, and a group of the Annunciation in granite in Carracedo de Montenegro. The sculpture in relief of the Nativity in the church of São Leonardo de Atouguia in Baleia displays a style clearly derived from fourteenth-century France. The placement of the Christ Child, seated—not like a newborn—with the terrestrial globe and receiving with the right hand the book that Mary offers him, is derived from the symbolism of Christ as both master/teacher and Lord of the world.

One of the most interesting works of Portuguese sculpture is the recumbent Christ, a classic piece in the bibliography of Portuguese art. In 1984, Bracons proposed its possible link to Catalan sculpture of the fourteenth century, a theory founded in the work's place of origin, the monastery of Santa Clara la Vieja in Coimbra, which was founded by the queen of Portugal, Isabel of Aragón. This Christ appears wrapped in a shroud, on top of the sepulchral slab with the sleeping soldiers below. The work dates to the late fourteenth century.

In the fifteenth century, João Alfonso de Oliveira do Conde is attributed with various Virgins and two statues of Santa Marina and Santa Catalina in the Vilhena collection; these works share stylistic similarities with the tomb signed by João Alfonso in Oliveira do Conde. These sculptures possess a lithe quality, with bodies inscribed in a curvacious pattern. There are works of a similar nature produced in the Mondego valley—São Gens de Boelhe, Tábuia, Bobadela, Cantanhede, Sepins—among which a Santa Lucía (of Alhadas) and a São Miguel, now in the Museo Nacional de Arte Antiga in Lisbon, stand out.

The Corpo de Deus altarpiece, dated 1443 and now in the Museo Machado de Castro in Coimbra, recalls other contemporary works of Catalonia. This polychromatic work is of eucharistic nature, with two angels supporting a chalice with the host beneath three large canopies. The piece was commissioned by Álvaro Fernandez de Carvalho, and is stylistically similar to the São Pedro de Arouca, an image that was influential in the upper Beira region. Documents show that between 1473 and 1514 Diego Pires o Velho lived in

Coimbra, where he sculpted a statue of the Virgin for the church of Leça da Palmeira, commissioned by King Alfonso V. From this figure an interesting group of statues are derived.

In terms of architectural sculpture, interesting works include the capitals of the Monastery of Celas (consecrated in 1293), the facade of the cathedral of Évora, and the facade of the church at the Monastery of Batalha. The Évora facade dates from around the third decade of the fourteenth century, considering that the works were commissioned by Bishop Pedro between 1322 and 1340. In these pieces one can detect a French influence filtered through the Catalan style of the time. The Apostles are displayed in elegant form, with expressions reflecting a delicate melancholic touch. The main facade of the Monastery of Batalha, from the early fifteenth century, has undergone significant restoration, and some of its statues have been replaced. The group was inspired by the maestro Huguet, and exerted considerable influence on Portuguese sculpture of the fifteenth century. Other exemplary facades include the main facade of the Cathedral of Antuérpia and the episcopal facade of the Cathedral of Palencia.

SEGOVIA

City and diocesis capital in Old Castile. The region where the city is now located was populated as early as the Bronze and Iron Ages. Inexplicably, the Roman aqueduct built by Trajan or Nerva does not match the few other Roman ruins of the area.

In the mid-sixth century, the archbishop of Toledo, Montano, granted lifetime jurisdictional rights over Segovia to a cleric who had been named Bishop of Palencia without his consent. By 589, as the Council of Toledo shows, the diocese (which included Coca and Buitrago) had its own bishop.

In the Early Middle Ages, Segovia was located in the so-called Extramadura castellana. The theory of

the Duero River valley depopulation in the latter part of the eighth century is well known. The scope of this phenomenon has been debated, but it was clearly a reality in Segovia, as is shown in the Christian repopulation efforts ordered by Alfonso VI and brought about by his son-in-law Raimundo de Borgoña in 1088. There are documents that describe the region previously as a barren land through which bears and wild boars roamed. Ilderado recognized the existence of the new diocese of Simancas in 940, which was also the year of the repopulation of Sepúlveda. The new settlers in the area came initially from Burgos and la Rioja, then from Navarre, Aragón, and even Galicia and Portugal. There were also some French settlers, as one street referring to *gascos* (Gascons) attests.

The city and its surrounding villages constituted a district called a *Comunidad de villa y tierra*, which extended to the other side of the central mountain range, and still is in operation. The diocese, under the jurisdiction of Toledo, was restored in 1119, with the Cluniac Pedro de Agen as its first bishop. San Frutos, a hermit that had lived in the last years of the Visigothic era in the Duratón canyon in Sepúlveda (since 1076 the Benedictine convent of Silos), was adopted as patron saint of the diocese. During this period many Romanesque churches were built, characterized by their atria.

The city militia participated in the reconquest of New Castile and Andalusia. Starting in the fourteenth century textile production developed; Salvador de Madariaga called Segovia the Manchester of its time, and the main cattle pathways (*cañadas*) of the *mesta* (sheep-herders' guild) passed through the region. The city played an important part in the dynastic and aristocratic conflicts of the fourteenth and fifteenth centuries. It was the favorite city of Enrique IV, who was almost a permanent resident. In 1474 Isabel la Católica was proclaimed Queen of Castile in the church of San Miguel.

SERFDOM *See* FEUDALISM, PEASANTS

SERMONS

A sermon is a type of hortatory religious discourse, or homily, that traces its origins back to the first days of Christianity. The earliest form of sermons manifested itself principally as a running commentary on a biblical passage. By the thirteenth century, however, this had been displaced by a type of oration known as the university sermon, which was usually plotted out roughly in writing and delivered orally in Latin. It reflected scholasticism's interest in rhetoric and logic, requiring the use of elaborate formal divisions and distinctions. From about 1220 onward, in part moved forward by the recommendations of the Fourth Lateran Council (1215), the rules for composing these new sermons were codified in the *artes praedicandi*, extended theoretical treatises that dealt with everything from the formal aspects of the composition of sermons to their content and reception. The great majority of preserved medieval sermons are of the university type because some form of them was often committed to writing. Research has shown a close link between the sermon tradition, its use of *exempla*, or illustrative anecdotes, and the rise of imaginative vernacular literature in medieval Europe.

Until relatively recently, little was known, and little research had been carried out, on the vernacular sermon tradition in medieval Iberia. In the last twenty years, however, important new findings have emerged. Although very few sermons in relation to the number that daily must have been preached during the Middle Ages survive due to their oral delivery, current research has increased the number above the mere ten that originally were thought to have been preserved in Castilian or Aragónese. The greatest number of extant peninsular sermons are in Catalan, 160, of which 150 are by St. Vincent Ferrer. The rest, a little over 100 texts, is comprised of sermons in Latin. There are no known Portuguese sermons. A sum nearing three hundred is thus thought to be the total for the surviving vernacular sermons in all the Iberian languages, the vast majority of which remain unedited and in manuscripts. A very slim number is available in modern editions. As more and more Iberian libraries are systematically cataloged, however, references to sermons will doubtless continue to increase.

SERRANILLA

A subgenre of lyric poetry characterized by the chance meeting in the countryside of a gentleman of the court with a rustic girl, and his ensuing attempt to seduce her, the *serranilla* seems to have its origins in the Provençal *pastourelle*, a learned form depicting such encounters whose earliest examples were parodies of courtly love. The Spanish version, however, is probably a hybrid of this courtly poetic form and medieval legends of dangerous mountain women that also appeared in popular song.

In the typical *serranilla*, the courtier recounts his travels through the sierra and his coincidental encounter with a shepherdess, whom he greets in a courtly manner that contrasts with her rustic character. It is at this point that poems of this genre begin to differ in the outcome of the initial conversation. Some peasant girls attempt to ward off the traveler with their rudeness; others, flattered by his courtly approach, immediately acquiesce to his desires. In the former case, the *caballero* (gentleman) will persevere in his persuasions with promises of gifts or a future life with him at the court, or further flattery. Possible resolutions include the seduction of the shepherdess, her continued rejection of his advances and subsequent departure from the scene, or an open denouement, in which the outcome of the episode is uncertain. Unlike some provençal examples, the Spanish pastoral lyric never depicts force used by the courtier in order to take by coercion what he is unable to obtain through persuasion, nor the arrival of peasant men to rescue the girl from possible violence.

An important element of the *serranilla* is its objective of contrasting the social classes of the protagonists; the "amorous" intentions of the gentleman never amount to more than licentious pursuit of a woman of humble birth who, by virtue of her low condition, is considered unworthy by him for the noble sentiments of courtly love. The *serranilla* was commonly recited to a court audience upon the return of a nobleman from a journey; thus the aristocratic public could share in

the “humor” of a country lass’s ingenuousness. The underlying note is, of course, one of disdain for the peasant class—particularly of its women—and the hypocrisy of the courtier in his veiled attempt to humiliate them.

There also exists a parodic version of the serranilla, notably in the *Libro de buen amor*. (Indeed, the first known pastourelle—written by the Provençal poet Marcabru in the twelfth century—is a mockery of courtly love and lovers.) In this variation, it is the shepherdess who initiates the ardent conversation; unlike the hypocritical man of the traditional form, she does not pretend to seek more than a brief, lascivious adventure. The female protagonist of the farcical model is normally of grotesque appearance contrived to be the antithesis of the era’s concept of the ideal woman.

The most famous serranillas—and the best of this class of poetry—are the works of the Marqués de Santillana. It was he who first used the term “serranilla” to refer to these pieces, and his examples epitomize the genre. Santillana finds his inspiration in the classical *pastourelle* as well as the *Libro de buen amor*’s parody of it; unlike these predecessors, however, Santillana never allows the courtly lover to be scorned. A particular feature of these pastoral poems is their realism: the poet provides historical and geographical detail that allow the pieces to be dated and related to specific expeditions outside the court. As his ambition was to contribute in a significant way to the poetry of his era, Santillana takes advantage of a stock poetic context in order to provide variations on the theme: he changes meter, rhyme, the attitudes of the protagonists, and the outcome of the poetic moment to create a series of distinctly diverse serranillas. His treatment of this genre has never been equaled by those who preceded or followed him.

After the Marqués de Santillana, other poets attempted serranillas with varying success: The most notable among them was Carvajales, whose poetic production appears in the *Cancionero de Stúñiga*. Carvajales’s pieces are characterized by the idealization of country life; indeed, he alters the traditional serranilla so that the rustic ambience becomes the salient feature, and replaces the shepherdess with a courtly lady. Other poets who composed serranillas are Pedro de Escavias, Fernando de la Torre, Francisco Bocanegra, Mendo de Campo, and Diego de San Pedro.

SESMARIAS

Sesmarias were lands that the Portuguese medieval municipalities used to distribute to their inhabitants with the condition of their being cultivated within a certain time and thus satisfying *solving* the quitrents established by tradition or by the *forais* (privileges).

The need for settlement and colonization of many territories conquered by the Muslims during the eleventh to thirteenth centuries led to a number of forms of land grants for unused land. On the other hand, the general rise of population in western and southwestern Europe in the same period and afterward compelled the clearing of forests and fallow ground. In order to assure some discipline in land appropriation, municipal deputies, appointed by the king or elected among the aldermen, were in charge of granting all land that might be disposed of within the city limits. As there were usually six deputies in charge, each one was known as a *sesmeiro* (Latin *seximus*, one-sixth), the land to be divided as a *sesmo* and the fraction distributed to each person as a *sesmaria*. Documented examples of *sesmarias* date from the early thirteenth to the late fifteenth centuries throughout most of Portugal and also in the new discovered islands of Madeira and the Azores, and in Brazil.

Being a form of land appropriation rather than a form of property, there were *sesmarias* granted in full property (*allodium*) as well as in long-term leases. Tilling the ground was always compulsory, although the stated periods varied from short terms (six months, one year) to indeterminate ones.

After 1348, the economic crisis aggravated by the Black Death and other plagues generated new interest in the *sesmaria* system. Several laws enacted by kings Afonso IV, Pedro I, Fernando I, and João I tried to make many lands productive that their holders had deserted, either by death or by emigration. They also forced rural and nonrural laborers to work for the same salaries and in the same way and place they always had. A system of passports was created to prevent open housing, and workers were apportioned among the proprietors. The law of 1375 (known as *Lei das Sesmarias*) went further in binding the workers to their traditional professions, preventing labor freedom, keeping wages low, and harassing the idle and the vagrant. In spite of this and other local regulations, enacted in the late fourteenth and early fifteenth centuries, the trend toward labor freedom, or at least greater labor freedom, continued. One hundred years later, a significant, if not a decisive, part of all labor was entirely free, and employment based on revocable and temporary hiring contracts.

SEVILLE, CITY OF

Seville is situated on the banks of the Guadalquivir River, to which it owes its existence and the role it has played throughout history as the center of an extensive hinterland and as a renowned port of call on the great international trading routes. Conquered by the Arabs in 712, it became the second city of al-Andalus and when the Umayyad caliphate was defeated, Seville became the capital of the most important kingdom to rise from its ruins. This position was maintained under the Almoravids and Almohads. Throughout these centuries a new city came into being, dominated by a local aristocracy that extended the perimeter of its city walls (287 hectares) and created a new city center that was consolidated in later centuries.

In 1248 Fernando III of Castile and León conquered the city. After a few decades of difficulties,

La Giralda (ancient minaret of Seville mosque). Islamic, 12th century. Copyright © Giraudon/Art Resource, NY. Tower of Giralda, Seville, Spain.

natural conditions helped to make it one of the most important urban centers in the Iberian Peninsula, with more than three-thousand inhabitants at the end of the fourteenth century, increasing to some eight thousand in about 1500. The large perimeter of the city walls made an extension of these unnecessary, although districts grew up beyond the city walls for strategic and economic reasons. An urban structure, taking form around the cathedral and the Church of El Salvador, came about and remained for centuries. In this area, where the majority of the population was concentrated, administrative, religious, and economic centers were formed. The greatest part of the population (60 percent) was involved in craftwork and the maritime professions, serving a local and regional market; some 30 percent was involved in commerce and the service sector; around 6 percent made its living from agriculture and livestock. In the social order attention is drawn to the consolidation of an aristocracy, whose power is based on resources that come from their rural properties, and connected to trade at high levels, and a monopoly of local government; a numerous contingent of Franks (some fifteen hundred inhabitants in the fifteenth century); the presence of an influential foreign colony, above all Italian, that controlled trade at high levels; and a noteworthy Jewish community, most of whom after the pogroms of 1391 became converts.

SHAQUNDĪ, AL-

Abū-l-Walid Ismāʿīl Ibn Muḥammad al-Shaqundī, *qāḍī* (judge) in Baeza, Ubeda and Lorca, was born in Secunda near Córdoba and died in Seville (1231) a few years before the city was conquered by Fernando III of Castile. A poet in his own right, he is better known for his contribution to the genre of literary epistle. His *Risāla fī fadl al-andalus* (*Epistle on the Excellence of al-Andalus*) was considered of sufficient interest by the famous historian of al-Andalus, al-Maqqarī (d. 1631) as to be included in its entirety in his *Nafḥ at-ṭib*. The *Risāla* was conceived as a rejoinder to the praise of North Africa made by Abū Yaḥyā Muʿallim from Tangiers, with whom he had a learned discussion in the presence of the governor of Ceuta, A. Yaḥyā

ibn Zakariyya. It was the governor who requested both to put their respective arguments in writing.

Al-Shaqundī's references to political figures, learned men and scientific achievements, famous poets and their compositions, cities and the artistic monuments by which they were known, which he summarized with exceptional sensitivity and good sense and expressed in a pleasant and elegant style, make this *risāla* a reliable source of information and a notable literary work. It is also of special interest for its unequivocal assertion of an Andalusian cultural identity and national consciousness against North African political, religious, and cultural imperialism in the Iberian Peninsula since the Almoravid invasion in the eleventh century.

SHEEP RAISING

The often sharply contrasting ecological patterns of the Iberian countryside, the frequent unsuitability for arable farming of extensive portions of the vast, elevated, mountain-strewn interior tableland of the *meseta* (plateau), and the manifest advantages during centuries of Reconquest warfare of mobile over fixed properties, all contributed to tilting medieval Spaniards and Portuguese in many regions toward a predominantly pastoral agrosystem atypical of western European mixed-crop and animal-husbandry agriculture. Roman Spain was already known for its superior wools; the *Leges Wisigothorum* show how on a drastically reduced commercial plane a pastoral economy persisted below the Pyrenees; and Islamic al-Andalus long possessed a flourishing sheep industry, producing milk for cheese, meat, and fleece for cloth making, an industry that was to bequeath some of its Berber pastoral vocabulary to the Christian north.

But it was the Luso-Hispanic states of the Middle Ages, commencing in the high Pyrenean and Cantabrian valleys, that were to advance far beyond such antecedents to create a dynamic complex of superior animals, skilled herdsmen (*pastores*), highly institutionalized forms and techniques, and an ever-expanding output of high-quality wools that by 1500 was to give Spain first place as supplier to the western European cloth markets and founder of even greater ovine empires in the New World.

The sheep upon which medieval Iberian pecuarianism rested were originally old native breeds of prehistoric origin such as the widespread, relatively coarse-fleeced, mottled-white churro; but this picture was radically altered by the introduction and rapid diffusion of the uniquely fine-fibered, heavy-fleeced North African merino breed, derived ultimately, as its name indicates, from the Merinid peoples of Atlantic Morocco. Just when this change began has been hotly contested; but so far as our known documentation goes, it did not antedate 1350 by much, and, after being perfected by Iberian Peninsular breeders, the merino swiftly became the lucrative staple insuring Spain's paramouncy in the European wool market.

A notable feature of peninsular sheep raising throughout the Middle Ages is its heavy dependence on transhumance, that is, the seasonal transfer of flocks from winter feeding grounds (*invernaderos*) to summer grazings (*agostaderos*) high in the mountains. This commonly operated within the boundaries of a single municipality or village community using the nearest sierra; but it could also take the form of more extensive highland foraging on the basis of intercommunal compacts, as with the Arago-Catalan *faceries* of the Pyrenees, Navarrese Salazar, and Rocal linkage with the Bardenas Reales near Tudela, or the *hermandades* of the Castilian towns flanking the central Sierras. The long-distance transhumance of the *mesta* (sheep raisers guild) over the sheep highways (*cañadas*) between northern León-Castile and the southern meseta pasturages in Extremadura, New Castile (La Mancha), Murcia, and Andalusia are well known; others of lesser magnitude also existed in Portugal leading to the Serra da Estrêla, or in the Crown of Aragón running between the Pyrenees, the lower Ebro River valley, and the Valencian Maestrazgo.

Municipal *fueros* and *forais* (codes) show control over pastoral affairs normally retained by the town government; but in two areas there also arose partially self-governing local associations of sheepmen. After 1250 there appear in the Castilian kingdom between the central Sierras and Andalusia a certain number of municipal *Mestas*, with their own elected *alcaldes* and organized on the basis of a constitutional charter, the *ordenamiento de mesta*, commonly confirmed by the crown. Similarly after about 1250 *casas de ganaderos* developed in Aragón, notably that of Zaragoza and others are known for Arago-Catalan-Valencian lands as *ligallos* (or *lligallos*), under *jueces de ligallo* and ordinances.

Much is still to be learned regarding the life and practices of *pastores*, themselves often owners of small flocks; or about the lamb-sharing *partido* contracts be-

tween owners and chief herdsmen (*mayorales*, *rabadanes*), and the general cycle of the pastoral year from one San Juan to another. Shearing sheds, the baling of sheep clip, and cartage to commercial centers and ports also still await study.

SHEM TOV OF CARRIÓN

Shem Tov Yizḥaq ben Arduti'el (ca. 1290–1360), Castilian rabbi and poet whose *Proverbios morales*, addressed to Pedro I and quoted in the Marqués de Santillana's *Prohemio e carta*, synthesizes Semitic poetics with the Spanish idiom in a permutation of a literary formula: the getting of wisdom. Its relative success has eclipsed Shem Tov's Hebrew compositions *Ma'aseh ha-rav*, a *maqáma* featuring a debate between pen and scissors; *Vam qohelet*, a *baqashah* consisting of two thousand words beginning with the letter *mem*; and, finally, *Ha-vidui ha-gadol*, a prayer of confession for Yom Kippur. This oeuvre provides a useful frame of reference for gauging the ethical, rhetorical, and philosophical dimensions of the *Proverbios morales*. Shem Tov also translated Yisra'el ha-Yisra'eli's liturgical treatise *Mizvot zemaniyot* from Arabic into Hebrew; the authorship of other titles sometimes attributed to him is dubious. Excluding inferences from his work, the scant known biographical information is obtained from a *dīwán* (book of poetry) written by Shmu'el ben Yosef ben Sason, and places him in Carrión de los Condes in 1338.

Drawing on the language of paremiology, medieval philosophy, the Bible, Talmud, and Arabic wisdom anthologies, *Proverbios morales* examines the ostensible dilemma posed to the individual by the unpredictability of human existence and endorses adherence to the Aristotelian mean in ethical matters, recognition of circumstances in social conduct, and ultimate faith in the Creator. Here, all things exist in complementary opposition—night and day, loss and gain, and so on; therefore wealth is ephemeral, happiness is momentary, and power mere vanity. For the individual, successful negotiation of such a world requires the perspicacious appraisal of circumstance since an action once advantageous may now be disadvantageous, as Shem Tov shows in a paradox on speech and silence. For the monarch, God's representative, duty requires that

he vouchsafe truth, justice, and peace, the foundations of political order.

The poem's language is consistent in its general phonetic, morphological, and syntactic features with medieval Castilian. Its distinctive traits include homoioteleuton rhyme, complex hyperbaton, phraseological parallelism, the prevalence of parataxis over hypotaxis, and the accumulation of grammatical functions in pleonastic pronouns.

The suggestion that the poem may be a vestige of a rabbinical *mester de clerecía* (clerical poetry) could ultimately establish its otherwise uncertain generic identity. The 725 alexandrine stanzas reveal a sustained tone of self-assurance in Shem Tov's poetic voice, equally adept at evoking poignancy, melancholy, or whimsy. The antonymic parallelism of his compositional technique, derived from Arabic and Hebrew poetics, sometimes interpreted as indicative of moral relativism, serves to enunciate extremes that define a center of equilibrium.

Each of the six extant manuscripts preserves multiple variants and stanza sequences, several suggest the complex social profile a single work may possess. One is redacted in Hebrew *aljamía* (Cambridge), another includes an anonymous prose prologue (Madrid), and a third records 219 stanzas written from memory and entered into evidence during proceedings for the crime of heresy (Cuenca). The first example implies genesis of the poem's main body for purposes of Jewish education. The latter pair allude to its essentially oral performance character; the commentator advocates memorizing the work, "que todo omne la deuiera decorar. Ca esta fue la entençio del sabio raby que las fizo," ["that each person should memorize. That was the intention of the wise rabbi who made it"] and the defendant charged with heresy swears he recorded "quantas a la memoria me han venido" ["as many as have come to memory"].

That the *Proverbios morales* were presented to Pedro I for his edification seems apparent, but the assertion that it was written specifically for a Christian audience warrants appraisal. That hypothesis relies upon the poem's redaction in Castilian, an opening apostrophe and closing reference to Pedro I, and a *captatio benevolentiae* summarizing the Jewish poet's situation when addressing a Christian audience of superior social rank. The delivery of medieval Jewish sermons in a vernacular places a correlation between language choice and intended audience here in doubt. The use of the *V(os)* form of address, required for addressing a social superior, is limited to the poem's introductory and concluding passages, the main body prefers the *T(ú)* form suitable for an equal or inferior in status. It may be inferred therefore that Shem Tov

composed the *Proverbios morales* for a destitute of equal or inferior status—that is, the Jewish community, and redacted occasional material in order to accommodate the poem for presentation before a different audience.

A subtle poetic composition, *Proverbios morales* succeeds in incorporating the complexity of human existence into a persuasive discourse on ethics and philosophy that addresses the dynamic of the individual in society.

SHUSHTARĪ, AL-, ABŪ AL-HASAN

The medieval Hispano-Arabic mystical poet Abū al-Hasan al-Shushtarī (b. 1212), who was born and who lived most of his life in Muslim Spain, introduced the colloquial *zajal* to the field of Ṣūfī (Islamic mystical) poetry. The *zajal* is the well-known strophic poem that uses the colloquial as its medium—in this case, the Andalusian medieval dialect—and particularly originated in Muslim Spain during the Middle Ages. As a "popular" art form that had not been used before or thought appropriate for sublime Ṣūfī expression, the Hispano-Arabic *zajal* that existed at the time was especially perfected by another Andalusian poet, Ibn Quzmān, who mainly wrote satirical and courtly love *zajals*. There is today enough evidence that this type of *zajal* was performed, sometimes by means of choral singing. In the East, Ṣūfī poets like Ibn al-Farīd of Egypt (d. 577) had been using the classical form of the Arabic *qaṣīda*, with its traditional framework of monorhyme and monorhythm and with classical Arabic language to express Ṣūfī thoughts. In Spain, however, strophic poetry—namely the *muwashshaḥa* and the *zajal*—evolved in Andalusian Arabic verse, demonstrating the influence of Romance popular literature. In other words, the *muwashshaḥa* and the *zajal* in their inception in Arabic literature became uniquely associated with al-Andalus. But it was Al-Shushtarī who first chose the *zajal* for Ṣūfī purposes.

Therefore, most important about Al-Shushtarī in this context is that his strophic poetry forms a link between two areas of interest in the literature of Mus-

lim Spain: the formal and esoteric, on the one hand (represented by the mystical philosophy of Ibn ʿArabī and Ibn Sabʿīn, two Ṣūfīs whom Al-Shushtarī followed), and the "popular" aspect of the Hispano-Arabic literary world (represented by the informal *zajal* and its master, Ibn Quzmān) on the other. Through the unity of these two strands, Al-Shushtarī sought to interpret and make accessible mystical ideas and to propound an understanding of Ṣūfism virtually synonymous with a vibrant, aesthetic perceptiveness. He therefore represents an important melding of the esoteric spirituality of Ṣūfism and a kind of emerging lay spirituality.

This yoking of a theological and an aesthetic perspective significantly illuminates the act and art of interpretation, which is the main area of concern in Al-Shushtarī's poetry. Ṣūfī scriptural (i.e., Qurʾānic) exegesis plays a fundamental role in this literary self-awareness that permeates the poetry. Consistent textual references such as "understanding" and "grasping allusions," "words," "terms," "symbols," or "signs" underline the concept of critical interpretation. Like all Ṣūfīs, Al-Shushtarī did not deal with texts—scripture or otherwise—superficially. He constantly asked his audience to "untie symbols" and to "grasp ultimate meanings," urging them to think, to analyze, and to put parts of a poem together in the service of the whole, as if inviting them to join his Ṣūfī path by interpreting his songs. Hence, this literary self-consciousness ultimately reflects a mystical self-consciousness as well, while the Ṣūfī principle of Qurʾānic exegesis shaped the way Ṣūfī poets, such as Al-Shushtarī, composed poetry and the way they expected it to be interpreted.

Al-Shushtarī utilized the means provided by this mystical tradition for symbolic expression, but his innovation in the use of the *zajal* for such marks his contribution in the field. He could not merely depend on the techniques provided by traditional rhetoric to achieve a combination of artistry and mysticism. In al-Shushtarī, the concept of "interpretation" in itself becomes the main concern, and the poetry comes to express the interrelation between critical perceptiveness of text and mystical views. It is this integration that Al-Shushtarī's strophic poetry fully realizes.

This relationship between the lyrical and the mystical manifests itself in three main features that act as systems of reference and regulation that afford the audience effective ways of responding spiritually as well as aesthetically to the lyrics. These reference systems are regarded from the standpoint of their mystico-aesthetic correspondence to convey Al-Shushtarī's mystical and aesthetical philosophy simultaneously.

The first aspect is the idea of the multiple levels of meaning existing within the poems—that is, the

symbolism. This feature directly translates into two areas of interest: the network of Ṣūfī doctrines and symbolic terminology as well as the literary self-conscious mode characterized by direct textual references. The major reference is that of *ramz* (symbol), hence underlying the symbolic composition of the poems and suggesting the application of symbolic interpretation in order to discern the text's binary dimension. In other words, Al-Shushtarī does not merely use symbols but calls attention to this use and to symbolic critical reading.

The second major area that also displays literary self-consciousness is structure—specifically ring composition and its relation to the theme of the “reflexive.” The ring structure embodies a circular principle of interpretation, which is most appropriate to the Ṣūfī mode of perception and to the tradition of composing strophic poetry. Ṣūfī exegesis, called *ta'wīl*, is the internal interpretation of the Qur'ān and seeks the inner level or primary meaning through returning the outward, literal plane of scripture to its original, hidden spiritual essence—hence a circular, reflexive movement. And in strophic poetry, the nature thereof allows the poet to utilize his strophes as movable structural units, which is more feasible than dealing with single lines in the more restrictive form of a classical *qaṣīda*. Al-Shushtarī could also use the interplay between the different parts of the *zajal* or *muwashshaḥa* (such as the *matla*, the *qufl*, and the *kharja*) to solidify the ring composition. Moreover, the phenomena of borrowing and of composing a poem based on an already established *kharja* (the last line in the song)—that is, starting from the end—or based on an established prosodic pattern (contrafaction) are all typical compositional techniques that enhance the circular effect. Thus, Al-Shushtarī was very conscious of specific structural patterns and their significance to the art of critical interpretation.

The third manifestation of that general literary concern lies in the element of performance itself, which is naturally realized with the pioneering use of the *zajal*. Because this is a poem composed to be sung or performed in public (sometimes in a choral manner), it affords the audience or recipients interaction with the art presented. The active participation involved here is what distinguishes Al-Shushtarī's mystical work, adding a new dimension to Ṣūfī poetry in general, and invigorating the whole mystical experience. Ṣūfī poetry here is thus no longer intellectually exclusive or highly theoretical and unreached, but a living part of the mystical existence. Al-Shushtarī even included within the lyrics themselves, and among his other created personalities, the persona of the *zajjal* (the *zajal*'s composer) or singer—that is, the persona of the poet/artist.

The two other personae are the ascetic, pious *faqīr* (epithet for Ṣūfī) and its symbolic counterpart, a wanton drunk. The first persona, the wandering, “ecstatic” Ṣūfī, seems to embody the character of Al-Shushtarī himself, a Ṣūfī *faqīr* who wandered in various lands and took his *zajal* singing in the streets and marketplaces. At times, however, Al-Shushtarī adopts the Quzmānī wanton persona; as he says in his “Zajal 99,” he literally puts on his defiant and unorthodox hat (exchanging his turban for a monk's hood). Of course, this device of putting on literary masks serves an important artistic purpose: the personalities ultimately join to form an underlying unity between literature and Ṣūfism.

As has been shown, the use of symbols and circular structure are ways of enhancing the concept of Ṣūfī exegesis and establishing the necessity of critical interpretation. In the same manner, drawing attention to performance and to various personae or voices further proves how Al-Shushtarī was aware that he presented a new art—not merely a Ṣūfī philosophical treatise or didactic poetry—and that he was interested in the intricate artistry of composition.

In the final analysis, the novel aesthetic position of Al-Shushtarī is that critical interpretation, from the Ṣūfī perspective, is a “circular” process in which an “essential,” spiritual truth becomes a poem: then by means of interaction with an interpreting audience (through public performance) the poem is returned to its origins. The correspondence between the theological dimension and the aesthetic dimension has one purpose: to illuminate the nature of the process of interpretation when linked to religious hermeneutics. Al-Shushtarī's poetry illustrates his characteristic blend of appealing and melodic simplicity, on the one hand, and sophisticated and even enigmatic complexity on the other. He was able to make “perfect form” (i.e., *zajals* and *muwashshaḥas*) in art indistinguishable from mystical pursuit.

SICILIAN VESPERS *See* SICILY

SICILY

Located at the maritime crossroads only a few days' sailing from the major Iberian and Levantine ports, Sicily played an important role in the political, commercial, and cultural development of the Mediterranean basin. While its strategic location made the island a natural port of call for merchant ships, offering its rulers considerable commercial advantages, it also made control of Sicily a unique political prize that was contested, at one time or another, by most of the major medieval powers. A parade of foreign invasions and temporary conquests dominate the political history: Romans, Vandals, Goths, Byzantines, Muslims, Normans, Hohenstaufens, Angevins, and Catalans all subjected Sicily to their authority. These conquests, while introducing fresh cultural influences, contributed to a xenophobic, pseudopatriotic belligerence among the populace that culminated in the bloody unrest of the fourteenth and fifteenth centuries. From the wreckage emerged an embryonic mafia, particularly in the island's rugged interior. Commercially, Sicily was an important center of agricultural production from Roman times, especially in cereals. The revival of trade in the tenth and eleventh centuries placed Sicily at the hub of Mediterranean commerce. With this advantage, the periods of Muslim and Norman rule enjoyed a singular prosperity that inspired a widespread and much-needed diversification of economic activity, including silk manufacture, the mining of alum, and the burgeoning trade in slaves.

Culturally, the royal court and coastal cities benefited from contacts with the other Mediterranean communities, whereas the inland territories experienced less foreign influence and less development. Contrary to her many mythologizing historians, Sicily's mixture of populations and cultures remained generally unmixed throughout the centuries, and the often-praised fusion of artistic styles in architecture and mosaics is evident in only a handful of examples, such as the magnificent cathedral at Monreale. The more common result was the stylistic chaos, interesting though unsuccessful, exemplified by the cathedral in Palermo. Nevertheless, Sicily was an important center for the translation of Greek philosophy and science, and the Sicilian school of poetry was influential in the development of the *dolce stil nuovo* of mainland poets like Guido Guinizelli and Dante.

Sicily became a frontier province of Byzantium in the early sixth century and was administered by military governors as a personal patrimony of the emperor. With its wealth of Latin and Greek ecclesiastical settle-

ments, Sicily remained a principal contact point between Rome and Constantinople throughout the iconoclast era, and provided a refuge for many exiled iconodules, thus initiating the island's medieval tradition of offering asylum to dissident groups. The emperor Leo III (r. 717–741) reorganized the island into the thema system, mandated the registration of all male children for military service, imposed heavy new poll, or capitation, taxes, and transferred the Sicilian dioceses to the jurisdiction of the Eastern Church.

Muslim raids began in the early eighth century and continued sporadically until a beachhead was established at Mazara in 827. By 902, with the fall of Taormina, Muslim control was secured. Their rule brought a new vitality to Sicilian life, reflected by the introduction of new crops (citrus fruits, sugarcane, cotton) and Palermo's rapid rise as an international market. Efforts at Islamization, however, generally failed. The Christian populace, both Latin and Greek, as well as the small Jewish community, enjoyed the status of *dhimmis*, or protected minorities. While traders from throughout the Mediterranean transacted in her harbors, Sicily profited especially from the commerce between Muslim Spain and the Muslim East. But the dynastic struggles between the Aghlabids and the Fatimids in Northern Africa, and the subsequent transfer to Egypt of the hub of east-west trade, hurt the local economy and contributed to internal conflicts among the Sicilian emirs. The Norman conquest of the eleventh century capitalized on these tensions. Roger I's seizure of Palermo in 1072 marked the symbolic end of Muslim rule, but the Islamic community remained an important presence in cultural and economic life under the patronage of the royal court.

The Norman period is perhaps the most celebrated chapter in Sicily's history. Under a series of industrious rulers—Count Roger I (d. 1101), then kings Roger II (d. 1154), William I (d. 1166), and William II (d. 1189)—Sicily rose to prominence as a Mediterranean power, now controlling the peninsular territories of Calabria and Apulia as well. These monarchs drew upon several traditions to unite their disparate population. Elements of feudal monarchy, imported from the north, were combined with characteristics of Byzantine political theology and the mechanisms of a Muslim-styled central bureaucracy. The resulting administration was noted both for its efficiency and (toward the peninsular inhabitants especially, who were always eager to break away from the Sicilian court) its cruelty. The economy gained strength through continued diversification, such as the new manufacture of a sturdy, if unrefined, wool. A papal grant of legatine authority, though apparently intended only as an ad hoc arrangement to secure the interests of the Latin Church, gave

the rulers broad powers to control the selection of bishops. Observance of the customary “personality of the law” provided separate Qu’rānic courts for the Muslim population and Byzantine justice for the Greeks. Laws and decrees were issued in Latin, Arabic, and Greek. Thus the realm enjoyed a considerable, and generally shared, prosperity, in which the various communities worked together and their cultures mingled in a series of notable artistic and scientific projects. Nevertheless it would be a mistake to exaggerate, as many have done, the beneficent tolerance of Norman-Sicilian society, for strong ethnic hatreds simmered beneath the surface. When Norman control collapsed, these burst into violence and became a hallmark of Sicilian life throughout the remaining medieval centuries.

The marriage of Princess Constance, aunt and heiress of William II, to Heinrich VI of Germany brought Hohenstaufen rule, and thus carried Sicily to the forefront of the papacy’s political concerns. During the long minority of Frederick II (d. 1250), Pope Innocent III administered the realm with little success. Palace intrigues, Muslim revolts, and invasions from Genoa and Pisa impoverished the kingdom and caused the loss of most of the royal demesne. Aided by gifts from the coastal cities, Frederick assumed direct control of the government in 1208 and began his campaign to restore order. Although he succeeded, and while he made the Palermitan court once more into a cosmopolitan center of trade, science, and art, his rule was not popular. Increasingly, Sicily was viewed not as the center of an important Mediterranean state that included the mainland provinces, but as a power base and economic resource for political schemes elsewhere. Popular resentment against foreign rule grew throughout the thirteenth century, increasing dramatically when the pope installed an Angevin government to replace the Hohenstaufen after Frederick’s death.

Angevin rule was harsh and hated. Charles I valued Sicily principally for what it could contribute to his larger aim to dominate peninsular Italy and the flagging Latin Empire of Constantinople. Needing to reward his supporters, he redistributed the inland estates and alienated several major urban centers. But the diminution of the royal demesne that this required cut deeply into royal revenues, for which loss he compensated by exacting heavy commercial taxes. These actions catalyzed antiforeign resentments among the Sicilians, displaced landholders and disgruntled traders alike. From 1282 to 1302 the War of the Sicilian Vespers engulfed the island. The French were driven off amid slaughter and their repeated attempts at reconquest successfully repulsed. But violent civil strife accompanied the larger struggle. Factions in favor of establishing an all-Sicilian republic battled pro-French

enthusiasts, while the inland barons seized vast stretches of freeholds and of royal and ecclesiastical estates. Unable to form a stable government of their own, the Sicilians invited the ruling comital family in Barcelona to assume the throne in Palermo. The first Catalan kings—Pedro (d. 1285), Jaime (d. 1296), and Fadrique II (d. 1337)—achieved a modicum of order and prosperity, but at the expense of crippling concessions of economic privileges and grants of civil and criminal jurisdiction. The later monarchs fared even less well. The cry of “Morano li Catalani” called many rebellions to arms throughout the fourteenth century. Viewed increasingly as foreign opportunists, the Catalans secured their power by pulling Sicily ever closer to the Spanish orbit. Local landholders were displaced in favor of nobles from Iberia; trade privileges gave Catalan merchants an inordinate control of imports and exports. In 1409 Sicily passed by succession to the direct authority of the Aragónese kings, which brought a formal end to an independence that had in fact disappeared much earlier. Alfonso the Magnanimous’s annexation of the mainland kingdom of Naples (1435) completed the process of subsuming the island into a larger Mediterranean polity that drew much of its strength from the resources it drained away from Sicily.

Despite its political woes, medieval Sicily recorded some signal achievements in art and science. Contact with Byzantium introduced a rich tradition of Basilian monasticism and the knowledge of seafaring, while Greek silkweavers, impressed into duty by Roger II’s soldiers, established a noteworthy palace industry at Palermo. Mosaicists from the East produced the superb art at the Cefalù cathedral, the Cappella palatina, and the Martorana church in Palermo. Elements of Greek architecture are evident throughout the island, most beautifully in the monastery of San Giovanni degli Eremiti. Arab Sicily produced important translations of Greek philosophy and science, such as Galen’s medical treatises and Euclid’s astronomical writings, plus some valuable commentaries. Al-Idrīsī penned *Kitāb Rujār* (*King Roger’s Book*), one of the greatest geographic works of the Middle Ages. Some good historical writing emerged after the eleventh century: Hugo Falcandus, Geoffrey Malaterra, and Peter of Eboli narrate the Norman period, while later centuries are described by Ramon Muntaner, Niccolò Speciale, and Michele da Piazza. A greater contribution lay in the further transmission of Greek and Arabic learning. Plato’s *Phaedo*, Ptolemy’s *Almagest*, and Euclid’s *Optics*, among other works, arrived in the west via translations commissioned by the Sicilian court in the twelfth century. Frederick II’s move to the mainland shifted the centers of literary and scientific study to

cities like Naples and Salerno; Sicily itself acquired no university until the fifteenth century.

SISEBUT

Of Sisebut's career prior to his election in 612 to succeed Gundemar (r. 610–612) nothing is known. He was possibly the most cultivated of all the Visigothic kings, and his accomplishments give some hint of the educational attainments of the Romano-Gothic aristocracy in this period. He composed a poetic epistle of sixty-one lines, which he dedicated to Isidore of Seville, on the subject of eclipses. This was in reply to Isidore's dedication to him of *De natura rerum*. This poem gives evidence of considerable reading on the king's part in the works of classical poets, including Lucretius and Manilius. Equally impressive is another probable composition of Sisebut: his *Life of St. Desiderius*, which recounts the career and death of the Bishop of Vienne who had been killed at the instigation of the Frankish rulers Brunchildis and Theoderic II in 607. Other evidence of his literary skill can be found in the small surviving group of letters attributed to him. These include an epistolary exchange with the leader of the Visigothic kingdom's principal enemies in the Iberian Peninsula, the Byzantine governor of Cartagena. Against the Byzantine enclave in the southwest Sisebut is reported by Isidore to have campaigned twice in person, and with some success. One of his generals and his successor as king, Suinthila (621–631), conquered one of the independent peoples of the northwest, the Ruccones. Sisebut's most controversial action would appear to have been his attempt early in the reign to impose conversion on the Jews. This was condemned after his death by the Spanish bishops. On his death in February 621 the throne passed briefly to his young son Reccared II, but the latter died within two months of causes that were never revealed.

SISNANDO DAVIDIZ, COUNT

Mozarab count of the frontier district of Coimbra in the last quarter of the eleventh century. It has been asserted that he was initially installed there by Fernando I of León-Castile after the latter's conquest of that city in 1064, but the earliest document that would place him there dates only to 1070. He surely commanded that frontier during the reign of Alfonso VI until his own death on 25 August 1091. According to the contemporary Muslim historian Ibn Bassām, Sisnando negotiated the surrender of and then briefly became governor of Toledo after Alfonso VI had conquered it in 1085 and attempted without success to dissuade that monarch from converting the major mosque of the city to a Christian cathedral. Certainly the count held property in Toledo that subsequently passed to Alfonso's daughter, Urraca.

He is said, as well, to have been educated in Seville and to have fled from that city to Coimbra. There he is credited with defending the continued use of the Mozarabic rite against the introduction of the Roman rite and to have himself located a Mozarabic bishop to head that see. Unfortunately, many of the documents employed to establish his career are themselves objects of considerable suspicion.

SLAVERY

Slavery in medieval Iberia was primarily an Andalusian phenomenon. The early Christian states could not afford to buy slaves. Captured Moors, like New World Indians later, made poor slaves, and most Moorish prisoners were more profitably traded for ransom. Andalusian conquests created an impoverished class of landless peasants, eager to work on any terms. In the late medieval period Moors captured at sea were used

as slaves in Valencia and Mallorca, and Portuguese navigation provided access to a source of black slaves.

Even from al-Andalus, information on such a widespread institution is scant. Seldom do we know the names of slaves, and recorded words are rare. There was little if any discussion of slavery as an institution; it is in the sixteenth century, with Bartolomé de las Casas, that its legitimacy was first questioned. Existing sources are legislation regarding slaves, Muslim historical or literary works in which slaves appear, inferences backward from the (by comparison) abundant documentation on the fifteenth century and later, both within the Iberian Peninsula and in North Africa, and fragmentary information from Christian sources about Christian slaves.

Slavery in al-Andalus was quite different from the modern stereotype of the institution. While there was undoubtedly abuse and slaves were of course not free, they were on the whole better treated and had more rights, than did slaves in the American South. Many lived nearly as well as their masters and mistresses. Affection between slave and owner was not unusual. Slaves of the wealthy were sometimes pampered household favorites.

Slave women often led a better life than did free women. The concubine had freedom to go about the town, more access to education, and a richer emotional and sexual life, however deficient by today's standards. Slave concubines could manipulate their masters into giving rich gifts. Marriage between master and slave was also not uncommon.

Manumission, especially upon the owner's death, was frequent. The children of a free man with a slave woman were free, and the mother who bore a free man a son became free as well, contributing to the close bond between mother and son typical of later Hispanic culture. Slaves could own property, and some were able to purchase their liberty. Some slaves and freed slaves achieved influence and political power. Freed slaves found little racial discrimination and were easily absorbed into the society as a whole. As is often observed, this contributed to the reduced racial tensions in the Hispanic world today.

There was no prohibition on the education of slaves. As educated slaves were more valuable, an owner might educate a promising slave. A man might do office work, letter writing, and accounting. Women could be entertainers: musicians, dancers, and poets (a few names and works have been preserved). Mostly, however, slaves did the hard and dirty jobs: kitchen work, animal care, manual labor, sometimes soldiering and prostitution. Slaves customarily were found in urban household settings, rather than on rural plantations. Ownership of slaves gave the owner prestige;

ownership of expensive slaves—eunuchs, educated, or white—even more so.

Slaves constituted some 10 to 20 percent of the population of al-Andalus. They were customarily imported rather than bred locally. A free man's offspring were free, and slave men, whose commercial value was low, were much less common than women. Those men there were had little interest in producing slave offspring, and the reproduction rate was low.

Slaves, therefore, were not just a significant demographic element but a source of continued ethnic and cultural mixing. Especially talented slaves were imported from Baghdad. The bulk of them were obtained through raids, as tribute from conquered kingdoms, or purchased in groups from native suppliers. Their origin changed considerably with changing external circumstances. In the first centuries of Islamic rule, most slaves came from eastern Europe; it was at this time that the word *slave* was split off from *Slav*. The well-developed industry was in the hands of the Jews, who brought caravans of slaves westward to the Andalusian slave markets, the largest of any contemporary Mediterranean country. Jewish doctors produced eunuchs, some of which were exported. When access to Slavic slaves was cut off by Christian development in France and Germany, black slaves came to replace them. These were transported by land across the Sahara. Mixture with them produced the dark skin of the Moors. Finally, there were Christian captives from northern Iberia. These were primarily women and children, the men having died in defending them. These scarce slaves were especially prized. Even if illiterate, they were better educated than blacks fresh from Africa. Also, their appearance was considered more attractive. They were favored as sexual partners, and were the mothers of nobles and rulers.

News of the sexual use of Christian women and children reached their homelands. The boy-martyr San Pelagio was a hero for resisting the amorous intentions of 'Abd al-Rahmān III, and the "Tribute of the Hundred Virgins" was an important Reconquest myth. The need to free Christian captives was frequently part of the call to arms. The existence of the captives was indeed convenient for Christian monarchs, and the issue was surely manipulated, just as in the sixteenth century the danger of Moorish pirates was used by the Castilian rulers to distract subjects from internal problems. All the same, the use of Christian women and children for sexual purposes, and the castration of Christian boys, were significant factors in solidifying Christian public opinion against Islam.

SORT, STEVE DE

Catalonian composer (ca. 1340–ca. 1417). After distinguishing himself as a performer on the exaquier, rote, harp, and organ, he was recommended to Juan I of Aragón (1350–1396) in the most enthusiastic terms by Juan's ambassador at Avignon. In all likelihood trained at Avignon, he was already an Augustinian friar when hired 18 October 1394 as Juan I's chapel organist. Martín I retained him until Sort's resignation of his post of Aragónese royal chapel organist into the hands of his pupil, Antoni Sánchez, on 26 March 1407.

Composer of the Credo for three voices (triplum, contratenor, and tenor) of the so-called Mass of Barcelona (Biblioteca de Catalunya, MS 971, no. 3) that appears in more *Ars nova* manuscripts than any other portion of the Ordinary of the Mass, Sort hypothetically composed his Credo at the Toulouse Augustinian monastery, to which he belonged in early youth. Copied in eight manuscripts (from Ivrea, no. 60, dated about 1365 where it is identified as *de rege*, to Apt. 16 bis, no. 46, dated about 1417), his Credo may owe its widespread diffusion to the Valois dynasty of Charles V (1364–1380), who delighted in it.

Available in at least four modern editions, Sort's Credo divides into eighteen sections that tally with text incises. Triplum (the fast-moving upper texted part) is notated without accidental in the signature, contratenor and tenor with one-flat signature. Ranging over a tenth (B-d¹), the vivacious triplum is almost entirely syllabic, with no text repetition and with extended melisma only at the final Amen. Fourteen of the eighteen sections in this earliest Spanish polyphonic mass end on G-chords, three on A-chords, one on F (fifteen final chords lack thirds). The much slower untexted lower parts, usually made up of ligatured notes, were presumably assigned to instruments.

SPAGNA

A courtly bassadanza (*dance*) that originated in mid-fifteenth century. The forty-six white semibreves that comprised the tune first appear with the title *Tenore del Re di spagna* in Antonio Cornazano's (ca. 1465) manuscript *Libro dell'arte del danzare* (Biblioteca Apostolica Vaticana, MS Capponiano No. 203), at folio 33^v. However, the first source to prescribe both the steps used in the dance and the dorian tune with a D-d octave compass bore the title *Casulle [Castille] la novele a xlvii notes a cinq mesures*. Published in Michel Toulouze's *S'ensuit l'art et instruction de bien dancer* (Paris, 1495/6), at folio A^v, this first printed version bore a name that changed with the dance's constant reappearance in various contexts to 1633 (*Alta, Le bail despaigne, La baixa de Castilla, Lo bas despaigno, La basse dance de Spayn, El bayli de Spagna* and *Spanier Tantz* are examples).

The dorian tune itself, which begins with a downward leap of a fourth from A to E and ends on D, inspired some nine polyphonic settings before 1510. The Jewish dancing master Guglielmo Ebreo da Pesaro (ca. 1425–1480), who spent the years 1465 to 1468 at the Neapolitan court of Fernando of Aragón, led the way with a two-part version called *Falla con misuras* in Perugia MS G.26 and *La bassa castiglia* in Bologna, Civico Museo Bibliografico, Q 16, lviii verso-lix. Against the dance tenor the upper part moves in faster notes. The first Spanish setting is an instrumental three-voice *Alta* by Francisco de la Torre (who enrolled in Fernando V's choir 1 July 1483), copied at folio 223 in the *Cancionero musical de Palacio* (Madrid, Royal Palace Library). The Spagna tenor in Ottaviano Petrucci's *Canti C. N° cento cinquanta* (Venice, 1504), fols. 147^v–148, lacks a composer ascription but the *Novum et insigne opus musicum, sex, quinque et quatuor vocum* (Nuremberg, Hieronymus Formschneider for Johann Ott, 1537), number 6, credits Josquin des Prez (ca. 1440–1521) with a four-voice setting entitled *Propter peccata quae peccatis*. Heinrich Isaac's *Missa la Spagna* (Petrucci, 1506) exploits the tune as a cantus firmus. The number of sixteenth-century instrumental settings by Antonio de Cabezón, Diego Ortiz, and others was multiplied by the use of the Spagna tune as a cantus firmus assigned to counterpoint students. The Roman composer Giovanni Maria Nanino left at least 157 counterpoints and canons utilizing the Spagna

tune. Its pedagogical use continued into the seventeenth century among such Neapolitans as Antonio Mayone, Rocco Rodio, and Giovanni Maria Trabaci. In total at least 280 settings of the tune qualify the Spagna melody as the longest use of a *basse dance* tenor in musical history.

SPANISH ERA See CALENDAR

SPANISH MARCH

The expression *Marca hispánica* has often been used to describe the area of northeastern Iberia that was taken into the Frankish Empire between 780 and 801 and that formed the core of what would subsequently be known as Catalonia. A "march" was a medieval frontier, and the term is preserved in the names of several other regions of Europe (the Welsh Marches, Marche, Steiermark). The *Marca hispánica* bordered Islamic Spain. From the Carolingian point of view this was a distant region at one limit of the empire. It is hard to know what else to call the eastern Pyrenees and the lands between the mountains and the Llobregat River when discussing the ninth to eleventh centuries. To refer to Catalonia is anachronistic as this is first found only in the twelfth century. Yet *Marca hispánica* is itself somewhat problematic by reason of its restricted appearance in contemporary sources and also because of the later tendentious implications of its use.

In the *Royal Frankish Annals* for the years 821 to 829, the term *Marca hispanica* appeared for the first time. In the official acts of the Carolingian rulers, however, the term was never employed. Rather, the region was identified as part of Spain (*Hispania*) or associated with Septimania as *Gothia*, and the inhabitants were called *Hispani* or *Gothi*. After 850, *Marca hispánica* drops out even in historical literature. It is notable that the so-called *Annales of Saint-Bertin* in their earlier

redaction refer to the Spanish March (for the years 844, 849, and 850), but that references for later years are to *Gothia* or *Hispania*.

In the course of the ninth century several different counties were formed, of which the most durable would be those of Barcelona, Urgell, Roussillon, Empúries, and Pallars. By the latter part of the century, in a pattern found throughout the troubled Empire, the Pyrenean counties had little contact with the imperial court and were controlled by a local dynasty that split into several branches.

Late Carolingian precepts refer to these counties collectively as part of Gothia (along with Septimania), sometimes distinguishing it a "farthest part" of Gothia. Hispania had earlier referred either to Muslim Iberia or the Carolingian redoubt. Applied to the Spanish March, Hispania became more frequent in the tenth century, but there was never a consensus among learned chroniclers. The French historian Richer, writing near the year 1000, referred indiscriminately to "nearer Spain," "Iberia," and "Gothia." Absent completely from the late or post-Carolingian age was "Marca Hispanica."

In the mid- and late seventeenth century, in the aftermath of the Thirty Years War and the Revolt of the Catalans, *Marca hispánica* was revived by French historians arguing for the annexation of Catalonia or defending positions in the negotiations regarding the Treaty of the Pyrenees. Carolingian precedent was bought in to justify treating Catalonia as part of an original French state. Pierre de Marca, who was named *intendant* for Catalonia in 1644, collected and published documents showing the attachment of Catalonia to the Carolingian Empire and its successor. This exhaustive, partisan (and still very useful) book was published in 1688 under the title *Marca hispanica sive limes Hispanicus*, an erudite play on the author's name and sanctification of a locution implying dependence on France. The Spanish March here means a frontier beyond which lies Spain, not part of Spain itself.

Given this background, it is not surprising that historians now are inclined to avoid "Marca hispánica" or use it only to refer to the early years of Carolingian administration. Its convenience is outweighed by its misleading implications. As José Antonio Maravall has succinctly noted, "the Spanish March is not the name of a country." At the same time, as Catalan historians emphasize, a degree of self-consciousness, apart from both France and the rest of Iberia, already characterized the region by the tenth and eleventh centuries. The polemical implications of *Marca hispánica* are caught up in the destiny of the term *Catalonia*, a term with its own peculiar taxonomic history, first em-

ployed at the point when the County of Barcelona was uniting with the Kingdom of Aragón.

SUEVI See GERMANIC INVASIONS

ŠŪFISM

Šūfism, or *tašawwuf* (from *suf*, wool) seems to have implied in its beginning a simpler ascetic way of life, with emphasis on poverty (*faqr*), and a life retired from the secular and luxurious ways of the new cities. It required a more personal approach to Islam, meditation of the Qurʾān, insistence on one's own spiritual purification, and the search for goodness and God. Only when this righteousness and consciousness was applied to society at large and to the social interpretation and observance of Islam did Muslim jurists (*fuqahāʾ*) begin to find this practice objectionable. In the doctrinal sense, primitive sufism soon involved itself in the Hellenistic eclectic metaphysics used by the first philosophers, and thus the theologians, the *mutakallimūn*, opposed it too.

Andalusian Šūfism has its roots directly in the East. In al-Andalus, the majority of scholars (*ʿulamāʾ*) and jurists (*fuqahāʾ*) interpreted the Qurʾān and Muslim law according to the malikite school and based their interpretation of religious texts on the *thahir* (obvious), the literal sense. This created an unfavorable atmosphere for the more rationalistic interpretation of doctrine such as in *muʿtazilite* theology and to the individualistic ascetism or esoteric doctrines that šūfism was adopting in the East. In the late ninth and early tenth centuries some Andalusian travelers to the East came in contact with the great philosophical and sufi schools of Egypt and Syria. Even though it was not necessarily a rule, many of the mystics in the Iberian peninsula followed a cenobitic form of life, similar to that led by Christian monks in al-Andalus, but also by many sufi communities in the East. Notable were those near Almería, from where they spread to Seville, Córdoba, and Murcia.

One of the first known in al-Andalus was Ibn Masarra (931), also considered the first philosopher of the region. Nothing is extant of his writings, and what is known of his doctrines has been gathered from refer-

ences to his teachings made in the works of Muslim philosophers and mystics until well into the fourteenth century. After this initial generation, most of the Andalusian Šūfis flourished after the conquests by the African Almoravids mid-eleventh century. And although they were a product of the philosophical and spiritual Andalusian world, most of them, as the case had been with Ibn Masarra, exerted their influence in northern Africa, to where many of them had been expelled or voluntarily emigrated to avoid the rigors of the Maliki rule predominant in al-Andalus. Of the Šūfis who spend their life in al-Andalus, many were seen as a political force often respected but never quite trusted by the orthodox exponents of Andalusian Islam. With the popularity given their spiritual masters in exile, they were often the cause of revolts, as the case was in Algarve with Abū-l-Qāsim ibn Qāsi and his novices, avowed followers of Al-ʿArif. In this sense they became socially important, although very little of their doctrine is known besides their claim to be disciples and followers of spiritual leaders of renown.

The first generation of prominence was that of Abū al-Abbās ibn al-ʿArif (1088–1141), born in Almería, already the center of a rather esoteric group of Šūfis. His method (*ṭarīqah*) attracted many students. Accused of heresy by the governor of Almería he was sent to respond to the Almoravid sultan in Marrakesh. Ibn al-ʿArif was released, but was poisoned by emissaries of the governor. He is held in great esteem because of his *Mahasin al-majalis* (*Book of Beautiful Seances*, perhaps in the sense of *states*). The book deals with the spiritual stages; written from the point of view of the mystic (*ʿarif*), everything, even virtues, are considered accidental and a means to an end, for the mystic only subsists in and with God.

Also persecuted and sent to Marrakesh with al-ʿArif were Muḥammed ibn al-Husain from Mallorca, who resided in Granada, and Abū al-Ḥakam ibn Baradjān from Seville, the famous author of a commentary on the Qurʾān and a book on the divine names.

These were followed in the next century by Abū Madyam of Seville and by the greatest of the Andalusian mystics, Muḥyi ud-Dīn ibn ʿArabī (1165–1240). A prolific writer, Ibn ʿArabī known especially for his *Fusus al-hikma futuhat al-makkiyya* (*Meccan Revelations*), and a book of mystical poetry, *Tarjuman al ashwaq* (*Interpreter of Desires*), and its commentary. He was the first to formulate the doctrine of existentialist monism. For him the existence of the Creator is the very essence of the existence of all created things. This too is his explanation for his mystical poetry, for created beauty is essentially a reflected splendor of the divine.

In the same century, Ibn Sabʿīn of Murcia (1218–1269), a disciple of Ishaq ibn Daqn, emigrated to Ceuta where he led a Şūfī community. His practice of strict poverty and isolation aroused the fuqahā's suspicions and he was forced to emigrate; he died in Mecca. His main book is *Qutb ad-dīn (Axis of Religion)*, while his most famous, *Sicilian Questions*, can only doubtfully be attributed to him.

It is difficult to give a summary of Şūfī doctrines. While many practices were adopted from Eastern Christian monasticism, the doctrinal body consists of eclectic elements of for the most part hellenistic, gnostic, neoplatonic, and some of Persian origin.

Ascetism is generally the beginning of the spiritual path: in the triumph over its attachment to the flesh the soul finds God. As the novice advances in his ascetic path (*ṭarīqa*) he receives spiritual graces, *fawāʿid*, with their perception based on an experimental wisdom, *maʿarifa*, by stages, *maqāmāt*, or by steps, *aḥwāl*, the soul reaches the ultimate goal, the divine, the only reality, *al-ḥaqq*.

The central theme of Şūfism is the mystical union, *fanāʾ*, which is normally explained in philosophical terms of mixed origin, always based on the notions of existence and knowledge. As there cannot be any reality besides God's, there cannot be existence besides His; as God cannot be dependent for His knowledge on what it is, He creates what he knows. This process of creative divine illumination leads on the one hand to the Aristotelian notion of the active intellect, but also to that of emanation, since reality, existence, and knowledge get easily confused.

Associated with the religious history of the peninsula is the dervish mystical order known as the *shadiliyya* movement, founded by Abū al-Ḥasan ash-Shadīlī, born probably in Ceuta about 1197. Totally devoted to religious studies and mystical doctrines since his youth, he preached in Tunis and often visited Mecca. He died in Upper Egypt about 1258. As with many of the spiritual leaders, he did not write much, pronouncing his teachings in the form of spiritual sayings and admonitions, some of which were collected some fifty years later. Abū Madyan, who lived in northern Africa, and considered the cofounder of the sect, and Abū al-ʿAbbas al-Mursī (Murcia 1287), who led a secluded life in Alexandria, were both originally from Spain. Their well-deserved renown is based on their activities in the oral teaching of their novices (*murīdīn*), for neither seems to have written much. Their influence, especially in Tunisia and Algeria, determined the direction of the mystical trends in the following centuries. Principles (*uṣūl*) of the shadiliyya are fear of God, steadfast observance of the law (*sunna*) as the only rule (any revelation that conflicts with the sunna should be re-

jected), disdain of mankind, surrender to the will of Allah, and quest of God in sorrow and in joy. The spiritual union (*fanāʾ*) is achieved through repetitive religious exercises. Ecstasy should not incapacitate one for the active life (if it is followed by sobriety).

The most important mystic of Andalusian origin associated with this school is Ibn ʿAbbad from Ronda (1332–1390). Born in Seville, he too spent most of his life in northern Africa. He is remembered for letters of spiritual direction and for his commentary on the sayings of the spiritual leader of the order, Ibn ʿAtaʾ Allah (*Sharh li-l-hikam al-ʿataʾiyya*).

Although some of the expressions used from Ibn Masarra to Al-ʿArif and Ibn ʿArabī can easily be understood as those of pantheism, others, who insist on God's inaccessibility and on the stages of the human soul on the way to the divine union, allow a metaphorical interpretation for even the most radical phrases. On the other hand for Ibn Masarra, and especially Ibn ʿArabī, by insisting on the unity of reality (*el-ḥaqq*) and the creative nature of divine illumination, both notions receive in Şūfism an ontological character, rather than a gnoseological one, and the mystic union *fanāʾ* that of substantial effacement of the self in God. For that reason emphasis on the esoteric interpretation of Şūfism lead even in the Islamic tradition to frequent accusations of pantheism.

Andalusian Şūfism could be characterized by its giving more importance to the Aristotelian, rather than Neoplatonic, analysis; by the relative absence of visionary aspects, even by the rejection of the charismatic graces and greater emphasis given to the ascetic path and to the psychological and pedagogical analysis of the several spiritual stages (Ibn al-ʿArif, Abū al-ʿAbbās of Murcia, Ibn ʿAbbād of Ronda).

After the Reconquest Şūfism suffered the same fate in the peninsula as Arabic culture and Muslim religion in general, showing its continuation in North Africa, while those Muslims remaining in the peninsula, the Moriscos, could not stop its rapid decline, and were able only to preserve religious traditions more as a ritual than as a doctrine.

For scholars of peninsular spirituality the major challenge remains the study of the influence that Muslim mystic doctrine and practices may have had on the Christian mystics of the following centuries—specifically on the Carmelite school (Sts. John of the Cross and Teresa of Avila). The verification of documentary contacts between both has remained elusive. More plausible but equally as elusive to document has been the presumption of popular contacts.

SYNAGOGUES

The synagogue (Hebrew *bet ha-keneset*; Sp. *sinagoga*) dates in Spain probably to the very origins of known Jewish settlement (ca. 300), although the famous “synagogue” of Elche is now thought to be, in fact, a church. Few, if any, remains survive from that early period, therefore. In Muslim Spain, Jews tended to live (for unknown reasons) near the southwestern section of cities, usually near the mosque. Most of the synagogues in Muslim cities were located near one of the city walls. The major cities inhabited by Jews in the Muslim period included Córdoba, Seville, Granada, Málaga, Lucena, Toledo, Valencia, possibly Jaén, Tarragona, Burgos, Zaragoza, and Barcelona. No synagogues from the Muslim period survive.

One of the earliest references to a synagogue in Castile comes from the events of 1196 when, in violation of a treaty, Alfonso XI of León invaded Castile. Caught in the middle was the Jewish castle, Castro de los Judíos, which was attacked and destroyed, along with the synagogue.

Shortly after the conquest of Córdoba, Innocent IV complained (1250) to Fernando III that the Jews

there had dared to rebuild their synagogue and add to its original height, contrary to canon law. The *Decretals*, composed by Ramón de Peñafort (ca. 1230), contain the ruling of Gregory I that Jews may not build any new synagogue, and that of Alexander III that a ruined synagogue may be rebuilt but not added to in any way. Fidel Fita was undoubtedly correct that once the increased height of the Córdoba synagogue was abandoned, the Jews were allowed to retain it and it was not destroyed. The present famous synagogue of Córdoba is certainly not this one, but a later building. It was made a national monument in 1885.

One way around the law of the *Decretals* was the creation of “private” synagogues in houses. Jaime I of Aragón-Catalonia, generally a good friend of Jews, granted such a right to a Jew of Barcelona in 1263, and ordered the *baile* to protect the synagogue and the Jews who came there. The *Siete Partidas*, composed for Alfonso X chiefly by Ramón de Peñafort, the same anti-Jewish canonist who wrote the *Decretals*, strictly prohibited the building of new synagogues (but noted that since the name of God is praised there, Christians are prohibited from defacing it, putting animals in it, or interfering with Jews worshiping there).

The two most famous synagogues extant in Spain today are, of course, those of Toledo. They are both national monuments, after having been converted into churches: Santa María la Blanca and El Tránsito (the latter now houses also the important Jewish museum). The former synagogue was constructed, supposedly, by Joseph Ibn Sūsan (d. 1205). However, careful examination of the present structure does not convince me that it is of so early a date, and it seems likely that it was either rebuilt later, or perhaps even constructed by another member of that illustrious family, not earlier than the thirteenth century. Little remains of what must have been the magnificent interior of this synagogue, but the impressive columns and remnants of the intricate engravings on the wall give some idea of its former glory.

The El Tránsito synagogue, near the home of El Greco (which was the house of the builder of the synagogue) was constructed by Samuel ha-Levy, the famous treasurer to Pedro I (ca. 1357). Its magnificent carved marble walls, intertwined with geometric and foliate designs and Hebrew inscriptions as well as the shields of Castile and León, have been repeatedly photographed and analyzed. A portion of the original tiled floor also remains.

There were numerous other synagogues in Toledo, including a later one (ca. 1380) which belonged to Samuel’s son, Mayr.

In Seville, Alfonso X (1252) provided that three former mosques be given to the Jews to be used as

Interior of a former synagogue. S. Maria la Blanca, Toledo, Spain. Copyright © Scala/Art Resource, NY.

synagogues. Others were soon constructed (in spite of canon law). The famous government official Yuçaf de Écija built another synagogue there sometime before 1339, and Alfonso XI requested permission from Clement VI at Avignon to allow the Jews to use this as a reward for their fighting together with Christians of the city against invading Muslims. In 1391, the notorious anti-Semitic archdeacon of Seville Ferrán Martínez, in stirring up the pogroms, complained of twenty-three synagogues in the city, but this is an obvious exaggeration. There were, however, at least six. Two were converted into churches (Santa Cruz and Santa María) and another remained a synagogue until the Expulsion, when it also became a church (San Bartolomé). Avila, another city with a very large Jewish population, also had several synagogues, most of which became churches.

In fact, since Jews lived in almost every city and small town in Spain, synagogues were found everywhere. Many churches in these towns are former synagogues. Important ones elsewhere in Castile were Burgos, Jerez, Jaén, Ocaña, Plasencia, Segovia, Huesca, Huete, and many others. Madrid, of course, had its synagogues, but they have long since disappeared. Similarly, throughout Aragón-Catalonia were those in Barcelona, Calatayud (at least six in the fourteenth century), Borja, Girona, Besalú, Lérida (earliest reference is 1173), and so on. Some interesting details include the bishop of Vic (1319) allowing Jews to relocate their synagogue in Tárrega; Jaime II (1326) permitting Jews of Burriana to build a new synagogue and cemetery; the infanta Violanta (1384), noting that Jews were widely scattered in the area and could not easily get to one synagogue, requested the bishop of Vic to allow a new synagogue in Cervera. The poet Samuel ibn Sason of Carrión wrote (ca. 1330–1340) that a Christian lady gave a house to the Jews to expand the synagogue of the ironsmiths.

Jews, like Christians, formed *cofradías* throughout Spain, either merchant or craft guilds or else charitable organizations. Hebrew sources confirm that many of these had their own synagogues. Women also, par-

ticularly in large cities, had their own separate synagogue. One of the most famous of these was in Zaragoza, which had numerous synagogues, including those of various *cofradías* (weavers, leatherworkers, visitors of the sick, etc.).

Women were not, however, always (usually?) separated from men in Spanish synagogues, as is obvious from manuscript illuminations, which are a major source for the interior of synagogues. In these illuminations may also be seen the large elevated platform, called *minbar* (never *almemar*, as modern authorities claim, and certainly not *anbol*), which is Arabic for a raised platform or pulpit in a mosque. From a desk on this platform the Torah would be read, which unlike Ashkenazic (European) synagogues was not kept in a large carved wooden ark, but rather enclosed in an elaborately decorated case (often of gold).

Another important fact to note is that, by Jewish law, a synagogue as such may only be used for services. Most of the synagogues in medieval Spain were, in fact, legally a *bet midrash* (house of study), where teaching and learning went on regularly. As such, they were also routinely used for public meetings of the communities. During the brief, horrible years (late thirteenth century) when Jews were compelled to listen to sermons by Dominican and Franciscan missionaries, synagogues were most commonly used for these.

Finally, unnoticed (remarkably) by all recent scholars is the fact that the palace of the Diputació General of Catalunya in Barcelona was constructed from Jewish houses, and that part of it is, in fact, the former “small synagogue” purchased from the Jews in 1416. The outer wall and windows still survive.

TAFUR, PERO

Pero Tafur was a courtier at the court of Juan II of Castile and the author of the *Andanças e viaje de Pero Tafur por diversas partes del mundo avidos*, a fifteenth-century book of travels. He was born at Seville in about 1413, where he was raised and educated until 1431. At the command of the master of the order of Calatrava, in 1437 Tafur undertook a journey to the Holy Land, described in his narrative. The entire trip took from that date until 1439. Embarking at San Lúcar de Barrameda on the Atlantic coast of the Iberian peninsula, Tafur's trajectory covered Italy, parts of North Africa, Judea, Cypress, Rhodes, Greece, the lands of the Tartars, Switzerland, Germany, Flanders, and Burgundy. In all his sojourns he encountered remarkable people and equally remarkable situations. He claims to have been grandly received most everywhere he went, especially in Germany where he was entertained by the emperor and in Italy by the pope.

The relation of Tafur's travels constitute a mesmerizing synthesis of both fact and fancy that competes easily with Marco Polo and Sir John Mandeville. Generally speaking they are comprised of both fact and fiction, reveal a fascination with wonder, and betray a close affinity to late Byzantine romance.

Upon returning to Castile, Tafur is said to have married a lady from Córdoba, had four children, and settled down to complete his memoirs in 1457. He died most likely in, or shortly before, 1484.

TĀ'IFA KINGDOMS

Muslim historians first used the term *tā'ifa* (Ar. *mulūk al-tawā'if*; Sp. *reyes de taifas*) in a pre-Islamic context, with reference to local Persian potentates who came to power after Alexander the Great's defeat of Darius III (333 B.C.). In Iberian terms, the taifa kings were those local rulers who emerged after the disintegration of the Umayyad Caliphate in 1009, in the tumultuous years that followed, both before and after the formal abolition of the Caliphate in 1031, and on through to the Almoravid invasions (1086+). In retrospect and with all due deference to significant geographic, ethnic, and political variations between the different taifa states, the *Memoirs (Al-Tibyān)* of the last Granadan taifa king, 'Abd Allāh ibn Bulluggīn written around 1090, in exile at Aghmāt, in Morocco, after his deposition by the Almoravids, do not seem too far off the mark: "every military commander rose up in his own town and entrenched himself behind the walls of his own fortress, having first secured his own position, created his own army and amassed his own resources. These persons vied with one another for worldly power and each sought to subdue the other." Yet we should not consider all taifa leaders as tyrants or, in modern terms, as military dictators. In the absence of central authority, people urgently sought leadership wherever they could find it: members of prominent families, important landowners, lesser officials, *qāḍīs*, *wazīrs*, *faqīhs*, all were to contribute to the taifa governments. In ethnic terms, four different groups of rulers were to emerge: (1) *Andalusíes*; (2) "Old" Berbers; (3) "New" Berbers; and (4) *Ṣaqāliba* (sing. *ṣiqḷabī*), Eastern European slaves. During the almost eighty-year duration of

TĀ'IFA KINGDOMS

Tā'ifa Kingdoms

the taifa *fitna* (civil strife), the control and the frontiers of the approximately forty different taifa entities were in almost constant flux. Yet these four groups can, allowing for their shifting circumstances, also be identified in geographic terms.

1. The *Andalusies* were acculturated, often patrician, descendants of early Arab invaders or, perhaps, also of early Hispano-Roman and Hispano-Gothic converts, who might eventually also pass as having “come over with the Mayflower.” These Andalusians were to control large urban centers, such as Seville and Zaragoza, as well as some smaller taifas like Silves, Huelva, Niebla, and Murcia. Descendants of Hispanic converts (*muwalladūn*; *muladíes*) ruled in Murviedro (now known as Sagunto; Valencia Prov.) and Mértola (Baixo

Alentejo). (For ongoing tensions between Old and New Muslims, see Monroe, *Shu'ūbiyya*.)

2. Berbers began settling in the Peninsula from the first years of the Muslim conquest. A descendant of one of these “Old” Berbers, ‘Abd Allāh ibn Muḥammad ibn al-Aḥṣas, was to gain control of Badajoz, taking the honorific title al-Muẓaffar (The Victorious). Following a pattern that was to evolve and prosper during the taifa period, Ibn al-Aḥṣas was a learned man, a noted poet, and a patron of the arts, forming a gigantic library and motivating the compilation of a now lost forty-volume encyclopedia: *Al-Muẓaffarī*. Other potentates of “Old” Berber extraction attained power in Toledo and in the towns of Alpuente (Valencia) and Albarracín (Teruel), the latter perpetuating the name of its taifa rulers, the Banū Razīn.

3. Like many another Muslim ruler, Al-Manṣūr had recruited numerous Berber troops from North Africa, to surround himself, as was the custom, with foreign mercenaries, who, initially at least, would be above local politics and on whose loyalty the sovereign could rely. (Compare the Egyptian Mameluks or the Moroccan sultan Mulay Ismā'il's vast seventeenth- to eighteenth-century army of Senegalese slave soldiers [*'abīd*].) Some of these "New" Berbers were also to become taifa kings: notably in Granada and, for a time, also in Zaragoza and Toledo. Smaller Andalusian states were also ruled by "New" Berbers: Carmona, Morón [de la Frontera], Arcos, and Ronda.
4. Slavery was, of course, a thriving institution in al-Andalus. West African slaves reached Spain across the Sahara to Morocco, but there were also great numbers of Eastern European slaves (*ṣaqālība*), many, but not all of them, Slavs, who were either sent overland through France and southward through the Ebro Valley, or by sea from Eastern Mediterranean ports. (Note the modern toponym *Ceclavín* [Cáceres] = Colloquial Hispano-Arabic plural *ṣiqḷābīyīn* [Asín Palacios].) Most dealers were European, particularly Venetian, slave merchants. The word *ṣiqḷabī* meant "slave," but it also came to mean "eunuch." Like other slaves in the Muslim world, some *ṣaqālība* were able to reach positions of notable power. With the fall of the caliphate, many *ṣaqālība* fled eastward to the Levant, where they established various taifas. The most impressive and most successful was the taifa of Denia, which extended far inland and also included the Balearic Islands. It was ruled by Mujaḥid al-Ṣiqḷabī, known as *al-rūmī* and probably of Sardinian origin. He maintained a substantial navy which he put to good use, even briefly invading his native island. Other taifas ruled by *ṣaqālība* were Almería, Valencia, and Tortosa. Mujaḥid left sons who held power in Denia and the Balearics long after their father's death in 1045, but other *ṣaqālība* as eunuchs, obviously could not establish dynasties and their time in power tended to be relatively brief.

If the eight decades of taifa rule was a time of political weakness and chaos, it was also, by contrast, a time of dynamic and eminently successful cultural expansion. This was "the most intense and the most brilliant century of Arabic-Andalusian culture." Ṭā'ifa rulers, relatively powerless in politics and war, competed and outdid each other as patrons of the arts and sciences. As we have already seen, in the case of Ibn al-Aftas in Badajoz, great libraries were formed and schools were established. The sciences flourished: mathematics, astronomy, pharmacology, engineering,

agronomy. The Golden Age of Hispano-Arabic and of Hispano-Jewish literature was the age of the ṭā'ifas. The ṭā'ifas have also given us superb architectural monuments, carvings, metal work, and tapestries. But Christians from the Hispanic north, who themselves once held only diminutive ṭā'ifa-like kingdoms paying tribute to the Córdoba caliphs, could now turn the tables on Islamic Iberia and exact confiscatory payments (*parias*)—protection money—from their Muslim neighbors. Unrelenting Christian conquests of Muslim land, such as the brief, but disastrous taking of Barbastro by Frankish knights in 1064 or Alfonso VI's permanent capture of Toledo in 1085, brought ever greater pressure on the ṭā'ifa kings. Help, but help at great risk, was available in Africa. Al-Mu'tamid ibn 'Abbād, the cultured poet-king of Seville, has left us a memorable one-liner with which to close the epoch of the taifa kings: "I would rather tend camels for the Almoravids than herd swine for the Christians." As the North African armies of Yūsuf ibn Tāshfīn swept northward, the elegant world of the taifas, with its refinement, its exquisite poetry, its luxury, and its tolerance, would come to an end and Al-Mu'tamid and his beloved Rumaykiyya would die in misery, as prisoners of the Almoravids at Aghmāt, in the Atlas Mountains.

ṬĀ'IFA KINGDOMS: THE SECOND ṬĀ'IFAS

Some historians find it convenient to designate the relatively brief period of chaos (*fitna*) between the disintegration of Almoravid control and the Almohad conquest, as constituting a second *ṭā'ifa* epoch. Local governance was variously taken over by *qādīs* (judges), by military men, or by alternative religious leaders. *Ṣūfīs* ruled in Almería and the Algarve. *Qādīs* came to power, temporarily at least, in Córdoba, Jaén, Granada, and Málaga. Military leaders, who had previously served the Almoravids, won out in Zaragoza, Valencia, Murcia, Ronda, and Beja. Christians from the north eagerly took advantage of the new disorder in al-Andalus. Portuguese, with the help of northern European crusaders, took Lisbon in 1147; Castilians, allied with Navarre, Aragón, and Catalonia, and with Genoese and Pisan support on the sea, temporarily captured Almería, in that same year; the last Muslim strongholds in Catalonia—Lérida, Fraga, and Tortosa—were taken, with the help of Knights Templars, in 1148–1149. The most durable of the Second Ṭā'ifa military rulers was Abū 'Abd Allāh Muḥammad ibn Sa'd ibn Mardanīsh (= Martínez?), doubtless a Muwallad of Christian extraction—though Arabic sources claim a Yemeni origin—who, based in Valencia and Murcia, controlled most of eastern al-Andalus, including Jaén, Úbeda, and Baeza, between 1147 and 1172, and who conquered Écija, Carmona, and Guadix, even laying siege to Córdoba and Seville and briefly taking Granada. Vigorous, irreligious, and overbearing—he increased his subjects' taxes—Ibn Mardanīsh was not averse to worldly pleasures, liked his wine, and, according to Ibn al-Khaṭīb, shared his roof with over two hundred slave girls. Especially after 1157, when the Almohads retook Almería, Ibn Mardanīsh—the *Rey Lobo* of Christian chroniclers—maintained and increased his contacts with the Castilians, who, along with Aragónese and Catalans, abundantly supplied him with mercenary soldiers. In 1169, Ibn Mardanīsh's ally and father-in-law, Abū al-Ḥasan ibn Hamushku ("the lop-eared"?; note Sp. *muesca* "ear markings of cattle"), the independent lord of Segura [de la Sierra] (Jaén), went over to the Almohads, dooming Ibn Mardanīsh's continued independence. He held out until 1172, when, at his death, his lands were taken over by the Almohads.

TAIO

Taio was Braulio's successor as bishop of Zaragoza. He took up his episcopal office in 651, and his signature is recorded among those of the bishops attending the Eighth and Ninth Councils of Toledo in 653 and 655. Little more is reported of his episcopate, nor is there any record of the date of his death. Indeed, the name of only one other bishop of Zaragoza has been preserved from the rest of the seventh and eighth centuries.

More is known of Taio's career in the period prior to his appointment to the episcopate, however. From two letters of Braulio, one of which is quite acrimonious, it may be deduced that Taio had been a priest and then the abbot of a monastery in or in the vicinity of Zaragoza. At some point in the 640s he was sent to Rome by the Visigothic king Chindaswinth (642–653) to find works of Pope Gregory the Great that were not then available in Spain. These would appear to have included some of the books of the *Moralia*. A legendary account of this visit, in which the whereabouts of the books were revealed to Taio in a vision, is contained in the Toledan *Chronicle of 754*. In 653/4 Taio produced a five-book collection of *Sententiae*, extracts from Pope Gregory's writings organized thematically, which he dedicated to Bishop Quiricus of Barcelona. Taio has also been attributed with six brief commentaries on the Books of Wisdom of the Old Testament, but this claim needs to be treated with skepticism.

TALAVERA, HERNANDO, DE ARCHBISHOP OF GRANADA

Born of *converso* (Christian convert) parents around 1430, Talavera studied and taught at the University of Salamanca and then rapidly rose through the ecclesiastical hierarchy, becoming Isabel the Catholic's favorite confessor and archbishop of Granada after its reconquest. He was almost certainly of Jewish origin, and his converso status was at one point investigated by the Inquisition; but he was also well connected to the nobility (the Álvarez de Toledo) and to influential clerics.

Talavera for a time taught classes of moral philosophy at the University of Salamanca before withdrawing to the Jeronymite house of Alba de Tormes. Later, his religious reputation persuaded Isabel the Catholic to invite him to the royal court, and by 1476 he was a member of the royal council and a political councillor of extraordinary influence, playing a strategic role in the financing of Columbus's "enterprise of the Indies," and above all taking charge of the religious fate of the population of reconquered Granada (1492). Talavera approached the problem of the defeated Muslims in an evangelical spirit, attempting to convert the defeated by persuasion and peaceful means. In this, however, he was thwarted by Jiménez de Cisneros who, rejecting Talavera's pastoral approach, used brutal force in order to convert or expel the Muslims.

Toward the end of his life, the saintly Talavera also had to undergo the indignity of having his family investigated by the Inquisition, on the grounds of heretical associations relating to a Jewish background. Although the notorious and sinister inquisitor Diego Rodríguez Lucero was dismissed from his charge by the pope, it was already too late for Talavera who, on his deathbed, entreated the Catholic Monarchs to intervene against the Inquisition. He died in May 1507. Talavera's concern with respect to the defeated Muslims of Granada damaged his reputation at the time but greatly enhanced it subsequently. By stressing teaching and persuasion rather than force, he anticipated later Counter-Reformation emphases of an evangelical nature. His reputation, even among the vanquished, was that of a truly religious man, even a saint.

TALMUD See RABBIS

TARIFA

City in Andalusia, province of Cádiz. The Romans knew it as Mellaria, important for its strategic location on the Mediterranean and for its role in Mediterranean commerce. It declined as a port under the Visigoths, but Muslim troops from Africa used the city as a beachhead for expeditions into the peninsula. Under Muslim rule, Tarifa also regained its economic importance. In July 710 Ṭarīf ibn Mallūq landed there with his forces and the city afterwards bore his name. After the decline of the emirate of Córdoba, Tarifa belonged first to Algeciras and then to the kingdom of Granada. Alfonso VI penetrated as far south as Tarifa in his raids on

Seville in 1082. The Almohads captured Tarifa in 1146, and the Almohad general Al-Manṣūr used Tarifa from 1190 to 1195 to land his troops for the campaign that would culminate at Alarcos. In 1275, Muḥammad II of Granada gave Tarifa, Algeciras, and Gibraltar to Abū Yūsuf Ya'qūb, sultan of Morocco, to use as a bridgehead to invade Castile. The Marinids established these cities as bases, which forced the Castilians to use naval power in the Straits of Gibraltar. The kings of Castile put pressure on the kings of Granada to surrender Tarifa, but Granada, fearing the loss of its link with Muslims in Africa, refused until Sancho IV captured Tarifa in 1292. Despite immediate efforts by the Granadans and the Moroccans to recapture the city, it remained Castilian, mostly due to the defense of the city by its *alcaide*, Alfonso Pérez de Gúzman (1256–1309). In April 1340 the combined armies of Granada and Morocco laid siege to Tarifa, but the siege was lifted by Alfonso XI of Castile and Afonso IV of Portugal in the Battle of Salado.

ṬARĪQ IBN ZIYĀD

Of Berber origin, Ṭarīq was the freed former slave of the Arab governor of *Ifriqiya* or North Africa, Mūsā ibn Nusayr (ca. 700–712). He may have held regional authority under the latter in the area of the Tangiers Peninsula and the southern shore of the Straits of Gibraltar prior to the invasion of Spain. He is said to have commanded the main Arab and Berber army that carried out that invasion in 711 and defeated the Visigothic king Roderic (710–711) in what is often called the Battle of Guadalete. The Arab sources present Ṭarīq as turning what Mūsā had intended to be an exploratory raid into a dramatic full-scale conquest in consequence of his victory. Mūsā had to hasten across to Spain to take overall command of the operations to prevent his subordinate from winning all of the glory. In some accounts Mūsā had Ṭarīq flogged for exceeding his instructions. The only early source for these events, the Christian *Chronicle of 754*, offers a subtly different version that commands greater credibility. According to this, civil war was raging in the Visigothic kingdom at the time of the invasion, and at least two Arab armies were involved, under the leadership of Mūsā and of Ṭarīq, respectively. The latter won the victory over Roderic, but it was Mūsā who took the

Visigothic capital Toledo. In the probably unreliable later Arab stories Mūsā is said to have planned to kill Ṭarīq, but was prevented by the order of the caliph. Both men were summoned to Damascus (in 712), where Mūsā fell into disgrace after the accession of the caliph Sulaymān in 715. After this nothing more is known of Ṭarīq.

TARRAGONA

Tarragona's prehistoric foundation is indicated by the popular attribution for its impressive "cyclopean" walls around its acropolis to mythical giants. The Romans used Tarraco as their main base of operation and developed the city as their provincial capital of Hispania Citerior, which was subsequently called the *Tarracensis*. During the Middle Ages Tarragona was known, as it is today, for its vast Roman monuments and ruins: a forum; a circus, with its paleo-Christian basilica church at its center; harbor fortifications, and late antique and early Christian necropolises in the lower city; on the very visible acropolis with its walls and towers, a Roman temple and fortified *palatium* or castle-like residence for the Caesars; and outlying roads and bridges, triumphal arches, a quarry, and an aqueduct. It was also the old Romano-Visigothic metropolitan see of northeastern Spain connected by oral tradition to St. Paul's mission to western Mediterranean port cities. The see of Tarragona was hallowed during the Decian persecution by the blood of martyrs (Bishop Fructuosus and his deacons), commemorated by the hymns of Prudentius, and documented by papal decretals as early as A.D. 385, sixth-century conciliar acts, and historical and literary references in surviving classics.

When the Visigothic defense of the city collapsed in 718 before the Muslim onslaught, Prospero, the last Hispano-Roman archbishop of Tarragona, fled to Liguria with the church's precious relics and famous *Orational*. While Muslim forces pushed toward Barcelona and beyond, Tarragona was occupied through the tenth century as evidenced by repair to the walls and aqueduct, pottery and ceramic remains, and conversion of the temple into a mosque under 'Abd al-Rahmān III (912–963). The coastline was fortified up to the so-called Punta de la Mora where Tamarit Castle stands, and the Campo was dotted with small Muslim villages that retain their Arabic toponymy to this day.

As the Muslim military occupation receded over the centuries, Tarragona became the focal point of a three-century contest for dominion.

The encroaching Christians by the eleventh century built a line of castles facing south from the march of Ausona to Barcelona's march of Olérdola between the coast and the Penedés, and above the Río Gayá along the northeastern edge of the Campo de Tarragona, while the Muslims built a juxtaposed hard-shell defense system in the mountains of the Priorat, the Muslim march of Ciurana with the Tarragona fortress as its vortex, to defend the Ebro borderland governed from Zaragoza and protected by Tortosa and Lleida. The Christians after the 970s attempted several reconstitutions of the ecclesiastical province and metropolitanate of Tarragona, unsuccessfully until Bishop Berenguer Lluçanes of Vic in 1090, allied with the Gregorian Reform, became the archbishop *in partibus fidelium*. Count Ramón Berenguer I had even attempted in the 1050s a bold coup and occupation of the city of Tarragona with an enfeoffment to the marcher Lord Bernard Amat. But the real reconquest began in the contest with the African Almoravids and in reaction to their counterattacks after the fall of Balaguer in 1106 to Urgell and the Aragónese taking of Zaragoza in 1118, resulting in Muslim raids along the coastline above Tarragona, the defeat in 1124 of the Catalans outside Lleida at Corbins, the disaster at Fraga in 1134 that left the Aragónese routed and their king, Alfonso I, mortally wounded, and the whole frontier up for grabs.

Undaunted, the ambitious Count Ramón Berenguer III forged a grand pan-regnal alliance system stretching from Aragón to Pisa and Genoa, and crusade movement orchestrated by the famous bishop of Barcelona, Oleguer Bonestruga, who in 1118 became the archbishop of Tarragona. Ecclesiastical restoration and reconquest thereafter were coordinated. The prelate succeeded in recruiting Norman crusaders to take Tarragona; their leader, Robert Burdet, was made *princeps* of Tarragona in 1129. Tarragona city was reoccupied militarily but was not immediately repopulated. Although Christian settlers began to move onto the Campo and the Muslims withdrew to their highland march of Ciurana, the Almoravid counterthrust after 1118 through the 1130s meant that the frontier was still very dangerous. Archbishop Bernat Tort in 1146 called a provincial council to renew the crusade. The allies, with energies heightened by a daring raid on Almería in 1147, afterward set up a naval blockade from Salou southward with ships from Barcelona, Genoa, Pisa, and Montpellier. Christian forces attacked Tortosa, which fell in 1148, and Lleida capitulated the next year. It was only then that in an effort

to attract more settlers to Tarragona, its inhabitants were granted a charter of freedoms. While the military orders and Arago-Catalan *hueste* (army) that subdued Lleida turned back toward Tarragona to outflank the Muslims in the Priorat, frontier barons from the Urgellian and Ausonan marches attacked from the north; Norman, English, and Catalan forces moved from Tarragona and Castelvél to secure the coast and southern defenses of the Ciuranan march. The Muslim castle of Ciurana fell in 1153, the campaign was largely over by 1155, and the spoils of war were mostly reallocated by 1158. Only then was the Campo de Tarragona really secure for Christian repopulation and the city safe for the permanent residence of the archbishop, who began building the see's new cathedral.

During the absence of the archbishops the Norman princes governed Tarragona semiautonomously, but with the formation of the Crown of Aragón, a separate principality there could not be tolerated by the house of Barcelona. Through their archbishops, beginning with Bernat Tort (1146–1163), pressure was applied to regain indirect secular authority over Tarragona. His successor, Hug de Cervelló (1163–1171), continued this policy of reimposition of archiepiscopal control over the Robert's sons, who revolted. A civil war ensued, during which the archbishop was assassinated in 1171. The Catalans united behind the new archbishop, Guillem de Torroja, and expelled the Normans, who were subsequently exiled to Mallorca. Thereafter archiepiscopal, abbatial, and baronial patronage sponsored a massive building program in the city, exemplified by commencement of a new cathedral, and throughout the Campo, especially at the Cistercian monasteries of Santes Creus and Poblet.

Tarragona as an ecclesiastical principality was re-incorporated in 1173 into the Crown of Aragón by a concordat between Alfonso II and Archbishop Guillem for corule. This cooperation continued until 1391, when Juan I gave up all secular claim to the archbishops. Meanwhile, Tarragona was revived as a commercial center and naval base with its nearby port of Salou for operations against the Balearics and the southern coastal reconquest of Valencia (1238). Its lower industrial zone between the port and acropolis grew, a mercantile district developed below the fortress, the acropolis was repopulated, municipal government was expanded after reforms in 1231 finally to include three Jurats and a council, and outlying communities were incorporated into the city. The Cistercians were the earliest arrivals, followed by the Carthusians much later, when they founded Scala Dei during the 1220s in the highlands; and within the city the Mercedarians were the first to arrive in 1224, the Poor Clares were next in 1256 with their confreres, the Franciscans coming

later in 1274 at the same time as the Augustinians. Tarragona's prosperity was terminated by the Black Death of 1348 when a fourth of the population succumbed; the remaining suffered from intermittent civil strife, exorbitant royal taxation, and trade competition from Barcelona. Recovery was slow; Tarragona's urban renewal was postponed until after 1570.

TÁRREGA, FRAY RAMÓN DE

Born of Jewish parents at Tárrega in the Catalan Urgell region (ca. 1335), he was baptized at age eleven, possibly upon the conversion of his parents. He entered the Dominican mendicant order at Cervera and studied at the Barcelona priory. At Palma in 1355 he taught logic, at Lérida from 1357, and theology at Cervera from 1365. His former teacher at Barcelona, the notoriously anti-Judaic Nicolau Eymerich, had in 1356 become inquisitor general of the Crown of Aragón; in 1368 he prosecuted Ramón for heresy for theological novelties. When Ramón refused to retract even under pressure from the Dominican master-general, Eymerich imprisoned him at the Santa Caterina priory in Barcelona.

Ramón's appeal on grounds of trial irregularities to the papal court at Avignon led to a papal commission of thirty theologians in 1371 to examine his writings. Ramón suddenly died on 20 September 1371, however, under circumstances suggesting murder or suicide; the metropolitan of Tarragona inaugurated a formal inquiry in 1371, no record of which has survived. Eymerich drew up twenty-two heretical propositions from Ramón's works; Pope Gregory XI condemned these in 1372. Sometimes called the Ramón Llull of Tárrega, his *Ars operativa* (also titled *De secretis* and *De quinta essentia*) is actually Llull's work. His *De invocatione daemonum* and *Conclusiones variae* are genuine.

TAXATION

The Roman tax system based on the *tributum soli*, or land tax, and the *capitatio humana*, or poll tax, continued in use in Visigothic Spain, though the distinction between them tended to be blurred. Regular evaluations of the land had been abandoned in the late imperial era so these tributes remained fixed amounts rather than variables depending on assessment. Other revenue sources included tolls on goods in transit, fines levied in court, confiscation, booty, and gifts. In Islamic Spain the principal legal impost was the *zakat*, or alms tax. Among other taxes were a land tax (*ushr*, *kharaḡ*), tolls, customs duties, sales taxes, tributes payable by Christians and Jews subject to Muslim rule, and tributes demanded of the Christian rulers.

In Christian Spain in the early medieval centuries the tax system was quite simple as the principal revenues continued to be drawn from sources fixed by custom. In general kings were able to manage quite well because their responsibilities were limited and so did not require a large bureaucracy; thus the expenses of the royal court were minimal. Nor did military operations entail substantial expenditures because royal armies were composed of individuals obligated to serve at their own cost. The expansion of the Christian kingdoms led to increases in the eleventh and twelfth centuries in both revenues and expenditures and the first appearance of an extraordinary tribute.

Customary tributes levied in the early medieval centuries included a land tax or rent (*functio*, *censum*, *tributum*, *infurción*, *quadregesima*; or, in Catalonia, *parata*, *usaticum*, *tasca*) of a seigneurial character payable by tenants on royal estates; this was also known as *marzadga* or *martiniega* because it was payable in kind, but later in money, either in March or at Martinmas (11 November). Tenants also owed the king labor services (*opera*, *sernas*), work on roads and bridges (*facendera*), payments for the use of pasturage (*herbaticum*, *herbazgo*) and woodland (*montaticum*, *montazgo*; in Catalonia, *forestatge*); inheritance dues (*nuntium*, *mortuarium*, *luctuosa*), hospitality (*hospicium*, *yantar*, *cena*), and provisions (*conductum*, *conducho*).

Also noteworthy were tolls (*portaticum*, *pedaticum*, *portazgo*, *pedazgo*) collected on goods and persons at the entrance to towns and at various points of transit. Among the important personal services required were guard duty (*anubda*; in Catalonia, *specula*,

mirall), especially in frontier areas exposed to Muslim attack. Townspeople were also obliged to participate in military expeditions of one sort or another (*hueste*, *cabalgada*); failure to appear in the host or *fonsado* was punishable by a fine called *fonsadera*.

Regalian rights also enhanced the royal coffers, especially as the Reconquest moved below the Duero and the Tagus Rivers. The monarch claimed a monopoly of the profits of mines and salt pits, whose exploitation was leased to private persons. The distribution of salt was also controlled by the crown. Rental of shops, claims over strays, buried treasure, flotsam, and jetsam were also incidental sources of income.

In the middle years of the eleventh century the rulers of the Christian states were able to demand *parias*, or tributes, from the petty Muslim kingdoms (*ṭawāʾif*) that replaced the caliphate of Córdoba. These sums were so substantial that Fernando I was able to pledge the payment annually of one thousand gold pieces to the monastery of Cluny; his son Alfonso VI doubled the amount, but the subjugation of the *tāʾifas* (party kingdoms) by the Almoravids brought that source of revenue to an end.

The invasion of Spain by the Almoravids, a sect of zealots from Morocco, raised the issue of extraordinary taxation for the first time. To meet the Moroccan challenge, in 1090 Alfonso VI asked for an extraordinary tax called a *petitum* or *pedido*, a name that describes its nature as a royal request. In time this seems to have become a regular levy collected without a prior request for it.

Royal needs expanded rapidly in the thirteenth century as greater funds were required to prosecute the Reconquest and to execute the more varied and complex functions of government. These tasks could not be carried out on the basis of the traditional imposts (*pechos*) of the past; though they continued to be levied, ever more frequent exemptions rendered many of them meaningless as sources of income for the crown. The expansion of government meant that chancery fees, fees charged by public notaries and scribes, and judicial fines (*calumnia*, *caloña*) were an increasing source of income that helped to pay the salaries and expenses of the personnel in the chancery and the courts. Military expenses could be met in part by the collection of *fonsadera*, as it was now often to the king's advantage to excuse people or communities from service in return for this payment. The king, in imitation of Islamic custom, also was entitled to a fifth (*quinto*) of the booty taken in war. The port towns along the Bay of Biscay were required from the thirteenth century onward to provide a certain number of ships for royal service or in lieu thereof a payment in coin.

Hospitality and provisions were two very important rights claimed by the monarch but they also aroused strong protest from the *cortes* (parliament). In 1284 Sancho IV set the amount of *yantar* due from the towns upon his personal visitation at six hundred *maravedís* for himself, two hundred for the queen, and three hundred for his son acting as his lieutenant. The *cortes* insisted that *yantar* was due only on a royal visit, but Alfonso XI declared that it should be paid even when he was engaged in military operations. The *adelantados* and *merinos mayores* responsible for territorial administration were also authorized to take an annual *yantar* of 150 *maravedís*. The *cortes* also charged that when royal officials took provisions, or *conducho*, they broke into houses, seizing food, drink, and animals, and often inflicted other damages without compensation.

In addition, the Mudéjars, or Muslims and Jews living under Christian rule, were subject to the payment of poll taxes whose importance rose as a consequence of expansion into Andalusia and Murcia in the thirteenth century. The Jewish communities in the towns were likely more well off than Mudéjars in rural areas and probably paid a more substantial amount. In 1280 Alfonso X compelled the Jews to increase their daily tribute from 6,000 to 12,000 *maravedís*, or from 2,190,000 to 4,380,000 annually. His son Sancho IV apparently reestablished the earlier amount.

As the Almohad regime disintegrated, Fernando III was able to impose an annual tribute on the kings of Granada, amounting to one-half the revenues of the kingdom, or 300,000 *maravedís*. In later times, whenever the king of Granada believed that he could do so with impunity, he refused payment, but he was usually compelled to resume it. This tribute was said to be one-fourth or one-fifth of the total revenue of the kingdom of Granada, which was estimated at about 560,000 *dinars* in the mid-fourteenth century, and at about one million silver *reales* in 1492.

The multiplicity of royal responsibilities required the development of extraordinary taxation. The problem was to find a suitable means. In the twelfth century the Christian rulers began to coin money for the first time and they quickly realized that one could profit by altering the content of coins while maintaining their face value. This practice evoked protest because of the resulting economic upheaval. Responding to such complaints, in 1202 Alfonso IX of León promised not to alter the coinage for seven years in return for the payment of one *maravedí* by each nonnoble freeman; this tribute came to be known as *moneta* or *moneda forera*. Three years later Pedro II of Aragón obtained a similar tribute called *monedatge*. The Portuguese *cortes* of 1254 also consented to the imposition of *mo-*

netágio in return for Afonso III's pledge to maintain the coinage intact for seven years. In time *moneda forera* became a regular tax given to a new king at his accession.

Fernando III also discovered that the Reconquest of Andalusia could be financed in part by laying hands on the *tercias*, that third of the tithe destined for the upkeep of churches; when the clergy protested the king emphasized that he needed the money for the defense of Christendom and so the papacy finally authorized the crown to take it. In reality the *tercias reales* usually amounted to two-ninths of the total.

The development of extraordinary taxation was advanced greatly in the reign of Alfonso X, who introduced the *servicio y montazgo*, a tax on migratory flocks of sheep. The *montazgo*, a pasturage toll on migratory flocks of sheep collected by the municipalities, was effectively transferred to the crown in the *cortes* of 1261, when the sheepowners agreed to pay the king an annual *servicio*. After the king levied the *servicio de los ganados* on migratory flocks in the *cortes* of 1269, these two imposts came to be known henceforth as *servicio y montazgo*.

While the internal toll known as *portazgo* continued in existence, the crown derived little profit from it because of alienation and exemption. Much more valuable were customs duties (*diezmo, almojarifazgo*) levied on imports and exports. In 1268 Alfonso X organized the regular collection of customs duties at assigned ports along the Bay of Biscay, and in Andalusia and Murcia. Although the nobility protested, the collection of customs duties was never abandoned. The system was revised by Pedro I, Enrique III, and Juan II, who established a series of customs posts along the frontiers of Aragón and Navarre to regulate mercantile traffic. In the later medieval centuries *diezmos y aduanas* were collected in the bishoprics of Calahorra, Osma, Sigüenza, Cuenca, and Calahorra, bordering Navarre and Aragón; the *diezmo y medio diezmo de lo morisco* was levied along the frontier with Granada, while the *almojarifazgo*, an old Islamic duty, continued to be collected in the ports of Andalusia and Murcia; the *diezmos de la mar* were gathered in Galicia and the Bay of Biscay. Customs duties levied at frontier posts were one of the most lucrative sources of income.

The mounting financial needs also prompted kings to ask the *cortes* to consent to regular subsidies on income known as *servicios* (in Catalonia, *donatiu*). The royal obligation to ask for consent was affirmed many times. In justification of his request the king usually argued that the utility or necessity of the realm required it; in specific terms that often meant that money was needed for wars against the Muslims. Once the king offered an appropriate explanation the *cortes* was

obliged to respond in a positive way. Thus the principle of consent to extraordinary taxation came to be firmly fixed. The *servicio* was at times a capitation tax payable at the same rate as *moneda forera*, but at other times it was a variable impost on movable goods. In Aragón and Catalonia the subsidy was often granted as a hearth tax (*fogatge*) or was based on customs duties.

Servicios voted by the Castilian *cortes* (parliaments) were usually collected from the townspeople, whose names and estimated wealth were recorded in registers (*padrones*) prepared for that purpose. Tax farmers (*arrendadores*) were ordinarily entrusted with collection, but their activities often provoked protest against their exorbitant demands or from those claiming exemption of one kind or another. In the *cortes* of 1387 Juan I tried to collect a *servicio* from everyone, but the nobles and clergy who were traditionally exempt complained and forced the king to back down.

Rising protests against the imposition of *servicios* caused the kings to look for still other ways of raising money. The *sis*a, varying from 1 percent to 3 percent, was a burden imposed on the consumer in the marketplace. An exceedingly unpopular tax levied initially by Sancho IV, it was abolished in 1295 after his death by his widow, who sought thereby to win support among the towns, but it was subsequently revised.

Under Alfonso XI, the *alcabala*, a sales tax of 5 percent falling on all consumers, whether clerics, nobles, townsmen, or peasants, came into general use. With the consent of various assemblies in 1342 and 1345 he was able to levy the *alcabala* to finance his military operations against the Moors. From the time of Enrique III, the *alcabala*, which increased to 10 percent in 1377, became a permanent tax levied annually without explicit authorization by the *cortes* and was the most important source of royal revenue.

In difficult times kings often resorted to the forced loan (*empréstito*) as a means of raising money. Fernando III was among the first to obtain such loans from the towns of Galicia in 1248. To allay protests, Alfonso X promised in 1255 to 1256 that he would not demand them, but the practice continued and Alfonso XI obtained loans of this kind in 1333 and 1337. Juan I in 1382 revealed that he had exhausted his income and intended to impose an *empréstito*; with that intention he indicated the specific sums that he expected several citizens of Murcia to pay. He assured them repayment of the *moneda* or *alcabala* in the next year, but he offered no guarantee that they would also receive interest.

The crown also borrowed money from domestic and foreign bankers but was often unable to promptly pay off these loans; thus a long-term debt made its appearance. In order to prosecute the war against Gra-

nada, Fernando and Isabel borrowed extensively, pledging repayment with an annual interest of 10 percent. As these certificates of indebtedness were held by *juro de heredad* that is, by hereditary right, they came to be known as *jueros*. In time they were issued in such great numbers as to threaten the monarchy with financial catastrophe.

Throughout the high and late Middle Ages the monarchy was constantly in need of funds, partly because of the nearly constant alienation of revenue-producing lands, rights, and other sources, and partly because of the frequent exemption of clergy, nobles, and others best able to pay taxes. The collection of taxes was also often inefficient and did more to enrich the tax farmers than to fill the royal treasury.

TECHNOLOGY, ARABIC

Hydraulic technology was that area most developed in al-Andalus, and the one best studied. Recent investigations by medieval archeologists have focused not on the great peri-urban *huertas* that traditionally have been viewed as the outstanding monument to the hydraulic skills of the Arabs, but rather on smaller, mainly mountainous “mesosystems” that in all probability accounted for most of the irrigated development in the first two centuries or more of Muslim rule. This kind of irrigation, moreover, is associated with a distinctive pattern of rural settlement, largely undocumented, and which archeology has now revealed to us. This pattern, which can be characterized as the *hisn/qarya complex*, consisted of eight to ten villages (*alquerías*) grouped around a castle or *hisn* serving the area's peasants as a refuge in times of insecurity, and practicing irrigation agriculture. The *alquerías* were originally settled by clans or tribal segments, either Arab or Berber, but preeminently the latter.

Irrigation was accomplished by an array of associated techniques, all of which could be constructed by peasants or local artisans. Water was diverted from running streams by gravity flow in surface canals: both the diversion dam (*azud*, from *sadda*, “to close”) and

the canal (*acequia*, from *saqiya*) are known by Arabisms in Spanish. Water was also conducted to fields from wells, either by means of a lifting device, or through underground conduits. The lifting technique most used was the "Persian wheel," known as *na'ura* or *saniya* in Arabic (*na'ura* yields *noria* in Castilian, while in Catalonia, the same device is called *sénia*). This was a horizontal wheel moved by the traction of an animal, generally a burro or mule, that engages a vertical wheel on which is mounted an endless chain of pots (the *noria* pot, in Arabic *qadus*, became *arcaduz* in Castilian). In general, water was not delivered directly to the fields but stored in a holding tank (*birka*, yielding *alberca* in Castilian) and then released into the farmer's fields when most appropriate. The wells were made of stone- or brickwork, and some of them had stairways leading down to the surface of the water. Ibn al-ʿAwwām's suggestion that two wells be linked together below the surface of the water, thus delivering more water to the *noria*, was in fact put into practice.

The Arabs also introduced large, current-driven *norias* that were run on the main canals of irrigation systems or on special feeders diverted from rivers. The one at La Ñora on the Aljufia Canal in Murcia was famous, as were the wheels on the Tajo and Guadalquivir Rivers that lifted water to Toledo and Córdoba, respectively.

Another method of delivering water was the *qānāt*, also called a horizontal well. It too taps into the water table but rather than lift the water at the point of extraction, a tunnel is dug running along the surface of the water table, so that water filters into it along its entire length; hence the *qānāt* is also called a filtration gallery. In order to first dig and then service the tunnel, air holes are dug periodically (hence the *qānāt* is also called a "chain well," even though the holes in the chain are not wells). The *qānāt* has mainly been studied in Persia, where some of them reach great lengths and are true architectural masterpieces. Likewise, it was previously thought that Andalusian *qānāts* were typically the monumental ones bringing water to cities like Madrid, with its *qānāt* system in the Guadarrama Mountains. But recent archeological studies have demonstrated not only that *qānāts* were ubiquitous in al-Andalus, but that they were very modest, and were built with construction methods quite similar to those of wells. Thus in Mallorca, *qānāts* were typically between 1 and 1.5 meters in height with widths of between .45 and .9 meters. The modest nature of the Mallorcan *qānāts* can best be appreciated by their scant length. The longest of the thirteen studied are 196 and 299.9 meters, respectively. But most are much shorter: a *qānāt* of 24.5 meters, having but two ventilation shafts, and a mini-*qānāt* of 16 meters, with but one

shaft, hardly the mighty channels like those bringing drinking water to Kirman or Madrid. Numerous place-names record the presence of *qānāts*: Canet (Mallorca), Puerto Lumbreras (Murcia), and Villacañas (Toledo) are examples.

Similar to the *qānāt* is the *cimbra*, a trench dug along the channel of a dry gulch in order to capture water by filtration, and then vaulted over. Tunnels carrying water underground but that have no filtration function are also known all over eastern Spain, where they are called *alcavóns*.

Water could also be lifted directly from a channel by a *swapes* or *shadufs*, known in al-Andalus as *aljataras* (as documented in the *Libros de Habices* of Granada).

We know a great deal about the incidence of hydraulic mills in Islamic Spain because many are listed in the *Libros de Repartimiento/Llibres de Repartiment*. The Repartiment of Mallorca lists numerous mills, some of them called *reha*, as in Reha Abenzeiar, from the Arabic *rāḥa*, meaning mill. Most of these mills were horizontal mills for grinding grain, run off of irrigation canals, and many, like the Molí de Cup, on the Canet Canal, were equipped with tanks called *cup* in Catalan, *cubo* in Castilian, so that water could be delivered to the paddle wheel under pressure. Thus there was ample power to drive multiple millstones in the same mill. The Repartiment of Valencia likewise lists more than one hundred mills. In rural areas, mills associated with irrigation systems were sited at the end of the canal system, whereas in Catalonia, the mill usually was sited near the head of the system with the irrigated fields downstream. In Mallorca, where the Arabs built very long sinuous canals winding through the mountains, each *alquería's* segment ended with a mill.

Inasmuch as horizontal mills were standard throughout the Mediterranean region, it is difficult to distinguish between those of Christian and Muslim construction; but one of the few mills still existing from before the conquest still stands, although ruined, on the Júcar River at Fortaleny.

Most industrial mills, such as fulling mills, forges, and some gristmills were vertical, powered by overshot or undershot wheels. Al-Qazwini describes an undershot mill on Mallorca that in times of water shortage could be converted to overshot. In Castile, the term *aceña* described a vertical mill—the famous *aceñas* lie on the Duero at Zamora—while *molino* implied a horizontal one. Paper, incidentally, was made entirely by hand in al-Andalus, although the Catalans later mechanized the process of macerating the paper.

TECHNOLOGY, CHRISTIAN

T. F. Glick's work on Muslim technology in the Iberian Peninsula demonstrates clearly the gaps that the study of medieval Iberian technology presents, while also allowing an appreciation of the differences that exist between the emerging interest in the topic in its Islamic and Christian contexts.

As a result of Glick's work recently there has been a broadening of the technological approach to medieval research. Conferences like the fourth Congreso de Arqueología Medieval Española—along with other meetings of wider chronological focus, such as the conferences on irrigation and mining in Almería and Ripoll, respectively—are demonstrations of this emerging shift in attitude.

Two important points should be made, however. The first is that medieval Christian industry and technology has not been studied from a strictly technical perspective. There are certainly numerous historical, archaeological, and to a lesser extent, artistic studies centered on the subject, but these typically follow their own methodologies, making a true synthesis of the material difficult. The second point is that within the complex sphere of technology, only certain topics—the mill, irrigation, mining, and metallurgy—have attracted the attention of the scholar.

The broad chronology of the period is marked by a gradual increase in information and sources—written and material—that begins with St. Isidore's excessively generic reports and leads to the detailed legislation on technology found in the *fueros* and other municipal ordinances. At the same time, the almost complete lack of visual imagery representing technology is eventually replaced by multiple Romanesque and Gothic works depicting work scenes. Given the current state of things, scholars must take on the project of compiling all data pertinent to industrial processes, reading the ample existent documentation from a technical, and not just historical, perspective. We also need to revindicate the importance of those archaeological ruins associated with the acquisition, fabrication, and

processing of products, as well as the transcendence of simple work tools and objects. Also fundamental is the need for the creation of an iconographic corpus, given that the integral form and use of medieval implements and tools can often be recuperated through historical images.

Finally, the study of medieval industry needs to move beyond a mere trend—this is apparent especially in the existence of "star topics"—and needs to widen its field of investigation to incorporate the whole range of topics associated with the subject.

Along with the unchanging nature of certain technological practices through periods of long duration, we must also emphasize the repercussions of economic factors as a counterpart to the continuity. Throughout periods of both economic prosperity and crisis, it is evident that the role of technology varies considerably. Parallel to these temporal variations, we should not lose sight of additional geographical variations; otherwise we risk mistaking what may be a local process for a widespread phenomenon of the Iberian Peninsula.

The complexity characteristic of the late Middle Ages is as much a product of the development of Christian society as it is a result of a greater abundance of available information. Therefore, it might be advisable to approach certain subjects going against the flow of time; that is, using an analysis of the abundant data provided in the late Middle Ages as a point of departure for a retrospective study of previous ages.

Excepting, in part, the topic of the mill, which generated an abundant historical bibliography starting in the 1970s, and a considerable group of archaeological studies in the 1980s, it is impossible to produce even a minimally coherent analysis of medieval Spanish technology. In fact, even with the mill there are still many loose ends that should be resolved in the future. For example, the differences among *rueda* (wheel), *molino* (a mill with a horizontal wheel), and *aceña* (a mill with a vertical wheel) need to be much better articulated, since several different types of mills often appear in the same place. Also, the meanings of these words within their regional and temporal contexts need to be better determined—in some occasions the *aceña* seems to be associated with irrigation as an element of water extraction. At the same time, the difference between *molino* and *aceña* should be distinguished, since the first was often transformed into the second. We also must differentiate between those *molinos* with intricate, costly infrastructures (barges, long canals, buckets) and those that lack a complex system of water transport and extraction.

The study of medieval agricultural industries can be approached and illuminated using both written texts and Romanesque and Gothic images, which until now

have not been exploited to their full extent. It is perfectly possible to document certain characteristics and statistics relative to agriculture, including the number of plowshares used in a field of planted grain (documents of the Segovia cathedral chapter, late thirteenth century); the system for harvesting grain, whether through the use of a flail or a thresher (the *fueros* of León); or the terms of agreement and work conditions decided through the system of salaries and tithes (the *furs* of Catalonia), to cite a few examples. With respect to the first point, it is worth noting that in Zamora and Segovia—and possibly many other areas—documents as early as the eleventh and thirteenth centuries indicate the existence of a requirement to till the land four or five times, a date that anticipates considerably the same phenomenon in other parts of Europe. Using iconography and written documents allows us to show that the regions in which certain agricultural implements were used, such as the flail or the cart with moveable axle, were more extensive in the Middle Ages than in subsequent times, thus demonstrating the temporal mutability of certain industries that are usually deemed as unchanged throughout periods of time.

The study of Christian irrigation has only been approached by opposing it with its Islamic equivalent in order to see which Moorish traits remain or change (Glick studied this for the Valencian region). This type of analysis, however, has not focused on texts describing the northern zones of the peninsula, which do not have a strong link to the Islamic methods. The organization of hydraulic systems and water transport needs to be studied as a general process that includes the water mill, agricultural irrigation, fishing, and the thrashing mill, not only because these elements seem to be associated with the larger system, but also because the presence of one of these mechanisms often allows for the later development of others (as in the case of the mills, which are converted into aceñas or thrashing mills).

With respect to cattle raising, it is interesting that the practice has not drawn investigative attention as an industry; this is perhaps due to the lack of a significant material culture that accompanies it.

The hunt has been analyzed by studying municipal ordinances and iconography, which show a clear social duality in the hunt. In addition to the noble hunt connected to the courtly world and to war, there is another type of hunt practiced by the poorer sectors of the population. Laws reflect the varieties of techniques used by these lower classes—many of them prohibited in certain areas—and the complexity of situations associated with trespassing or with other places where hunting was not allowed. Though it has not been given the scholarly attention it deserves, fishing also takes on

considerable importance in medieval life, as is reflected in the monastery's control of the practice, its association with the mill, and the regulation of fish sales in urban sectors.

Current research on mining or metallurgy in the Catalan Pyrenees or in the Cantabrian range will allow us to assess in the future the importance of the iron industry in the economy of neighboring areas and its influence on those industries in which the presence of metal is important.

The study of the handicraft industry is quite uneven; there are studies on the textile industry, the production of ceramics, etc., but we still lack studies on many other practices. We must keep in mind that in late urban documents, the craft industry is shown to have a high level of specialization.

From a social point of view, we must emphasize the fact that individuals in power—both in religious and secular positions—and members of the rural community played important roles as creators and guardians of industrial methods. This can be seen in various occasions in the clauses of agricultural contracts and in legislation in the *fueros* and municipal ordinances, and clearly takes shape in the specifications indicating what agricultural work needed to be performed and how such work should be realized, and in generic forms that required the work to be performed correctly. But the agricultural sphere is not the only sector where this occurs, as this attitude is also documented with respect to ironworks, breadmaking in the ovens of the nobility, and the mass-production of handmade works.

We cannot conclude without mentioning the importance of groups of “foreigners” in the development of certain technologies as evidence of the human mobility observable in the Middle Ages. A phenomenon like the Mozarabic migrations explains in part the spread of Islamic industrial methods in northern peninsular regions. In addition, the progressive conquest of zones in al-Andalus brings about the adoption of typically Moorish technological infrastructures that were not always well assimilated by Christian communities (on occasion the canal systems typical of irrigation-related industries show up in regions as far north as Catalonia *before* the conquest of Valencia or Andalusia). Other groups such as the Cistercian monks have affected the development of specific industries. Their relationship with the stress placed on mining and ironwork is well known; to a lesser extent, attention has also been drawn to the Cistercian influence on agriculture. In this brief summary, we should not forget the presence of an important collective of artisans from beyond the Pyrenees that spread their knowledge in Iberia.

TÉLLEZ DE MENESES, LEONOR

A member of the Portuguese branch of the important Castilian Meneses family, Leonor was born circa 1350 in Trás-os-Montes. She became a lady-in-waiting to the Portuguese princess Beatriz, half-sister of King Fernando I (1367–1383). According to a 1371 treaty between Castile and Portugal, Fernando was to marry Leonor, daughter of Enrique II of Castile. He instead fell in love with Leonor Téllez, who was then married to João Lourenço da Cunha. The king had their marriage annulled, and he wed Leonor himself in 1372. In spite of growing opposition from his subjects, Fernando empowered Leonor who, in rather unprecedented fashion, coruled with her husband and achieved extraordinary influence and power over the conduct of domestic and foreign affairs.

She established a long-lasting extramarital relationship with Juan Fernández Andeiro, a Castilian knight who had gone to serve the Duke of Lancaster in Gascony in 1371. When Fernando died in 1383, she was appointed regent with the power to govern until the majority of her daughter Beatriz who, in 1383, had married King Juan I of Castile with the stipulation that the child of this union would be future king of Portugal. When the queen's pro-Castilian policies became clear to the majority of the Portuguese and that this marriage virtually guaranteed the union of the two crowns, they rose against Leonor and her adviser and rallied around the figure of Fernando's illegitimate half-brother, João, master of the Order of Avis. The master arranged for the murder of the queen's favorite and prepared to resist the Castilian armies of Juan I summoned to Portugal by Leonor. She ceded the regency to the Castilian king but soon plotted to kill him. Juan ordered her taken to the nunnery of Santa Clara in Tordesillas, in Castile, where she died in 1386. Meanwhile, in the Battle of Aljubarrota, the Portuguese soundly defeated the Castilians, thus securing the throne for the House of Avis and averting the merger of the two kingdoms.

TEMPLE, ORDER OF THE See MILITARY ORDERS**TENORIO, PEDRO**

Tenorio's date of birth is unknown; he died at Toledo, where he was archbishop, on 28 May 1399. Tenorio was a partisan of Enrique de Trastámara in the civil war leading to the murder of King Pedro I of Castile and the accession of the Trastámaran dynasty. Early on, as a result of his partisanship, he was forced into exile by Pedro I, first to France and then to Italy. While in Italy, he studied under the eminent canonist Baldo degli Ubaldi, taking a doctorate in canon law at Rome.

After the battle of Nájera, two of Tenorio's brothers were executed by Pedro I. Tenorio escaped the same fate thanks to the intervention of the papal legate, Guido da Bologna, in whose household he served. Tenorio went to Portugal and in 1371 was named archbishop of Coimbra. Pope Gregory XI named him archbishop of Toledo on 13 January 1377.

Tenorio is best known for his political and military activity. During the minorities of both Juan I and Enrique III, he exercised his authority and partisanship in advancing his personal interests as well as in the direction of the realm, becoming one of the most influential notables in the kingdom. In 1391, for example, after a controversy erupted over the will and intention of Juan I regarding the guardians of his son, Enrique II, a regency council under Tenorio's guidance was installed to direct the kingdom and watch over the boy during his minority. The arrangements lasted only into the first months of 1391, when deep divisions among the ambitious nobles who formed the membership emerged. Pero López de Ayala and his nephew Diego Hurtado de Mendoza figured in the latter group. The situation was immediately aggravated by a series of calamities that confronted the monarchy with a set of difficult decisions. Most important among those events was the anti-Semitic violence that broke out in Seville in the spring and spread throughout the kingdom during the rest of the summer. The council's internal divisions were resolved only by means of the actions of Enrique's aunt, Leonor, Queen of Navarra, who with the assistance of the papal legate, arranged for the disputing parties to accept, with some modifications, the original guardians Juan I had named for his son in his will. The following year was followed by trouble with the kingdom of Granada, and the Portuguese with

whom a truce was finally reached in 1393. Despite all earlier efforts, discord among the members of the regency council continued and Tenorio, who threatened to resign, was taken prisoner and forced to turn over several fortifications under his protection.

TERESA ALFÓNSEZ

The natural daughter of Alfonso VI of León-Castile, the first queen of an independent Portugal, and mother of the first king of Portugal, Afonso Henriques (1128–1185). Born about 1083 to a noblewoman of western Asturias, Jimena Munoz, she was married to the French Burgundian count Henry sometime before the fall of 1096. At that date the two were given the control of the county of Portugal by Alfonso VI. After the latter's death in 1109, Henry and Teresa attempted, without success, to displace Teresa's half-sister, Urraca, on the throne of León-Castile. In either 1109 or 1110 a son, Alfonso Enriquez, was born to the pair and in 1112 Count Henry died. From that point, Teresa ruled the county of Portugal, taking the title of queen in 1117. Her struggles with Urraca continued in the form of border disputes, and in the course of that rivalry she took the Galician noble, Fernando Pérez, first as lover and then as husband. This action led to a break with her son and in the Battle of San Mamed on 24 June 1128, the couple were defeated and forced to flee to Galicia, where Teresa died in November 1130. She also had a daughter, Sancha, by Count Fernando.

TEXTILES

Textiles and textile fibers were important components of trade and industry in the Iberian Peninsula, both north and south, although Muslim Spain was more active in the production of luxury textiles for most of the medieval period. Andalusian textiles were widely

Detail of the so-called Gilgamesh motif on a silk weaving found in the tomb of Bishop Bemard Calvo of Vich.

disseminated to Europe and the Islamic world from the ninth to the twelfth century. In the tenth century, the Muslim author Ibn Ḥawqal extolled the "precious garments of linen, cotton, and silk" available in Córdoba, and reported that Andalusian silks were sent to Egypt and even as far as Khurasan. References to luxurious "Spanish" textiles (probably of Andalusian manufacture since Christian Spain was not producing many fancy fabrics in this period) appear in European Latin texts by the ninth century. Later documents from the Muslim world, Europe, and Christian Spain show that Andalusian textiles were available in these regions. Within the peninsula, the 1162 *fuero* of Mos set a toll on "robes coming from the land of the Moors." Mozarabic wills from twelfth-century Toledo mentioned Andalusian articles of clothing, and Valencian fustians appear in an inventory of household effects from Zaragoza at the same period. In 1207, the Cortes of Toledo set tariffs on *cendal* imported from Murcia. Fabrics found in the royal tombs at Santa María la Real de las Huelgas in Burgos also testify to the diffusion of Almoravid, Almohad, and Naṣrid fabrics in the northern peninsula.

Silk was the most important fiber to the Andalusian textile industry, and silkworms probably reached the Iberian Peninsula in the eighth century. Three factors were necessary for the success of silk manufacturing. First, the mulberry trees on which to feed the silkworms; second, the human technical skills required to handle the silk; and third, sufficient numbers of people involved in the business to maintain viable levels of production. These requirements limited the silk industry geographically and rendered it susceptible to climatic and demographic fluctuations, but it thrived in southern Spain for most of the Muslim period. The industry reached its height under tā'ifa, Almoravid, and Almohad rule, and the Muslim geographer Al-Idrīsī counted three thousand farms raising silkworms in the mountains around Jaén in the middle of the twelfth century. Silk was also produced in Christian Spain by this century, particularly in Valencia, but this output was not competitive until the later Middle Ages.

We know most about the Muslim silk industry in Almería, where Al-Idrīsī reported eight hundred workshops devoted to the production of silks and brocades. Another twelfth-century geographer, Al-Zuhri, reported that "nothing is hidden from any of the craftspeople here . . . in Almería, every type of elegant furnishing is manufactured, and everything is perfectly made. All the people here, men and women, work with their hands; the most frequent craft of women is spinning, which brings silk to its high price, and the most frequent craft among men is weaving." The high numbers cited here suggest that silk production was a cottage industry, both at the level of cultivation and later textile manufacture. Many people would have been involved, and even children were useful because their small fingers were better at unwinding the delicate filaments from the silk cocoons.

References to Andalusian raw silk and silk textiles decline after the early thirteenth century, and although the industry continued in Nasrid Granada, it appears that Spanish silk no longer dominated western Mediterranean markets in the later Middle Ages. Demographic and political changes in the peninsula seem to have adversely affected the silk industry. Likewise, competition from silk ateliers in southern Italy and Sicily was a factor in the industry's decline, as was the increasing availability of other luxury fabrics. Whereas Muslim Spain had once exported silks to Europe, now Iberian consumers were eager for Flemish and Italian woollens and linens.

Beginning in the thirteenth century, the main centers of Iberian textile production moved to the northern peninsula, and there was a gradual shift in production so that wool, linen, and other fibers superseded silk by the later Middle Ages. An analysis of textile nomen-

clature in fifteenth-century Castilian documents indicates that the majority of textiles available in Christian Iberian markets were made of wool and fibers other than silk.

Sheep had been raised in the peninsula since Roman times, but Roman and Andalusian wools were inferior to the merino wool that became the standard Castilian export. There seems to have been a lag of roughly a century between the decay of Andalusian silk traffic and the full-fledged development of the wool industry. Already by 1253, however, the routes (*cañadas*) for the flocks had been established, and the incorporation of the Honorable Assembly of the Mesta of the Shepherds by Alfonso X in 1273 probably confirmed earlier royal grants (now lost). Small quantities of Iberian wool were imported to England by the 1260s, and a Bruges ordinance of 1304 also noted sales of Spanish wool. By the middle of the fourteenth century, exports of Iberian wool were well established and the wool trade would dominate the peninsula's commerce for the next two hundred years. It has been estimated that by 1467 the Castilian sheep population had reached 2,700,000 head, double what it had been in the thirteenth century.

The growth of Iberian wool production marked a dramatic reorientation of the peninsula's economy, since a textile industry and trade based on sheep, and on the long seasonal migrations of shepherds, was very different from the small, sedentary, family-based operations characteristic of silk cultivation. The development and success of the wool trade in the Iberian Peninsula may be attributed to several interrelated causes, among them the facts that the climate and terrain of Castile were well suited to migratory sheep herding (particularly in a period when military campaigns had disrupted agriculture in the central peninsula); that conquests and territorial expansion in the thirteenth century had thinned and redistributed the Castilian and Aragónese populations; and that foreign demand fostered traffic, and burgeoning textile industries in Flanders, France, and Italy provided a ready market for Spanish wool.

THEATER

The conventional picture of medieval Iberia—particularly of central Spain and Portugal—as a theatrical desert is slowly yielding to a more balanced image of a region which, broadly speaking, engaged in the same ludic activities as other western European countries. The liturgical drama flourished in Catalonia, where the earliest texts are preserved in a tenth- or eleventh-century troper from the Benedictine monastery of Ripoll. One Easter drama, *Verses pascales de III M[ariis]*, boasts a highly developed apothecary scene. An extant fourteenth-century customary from Girona contains detailed staging instructions for eight plays, among them a sophisticated Easter drama, also *Repraesentatio Partus Beate Virginis* and *Processio prophetarum*. At the Cathedral of Vic, the *Cantus sibyllae* and *Quem queritis in presepe, pastores, dicite?* were chanted at Christmas but not the more developed European *Officium pastorum*.

Church documents from Lérida confirm that the cathedral mounted Christmas and Easter plays, also a spectacular Pentecostal *Devallament de la colometa*, which employed aerial machinery and a mechanical dove with firecrackers attached to its wings. Similar church dramas were staged in Valencia and Mallorca, although at Palma de Mallorca all the prophets, not just the Sibyl, appeared on Christmas Eve. Catalonia and Valencia were home to elaborate Assumption plays, with the Elche drama still an annual event. By the late fourteenth century the feast of Corpus Christi was celebrated with increasingly costly street processions that featured biblical pageants (ninety-nine in Barcelona by 1424). In Valencia some pageants evolved into genuine plays, three of which are extant.

Castile presents a somewhat different picture of liturgical drama with its two idiosyncratic eleventh-century Easter tropes from the Benedictine monastery of Silos. Richard Donovan argues that the overarching influence in Castile of Benedictine monks from Cluny

accounts for the disappearance of liturgical drama after the eleventh century. This disappearance, however, appears to have been less than total and may be explained in part by the wanton destruction of monastic libraries. Early printed missals, with even earlier service books embedded in them, and allusions to church drama in heterogeneous documents strongly imply that, by the late fourteenth century, and possibly a hundred years earlier, Castile celebrated all the important feasts with plays in Latin and Spanish. Toledo records the *Cantus sibyllae* at Christmas Matins and *Pastores, dicite, quidnam vidistis?* at Lauds, with choir boys (*seises*) disguised as shepherds singing and dancing; also performances for Candlemas, Good Friday, Easter Sunday, and Pentecost. The *Auto de los Reyes Magos*, by far the most representational of the twelfth-century European vernacular plays, looms as an anomaly. Possibly of foreign provenance, it nonetheless survives in Mozarabic Spanish.

Elsewhere in central Spain there is evidence of the Sibylline chant in León, Easter drama in Zamora, the *Depositio crucis* and colorful *Procesión del pendón* in Palencia, the *Depositio crucis* and *Elevatio crucis* in Jaén, the *Quem quaeritis* in Zaragoza, and, after the Reconquest, the *Elevatio crucis*, *Visitatio sepulchri*, and *Procesión del pendón* in Guadix and Granada. Two early-fifteenth-century texts, one a Procession of Sibyls in Spanish and Latin, and a Latin *Planctus passionis*, are eminentlyactable. In the 1460s Gómez Manrique's Nativity play, composed for the Poor Clares of Calabazanos, features a traditional Joseph, who questions Mary's chastity and an Adoration scene in which the infant Jesus is presented with the instruments of his Passion. Manrique's passion play, with speaking parts for the Virgin, John, and Mary Magdalene, unfolds at the foot of the cross. Fr. Iñigo de Mendoza incorporated a stage-worthy Nativity play into his *Vita Christi*, while in 1487 in Zaragoza a spectacular Christmas song-drama, comparable to those mounted in Valencia, with a revolving heaven (*paraíso*), was performed for Fernando and Isabel.

The relatively late appearance in Castile of Corpus Christi pageants and plays is attributed to its late urbanization. Yet by the second half of the fifteenth century biblical *autos*, tracing the spiritual history of humankind and boasting speaking parts for the characters, were mounted on pageant-wagon stages in Toledo, and by the early sixteenth century in Salamanca, Seville, Zaragoza, and Madrid. Extant documents, however, make no allusion before the early sixteenth century to the uniquely Spanish *auto sacramental*.

In western Iberia records of church drama are even sketchier. In Galicia the *Visitatio sepulchri* satisfied European pilgrims visiting Santiago de Compostela at

Easter. In Portugal, however, no evidence has appeared yet of Latin Resurrection drama, but a Nativity tradition like that of Castile is recorded. On Christmas Eve 1500, choir boys disguised as shepherds entered the royal chapel, dancing and singing *Gloria in excelsis Deo*.

As early as the thirteenth century medieval chronicles record an Iberian court theater that included ostentatious pageants and mummings often accompanying royal receptions and banquets. In eastern Spain, among the most colorful ceremonies were the welcome of Alfonso X el Sabio to Valencia in 1269, and in Zaragoza the coronations of Aragónese monarchs Alfonso III in 1286, Sibila in 1381, Martín I in 1399, and Fernando de Antequera in 1414. Thus the ballroom of the Aljafería in Zaragoza, with its canopy depicting heaven, became the setting for an impressive series of allegorical pageants.

The Castilian kings, particularly Juan II, also relished the wooden castles, passages at arms, and allegorical *entremeses* that glorified the monarchy. The *Farsa de Avila* (Farce of Avila, 1465), conversely, enacted the mock deposition of Enrique IV. Also in the 1460s the court of Miguel Lucas de Iranzo, Condestable of Castile, became the center of a secular and religious theater including *invenciones*, *entremeses*, and *representaciones*. The condestable's Magi play claimed as its stage the streets of Jaén and interior of his palace. Two *momerías* (short, comical interludes) survive by Gómez Manrique, and one by Francisco Moner, while Francisco de Madrid's *Egloga* (1495) is a full-fledged political drama.

Portuguese mummings rivaling those of Castile accompanied royal weddings in 1387, 1429, 1451, 1486, and particularly December 1490, when the king appeared as the Knight of the Swan. There were also a *mourisca* (*feira de mouros*, or festival of Moors), wooden castles, and the familiar *paraíso*. The Christmas *momos* (interludes) of 1500 featured the Garden of Love in Ethiopia, which included a three-headed dragon, giant, a ship on wheels, and a large cast of performers that presage Gil Vicente's festival plays.

Medieval Iberia also witnessed popular expressions of festivity with theatrical overtones, but information about them is limited mainly to civil and ecclesiastical condemnations. Descendants of ancient mimes performed throughout Iberia in palaces, churches, and public squares. Minstrels sang, danced, played musical instruments, also blackened their faces or disguised themselves as devils, wild men, animals, and engaged in pantomime that smacked of paganism. Carnavalesque rejoicing is recorded both inside and outside the church. Under the vague, nondescript *juegos de escarnio*, (mocking games) Alfonso el Sabio

attempted to outlaw from the churches cross-dressing and other excesses associated with the *festum stultorum* (feast of fools), but the proliferation of late fifteenth-century prohibitions attests to the resiliency of festive merrymaking. The *fiesta del obispillo*, (feast of the little bishop) celebrated throughout Iberia by the late fifteenth century, also got out of hand and was repeatedly proscribed only to be reinstated by popular demand. Folk traditions like the *tarasca* (dragon in Corpus Christi play), *gigantes* (giants), and wild men eventually received official endorsement for Corpus Christi and other feasts. Church-sponsored biblical pageants reflected an attempt to curb spontaneously organized *juegos* in Spain, (*jogos* in Portugal), which included erotic scenes, mock battles, and cavorting devils. These shows, however, may contain the seeds of popular farce, whose first literary expression in Castile is the *Auto del repelón* (1509), attributed to Juan del Encina.

Evidence is stronger for a farcical tradition in medieval Portugal. Yet to be determined, however, is the extent to which the *jogos* and *arremedilhos* (imitations) helped shape Gil Vicente's and Anrique da Mota's farces, where comic medieval stereotypes like cuckolded husbands, scheming wives, pixilated clerics, incompetent judges, impoverished *hidalgos* (noblemen), avaricious Jews, loutish peasants, and conniving black servants appear in conventional farcical plots and speak a comic idiom that includes special dialects for peasants, blacks, and Jews. These farces satirize the political, social, and religious mores of their time.

Medieval definitions of ancient *theatrum*, *scaena*, *comoedia*, *tragoedia*, recorded already in Isidore of Seville's *Etymologiae*, were revived by fifteenth-century humanists. Enrique de Villena's description of *theatrum*, embedded in his annotated translation of Virgil's *Aeneid*, stands out as especially detailed and functional. Finally, Latin humanistic comedy shaped Fernando de Rojas's *Tragicomedia de Calisto y Melibea*, which was amenable to private as well as public reading with a single reader projecting all the roles, or with speaking parts assigned to a narrator and the action performed by mimes in accordance with medieval practice.

THEODEMIR, COUNT OF MURCIA

In the wake of the Muslim invasion of 711, Theodemir came to terms with 'Abd al-'Azīz, the son of Mūsā ibn Nusayr, and retained control over Murcia as a tributary of the Muslim government. The pact (*dhimma*) worked out between the two has survived, providing historians of Spain with a rare, detailed look at the institution that allowed the Muslims to gain control over Spain so quickly. In it Theodemir—or Tudmir, as his name is transliterated in the Arabic document—agreed to recognize the overlordship of 'Abd al-'Azīz and to pay tribute in the form of a yearly cash payment supplemented with specific agricultural products. In exchange, 'Abd al-'Azīz promised to respect Theodemir's property and his dominion over the province.

An apparently interpolated passage in the *Mozarabic Chronicle of 754* provides more details about Theodemir. He had served under both Egica and Witiza, distinguishing himself in battle against Byzantine naval forces. The treaty that he negotiated with 'Abd al-'Azīz was, according to the chronicle, respected by the caliphs in Damascus up to his death in 744. He was succeeded as lord of Murica by Athanagild, who may have been his son.

THEODOMIR, BISHOP OF IRIA FLAVIA

Theodomir (ca. 819–847) is the first of the medieval bishops of Iria Flavia, (now Padrón) on the northwest coast of Spain in Galicia, for whom we have secure historical evidence. That see had existed in the Visigothic period but the episcopal succession there was interrupted by the Muslim invasion after 711 and was only restored, probably, by Alfonso II of Asturias (791–842). Before the discovery of the inscribed cover to his coffin in this century it was possible to regard the bishop himself as an apocryphal figure.

Bishop Theodomir is famous largely as the prelate during whose pontificate the remains of St. James the Great were unearthed, sometime about the year 830,

in the nearby location later to become known as Santiago de Compostela. The best-known source for the incident is the twelfth-century *Historia Compostelana*, which describes reports reaching the bishop of strange lights and angels that had begun to appear at night in a nearby forest. Investigating himself, the bishop found in the forest a small shrine and a marble tomb. He then reported the event to Alfonso II, who had the first of several churches erected over what was to become a shrine and pilgrimage center second only to Rome itself in the medieval western world. The bishop is also said to have moved the residence of the bishops of Iria Flavia to Santiago de Compostela.

The almost as famous but apocryphal grant of the *votos*, or annual tribute to be paid by all of Christian Spain to the shrine of Santiago, is actually dated during his pontificate, 25 May 834. But Theodomir is not mentioned in it and this purported diploma of Ramiro I (842–850) has largely ceased to have its defenders.

THEODOSIAN CODE

The Theodosian Code was the first official codification of Roman law. It had been preceded in the late third century by two informal attempts at codifying existing imperial legislation, known as the Gregorian and Hermogenian Codes. This code was named after the emperor Theodosius II (402–450), under whose authority it was compiled. The work of codification was carried out by a commission headed by the former quaestor and prefect Antiochus. The code was promulgated in the year 438, and the text of its formal reception by the Senate in Rome has been preserved. The work was divided into sixteen books, each subdivided into titles. Each title contained, in chronological order, all of the laws relevant to its theme that had been issued in the form of imperial edicts or rescripts since the reign of the first Christian emperor, Constantine I (306–337). Because of the nature of the processes for the issuing of imperial law at this time, there was much contradiction and uncertainty as to the continuing validity of particular edicts, and thus the intention behind the codification was to produce an authoritative compilation

that could be employed in the courts of the empire. In fulfilling this aspiration the Theodosian Code was only partly successful, and had to be replaced in the eastern half of the Roman Empire in 529 by the Code of Justinian. In the West, however, it remained influential and the Visigothic *Breviary of Alaric* and the Burgundian *Lex Romana Burgundionum* were derived from it.

THEOLOGY

Despite the diversity of themes, methods, and questions in theological thought and practice in medieval Iberi from the sixth to the sixteenth century, two factors stand out during this period as common threads running through peninsular reflections on the divine and the relationship of the divine to the world. First, there really was no such thing at any time during this stretch as an Iberian theologian, a person whose main task it was to engage in theological speculation. Rather, we see a multitude of figures, be they monastic or lay reformers, bishops, abbots, friars, or canon lawyers, who wrote about theology as one part of their larger activities. Doctrinal formulation was not just inseparable from the more practical issues and questions about how to live as a Christian in the world, it emerged precisely out of seemingly mundane, in the literal sense, questions. Second, these very different figures are linked by the fact that they all habitually made use of the work of thinkers from outside the peninsula to respond to local issues and questions. What we see in Iberian theology is a host of creative people capable of taking ideas from others, defined in sometimes very different circumstances, and adopting and adapting them, whether in so-called original treatises or in works of compilation, to create new syntheses with Iberian problems and solutions in mind.

The conversion of the Visigothic kingdom from Arian to Catholic Christianity was the first problem requiring a theological component to its solution. The Visigothic Arians, who denied that the Son and Holy Spirit were coequal with the Father, had always been a minority among the Catholic Hispano-Roman subject population. King Reccared followed his personal conversion in 587 to Catholicism by formally converting the kingdom to orthodoxy at the Third Council of Toledo in 589, under the influence of Bishop Leander of

Seville who had written works of anti-Arian polemic earlier in his career. The articles of the council, which were subscribed by eight formerly Arian bishops and five leading Visigothic nobles, among others, included a declaration of orthodoxy by Reccared that recalled the authority of the ecumenical church councils, cited the credal formulations of Nicaea (324), Constantinople (381), and Chalcedon (451), promulgated a new creed, and denounced Arian beliefs in a series of twenty-three anathemas that recapitulated Catholic doctrine. The theological formulations of this council bear the imprint of the North African theologians who were so influential in the Iberian Peninsula at this time. The council proposed three theological initiatives. It required the recitation of the Nicæan Creed during the Mass; it added to the Creed the *filioque* clause asserting that the Holy Spirit proceeded from the Son as well as from the Father; and, again under the influence of the African church, it ignored the condemnation of the Three Chapters by the Fifth Ecumenical Council of 553.

Later councils in the peninsula continued to dwell on questions of Trinitarianism and Christology. The Second Council of Seville included a discussion of the relationship between the divine and human natures in the single person of Christ that seems to bear the imprint of its presiding bishop, Isidore of Seville. Isidore is the most well-known author of the Visigothic period for his encyclopedic *Etymologies*, historical writings, works of exegesis, and his study of the liturgy, *On the Offices of the Church*. He was followed by other important authors, like the two bishops of Toledo, Ildefonsus, whose *On the Perpetual Virginity of the Virgin Mary* was an influential prod to Marian devotion in the West, and Julian, whose *Sign of the Future Life*, which exists in some 186 manuscripts, collects the teachings of Augustine, Jerome, Ambrose, Gregory the Great, and Isidore among others, on the origins of death, the fate of souls after death, and the resurrection of the body.

The peninsula was conquered by the Muslims in 711. The teachings known as Adoptionism of Elipandus of Toledo and Felix of Urgell, condemned by the Carolingian Synod of Frankfurt in 794, have often been seen as a response to the Muslim position that Jesus was simply a fully human prophet. Recent lines of argument see the controversy between the Adoptionists and their Iberian opponent, Beatus of Liébana, not as reflecting Eastern debates on Nestorianism and the positions taken by the Council of Chalcedon, but rather as differing interpretations of the Christological formulations of Western and African thinkers like Augustine, Tyconius, Leo, and Fulgentius. This reading sees the Adoptionists and Beatus as presenting different versions of a uniquely Iberian Christology. After the *Com-*

mentary on the Apocalypse of Beatus, we have very little original theological writing for several centuries, although theological ideas continue to be expressed in innovative ways through the media of the visual arts, in manuscripts, sculpture, and small objects.

From the thirteenth century, as Christian conquest of Muslim-held lands solidified, Christians had to come to terms for the first time with large populations of Muslims and Jews living in their midst. This fact reignited theological reflections of very different kinds including the emergence of a kind of theological school of thought in Toledo under the aegis of its archbishop, Rodrigo Jiménez de Rada. This school wedded together the neo-Platonic cosmology and mathematical speculations on the Trinity of thinkers associated with Chartres; ideas about divine grammar stemming from Gilbert of Poitiers and ultimately from Boethius; and a notion of the hierarchy of being deriving from Pseudo-Dionysius and John Scot Eriugena. Alain of Lille is the common denominator for much of this, and it is likely that Rodrigo, and possibly the other figures associated with this school, who include Michael Scot, Mauricio of Burgos, Mark of Toledo, and Diego García, chancellor of Castile, had contact with Alain at some point. Toledan thinkers shared an understanding of divine unity, of the relationship between divine unity and plurality, and of the cosmology of the universe as a hierarchy of being stemming from God and encompassing all creation. This understanding of the relationship between unity and plurality left a place for non-Christians to live, subordinated to the rule of the Christian Church. This theology justified a unified but not necessarily uniform Iberia.

Other thirteenth-century theological work is inseparable from joint projects to reform Christian life and to missionize to Muslims and Jews. We can place in this category the efforts of Ramon de Penyafort, canonist and general of the Dominican Order. Penyafort was a supporter of the mystic, missionary, and prolific author, Ramón Llull. Llull's goal was to provide convincing reasons for Muslims and Jews to convert by starting from principles acceptable to all, such as God's unity and goodness. Llull shows that the divine attributes, each of which is real and operates in a threefold mode of agent, patient, and action, are active and evident also in the created world. As expressed through his numerous polemical, contemplative, philosophical, and scientific works, Llull argues that the Christian mysteries, like the Trinity and the Incarnation, were part of the very structure of the universe. This is so he can prove the truth of these mysteries by showing that creation would be incomplete without them. Llull's system eliminates the gap between theology and philosophy or, indeed, any of the other sciences.

Beginning in the late twelfth and thirteenth centuries, the Iberian vernaculars come into their own as media for the transmission of theological thought, and the importance of these languages only increases in subsequent centuries. From the early period, we have Gonzalo de Berceo's *Sacrificio de la Missa* and his various Marian texts. Ramón Llull wrote many of his works in Catalan. Others wrote devotional texts like Arnaldo Pons's *Diálogos entre el alma y el Creador* and works on mental prayer, or catechetical works, as in those on the ten commandments. Notable is the thirteen-volume encyclopedia of Christianity, *Lo chrestiaà*, of the Franciscan, Francesc Eiximenis, and the work of Castilian poets like Ambrosio Montesino and Juan de Padilla.

In the fifteenth century we see a confluence of different streams of thought. Llullism, which had survived the fourteenth century attack on its perceived rationalism by Nicolás Eymeric, remained a potent force for its speculative and mystical theology. An indigenous Franciscan and Hieronymite Observantine tradition was joined by a Benedictine tradition infused by the Christian humanism of Naples and the reforming efforts of St. Justina of Padua. The Observantines share an emphasis on the humility and suffering of Christ, and the poverty and simplicity of their own lives. Finally, the Devotio Moderna tradition of northern Europe, which was to reach its culmination in the career of Erasmus, had an impact on the peninsula, with its nonmystical theology and devotion to the human Christ. The merging of these strands can be seen, for example, in the career and writings of García Jiménez de Cisneros, abbot of Montserrat and author of the *Exercises of the Spiritual Life*. These syntheses of the fifteenth century would go on to influence the creative geniuses of the sixteenth, Teresa of Ávila and Ignatius of Loyola.

TIRANT LO BLANC

A fifteenth-century Catalan novel of chivalry written by the Valencian knight Joanot Martorell. The first edition (Valencia, 1490) bears a second author's name, Martí Joan de Galba, but it is difficult to know exactly what he contributed. A second edition (Barcelona, 1497) shows that *Tirant* was a best-seller of the fifteenth century. The plot has three parts. From chapters 1 to 116 Martorell describes the hero's education, which begins with the story of Guillem de Vårøic, the highest model for a Christian knight (chapters 1–27). Guillem is a character borrowed from the twelfth-century Anglo-Norman poem *Guy de Warwicke*, translated into Catalan by Martorell himself. Vårøic defeats the Muslim invaders of Great Britain and, after refusing all rewards for this great achievement, becomes a hermit. Tirant meets him in a lonely land during his journey to the king of England's marriage feasts and takes advice from him. On his way home, our hero and his cousin Diafebus tell Guillem about Tirant's great deeds (chapters 28–98), which made him the finest living knight in the world. In order to consecrate his military skill to the struggle against the unbelievers, Tirant decides to rescue the island of Rhodes, besieged by the Turks. During his visit to Sicily, Tirant arranges for the marriage of the heiress of that country to a younger son of the king of France. There Tirant receives a letter from the emperor of Constantinople asking for help. With his landing on Greek shores in chapter 117, the second part of the novel begins. From there to chapter 297 Martorell builds the best of his narrative on a mixture of romantic and military episodes. The hero falls passionately in love with the emperor's young daughter, Carmesina, and at the same time becomes the captain of all the Christian armies in Greece. The successful love stories between Diafebus and Estefania and Hipòlit and the empress, and the erotic games planned by the princess's friend Plaerdemavida are some of the most famous episodes of that part of the novel. Then Martorell describes the great victory of Tirant against his Muslim enemies and Greek adversaries and also his defeat in bed with Carmesina. In the following chapters the celebration of Christian victory is darkened by new Turkish aggressions. On the other hand, the Viuda Reposada, Carmesina's wicked nurse, manages to convince Tirant that his beloved has a repulsive black lover. The hero, in deep despair, decides to expose himself to death on the battlefield. The ship bringing him there sinks and the third part of the novel starts (chapters 298–487). Tirant reaches North African shores and begins a new period of military achievements; in the end he converts the entire local Muslim population to Christianity. The African king Escariano becomes Tirant's close friend and is one of

the many allies that our hero gathers at the end of the book to rescue Constantinople from the Turks. Just when the emperor decides to make him his heir and the husband of Carmesina, Tirant dies of a bad cold, thus in turn causing his betrothed and her father to die of sorrow. Thanks to Tirant's deed, the new emperor rules a country free from Muslim danger, but he doesn't belong any more to the heroic lineage as his predecessors.

In spite of the variety of his sources (Ramon Llull, Muntaner, or Guillem de Torroella among Catalan writers, and John of Mandeville, Boccaccio, Petrarch, or Guido delle Colonne among Latin and Romance authors), Martorell was a very original literary creator who wrote an extraordinarily precise descriptive prose and endowed some of his characters with astonishing realistic features. But Martorell also filled his pages with long rhetorical digressions, often borrowed from other writers, which we assume were appreciated by contemporary readers.

TOLEDANO, EL See JIMÉNEZ DE RADA, RODRIGO

TOLEDO, CITY OF

The city of Toledo, the Toletum of pre-Roman origin, is situated almost at the geographical center of the Iberian Peninsula. Toledo rests on a granite hill surrounded on three sides by the Tajo River and, as such, until the modern age always enjoyed an ideal defensive position. Historically and culturally Toledo is one of the most important cities in Iberia. Early on it became an archiepiscopal see and, in the early Middle Ages, its archbishops became the primates of the Spains.

During the early Middle Ages, the Visigoths, who had invaded and conquered the Roman provinces of Hispania in the 470s, favored Toledo as their primary seat. Beginning in the sixth century, a distinguished series of archbishops of the see of Toledo presided over a succession of councils that issued important legislation for the early medieval Iberian Church. Toledo's greatest prosperity began under Islamic rule (712–1085), first as the seat of an emir and briefly after 1031 as the capital of an independent kingdom presided over by the Banū Dhū-l-Nūn, a Berber dy-

nasty. Under its Islamic rulers, and later after its conquest in 1085 by the Christian king Alfonso VI of León and Castile, Toledo was the single most important crossroads of Jewish, Moslem, and Christian cultures in Europe. It was there that, almost immediately after the Christian conquest of the city, its new archbishop, Raimundus, inaugurated a vast project translating scientific, philosophical, and literary works from Arabic into Romance and then into Latin, for their subsequent diffusion in Europe. As a cultural and linguistic melting pot, it was always easy to find both the texts and the translators to render them into other languages prior to their dissemination. Azarquiel, the great Muslim astronomer, worked early on in Toledo; the *Ptolemaic Tables* (the so-called *Almagest* or *Tablas toledanas* were first translated there); and later the city attracted a distinguished host of scientists and men of letters ranging from Abelard of Bath, Michael Scot, Peter the Venerable, Gherardus of Cremona, and Hermannus Alemannus, to local savants like Dominicus Gundisalvus (Domingo González) and Juan Hispano, all hungry for knowledge and ready to exploit Toledo's universal reputation for learning. To be sure, Toledo's association with science and wonder won the city fame as a center of magic and the black arts throughout the Middle Ages.

TOLEDO, COUNCILS OF

Introduction

The ancient Iberian Church deliberated matters of discipline largely through councils. Numerous episcopal assemblies were convoked in Spain, from the age of Diocletian (the council of Iliberis, ca. 306) until the Muslim invasion of the Iberian Peninsula in 711. These meetings were held in various Hispanic cities and under varying political conditions, both under the Roman Empire before and after the Edict of Milan (313) and under the Visigothic monarchy before and after the conversion of the barbarian populations to Christianity (589), all throughout a period of more than four hundred years. These assemblies, a large portion of whose acts have been preserved, created the institutional and disciplinary framework within which the activities of the Hispanic Church developed. The nature of the councils continued to evolve until the eighth century, when they gave shape to three types of conciliary assemblies: the diocesan synod, the provincial council, and the national council, which is known as the general council (*concilio general*) in historical sources. The majority were provincial councils, since the ecclesiastical laws in effect required all bishops in a given province to meet annually, though such ordinances were not always strictly obeyed. The most important councils, however, were the concilios generales, or national councils, of Toledo, convoked in the city that served both as capital of the monarchy and as the most important metropolitan seat of the Visigothic kingdom. These general councils constituted an innovation of the Hispanic Church.

The Number of Councils

Manuscript tradition has shown the existence of eighteen councils of Toledo. The first two were provincial Toledan councils that convened when Toledo was not yet the metropolitan seat of Cartagena. The first of the general councils was the Third Council of Toledo (589), held in the royal city to ratify the conversion of King Recared and the Visigothic people to Catholicism as well as their solemn abjuration of the Arian heresy. An additional interprovincial council in 597 and a Carthaginian episcopal assembly in 610, both convoked in Toledo, are not counted among the general councils nor anthologized in the *Colección Canónica Hispana*. The Ninth and Eleventh Councils of Toledo, held in

655 and 675 respectively, were also of a provincial nature. Although the Fourteenth Council of Toledo (684) was also of a provincial character, representatives of other ecclesiastical regions attended, making the assembly difficult to classify. The proceedings of the Eighteenth Council have not been preserved.

There were, then, twelve general Councils of Toledo: the Third (589), Fourth (633), Fifth (636), Sixth (638), Seventh (646), Eighth (653), Tenth (656), Twelfth (681), Thirteenth (683), Fifteenth (688), Sixteenth (693), and Seventeenth (694). As can be noted, these national councils were convoked in a highly irregular manner, responding to concrete necessities. Despite the evidently general nature of the Third Council (589), the institutional rules that regulated the concilio general were not elaborated until the Fourth Council of Toledo in 633.

Jurisdiction of the Councils

The seventh century saw the evolution and perfection of the organization and regulation of the provincial and general councils. These ordinances were expressed in an *ordo de celebrando concilio*, a ceremonial and canonic collection that was increasingly amplified starting with the Fourth Council of Toledo. While the provincial council took up ecclesiastical and civil matters in provincial areas and in principle met once a year, the general council was convoked whenever necessary to deal with general matters that affected the whole kingdom and to deliberate on problems of faith and of common interest, including political affairs. Therefore, the general council was designated as a superior deliberative body that decided both ecclesiastical and civil matters. In addition, it functioned as a judicial body in cases involving bishops: all prelates were subject to the council's jurisdiction, including the primate of Toledo. The general council's decisions became official legislation of the kingdom, after receiving royal sanction (*Lex in confirmatione concilii*). Because the Visigothic monarchy was chosen by election, at times serious conflicts arose concerning the legitimacy of certain kings who were helped to the throne via reproachable procedures: these aspirants to the monarchy sought justification through the protection of the general council. In doctrinal matters, the councils formulated a collection of theologically determined symbols of faith, always in concordance with the first four ecumenical councils, which were considered equivalent in authority to the four Gospels. The general Councils of Toledo also played the important role of serving as a unifying bond between the ecclesiastical community and the universal church.

The Nature of the Councils

Prelates in attendance at the councils were entrusted with responsibilities ranging from the ecclesiastical to the civil, the legislative to the judicial, and the fiscal to the dogmatic, depending on the circumstances. There was no clear demarcation of jurisdiction: the king and the Visigothic magnates possessed certain specific powers, but at the same time the council limited excessive civil authority in individual cases. As a result, the council was a *sui generis* institution that is difficult to comprehend through a modern lens. The peculiar collaboration and intersection of ecclesiastical and political powers was considered normal within the historical context, in which the monarchy declared itself Catholic and required the aid of the church in both matters of faith and of the state.

Following the ancient tradition of the ecumenical councils, the summoning of the council came from the king, who would then appear, advised by his counselors, at the commencement of the sessions in the hall where the assembly was gathered to deliver the *tomus regius*, which contained the day's schedule or the list of subjects around which the conciliary discussions would revolve. Once the council ended, the king generally sanctioned the assembly's proposals.

Naturally, the default members of the councils were the bishops, who could be represented by their vicars when necessary. The bishops always endorsed the conciliary proceedings and prepared the resulting canon laws. Titled members of the most important abbeys of the kingdoms also played important roles, but their signatures do not appear regularly until the councils of the latter part of the seventh century. Many councils were also attended by laymen from civil, administrative, and royal spheres, usually either as part of the king's entourage or as official attendees summoned by the conciliary fathers. As in the case of the abbots, the signatures of certain Visigothic magnates also began to appear in the late seventh century. The presence of these dignitaries was petitioned because of the political nature of the subjects frequently debated in the councils.

Members of the lower clergy—priests and deacons, for example—were also known to attend certain sessions, always sitting behind the bishops. The bishops, in turn, were seated in order of precedence according to the date of their ordination. Complaints against bishops or others in power could be disclosed in the assembly.

Theological Contributions of the Councils

All general councils began with a three-day period of spiritual preparation dedicated to fasting and theologi-

cal reflection on the mystery of the Trinity. This practice should probably be interpreted as an effort designed to eliminate any trace of Arianism, as well as a means of producing symbols of faith that would later prove useful in the formation and training of the clergy and in the catechistic indoctrination of the lay population. Some councils chose to manifest the assembly's faith following the confession of the Nicene-Constantinopolitan Creed, while others created their own formulas, many of which enjoyed considerable prestige because of their acceptance and diffusion throughout Christianity and their theological contribution to the church's growth. One of the most well-known contributions was the introduction of the *Filioque*, a dogmatic expression that would later provoke frequent difficulties with the Eastern Church.

Canon Law

The Councils of Toledo are the primary source of ecclesiastical legislation in the Hispanic Church. Canon law proceeding from the councils was incorporated in the *Liber Iudiciorum*; at the same time, royal decrees and orders were assumed by the councils. Based on these materials, with the addition of other non-Spanish councils and pontifical decretals, the *Colección Canónica Hispana* was created in the seventh century and adopted within the juridical world in the peninsula, which was governed *secundum legem gothicam et canonicam*. This collection of laws exerted great influence on the Carolingian collections and on Gratian's *Decretum*, through which the councils indirectly influenced the common law of the Latin Church.

TOLEDO, VISIGOTHIC KINGDOM OF See
 VISIGOTHIC KINGDOM, TOLEDO

TOMB CULTS

While the church and the faithful were clear about the special nature of sainthood, whether universally or only locally recognized, and honored the saints in calendars and special liturgies and images and relics, we find in many places in the Middle Ages cults of only slightly less veneration granted to secular persons of distinction when these persons had attracted legendary and especially literary fame. Monarchs and nobles alone seem to be candidates, and for a cult to arise it was essential that the person should be entombed, or believed to be entombed, in a prominent place inside a monastic or other church. Fictitious personages such as the epic heroes Bernardo del Carpio and the Siete Infantes de Lara could materialize out of folklore and vernacular epic and be provided with tombs—presumably containing bones—and then counted on an equal basis with heroes whose tombs were genuine. The medieval mind hardly concerned itself with questions of authenticity that so trouble us, and if a Christian or moral message for the faithful was created or enhanced by forgery of a tomb or of documents or objects—*pia fraus*—this was acceptable enough.

Burials of historical persons can be dated fairly precisely, though their tombs may often have been improved later, and the often important Latin verse epitaphs may not be contemporary with a first burial. Evidence for any cult is generally late and incomplete. The matter is important because while legendary accretions could occur at any time, literary texts about heroes had a point and date of creation and scholars try to determine these. On present evidence, whatever part monks and their documents played in literary creation by vernacular writers, the cult of a heroic tomb was the result of the propagation of a relevant literary text by oral or (more rarely) written means. Public interest was stimulated and the church then encouraged the cult. Both literary text and cult had ample models in France (e.g., poems and tombs relating to the stories of Roland and William of Orange) and were known in northern Iberia. The church's motivation was simple. Visitors to tombs gave money, important ones donated lands and legacies, and monarchs and nobles requested burial in churches already so distinguished, leaving more money so that masses should be said for their souls.

Aragónese, Leonese, and Portuguese lands seem to have had few such cults. Navarre was rich in Carolingian resonances (Roncesvalles, etc.), and Old Castile was prime territory for these cults as it was for

heroic legend and epic verse (A.D. Deyermond has a helpful map and commentary in *Epic Poetry and the Clergy*. London, 1969, xviii). San Pedro de Arlanza claimed the tomb of its founder, Count Fernán González, and others connected with him; also of Mudarra, the avenging hero of the *Siete Infantes* story. San Salvador de Oña had a number of royal tombs, notably that of Sancho II of Castile who was killed before Zamora in 1072 in circumstances believed traitorous, and who was the subject of a Latin *Carmen* and a later vernacular epic; it is known that he twice promised his body to Oña (documents of 1066, 1070). San Pedro de Cardeña had the tomb of Count Garci Fernández (d. 995), reputed rebuilder of the monastery and victim-hero of the *Condesa traidora* story; also, and eventually of much greater importance, the tombs of the Cid Ruy Díaz de Bivar (d. 1099) and his wife Jimena. Aguilar de Campoo claimed the tomb of the fictitious epic hero Bernardo del Carpio. So valuable were these possessions in terms of prestige and income that competition developed (as for saintly relics): San Juan de la Peña in the Aragónese Pyrenees claimed the tomb of the Cid's Jimena (as it did possession of the Holy Grail); Oña and San Isidoro of León claimed the epic protagonist Infante García (d. 1029), both with convincing epitaphs; in the late 16th century Arlanza, San Millán de la Cogolla, and the parish church of Salas de los Infantes vied to claim diverse portions of personages from the epic *Siete Infantes de Lara*. Even villains might figure, presumably with tales of repentance Doña Sancha the *Condesa traidora* was at Oña, and prominent in its very foundation-legend. The two Infantes de Carrión from the Cid story were at Cornellana, west of Oviedo.

What form did a cult take? We do not know precisely. A tomb would have been shown at any time to visitors and improving tales told by a monk. On a special day in the year, a formal "anniversary," the community and local dignitaries might gather to give praise and hear readings. At Cardeña an immense pantheon of tombs was created for almost everyone associated with the Cid in life and literature, probably in the early fourteenth century; each tomb bore its heraldic device, important to local families and benefactors with proud genealogies. By 1272 the monks had confected a lengthy *Estoria del Cid* which mentioned these names while centering on the Cid's last pious weeks, death, and burial, adding details about objects displayed by the tomb: a chess-set, cups, a chest, the customary sword, spurs, and banner. Out in the courtyard the burial of his epic horse Babieca was shown too.

TORDESILLAS, TREATY OF

The Treaty (or more accurately, Treaties) of Tordesillas were signed between Castile and Portugal on 7 June 1494. The most important provision of the treaties was the agreement that Castile and Portugal would recognize a line of longitude running 370 leagues west of Cape Verde as separating their respective spheres of imperial activity.

Castilian and Portuguese traders and adventurers, often backed by members of the nobility, had competed for slaves, ransoms, and trading opportunities off the Atlantic coast of Morocco since the fourteenth century. Both kingdoms claimed sovereignty over the Canary Islands and initiated attempts to conquer and settle them. In the 1450s the papacy granted spiritual jurisdiction to the Portuguese Order of Christ, whose administrator was the Infante Dom Henrique (Henry the Navigator). After the outbreak of war in 1475, Castilian and Portuguese rivalry spread to the coast of Guinea, but in the Treaty of Alcaçovas in 1479 a preliminary demarcation of spheres of influence was agreed upon. Castile was to have sovereignty over the Canary Islands and Portugal was to have exclusive rights in Madeira, the Azores, and on the coast of Africa south of Cape Bojador.

King João II, who came to the throne in 1481, began the active search for a route to the East, sending exploratory expeditions down the African coast and rejecting Columbus's proposals for a western voyage in 1484. Although Africa was rounded in 1488, no route to the East had been opened when Columbus, by then in Castilian service, announced his discovery of islands to the west of the Azores in March 1493. João II at once claimed that these islands were in the Portuguese sphere but it was clear that the Treaty of Alcaçovas did not provide for these new discoveries. While Columbus prepared for his second voyage, Castilian diplomats at the papal court pressed the pope, the Spaniard Alexander VI, for bulls recognizing their sovereignty. Four bulls were issued between March and September 1493. By the second of these a line of demarcation was declared lying one hundred leagues west of the Azores, but the fourth bull declared that all the areas to be discovered in the East belonged to Castile unless they were already occupied by another Christian power.

Meanwhile Portugal had responded to Columbus's discoveries by threatening to intercept any further expedition and by initiating negotiations with Cas-

tile. An embassy went to Barcelona in April 1493 and proposed a demarcation line granting Castile all discoveries north and west of the Canaries while Portugal took the areas to the south of it. This was suggested on the mistaken assumption that Columbus's discoveries lay to the north as he himself had initially claimed. In August, after the publication of the second bull, the Portuguese sent another embassy, which had achieved nothing by the time the fourth bull was published in September. Further negotiations then took place at Lisbon and Medina del Campo during which the Portuguese accepted the principle of a line of longitude, as had been proposed in the second bull, but insisted that it be moved to 370 leagues west of Cape Verde (instead of 100 leagues). This was eventually accepted and incorporated in the treaty, which was signed in the Castilian frontier town of Tordesillas in June 1494.

It is remarkable that the two states should have adopted a line of longitude as the division since no one at that time could calculate longitude. The Portuguese insistence that the line be moved a further 270 leagues to the west has been taken as evidence that they already knew of the existence of Brazil, a significant part of which did indeed fall within their sphere under the Tordesillas agreement. An alternative suggestion is that the Portuguese already knew that the Atlantic wind systems circulated in a counterclockwise pattern and wanted to make sure that the seas that their ships would have to sail to reach the Orient fell within their jurisdiction.

The Tordesillas line only demarcated spheres of influence in the "Ocean Sea" (that is, the Atlantic) and was regularly featured on maps of the world after 1500. The Cantino Planisphere is the earliest Portuguese map to show the Tordesillas line. It was drawn in Lisbon in 1502 and was obtained for Ercole d'Este, Duke of Ferrara, by his agent, Alberto Cantino. The map is to be found in the Biblioteca Estense, Modena. A detailed account of the map is to be found in Cortesão A. and A. Teixeira da Mota. *Portugaliae Monumenta Cartographica*. 6 vols. Lisbon, 1960. Vol. 1, 7–13, and plate 4. The Tordesillas line proved remarkably successful in preventing quarrels between the two imperial powers, and no serious dispute took place between them in the Americas until the eighteenth century. The second Tordesillas agreement had covered North Africa and a further treaty in 1509 had defined the separate spheres of influence of the Castilians and Portuguese in that region. When Castilian ships under the renegade Portuguese, Magalhães (Magellan), reached the Moluccas in 1521 the threat of conflict in the spice islands led to an attempt to extend the Tordesillas line to the other side of the world. A new line was recognized at the Treaty of Zaragoza in 1529, which placed the

Moluccas in the Portuguese "half" of the world but left the Spaniards free to exploit the Philippines.

TOROS DE GUI SANDO See CATHOLIC MONARCHS; ENRIQUE IV, KING OF CASTILE, JUANA OF CASTILE

TORQUEMADA, JUAN DE

Juan de Torquemada (1388–1468) was the foremost papal apologist of his day. At an early age he entered the Dominican order at San Pablo de Valladolid. After attending the Council of Constance from 1416 to 1418, he studied theology at the University of Paris. Torquemada served as a prior in Castile before representing both his order and Juan II at the Council of Basel. In Basel, the friar joined the Reform Deputation, wrote in defense of orthodoxy, and composed his first papalist polemics. Eugenius IV rewarded Torquemada's efforts with the office of master of the Sacred Palace.

When Eugenius IV translated the council to Ferrara in 1437, Torquemada left Basel for Italy. He represented the pope in Germany in 1438 to 1439 before reaching the pope's council, then sitting at Florence. There the friar took part in the negotiations reuniting, briefly, the Greek and Latin churches. Then, when in 1439 Eugenius IV answered an effort by the Council of Basel to depose him with a bull of condemnation, he staged a debate between Cardinal Cesarini, defending conciliarism, and Torquemada, defending papalism. The Dominican theologian was absent in France representing the papacy when he learned of his promotion to the cardinalate.

After returning from France in 1440, Torquemada remained in the curia until his death in 1468. His one notable absence was his journey with Pius II to the Congress of Mantua (1459–1460), which attempted to organize a crusade against the Turks. Among the cardinal's writings from this period were an attack on

Islam, a defense of Jewish converts to Christianity, and tracts on apostolic poverty. Other writings were more devotional in nature; and one, his *Meditationes*, was the first illustrated book printed in Italy. The most important of Torquemada's writings were a commentary on Gratian's *Decretum*, reinterpreting key texts cited by the conciliarists in a papalist sense, and his *Summa de ecclesia* (1453). That monumental synthesis of medieval papalism defended the ecclesiastical institution against the doctrines of Wyclif and Hus, as well as attacking conciliarism. Torquemada's Thomist doctrine of papal supremacy argued that the power of jurisdiction, by which the church was governed, was given to lesser prelates by the papacy; but it claimed for the pope only an indirect role in temporal affairs, as a consequence of his spiritual responsibilities.

Torquemada also participated in the reform of individual religious houses; and he defended the interests of the Dominican order, particularly those of the Observant movement, at the curia. The cardinal also took an interest in art, employing Fra Angelico. His chief interests, however, remained theological. Torquemada is buried in the Annunciation Chapel at Santa Maria sopra Minerva in Rome. There he is depicted, in the habit of his order—not in a cardinal's robes—in a painting by Antonozzo Romano presenting to the Virgin of the Annunciation poor girls dowered by a guild he had founded in her name.

TORQUEMADA, TOMÁS DE

Born in the town from which he drew his surname, in the province of Palencia, in 1420. He was nephew to the no less famous Cardinal Juan de Torquemada, author of the *Tractatus contra Midianitas*, written in defense of the Jewish *conversos* (Christian converts) from whom he, and correspondingly Tomás, were said to have been descended. As a young man, Tomás entered the Order of St. Dominic in the priory of San Pablo in Valladolid, and resided as a friar in the convent at Piedrahita. He was later appointed prior of the convent of Santa Cruz in Segovia, a title he retained throughout his career; and at about the same time was chosen to be a confessor of Queen Isabel and King Fernando: it is in this role that he appears in the only

painting that is believed to depict him faithfully, Berruguete's *Virgin of the Catholic Kings*, in the Prado.

On 11 February 1482 he was appointed by papal bull as one of seven new inquisitors to continue the work of the recently founded Inquisition (the first two inquisitors had been appointed in 1480). In 1483 a new central council, the Consejo de la Suprema y General Inquisición, was set up by the king and queen to govern the inquisition, and Torquemada was chosen to head it as inquisitor general. On 17 October 1483 another papal bull, which conceded control of the inquisitions of the Iberian Peninsula to the crown, also appointed Torquemada as joint inquisitor general of the three realms of Aragón, Catalonia, and Valencia. In this role, he was empowered to intervene in any part of the peninsula in a way that not even the crown was always able to. Torquemada subsequently played a key role in forcing through the introduction of the new inquisition in the realms of the Crown of Aragón, which still retained their old inquisitors from the medieval inquisition. In May 1484 Torquemada appointed new inquisitors for the eastern kingdoms, but faced enormous opposition, fundamentally because the new appointees were all Castilians and their tribunal was not subject to the laws of the kingdoms; in Aragón one of the appointees, Pedro Arbués, was murdered in 1485. To find a way out of the impasse, in February 1486 pope Innocent VIII sacked all the existing papal inquisitors in the Crown of Aragón, and secured the simultaneous withdrawal of the Castilian nominees. This left the way open for Torquemada to start again with new appointees.

The important contribution made by Torquemada to the new inquisition is confirmed by the fact that he wrote its first rule book, the *Instrucciones*, first drawn up in November 1484 and then later amplified in versions of 1485, 1488, and 1498. Together with additions made in 1500, these early rules were known as the *Instrucciones Antiguas*, and laid down all the procedures of the tribunal in its early period. Torquemada must not, however, be viewed as all-powerful. As inquisitor general he was no more than chairman of the Suprema and could be overruled by it; moreover, his commission, which came from the pope, could be revoked at any time. In 1491 and again in 1494, while Torquemada was still functioning, additional and temporary (until 1504) inquisitor generals were appointed to aid the work of the inquisition, proof that he did not hold unquestioned power.

No documentary proof whatsoever exists for attributing to Torquemada the evidently anti-Semitic philosophy of the early inquisition, or responsibility for the bloody excesses of the tribunal; but neither is

there any reason to question the traditional view that sees him as the driving spirit behind its early years. It is unquestionable that he was a major force behind the expulsion of the Jews in 1492: King Fernando stated expressly, in a letter that he sent to several nobles, that “the Holy Office of the Inquisition has provided that the Jews be expelled from all our realms.” A story of uncertain origin states that when the Jews tried to buy their way out of the expulsion, Torquemada burst into the presence of the king and queen and threw thirty pieces of silver on the table, demanding to know for what price Christ was to be sold again.

A strong supporter of religious reform, Torquemada in 1482 founded the beautiful monastery of Santo Tomás in Avila, where he died on 16 September 1498.

TORRE, ALFONSO DE LA

Theologian and writer in the vernacular active in the mid-fifteenth century, remembered nowadays as the author of the *Visión deleytable*, a philosophical dialogue and survey of the seven liberal arts, natural theology, and ethics. The work is in large part a cento of older texts, mostly unidentified and at times heavily amplified and supplemented by the author, and bound together by an allegorical dialogue. The *Visión* enjoyed a certain currency in its own century and in the two following. By the end of the seventeenth century it had undergone eleven printings, had been translated into Catalan and Italian and, unbelievably, back into Spanish.

What is most notable, indeed astonishing, about Torre's dialogue and the thought it expresses is the fundamentally Averroist and rationalist direction of its argument, especially of its theology. The main index to this tendency is, of course, the author's choice of sources, in some instances unremarkable, in others quite otherwise. Thus the passages on the liberal arts depend largely on Isidore of Seville and Al-Ghazālī. The pages on cosmology, on the influence of the spheres on the sublunary world, are from a source Torre calls simply “Hermes,” but which is in fact the *Latin Asclepius*, very well known and influential in Western Christendom. But the matter on natural theology comes not from a Christian source, but from Maimonides's *Guide for the Perplexed*. This notable text

brings to the *Visión* unaltered the Maimonidean teaching about the nature of God, eminently his existence, unity and incorporeity, but also his power, omniscience, and Providence. One should add that the passages in the *Guide* that express views at odds with what we could call common Christian theology—on providence, for example, or on the nature of evil—are preserved in the *Visión* without embarrassment. There is also in Torre's text, as we should note in fairness, a series of chapters that speak plain Christian language. But the author makes absolutely no effort to reconcile the sense of these pages with the rest of his argument, and one might indeed reasonably guess that this passage is a sop, a concession to the Christian reader, who elsewhere in the work is induced to accept views that at best are on the outer limits of orthodoxy.

The rationalist strain is sustained in the *Visión* in passages entirely separate from those directly and extensively dependent on the *Guide*. In a pair of lines early in the work Torre alludes hastily to Maimonides's theory of prophecy, roughly the view that God speaks to his prophets “mediante la lumbre yntelectual” (by means of intellectual enlightenment). In a second short passage he refers clearly to Maimonides's notion that the Bible speaks one language to the wise and learned and another to the vulgar, or in Leo Strauss's words, that Scripture “is an esoteric text, and that its esoteric teaching is akin to that of Aristotle.” More important, perhaps, the *Visión*'s chapters on ethics make few significant allusions to Christianity, or indeed, even to the idea of rewards and punishments in the other world.

Torre at one point says that the will of God can be understood in two senses, as what he wills directly and as what he wills virtually as he foresees the consequences of his first decision. Significantly, this theme is not Maimonidean; it savors of Christian scholasticism, and is possibly of Scotist or nominalist tendency. In other words, Torre's rationalism is not an accident. When he presents unmodified Maimonidean teachings that are at variance with those of Christian theology, the choice of doctrine is not innocent; it is certainly not made in ignorance. Torre was, as we have seen, a legitimate theologian, a *bachiller en teología*, and the knowledge of Christian divinity revealed in details of the course of the *Visión* is fully professional. His choice of themes, therefore, must have been fully deliberate. What, then, are we to think of this strange book and its author? Was Torre a crypto-Jew? Perhaps; the case is interesting. One should note that the mixture in the *Visión* of Jewish authorities and Christian is in no way alien to later medieval Jewish Averroism; the conversion of Shlomo Halevy/Pablo de Santa María was due in great part to his early familiarity with Aquinas.

nas. Torre's final plea to the Infante don Carlos not to show his book to a third person is itself revealing. Maimonides himself lays it down firmly that high doctrine should not be revealed to the vulgar.

TORROELLAS, PERE

Poet of Catalan origin, born about 1410, who composed verse in both his native Catalan as well as in Castilian. Torroellas was closely tied to the court of Navarre and served as majordomo to Carlos, prince of Viana. In 1441 Torroellas fought as a partisan on the side of the Infantes de Aragón at Medina del Campo, where he was taken prisoner by don Alvaro de Luna. Ransomed by the Aragónese faction, he traveled to Naples in 1445 on a diplomatic mission for the Crown of Aragón. Between 1446 and 1450, Torroellas held the title of *oficial del cuchillo* (master of the knife) at the court of Navarre, returning to Naples in 1450, where he lived the life of a courtier and had occasion to come in contact with humanists like Giovanni Pontano. Upon the death of Alfonso V the Magnanimous, Torroellas returned to the Iberian Peninsula, where he led an intense political and literary life until his death in about 1486.

The period encompassing Torroellas's most concentrated literary activity ranges from 1440 to 1460. His *Maldezir de mugeres*, written sometime between these dates, circulated throughout the entire Iberian peninsula and lent him the reputation of the paradigmatic misogynist. Antón de Montoro, Gómez Manrique, and Suero de Ribera, among others, wrote verse responses to Torroellas's *Maldezir*, characterizing its author as the mortal enemy of womankind. In *Grisel y Mirabella*, a sentimental romance by Juan de Flores from the last quarter of the fifteenth century, Torroellas is portrayed as the arch-antifeminist who defends the qualities and virtues of men over women in a judicial debate with Braçayda, or Cressida of the legends of Troy. Braçayda is called to court to advocate the interests and virtue of women. After Torroellas's forensic triumph in the name of men, he attempts to seduce Braçayda, who—(along with other ladies of the court)—flails him alive.

TORTOSA

The Roman city of Iulia Ilerga Dertosa named after Mercury as a place of commerce, situated along the Ebro River above its delta and the coastal thoroughfare from Valencia to Tarragona and Barcelona. The Romano-Visigothic city and its territory fell to Muslim dominion between 713 and 718, and after initial alliance with Valencia it more generally fell under Banū Hūd control from Zaragoza as the southernmost anchor of the Muslim march against the Christian northeast. Muslim Tortosa developed a sprawling residential and garden region beyond the walls of the old commercial district situated on a crowded shelf between the river and a fortified acropolis dominated by the castle of La Zuda. It grew increasingly autonomous after the civil war during the 1080s between the brothers Al-Mut'amin and Al-Mundhir, as did the mountainous region between the Ebro and Tarragona. Its independence as a *tā'ifa* (party) kingdom ended in 1099 with the Almoravid invasion, and after the fall of Zaragoza in 1118 to the Aragónese and collapse of the Muslim alliance system, Tortosa became increasingly vulnerable to Christian reconquest.

In response to the Almoravid menace and in keeping with expansionist dynastic ambition after Count Ramón Berenguer IV's marriage to Petronila of Aragón, Barcelona initiated a panregal program to absorb the entire Muslim march of the Ebro into the emerging Crown of Aragón. After helping his influential churchman, Bishop Oleguer of Barcelona, take and hold Tarragona in 1118 to 1128, Catalan forces began a systematic encroachment of the frontier between Tarragona and Tortosa. The Christian advance was slowed by its bifurcation between the Lleidan and Tortosan marches, the Muslim castle-dotted highland march of Ciurana, and Muslim naval supremacy on the Mediterranean. However, after 1146 the Christian grand alliance of Barcelona with Montpellier, Genoa, and Pisa that had been formed originally to take Tarragona, was renewed against Tortosa and its ally, Lleida. Preliminary land grants were promised in anticipation of victory and the Knights Templars moved into the borderlands. Armed with a crusade bull from Pope Eugenius II, comital forces penetrated the outlying Muslim defenses in 1147, laid siege to Tortosa on 1 July 1148, and entered the city at the very end of December. The major players were the Catalans from Barcelona, Ausona, and Urgell, led by Ramón Berenguer IV and the grand seneschal Guillem de Moncada; their new frontier baronage from Cervera, Castelvell, and Olérdola, and their castellans; churchmen led by Archbishop Bernard Tort, who would appoint the Augustinian Canon Ramon Gaufred from Saint Ruf in Avignon to the new see of Tortosa; the military orders, especially the Knights Templar

from Barberá and Montblanc; a multistate naval blockade directed by consuls from Genoa; and even English and Norman mercenaries and crusaders who had participated in the subjugation of Lisbon and Tarragona.

Those Tortosan Muslims who did not leave for Valencia joined their countrymen outside the conquered city, which was divided largely into thirds as spoils of war: the Moncada would govern from La Zuda with rights to the old city where the church was also to make its claim; the port section went to Genoa; and the count took suburbia, while giving the Templars several outlying castles and a fifth of the revenues from the countryside to maintain the perimeter defenses. A separate *Judería* was established outside the walls. The Genoese occupied a merchant district, but by 1181 they abandoned their seignorial rights to the Templars. The bishopric reconstituted in 1150 by Pope Adrian IV was able to consecrate its cathedral by 1178. The southward advance of the Arago-Catalan reconquest slowed down to assimilate Tortosa, but in accord with Alfonso II's treaty of Cazola with Castile-León in 1179 the Christian drive south and across the Mediterranean to the Balearics was renewed in 1225 after the minority of Jaime I. The capture of Valencia in 1238 secured Christian Tortosa.

Tostosa grew like a boomtown as a regional commercial center and the major port between Tarragona and the war zone in Valencia. Trade routes with Naples and Sicily were especially lucrative. When the *Costums de Tortosa* developed between 1250 and 1260, the city fell increasingly to civilian control. By 1277 it was governed by three procurators, or municipal magistrates. It was reincorporated into Catalonia in 1295 by Jaime II, but its commercial heyday was eclipsed by post-reconquest Mallorca and Valencia. Tortosa lost population to intermittent plague and competing trade centers, and suffered from recurring strife between its Christian majority and conversos, as attested by the famous Disputation of Tortosa convoked in 1413 by Pope Benedict XIII to debate Christian and Jewish polemics. Its Moriscos were finally expelled in 1610.

TOULOUSE, VISIGOTHIC KINGDOM OF See VISIGOTHIC KINGDOM, TOLEDO, TOULOUSE

TOURNAMENTS

Strictly speaking, the tournament that developed in the countries between the Loire and the Rhine was not practiced in Iberian culture, although there were similar celebrations also incorporating horses and weapons. The history of the peninsular breed of tournament can be divided into two clearly distinct eras. Before the fourteenth century, they were indigenous Castilian traditions: *alancear tablados*, *bofordar*, and *correr toros*, for example, are mentioned in the history of the Infantes de Lara and in the *Siete Partidas*. These competitions are similar to the European competitions in which contestants display skill and strength through the control of their horse and the handling of their weapons, but lack other essential components of the tournament, particularly the one-on-one fight. Perhaps the most similar external feature was the formation of a team of bofordadores mounted *a la jineta*, on horses cloaked with heraldic emblems. Armed with the *bofardo*, a short projectile spear decorated with a pendant, the horsemen performed short equestrian exercises, throwing the bofordos into the air and catching them, or launching the spears at tablados, large wooden platforms, until they were destroyed. The atmosphere in these festivals was much more popular and traditional than the European tournament, and even the bofordadores belonged not to the nobility but to the middle class. Missing from these Castilian celebrations was the exaltation of the individual inherent in the chivalric spirit—the names of the bofordadores didn't matter much—as well as the marginal yet necessary rescue/ransom plots that provided a narrative (and often erotic) context for the tournament.

The traditions associated with the peninsular tournaments change during the fourteenth century, in part because of the effect of the growing Anglo-French cultural presence. At the same time, with the Reconquest's activity slowing down, knights no longer considered the fight against Islam an enterprise that justified their existence, and as a result began to perform feigned wars. Jousts, tournaments, and other knightly displays soon acquired social distinction and prestige, with participation reserved for the nobility. Accompanying these celebrations was the growing use of insignias, emblems, and other visual adornments, which became especially important for the aesthetic appeal and ambience of the event. Representations of tournaments in the plastic arts of the beginning of the fourteenth century, such as the ceiling work of the Cathedral of Teruel (portraying two Christians fighting each other) and the

cloister of the Cathedral of Pamplona, attest to the popularity of the events. A short time later in 1335, Alfonso XI created the *Caballería de la Banda*, one of the first chivalric orders in Europe. Religious brotherhoods (*cofradías*) imitating these organizations, such as the Santiago de la Fuente in Burgos and Nuestra Señora de Salor in Cáceres, also began to appear, and also performed equestrian exercises.

The evolution of the Iberian tournament culminates in the first half of the fifteenth century, when a large number of jousts, tourneys, *juegos de cañas*, and displays of horsemanship take place. In those events, pomp, showiness, and dazzling—sometimes elaborate—stage scenery tend to overshadow the display of strength, skill, and valor.

TOWNS

The origins of towns in medieval Iberia have been the subject of a good deal of debate by historians. Most would now accept the thesis of Sánchez Albornoz that the Roman municipia atrophied in the wake of the late imperial economy and the taxation policies it engendered, declining yet further during the Germanic invasions. While urban life survived and even prospered in Muslim Spain, the Christian North endured what some have argued to be the near total disappearance of towns. While one might therefore offer a Pirenne model in Iberia, in fact Pirenne neither studied nor knew much about the Iberian peninsula during the post-Muslim invasion era. The Belgian scholar's influence is nonetheless felt, and Hispanic scholars have explored various decline and revival theories to explain the reappearance of towns in the northern territories. From these investigations, it is clear that no one model explains the growth of towns in Christian Hispania. Rather, historians have discovered a labyrinth of developmental paths affected by such variables as century of emergence, geographical location, economic opportunity, and military need. The availability of a coastline for commercial development dramatically influenced the evolution of many Asturian, Galician, Portuguese, and Catalan towns. On the other hand, the lack of sea access had a restrictive impact on León-Castile. The concentration of Roman and Muslim influences in the south and east affected municipal histories in those areas. As if geographical and cultural differences did

not create sufficient complexities for the investigator, the relative paucity of source materials for much of the peninsula prior to the twelfth century limits our understanding yet more, especially in the case of León-Castile.

At least four major routes to the development of towns in Christian Hispania evolved. First, episcopal and archiepiscopal centers clearly generated concentrations of population that led to urban growth. Second, developing commercial and trading opportunities played a role, especially in Navarre and northern Castile, influenced by the growing importance of the pilgrimage to Santiago and in Catalonia, where land and seaborne trade developed by linkage to the Occitan and Provençal regions in France and to Genoa in Italy. Third, garrison theories find useful evidence of fortified areas on and behind the frontier that drew settlement through the provision of security. Finally, agrarian and pastoral settlements fostered by kings, nobles, and monasteries offered possibilities by means of the combination of group security and town-countryside regional trade. In most cases, some mix of these factors was at work to achieve a municipal concentration. Any of these routes could also provide the emergence of a sense of difference felt by the residents of these settlements that they were a class apart, members of a growing body of individuals we can call townsmen. To these categories of towns the Reconquest would provide the acquisition of larger Muslim settlements, especially Toledo (1085), Zaragoza (1118), Lisbon (1147), Córdoba (1236), Valencia (1238), Jaén (1246), and Seville (1248).

The best indications we have of the institutional development of peninsular towns survives in the charters they received, known as *fueros* or *cartas pueblas*. Some of these were granted at the time of settlement or conquest of a new site, others were awarded years or even decades subsequently. Such materials inform us as to the special legal status of the inhabitants, starting with a few exemptions or privileges in the eleventh and earlier twelfth centuries, then elaborating into full-scale law codes starting in the later twelfth century. During the thirteenth century, the kings began to explore the possibilities of revived Roman law, contributing to the issuance of large lists of customs for towns, especially in Portugal and Aragón. Attempts to establish such uniform statements by Alfonso X el Sabio in his granting of the *Fuero real* to a number of towns met with a sharp reaction by the older towns defending their traditional *fueros*, requiring Alfonso X to retreat from this policy later in his reign. These sources tell us that the various grantors, especially the kings, sought to attract settlers to these towns with attractive grants of freedom, an increased opportunity to elect

their own local councils (*concejos*), elect their own executive officials (*jueces*, *alcaldes*, and *cónsules*), and establish their right to be independent of the local nobility. *Caballeros*, who maintained a horse and dwelled in such towns, enjoyed a tax exemption. From these towns the monarchs gained a settled populace in sometimes difficult frontier locations, and often a municipal militia to contribute to defense of the region as well as the campaigns of the king. The economic life in the Leonese-Castilian towns indicates a major dependency on livestock raising and warfare with its periodic infusion of booty. The wool they produced, enhanced by the addition of the merino breed from North Africa after the thirteenth century, fostered a respectable regional trade, and, at least in the case of Cuenca, actual manufacture of woolen cloth. Strengthened by their grants of freedoms and armed to meet their strategic situation, these Meseta towns would contest royal efforts to reestablish strong centrist government. The townsmen were aided in this effort by their participation in the meetings of the royal council (or *cortes*), occurring earlier in Spain than elsewhere in western Europe. The lesser aristocracy who dwelled in the municipalities, known as the *caballeros villanos*, increasingly came to dominate these towns by the late thirteenth century.

On the Atlantic and Mediterranean coasts, towns evolved somewhat differently. With more access to seaborne trade, especially on the Mediterranean, a more active commercial class developed on the Cantabrian coast, in parts of Portugal, and in Catalonia. Regarding institutional development, the towns of the upper Ebro in the kingdom of Aragón followed a pattern very like that of Castile. Exposed to Muslim assault but somewhat better protected by the Iberian Cordillera, the Aragónese towns received *fueros* like those of the center. Indeed, the *Fuero de Teruel* is very similar in content to that of Cuenca. Coastal Catalonia, on the other hand, while receiving royal grants of rights and obligations known as *cartas de franquicias*, *furs* and *costumbres* that were similar in format to the Castilian and Portuguese charters, reveals a wider variety of trading and commercial activity. The patrician wealthy class that developed in the larger towns like Barcelona and Valencia demonstrated strong resistance to royal authority as well as the countryside nobility. Italian influence was felt strongly in the Catalan towns in their maritime development and in art and architecture as well. By the late thirteenth century, however, the count-kings of Aragón pressed Roman-influenced law in the larger municipal codes like those of Valencia and Tortosa. The Crown of Aragón witnessed townsmen being invited to attend the royal cor-

tes with the aristocrats at roughly the same time as Castile.

The conquest of the larger towns of Muslim Luso-Hispania by the Christian kingdoms presented the monarchs with problems not faced by their contemporaries to the north. Towns such as Toledo, Lisbon, Córdoba, Valencia, and Seville possessed well-developed economies and social structures, often more advanced than those of the municipalities of the conquering states. The Aragónese were more successful in maintaining these classes and structures in Valencia than was the case in Castile and Portugal, but at a cost of dealing with large Muslim populations that sometimes became sources of conflict for the newer Christian residents. Increasingly the Muslims and Jews were ghettoized, reducing the social contact needed to affect social interaction (*convivencia*). Seville and Córdoba, especially, saw their economies decline as the Muslims were driven to the countryside in the wake of urban revolts (1264–1266), and the links to the other Muslim states were atrophied. Valencia remained tied more closely to its former trading partners in the Mediterranean, and became for a time the most important town in the Crown of Aragón.

The towns engaged in an uneasy struggle with the peninsular monarchs during the later Middle Ages to retain their rights and privileges obtained during the earlier Reconquest. Occasionally the towns got the upper hand, wresting new privileges through insurrections, such as the Valencian Unión of 1348 or the alliances made by Barcelona with France in the fifteenth century. In Castile, Alfonso XI moved to constrain the growing power of the urban nobles, pressing royal officials (especially the *corregidores*) on the town governments, a movement set back by the civil war in the reign of Pedro the Cruel, then to be renewed by the Trastámaran kings. Fernando II of Aragón and Isabel I of Castile would intensify these efforts in the late fifteenth century in their respective realms, as Renaissance despotism defeated medieval municipal independence in all of the developed Western monarchies. Economically, the peninsular towns faced in turn the growing stagnation of the Western economies in the fourteenth century, followed by the devastations of the Black Death, that reached the east coast of Iberia in May 1348, striking the great port cities of Barcelona and Valencia and spreading throughout the peninsula by 1349. As with the remainder of Europe, Spain and Portugal experienced periodic later outbreaks of the Black Death, the worst years being 1384, 1415, and 1474–1479. In addition to the economic dislocations caused by these plagues, the social fabric of the towns was rent by the pogroms against the Jews by a fearful Christian population presuming God's wrath. Such

disorders led to greater penetration of municipal government by the monarchs, and to the attitudes that resulted in the ultimate exile of Jews and then Muslims from Iberia.

TRADE, MUSLIM

From the Umayyad period until the early thirteenth century, the trade of al-Andalus was closely linked with markets elsewhere in the Muslim Mediterranean world. During these centuries, regular maritime traffic linked southern Spanish ports (particularly Seville, Málaga, and Almería) with trading centers in North Africa, Sicily, and Egypt. Some merchants traveled the entire length of the Mediterranean by sea, making stops along the way for trade and transshipment, while others made a shorter sea journey from Spain to North Africa, then continued their journeys overland by caravan.

International traffic was mainly limited to the port cities of Muslim Spain. Almería, the most important among these, was described by a twelfth-century Arab geographer as the "key" to Andalusian commerce, a city providing access to Iberian markets from the wider Mediterranean. Within the Iberian Peninsula, goods and merchants traveled by land with pack animals, or along rivers, to inland cities. For example, goods arriving by sea in Seville had to be transferred to smaller vessels for passage up the Guadalquivir River to Córdoba. Inland trade was probably handled by local merchants.

Muslim Spanish ports were also in contact with commercial centers in southwestern Europe, such as Genoa, Pisa, and Marseilles, by the late twelfth century. Genoese notarial documents, which survive from as early as the 1150s, show Genoese merchants trading with *Yspania* (the generic Latin term for Muslim Spain), the Balearics, Almería, Denia, Valencia, Seville, and other regions. After the middle of the thirteenth century, trade in southern Spain was dominated

by Christian merchants, especially Catalans and Genoese. The latter gained special privileges in Seville (where Fernando III renewed earlier grants made to Genoese traders under Almohad rule), and in the ports of Nasrid Granada. In the late Middle Ages, the opening of the Straits of Gibraltar to Christian shipping and the development of Atlantic routes allowed new commercial connections to grow up between ports in southern Spain and northern Europe.

Prior to this period, however, Andalusian trading interests focused almost exclusively on the Mediterranean and the Muslim world, and routes to and from Muslim Spain were controlled by Muslim and Jewish merchants. Some of these traders were based in Spain, and some had family ties in al-Andalus, while some came to the peninsula from other regions of the Muslim world. Many were affiliated with partnership networks stretching the length of the Mediterranean, and it would not have been unusual, in the eleventh or twelfth century, for merchants in Almería to correspond with partners in Tunis or Cairo about the price, quality, and availability of goods. Although Muslim and Jewish merchants controlled traffic between al-Andalus and other Muslim markets through the late twelfth century, these traders rarely visited Christian ports.

A wide variety of merchandise was bought and sold in Muslim Spanish markets, and all of the major commodities of general Mediterranean trade appear to have been available in the peninsula. Eastern "spices"—including dyestuffs such as indigo, lac, and brazilwood; spices such as pepper, ginger, cinnamon, and mastic; and aromatics such as musk, aloes, camphor, and spikenard—were all imported to Muslim Spain. A wide variety of woven textiles and textiles fibers also arrived (including Eastern rugs and vast quantities of Egyptian flax), together with metals, gemstones, foodstuffs, and ceramics. Muslim Spain also produced and exported an assortment of its own goods to balance these imports. These included Andalusian raw silk and silk textiles that were transported throughout the Mediterranean; "spices" such as *qīrmiz* (a dyestuff) and saffron; olive oil and dried fruits (especially figs); and Córdoba leather. Likewise, during certain periods, the peninsula served as a distribution point for commodities coming into the Muslim Mediterranean world from western Africa (gold) and northern Europe (slaves and furs).

Sources on Muslim Spanish trade are varied. Collections of Islamic legal rulings (*fatwas*), handbooks for market inspectors (*ḥisba* manuals), and biographical dictionaries provide data on merchants, commercial law, and commodities. Arabic geographical writings, travel accounts, and literature are also useful for their descriptions of Andalusian cities, markets, routes, and

products. Documents from the Cairo Geniza, though mainly originating in Egypt, offer invaluable information on merchants and goods in the medieval Mediterranean world, including Muslim Spain. Although the Geniza letters were written to and from Jewish merchants, the data that they contain may be more generally applied. As noted above, Christian materials from northern Spain, France, and Italy are likewise useful.

TRANSLATIONS, SCIENTIFIC, PHILOSOPHICAL, AND LITERARY (ARABIC)

In discussing translations in Iberia one is concerned primarily with translations from Arabic into Latin, and principally with scientific and philosophical texts. Not that there were no translations in the other direction, and from other languages. In Arabic Andalus several Latin works—including portions of the Bible, Columella's book on agriculture, and Orosius's history were translated from Latin into Arabic. Moreover, Jewish scholars played an important part as interpreters for Christians and translated several Arabic texts into Hebrew for the Jewish communities in Spain. From the mid-thirteenth century, translations from Arabic into Castilian and Catalan began to be made. While Arabic tales and poetry undoubtedly influenced the Latin and Romance literature of the Middle Ages, the instances of a piece of Arabic literature being translated for its own sake are limited almost entirely to the field of exemplary tales, such as *Kalīla wa Dimna* ("The Tale of the Two Foxes").

The earliest known translations from Arabic in Iberia are in the fields of divination and astrology and those parts of mathematics that prepare the student for these subjects, such as geometry and astronomy. Divinatory techniques could at first have been picked up from Arabs by example rather than through texts. For instance, one could learn how to cast lines of dots randomly on the ground and join them together in pairs

in order to form the figures used in "the science of the sand," which became known by the literary Latin term *geomancy*. Or one could learn how to turn the letters of the names of each of two protagonists in a battle or a contest into numbers to determine which of them would win. Or one could learn how to find out hidden things or predict the future by observing various marks on the shoulder blade of a sheep that had been slaughtered and boiled until the flesh had fallen from the bone. Most of these techniques could be learned with the aid of a good memory or, at most, a sheet of parchment giving the names and meanings of the sixteen geomantic figures, a list of the number-letter equivalents, or a plan of the shoulder blade with the significations of each of its areas written in.

At some stage, however, more detailed explanations were written down. Our earliest Latin text containing information from Arabic sources happens to be of this kind. It was written in the late tenth century, and is known variously as *Liber Alchandreī*, *Mathematica Alchandreī summi astrologi*, and *Mathematica Alexandri summi astrologi*—all these names implying some connection with Alexander the Great of Macedon. A large part of this text consists of "interrogations" posed by the client and "judgments" given by the astrologer on matters of everyday concern, such as marriage, business dealings, the sex of one's unborn child, and the outcome of an illness. The judgment is found by applying to the celestial "places," a number derived from the names of the client and of his mother. This form of judgment is distinctly Arabic, and survives to this day in North Africa. The *Liber Alchandreī* recalls the polyglot atmosphere of al-Andalus, for it includes, alongside Arabic names for the zodiac signs and the planets, Hebrew names for the same terms and for the letters in which the names of the client and his mother must be written and a letter of Petosiris to Nechepso, which was probably translated from Greek in the late classical period and was part of the surviving Latin culture in Spain.

At about the same time (late tenth century) we have our earliest examples of Arabic numerals, appearing in two Latin manuscripts of Isidore's *Etymologies* written in the monasteries of San Martín de Albelda and San Millán. The same Arabic numerals appear in early eleventh-century Latin texts on the abacus, in which they are used to differentiate between the nine different counters used for the nine digits. Toward the middle of the twelfth century the abacus began to be replaced by a method of calculation with Arabic numerals not marked on counters but written directly on a board thinly covered with sand, or on parchment. This was the algorism, in which the same Arabic numerals were used, and which had been taken, along

with the method of calculation, from a single text by al-Khwārizmī—his *On Indian Calculation*.

The introduction of the algorism is symptomatic of the change in the process of transmission of Arabic science in the twelfth century. The transmission acquires a firm literary basis. This is hinted at in the injunction of Ibn ‘Abdūn, the jurist writing in Seville in the early years of the century who forbids the selling of books to Jews and Christians because they translate them and pass them off as their own compositions.

One of the earliest of these translators was Hugo of Santalla, working in Aragón under the patronage of Michael, who was bishop of Tarazona from the time of its reconquest (1119) until 1151. The subject matter of his translations is astronomy, astrology, the divinatory sciences, and a cosmology—*The Secrets of Nature*—that includes the earliest version of the alchemical “Emerald Table” of Hermes. A near Arabic neighbor of Bishop Michael was the last of the Banū Hūd Dynasty of Zaragoza, Saif al-Dawla. After the fall of Zaragoza to the Christians in 1118 the Banū Hūd took up residence in Rueda Jalón, some fifty-five kilometers from Tarazona. He had a library from which Bishop Michael was able to choose some works for Hugo to translate.

The Banū Hūd had a reputation for their patronage of learning. Two members of the dynasty themselves achieved reputations for their remarkable mathematical talents: Aḥmad al-Muqtadir bi-llāh (who ruled from 1046 to 1081) and his son Yūsuf al-Mu’taman ibn Hūd (1081–1085). The latter composed a comprehensive book on geometry known as “The Perfection” (*Al-Ishtikmāl*), which drew on a large number of sources, including Euclid’s *Elements* and *Data*, the *Spherics* of Theodosius and Menelaus, the *Conics* of Apollonius, Archimedes’s *On the Sphere and Cylinder*, Eutocius’s commentary on this work, Thābit ibn Qurra’s treatise on amicable numbers and Ibn al-Haitham’s *Optics*. Probably during the reign of Aḥmad al-Muqtadir bi-llāh, whose renown extended to astronomy and philosophy, Al-Qarmanī (d. 1065), a pupil of the best-known Andalusian mathematician of the Middle Ages, Maslama al-Majrīṭī (tenth century), introduced the *Letters of the Brethren of Purity* into Zaragoza. It is likely that Al-Qarmanī also brought Maslama’s revision of the tables of Al-Khwārizmī from Córdoba to Zaragoza.

Some idea of which texts remained in the library of the Banū Hūd when they moved to Rueda Jalón can be gauged from the evidence of Hugo’s translations. In only one preface does he mention this library (*armarium Rotense*), but that is precisely his preface to a commentary on the tables of Al-Khwārizmī, which must have been known in Zaragoza. It was also translated by Abraham ibn Ezra, a Jewish scholar from

neighboring Tudela, a town on the river Ebro with an important Jewish community.

The translators Hermann of Carinthia and Robert of Ketton are said to have been working in the region of the Ebro in 1141, and could well have been in Tudela; Robert was later canon of the church there. Hermann knew several of the same sources as Hugo, and perhaps also had access to the library of the Banū Hūd. For he knows the works of Theodosius and Archimedes, and made versions of Euclid’s *Elements* and Al-Khwārizmī’s astronomical tables, all of which were apparently in the Banū Hūd’s possession. In his major original work, the cosmogony called *On the Essences* (*De essentiis*), Hermann cites the Emerald Tablet from the *The Secrets of Nature* (he is the only Latin scholar beside Hugo who appears to know the latter work), and refers to several other Hermetic works. Hugo’s translations had a very limited diffusion. Hermann and Robert, on the other hand, advertised their work to the highest European authorities of the time. Robert promises to Peter the Venerable, abbot of Cluny, who was responsible for promoting the Cluniac reform of the Christian Church in Spain, “a celestial gift which embraces within itself the whole of science”—that is, a work on astronomy, whereas Hermann sent one of his translations (that of Ptolemy’s *Planisphere*) to Thierry of Chartres, the foremost educator in France of the second quarter of the twelfth century. In the preface to this translation Hermann sketches a history of astronomy, refers to the basic textbooks on the subject, and advertises three of his own works and one of Robert’s. Thierry was engaged in compiling an annotated “library” of texts on the seven liberal arts (the *Heptateuchon*), and included two translations from Arabic, which may be in Robert and Hermann’s versions.

A decade or two after Robert and Hermann’s project to translate and send to France texts on geometry and astronomy, an even more comprehensive program of translations was planned and undertaken, this time in Toledo. The motive force for this program seems to have been an archdeacon resident in Toledo called Dominicus Gundissalinus (Domingo González). He described each of the sciences in turn in his *On the Sciences*, drawing largely on the translation of Al-Fārābī’s *Classification of the Sciences* made by Gerard of Cremona (d. 1187). Al-Fārābī’s *Classification of the Sciences* provided a template for Gerard on which to pattern the program of his own translations, several of which were used in turn by Dominicus when he adapted Al-Fārābī’s text into a comprehensive account of philosophy and its parts—*On the Division of Philosophy*—patterned on schemata developed by Thierry of Chartres and his pupils. With Dominicus and Gerard of Cremona we see not only a high public profile given

to translations from Arabic, but also an expansion of the range of texts into medicine and philosophy. Gerard translated several of Aristotle's works and some commentaries on Aristotle by Arabic authors or Greek commentators whose work had been translated into Arabic. On the other hand, Dominicus and his associates Avendauth and Johannes Hispanus translated the works of Arabic and Jewish scholars who had summarized and reinterpreted Aristotle's philosophy in the light of Neoplatonic trends—for example, Ibn Sīnā, Ibn Gabirol, and Al-Ghazālī.

The thirteenth century witnessed a continuation of the translating activity. Two conspicuous elements about this activity should be noted: (1) The transmission of the results of the last flowering of philosophy in Islamic Spain; and (2) The rise of "official translation"—that is, translation as part of public policy, either to aggrandize the newly emerging Spanish nation, or to convert the Muslim.

Turning to the first of these, under the Almohads there occurred an Indian summer for philosophy in Islamic Spain. This took the form of a burst of "fundamentalist" Aristotelianism unparalleled elsewhere in the Arabic world. The central figure is Ibn Ṭufayl (d. 1185), the court physician of the Almohad leader in Córdoba and the composer of the philosophical novel *Ḥayy ibn Yaqzān*, which inspired Daniel Defoe's *Robinson Crusoe*. Ibn Ṭufayl had introduced to the Almohad ruler the philosopher Ibn Rushd (Averroës, d. 1198), and inspired Al-Biṭrūjī (Alpetragius) to write his book on astronomy. This book, *On the Movements of the Heavens* (written ca 1200), was a revolutionary attempt to replace Ptolemy's astronomical system with a model that was compatible with Aristotelian physics. Averroës in his turn undertook the most ambitious project ever conceived for interpreting Aristotle: three levels of commentaries for the whole of Aristotle's works, to which a commentary on Plato's *Republic* was added. These consisted of summaries of the texts, paraphrases, and line-by-line exegeses.

Andalusian Aristotelianism appears to have had little influence on subsequent Arabic scholarship. Its influence on Latin and Hebrew philosophy and science was, on the other hand, immense. It was in this intellectual climate at Córdoba that the philosophy of Maimonides (1135–1204) was formed. And within a few years of their composition the works of both Al-Biṭrūjī and Ibn Rushd were being translated into Latin and Hebrew. The first translations were made in Spain. Michael Scot translated *On the Movements of the Heavens* in Toledo in 1217, five years after the defeat of the Almohads in the battle of Las Navas de Tolosa. To Michael Scot are also attributed the earliest transla-

tions of Averroës, which he probably began in Spain and continued when he moved to Italy in the 1220s.

The continuation of interest in Aristotelianism in Christian Spain in the thirteenth century is evident from the following facts: Álvaro of Toledo (fl. 1267–ca. 1286) copied out Michael Scot's translation of Al-Biṭrūjī's *On the Movements of the Heavens* and wrote a commentary on Averroës's *On the Substance of the Globe*. He dedicated the latter to the archbishop of Toledo, Gonzalo García Gudiel, who himself had collected several manuscripts of the works of Aristotle, Avicenna, and Averroës by 1273. The archbishop commissioned a translation of those books on natural science in Avicenna's *Shifā'*, which had not been translated by Dominicus Gundissalinus.

With García Gudiel we come to the very end of the thirteenth century. If we retrace our steps we can follow the course of "official translations" through the century. The Battle of Las Navas de Tolosa (1212) and the subsequent capture of Seville and Córdoba, leaving as the only Islamic kingdom in Spain the vassal state of Granada, gave the Christian bishops and kings a great feeling of confidence. We see at least one archbishop and two kings who produce texts in their own names to further the Hispanization and Christianization of the Iberian Peninsula.

Rodrigo Jiménez de Rada, archbishop of Toledo from 1210 to 1247, wrote the *Historia Gothica* and the *Historia Arabum*, both of which rely heavily on Arabic sources. A canon in his cathedral called Mark was asked by his archdeacon, Mauritius (whom we have mentioned before), to translate the Qur'ān and the Profession of Faith of the founder of the Almohad movement. Jaime the Conqueror, king of Aragón (d. 1276), was more a warrior than a cultural hero, and added Valencia, Murcia, and the Balearic Islands to his kingdom. But he also wrote a unique biography in Catalan—the *Llibre dels feyts*—and set up a school for training missionaries.

The most remarkable instance, however, is that of Alfonso X, el Sabio, king of León and Castile from 1252 until 1284. His nationalism is evident in his great law codes and histories (of Spain and of the world), which build on the earlier histories of Rodrigo Jiménez and even on the Islamic literature translated by Hermann of Carinthia and Robert of Ketton. Above all, it is evidenced by the fact that he chose to use Castilian as the literary language of his court. He was not so interested in Aristotle, but sponsored the translation of texts on magic, the science of the stars, entertaining stories, and games (including chess, draughts, and backgammon). Not only was the language of these translations Spanish, but also he made it seem that the authors themselves were Spanish, calling, for example,

the author of the *Ghāyat al-ḥakīm* “Picatrix Hispanus.” Of course, in a way, they were. The author of *Ghāyat al-ḥakīm*, though not Maslama al-Majrīṭī himself (as the Arabic attributions suggest), lived in al-Andalus in the eleventh century.

Latin-reading Europeans were interested in the texts for practical purposes or for making progress in mathematics or philosophy. The Arabs were not mere conduits of ancient Greek learning. Admittedly, translators were searching out Ancient Greek works and occasionally complained when they could only find an Arabic translation of a Greek work. This was the case with Eugene of Palermo (twelfth century), who reluctantly used the Arabic version of Ptolemy’s *Optics*. The Greek version has yet to be found. Gerard of Cremona, Robert of Ketton, and Hermann of Carinthia were all aiming for the *Almagest* of Ptolemy, but they acknowledged that scholars writing in Arabic had developed, added to, or made more accessible the texts of antiquity. Understanding the *Almagest* may have been the aim of every aspiring astronomer, but most scholars in the Middle Ages, including Dante, found it easier to use the shorter *Elements of Astronomy* of Al-Farghānī. Ptolemy’s *Tetrabiblos* was regarded as the fountainhead of teaching on astrology, yet the works of Abū Ma’shar and Al-Qabīṣī were much more frequently copied and cited. Avicenna’s *Sufficiency* (*Shifā’*), as its title implied, provided a full curriculum in philosophy and, partly because it gave clear-cut answers rather than left questions hanging in the air, it was easier to manage than the several books of Aristotle’s philosophy and was consequently popular. Averroes, on the other hand, with his three tiers of commentary to each of Aristotle’s works, provided a thorough going method for a detailed study of Aristotle and a model for Latin commentaries from the mid-thirteenth century onwards.

The Arabs of the Middle Ages seem to have had a special flair for mathematics, and the Latin translations in this field provide only a dim reflection of the true splendor of the achievements of men like Al-Mu’taman ibn Hūd or Omar Khayyam. The translations did, however, introduce into the West calculation with Arabic numerals, algebra, trigonometry, and advanced geometry. In medicine, above all, Arabic works held sway in the Middle Ages. One need only mention the names that became familiar in the Latin forms of Avicenna (this time as author of the *Canon of Medicine*), Rhazes, Mesue, Isaac, and Abulcasim; these being Ibn Sinā, Al-Rāzī, Ibn al-Māsawaih, Ishāq al-Isrā’īlī, and Abū-l-Qāsim, respectively.

Most of these texts had originally been translated in Spain. Many of them had been written by Muslims (or, to a lesser extent, Christians or Jews) resident in Spain. We have already mentioned Maslama al-

Majrīṭī, Al-Bitrūjī, Averroes—and Ibn Bājja, whose views were known through the commentaries of Averroes. But there were others, such as ‘Arīb ibn Sa’d, who contributed to the composition of the tenth-century Calendar of Córdoba; Abraham bar Hiyya (d. c. 1136), the author of a book on trigonometry translated by Plato of Tivoli under the title *Liber embadorum* (“Book of areas”); the eleventh-century mathematician and astronomer Ibn Mu’adh of Jaén whose works on atmospheric refraction (*De crepusculis*) and *Tables of Jaén* were translated by Gerard of Cremona; and Al-Zarqaluh, whose astronomical tables composed for Toledo in about 1070 became the standard tables in use in Latin translation in the West between the late twelfth and early fourteenth centuries. But Arabic texts also arrived in al-Andalus from the furthest parts of the Islamic world and this, in itself, testifies to the brilliance of the academic society in Islamic Spain. What Hugo of Santalla said of the subject of his own astrological translations would have been echoed by many of his fellow Latins: “It befits us to imitate the Arabs especially, for they are as it were our teachers and precursors in this art.”

TRANSLATIONS, SCIENTIFIC, JEWISH

Jewish scientific and medical studies date at least to the Hellenistic period (if not earlier) and reached their first zenith in Babylon in the Talmudic era. The Mus-

lim civilization brought increased knowledge, made available through Arabic translations, of all ancient science and mathematics. Jews played a major role in this, both as translators and as originators of scientific and medical knowledge. That tradition continued in Muslim Spain. There was as yet no need for translation, however, since all Jews knew Arabic. Only toward the end of the twelfth and throughout the thirteenth centuries do Hebrew and Spanish translations from Arabic texts appear.

It is at once necessary to dispel the old myth according to which Raimundo, the archbishop of Toledo (1125–1150), sponsored a “school of translators.” There is not one shred of evidence to support this. This was even less true of Aragón-Catalonia, where writers talk about such a school under the patronage of Miguel, bishop of Tarrazona (1119–1152), or that of Barcelona with Plato of Tivoli (ca. 1116–1145) and which supposedly included the Jew Abraham bar Hiyya. In fact, the activity was mostly on an individual basis, and the present state of knowledge does not permit elaborate theories on the relationships between these translators.

The most problematic, and in many ways most important, of these Jewish translators was one who apparently converted (even this is far from certain), known as Juan ibn Daūd, or Johannes Avendauth, about whom much confused scholarship has been written. The only thing certain is that he worked in the latter part of the twelfth century with Domingo Gundisalvo (Domingo González). (There is certainly no reason to assume *two* Ibn Daūds, one a Jewish philosophical translator and the other a *converso* scientific translator; nor is he to be confused, as has been done, with Juan Hispalensis, bishop of Toledo.)

His translations into Latin, particularly of Arabic philosophical works, predate those of Domingo, and apparently even some works attributed to Domingo are actually Ibn Daūd's. Scientific works translated by him include *Qusṭā b. Lūqā*, various treatises of Ibn Sīnā, pseudo-Aristotle, *Liber de causis*, Maslama al-Majrīṭī of Córdoba's treatise on the astrolabe, and other works.

Far more important for science was the work of several Jewish translators and astronomers who collaborated in the scientific treatises sponsored by Alfonso X. Indeed, they wrote the majority of the works comprising the *Libros del saber de astronomía*, as well as the famous *Tablas Alfonsies*, and translated (into Spanish) many other works. Among these was the *Lapidario*, translated by Yehudah b. Moses ha-Kohen (“Mosca”) and the *Azafēha* (*Ṣafīḥa*) of “Azarquel” (Al-Zarqāllah) in Latin. He may also have played a part in the translation of the *Liber picatrix*. Yehudah was perhaps a physician of the king, possibly of the Ibn Sūsan family. Another more famous royal physician,

Abraham Ibn Waqār (see Ibn Waqār Family), also was a translator for Alfonso, first of Sura 70 of the Qurʾān (*La escala de Mahoma*), then a cosmography of Ibn al-Haytham, and finally (1277) a new translation of *Azafēha*.

Another work translated by Yehudah ha-Kohen, not in the Alfonsine corpus, is an astronomical treatise of Al-Bīṭrījī of Seville, which was also translated by Moses Ibn Tibbon in Provence (1259).

The need for *Hebrew*, as opposed to Spanish or Latin, translations was most evident in Provence and parts of Catalonia, where few Jews knew Arabic. The earliest such translation was done by Abraham b. Hayya, himself a renowned philosopher and scientist (twelfth century). His scientific work itself contains summaries and excerpts from Arabic writings, but in Barcelona (1135–1136) he translated an astrological work of the famous Hālī, as he became known to the Latin world (Aḥmad b. ʿAlī al-ʿImrānī), and then worked with Plato of Tivoli on the Latin translation of a geometry book. (The translation work of another more famous Abraham, Ibn Ezra, is not considered here, because most of this work was done out of Spain.)

The Ibn Tibbon family of Provence was particularly famous in the field of translation. Moses Ibn Tibbon translated Aristotle's *Physics*, with a compendium of Ibn Rushd (Averroës), and also *De generatione et corruptione* (both published; the second only in a Latin translation), and the commentary of Ibn Rushd on *Parva naturalia* (all ca. 1250–1254). Later (1274) he translated Muḥammad Jābir Ibn Aflaḥ of Seville on astronomy, which was again translated by another famous member of the family, Jacob bar Makhir. Again, both Moses and Jacob made translations from the Arabic of the complete Euclid. Samuel Ibn Tibbon made a translation of Aristotle's *Meteora* for a patron in Toledo.

Zeraḥyah b. Isaac b. Shealtiel Gracian (Ḥen) was the most famous translator of Catalonia (Barcelona) in the thirteenth century. He was in Rome (1277–1290), where many of his scientific translations were done. Among these were Ibn Rushd's “Middle Commentary” on Aristotle's *Physics* (published), and on *De generatione et corruptione*, as well as a translation of the pseudo-Aristotelian *De causis*.

Medical works were, of course, also translated. The earliest is probably a work of Abū-l-Qāsim, translated by Shem Ṭov b. Isaac of Tortosa (b. 1196). Natan ha-Meʿaṭi also made a translation of this work, as well as other medical works (those of Galen, Hippocrates, et al.), some of which are actually named as being in the possession of a Jewish doctor in Fraga in 1381. The kings also employed Jews as official translators

of Arabic, and at least one of these, Vidal Benvenist de Porta, was paid by Jaime II to translate Arabic medical works (1296). In Provence (fourteenth century) medical works were translated by Yehudah ben Solomon Natan and Abraham Avigdor, including chapters of Arnau de Villanova (all in manuscripts).

TRASTÁMARA, HOUSE OF

The Trastámaran dynasty owed its origins to the civil wars of fourteenth-century Castile. When Alfonso XI (1312–1350) died, the succession fell to Pedro I (1350–1369), his legitimate son from his marriage to Mary of Portugal. The new king was violent and authoritarian by nature (hence his epithet, "the Cruel"), and he soon provoked the hostility of many nobles. Among the latter there were potential leaders of substantial power and influence, such as the children resulting from Alfonso XI's long liaison with his mistress Leonor de Guzmán, particularly Enrique of Trastámara, Pedro's illegitimate half-brother. But if in the early stages the civil wars represented a struggle between the authoritarian Pedro I and the coalition of nobles led by Enrique of Trastámara, both sides soon sought support from outside the kingdom, and Castile was drawn into the Hundred Years War, the French supporting Enrique and the English supporting Pedro. In 1365, the exiled Enrique invaded Castile and proclaimed himself king as Enrique II (1366). With the help of the English, Pedro mounted a counter invasion and defeated the Trastámarans at Nájera (1367). His triumph was temporary. In 1368, Charles V of France provided decisive military support for Enrique who yet again invaded Castile and finally defeated and murdered Pedro at Montiel (1369). Thereafter a succession of Trastámaran kings ruled in Castile: Enrique II himself (1369–1379); Juan I (1379–1390); Enrique III (1390–1406); Juan II (1406–1454); Enrique IV (1454–1474); and Isabel the Catholic (1474–1504).

But the Trastámaran dynasty also established itself in the Crown of Aragón and the kingdom of Navarre. In 1412, Enrique II of Castile's younger brother, Fernando of Antequera, succeeded in having himself elected as king of the Crown of Aragón at the Compromise of Caspe (Fernando I: 1412–1416) and was suc-

ceeded by other members of this Trastámaran line: Alfonso V (1416–1458); Juan II (1458–1479), who also became king of Navarre in 1425; and Fernando II the Catholic (1479–1516), who married Isabel the Catholic in 1469, both of them subsequently being known as the Catholic Monarchs and reigning in Castile from 1474 and in Aragón from 1479. With their respective deaths the Trastámaran dynasty came to an end and an imperfectly united Spain was ruled by the Hapsburg dynasty.

Were there any relatively consistent features that characterized the ruling members of the Trastámaran dynasty? At a rather pedestrian level it may well have been that a relatively regular policy of endogamous marriages produced what is frequently referred to as "the Hapsburg jaw," the pronounced jaw being very evident in the mortal remains of Enrique IV and perhaps inherited by the Hapsburgs from the Trastámaran dynasty.

But far more important were the evident concerns which at least some of the Trastámaran rulers felt both with respect to the legitimacy of their kingship and the need to reward those who had supported them. Enrique of Trastámara had depicted Pedro I as a tyrant who unjustly persecuted his subjects and was an enemy of Christ. These were grounds which might serve to justify rebellion, but they did not legitimize his own "illegitimate" claim to the throne. In order to do this he had to emphasise the elective nature of monarchy while at the same time trying to prevent the consequences that "election" might have on royal authority. He attempted to do this by arguing that there had not really been a rebellion against Pedro I; instead God had intervened to secure the tyrant's departure. Later, when facing the crisis posed by English military intervention in support of John of Gaunt's claim to the throne, derived by virtue of his marriage to Pedro I's daughter, Constanza, Juan I of Castile simply avoided the issue by blatantly asserting that the Trastámaran dynasty had the best hereditary right to the succession. Later Juan II was to go much further and make extensive use of what he referred to as his absolute royal power (*poder real absoluto*) in order to make new laws or ignore existing ones, but "elective" precedents were once again to surface as an issue when rebel nobles deposed the effigy of Enrique IV at Avila in 1465 and elected his half-brother Alfonso as king, justifying their actions by drawing upon precedents from as far back as the thirteenth century. Earlier, the Trastámaran dynasty in Aragón faced similar problems for the simple reason that Fernando of Antequera had been "elected" king at the Compromise of Caspe, a fact he attempted to ignore by stressing the role of divine intervention in the proceedings.

But how exactly did the divine intervention work? Another salient feature of the Trastámaran dynasty was its devotion to the Virgin Mary. Enrique II was devoted to the Virgin of Tobed, and the Trastámaran kings were particularly fond of the Heronymite monastery of Guadalupe, which was established in 1389 on the site where an image of the Virgin had been discovered. For his part, Fernando of Antequera went out of his way to stress that his "election" at Caspe was nothing less than a miracle, a predestined event arranged by the Virgin as a reward for his undoubted devotion to her. Poets predicted and celebrated the results with praise to the Virgin, and in an enormous altarpiece in the Prado, known as *El Retablo del arzobispo Sancho*

de Rojas, the child Jesus, sitting comfortably on his mother's lap, leans down, blesses a kneeling Fernando of Antequera with one hand and places the royal crown on his head with the other (and, of course, not one elector is in sight).

The need to reward those who had supported them during a succession of serious crises posed enormous problems for the Trastámaran kings. The rewards may have been titles, lordships, privileges, the financing of mercenaries, or various forms of cash payments on a regular and recurring basis. Generally referred to as *mercedes*, they all ultimately involved money, either indirectly or directly. After all, did not these kings owe their power to French support, to soldiers of fortune

like Bertrand du Guesclin who had led Free Companies of mercenaries in their support, and all those within Castile who had supported them? This financial crisis, moreover, was linked to another one of a more serious nature. In general, western Europe was in the grip of a famine of precious metals. Both silver and gold, the essential elements determining the content of minted coins, were in short supply due to factors affecting the sources of supply (Eastern Europe in the case of silver; trans-Saharan Africa in the case of gold). This "liquidity" crisis demanded solutions as urgently as did the political problems to which it was related. It is to the credit of their ingenuity and the skill of their councilors that the Trastámaran kings coped with such problems, although there were obvious and signally dismal exceptions, Enrique IV above all.

The first and most obvious way of dealing with these problems was debasement of the coinage, debasements that inevitably led to a devaluation of the Castilian money of account, the *maravadi*, an accounting money (not a real coin) used to calculate the sums involved. Devaluation of the *maravadi* inevitably entailed a reduction in the sums of money owed by the Trastámaran kings. Bertrand du Guesclin and other mercenaries were paid off in this way. Equally, the recipients of the famous *mercedes* within Castile were to find that the nominal values of their privileges were eroded in real terms. There were, however, exceptions. John of Gaunt insisted on being paid properly in international coins of a genuine fineness and weight, and in the course of time the recipients of *mercedes* within Castile realized that their privileges were being eroded in real terms and pressed for additional *mercedes*. The late fourteenth and fifteenth centuries (up to about 1485) were consequently affected by an alternating spiral of demands for monetary rewards by the nobility, royal debasements/devaluation of the coinage, and new demands for increments.

In the course of all these turbulent sociopolitical and economic fluctuations certain trends became clear. Plagued by internal problems (noble unrest, both real and potential) and by external obligations (Lancastrian debts; the need to honor the alliance with the French, at least morally), the Trastámaran kings could pay but scant attention to the traditional "manifest destiny" of Castile, the conquest of Granada. The result was that, with some infrequent but important exceptions (Fernando of Antequera above all), the task of reconquest was to be given up until the Catholic kings rescued it in the 1480s. On the whole, the pattern of relations between Trastámaran Castile and Muslim Granada was one of intermittent truces (never definitive peace treaties), the terms of which required that the Naşrid rulers paid *parias* or tribute payments at fairly regular inter-

vals to the kings of Castile in return for the temporary cessation of formal hostilities.

As far as the French were concerned, the early years of genuine partnership were largely over by the 1390s. French (and Burgundian) influences continued to be extremely important. The Castilians, for example, drew heavily on French experience when reforming their military institutions, and in literary, artistic, and architectural terms Franco-Burgundian patterns for long predominated over Italian ones. But in political and commercial terms, the Trastámaran monarchy concentrated on keeping vital trading routes open. When the French demanded privileges for their merchants, they found unexpected resistance from a Castile that was drawing closer to those whose trading interests were of mutual advantage, the Low Countries, Brittany, and even England.

The kings of the Trastámaran dynasty were, above all, opportunists. Despite appearances, their power was based on the principles of mutual self-interest: a sharing of power, wealth, and privileges with selected and loyal noble families (often newly promoted), a calculated policy of financial rewards to foreign and internal supporters, coupled with shrewd (but at times panicky) devaluations, and a foreign policy that paid lip service to ideals (the reconquest and support for the French against the English) without involving too many real sacrifices. Only with the Catholic kings, Fernando II and Isabel, were these patterns to change. By the time of their accession, the Trastámaran dynasty had been largely discredited, due above all to the miserable years of anarchy during the reign of Enrique IV.

TRAVEL LITERATURE, CHRISTIAN

Travel literature may be defined as a narrative, presented as factual, in which the author relates his or her own journeys in foreign parts (as far as medieval texts are concerned, generally Asia). The features of such writing are, in varying degrees, curiosity (defined as a taste for the monstrous), piety, desire for knowledge, fakery, and a tension between personal experience and received tradition.

If the author's Galician nationality is accepted, the *Peregrinatio* of Aetheria (alias Egería), variously dated between the fourth and sixth centuries, is the earliest Hispanic travel book. It exemplifies the pilgrimage account, marked by piety and a greater interest

in the past of the Holy Land as revealed in a set of monuments than in its contemporary human or economic geography. Also in the pilgrimage tradition is the Hebrew *itinerary* of Benjamin of Tudela (ca. 1161).

The *Libro del conocimiento de todos los rreynos* (ca. 1350–1360) is, like the *Travels* of Sir John Mandeville, a fake, based not on the author's own travels, but more likely on a world map that, as was often the case, was copiously annotated. Its interest in heraldry, expressed in the inclusion of illuminated escutcheons in the manuscripts, classifies it as a work of political geography. The manuscripts also show the monstrous races, an iconographical theme that typifies the sixteenth-century printings of the Spanish translation of Mandeville.

Ramon de Perellòs visited St. Patrick's Purgatory circa 1396 in order to interrogate the soul of his master, Juan I of Aragón, who had died under suspicious circumstances. The *Viatge* combines a firsthand account of his journey to Ireland with a description of St. Patrick's Purgatory derived from written sources. The evidence of the manuscripts and the incunable edition suggests that early readers valued the latter, pious, element more highly. Ruy González de Clavijo, ambassador of Enrique III of Castile, led an embassy to Tamerlane in 1401. The *Embajada a Tamorlán* is probably a group effort under the direction of Alfonso Páez de Santa María. Its descriptions are convincing firsthand accounts. Pero Tafur undertook his travels, written up as *Andanças e viajes*, circa 1453, in order to compare the political systems of various foreign states. The objective observations of Tafur and Clavijo distinguish them from earlier devotional or curious travelers.

The most successful medieval Hispanic travel book, with some 112 editions between 1515 and 1902, was the *Historia del infante don Pedro de Portugal*, attributed to one Gómez de Santisteban. It is, however, another fake.

The peninsula also produced medieval translations of other European travel books: Marco Polo (in an Aragóense version done for Juan Fernández de Heredia from Catalan), Prince Hayton (Herodian Aragóense), and Sir John Mandeville (Aragóense and a fragmentary Catalan version).

TRAVEL LITERATURE, MUSLIM

Muslim travel literature is enormously rich and bridges both geographical writings and historiography. Here we will discuss some of the more important, representative authors and their works. As with other medieval Arabic literary genres, some early Hispano-Muslim travel writers are known only through brief quotations in secondary sources. Such is the case with Ibrāhīm ibn Aḥmad al-Ṭarṭūshī (from Tortosa, tenth century) and Aḥmad ibn ʿUmar al-ʿUdhri (d. ca. 1083). Both traveled in northern Europe and both wrote detailed reports on France, England, Ireland, and the Baltic regions (Germanic, Old Prussian, and Slavic), noting local toponyms, customs, and other ethnographic data. Al-Ṭarṭūshī eloquently conveys his *dépaysement* in the face of Western singing: "Never have I heard more hateful singing than that of the people of Scheswig and it is a growling that comes out of their throats like the baying of dogs, but even more bestial." More amply documented, Abū Ḥāmid al-Gharnāṭī (from Granada) (ca. 1080–ca. 1169) lived most of his life in the East, made the pilgrimage to Mecca (1155), and traveled extensively in Asia and Europe and to Egypt, Syria, Iraq, Persia, Caspian regions, southern Russia, Rumania, and Hungary, reporting on cities, peoples, animals, and diverse marvels. Abū ʿAbdallāh al-Idrīsī, the great geographer (ca. 1100–1165), wrote under the patronage of the Norman king, Roger II of Sicily. His *Book of Roger* (*Kitāb al-Rujārī*) reflects extensive travels in Spain and the Maghrib and earns him a place of honor among the Hispano-Muslims, even though he was born south of the Straits. Abū-l-Ḥusayn Muḥammad ibn Jubayr (b. in Valencia, 1145) twice completed the pilgrimage and died at Alexandria during a third attempt (1217). He has left us a paradigmatic, colorful, day-by-day account of his first trip (1183–1185), a model for future *riḥla* literature (pilgrimage reports). Of particular interest to Hispanists are his pages on Christian-Muslim symbiosis at the court of William II of Sicily.

Prince and champion of Muslim travelers was the Moroccan Abū ʿAbdallāh ibn Baṭṭūṭa (1304–ca. 1368 or 1377), whose astounding *riḥla* was written down, edited, and supplemented (with frequent quotes from Ibn Jubayr and perhaps also personal recollections of al-Andalus) by the Hispano-Arabic scholar and poet, Abū ʿAbdallāh Muḥammad ibn Juzayy (b. in Granada, 1321–ca. 1355). Leaving Tangier in 1325, Ibn Baṭṭūṭa embarked on an epic journey, lasting almost thirty

years, that would take him to the outermost reaches of the Islamic world, through North Africa, Egypt, Syria, Arabia, Iraq, Turkey, the Russian steppes, Persia, India, Bengal, and Sumatra, and onward to China and, after his return to Morocco in 1349, also to the city of Timbuktu, in Mali. There were four different visits to Mecca and innumerable side trips along the way: among the most memorable, to the city of Kilwa, in East Africa; to the Muslim Bulgars, on the Volga; to Constantinople, in the retinue of a Byzantine princess; to South India, with hairbreadth escapes from death by shipwreck or at the hands of Hindu brigands; and to the Maldive Islands, off India, where Ibn Baṭṭūṭa married a total of six wives during his relatively brief sojourn. His visit to Islamic Spain (1350) is particularly interesting: Disembarking at Gibraltar, Ibn Baṭṭūṭa traveled by way of Ronda and Marbella—barely escaping capture by Christian pirates—through Málaga, Vélez, and Alhama, to Granada, which he characterizes as “the bride of the cities of al-Andalus” (anticipating, by almost a century, an exquisite metaphor in the famous ballad of *Abenámbar*). A minor detail of the journey to Timbuktu eloquently evokes the cosmopolitan world of Muslim merchant-scholars, in which Ibn Baṭṭūṭa had come to move comfortably and to feel thoroughly at home: Waiting for the winter season, when caravans moved south across the Sahara, Ibn Baṭṭūṭa spent four months at the edge of the desert, in the Moroccan entrepôt of Sijilmāsa. His host was Muḥammad al-Bushrī, whose brother, Qiwām al-Dīn, had given Ibn Baṭṭūṭa lodging in the Chinese port of Qanjānfū, at the other end of the known world, just six years before.

Abū Ishāq Ibrāhīm ibn al-Hājj al-Gharnāṭī (in ca. 1312–ca. 1367) twice made the pilgrimage, but his *riḥla* has only survived fragmentarily, in passages quoted by other authors. His travel notes on a trip through Morocco in 1344–1345 have, however, come down to us intact. The case of Leo Africanus (al-Ḥasan ibn Muḥammad al-Wazzān al-Zayyātī) is thoroughly exceptional. Born in Granada (ca. 1489–1495), his family took him to Morocco soon after the city’s capture by the Christians (1492). Early on, the future Leo twice journeyed to Timbuktu and also traveled extensively throughout North Africa. He made two trips to Egypt and, on the second one (1517), completed the pilgrimage, but, on his way home, was captured by Sicilian pirates at Djerba, taken to Rome, and presented to Pope Leo X, Giovanni de Medici, who convinced him to be baptized (1520), taking the name of his patron, Johannis Leo de Medicis. In Italy, Leo became a renowned teacher and scholar. His *Descrittione dell’Africa*, reflecting his extensive travels, was written in Italian and translated into Latin and various modern

European languages. Eventually, Leo was able to return to North Africa, where he died, a good Muslim, in Tunis, sometime before 1550.

The *Coplas* of an anonymous Morisco *alhichante* (pilgrim; Arabic, *al-hājj*), from the Aragónese town of Puey Monzón (now Pueyo de Santa Cruz), were written in *aljamía* (Spanish in Arabic letters) and are preserved in a unique manuscript, part of the secret personal library of a Muslim bookbinder who had hidden the volumes under the floorboards of his house, in the town of Almonacid de la Sierra, before going off into exile in 1609. The poem, only discovered in 1884, traces the pilgrim’s adventures—departure from Valencia, a great sea storm off Libya, wonders of Cairo, Mecca, Medina, and Jerusalem, and the pilgrimage itself, with its sacred monuments, relics, and rituals. The *Coplas*, like other Morisco-Spanish texts, written in Arabic letters to disguise their content and, in this case, hidden away against religious persecution) conclude the record of Hispano-Muslim travelers on a note of sadness, fear, and deprivation.

TRINITY, ORDER OF THE See CHURCH; RELIGIOUS ORDERS

TRISTE DELEYTACIÓN

Sentimental novel written in the third quarter of the fifteenth century by an anonymous author, perhaps Fray Artal de Claramunt (Riquer). The novel is an amatory fable with an unfavorable ending, with a preponderance of doctrinal discussions. Its schematically sketched characters are designated by acronyms. Narrated in both prose and verse, sometimes in first person, sometimes in third, the work plays with the status of the narrator and comments ironically on its own subject in several passages (Gerli, Blay Manzanera).

The novel consists of poems, letters, and debates that are in themselves complete literary works; an extensive versified ending narrates a journey to Love's Hell, Purgatory, and Paradise.

The only extant manuscript (Barcelona, Diputació, MS. 770) is described by Riquer. The linguistic problems and issues raised were not resolved in any of the existing editions (Gerli brings in errors; Rohland adds ambiguous graphical elements). The manuscript contains a Catalan lament as well as Catalan words, and was considered to be of Catalan origin until Gómez Fargas de Antolín defined these characteristics as Aragonese.

Certain autobiographical traits are reinforced by the presence of names of contemporary figures. Among its rich intertextualities are echoes of Boccaccio, Dante, Santillana, and Rodríguez de Padrón; poetic forms and techniques like the debate between the brain and the heart, the aedilic allegory, lamentations, the tomb of love, nonsense verse, and the journey to the afterlife; and names of literary characters. The work leaves behind the proposals of courtly love (which it addresses in discussing the theme of Andreas Capellanus's *De arte amandi*) and concludes instead that by observing certain "practical rules" (*normas prácticas*), the woman can and should choose her own lover, putting the fable's forewarned limitations to the test. According to Tudorica Impey, the text displays "una mentalidad nueva, vital y utilitaria, que descansa en un cambio de *mores* y valores (a new and lively utilitarian mentality based on a change of mores and values)".

TROUBADOURS, CATALAN

Apart from geographical and linguistic connections, many historic events, starting with the reconquest of the northeast of Catalonia by the Franks, account for cultural, political, and religious links between this re-

gion and the Occitan territory. This northern perspective was highly developed politically in the twelfth century by the counts of the House of Barcelona (kings of Aragón since 1137) and finished dramatically at the Battle of Muret (ca. 1213), where King Pedro I the Catholic was defeated and killed when defending his Occitan vassals from the French army. Since then, the interests of the Crown of Aragón north of the Pyrenees were restricted to Rosselló and Montpellier, though, in the meantime, the troubadour lyric was so deeply rooted in the Catalan courts that they became not only a refuge but lively centers where this tradition, after Muret, underwent a decline.

The extant corpus of the Catalan contribution to the troubadour poetry is about two hundred poems, written by twenty-four poets, and roughly covers the first half of the twelfth century and the thirteenth. Apart from mere references to a certain Ot de Montcada and some other names, it starts with Guerau de Cabrera's *sirventes-ensenhamen* (poem of praise and blame), which contains a broad account of literary culture and mentions four troubadours of the second generation—his friend Marcabrun and Jaufré Rudel among them. Although controversial, Berenguer de Palol's production (nine *cansos* and four more of dubious attribution) should be placed between 1150 and 1164, and we know that the count-king Ramón Berenguer IV (d. in 1362) was alluded to in some passages from Marcabrun and Peire d'Alvernhe. All this points to earlier contacts, yet the very flourishing of troubadour lyric in the Catalan courts happened in the reign of Alfonso I the Chaste (1162-1196), *aquel que sabet trobar*, and his son Pere I (1196-1213). Alfonso's literary interest had much to do with politics. Through poetry, he tried to strengthen his rights to Provence by encouraging the troubadours to attend his court and even composing some poems himself: apart from one *canso*, we have a *partimen* with Guiraut de Bornelh, Alfonso's best propagandist. We find the best of the troubadours among those who write in his service (Folquet de Marselha, Arnaut Daniel, Peire Vidal, et al.) or against his expansionism (Bertran de Born) and, of course, there is mutual benefit from this literary exchange, as we can see in the case of Ponç de la Guàrdia (ca. 1140-ca. 1190), vassal of Alfonso whose rich love poetry seems to have been appreciated in Provence.

Guillem de Berguedà was the greatest Catalan troubadour of this period and also made use of poetry as a weapon, sometimes ironically, against Alfonso. He was endowed with a strong character and a sharp, often cruel sense of humor, which he never hesitated to use to ridicule his rivals. One can appreciate his poetical individuality in many of his thirty-one pieces, written from 1370 on, either when he combines feroc-

ity with an apparent naivety of style, or in his sincere *planh* for one of his personal enemies' death. One can assign Guillem de Cabestany's life to a slightly later period, still hidden behind a sentimental legend that made him an archetype of the martyr of love. Contributing to this fame, his eight love poems are much on the sentimental side of the troubadour mainstream, such as *Lo doutz cossire*, a very synthesis of the delicacy of the *fin'amors*. Still in the second half of the twelfth century, the court of Huguet de Mataplana seems to have been another troubadour center. This nobleman, who died after being wounded at Muret, was delighted by holding poetical debates—once with Raimon de Miraval—in which he demonstrated a bizarre sense of humor, as when impersonating an evil apparition that visits an uncertain Blancasset. Furthermore, Huguet's literary environment was precisely evoked by Ramon Vidal de Besalú in his verse narrative *So fo el temps c'om era jais* (not after 1213). On the whole, Vidal's works reflect the transition from the Golden Age to the decline, since, insofar as he looks back to Alfonso's court (*Abrils issi'e mays intrava*, after 1199), he is putting an end to the former, whereas his courtly *fabliau*, the *Castia gilos* (after 1214), proves the vitality of the latter. Moreover, his grammatical treatise *Las rasons de trobar* (not after 1213), the earliest in a Romance language, is both a symptom of the decadence of Occitan and a personal reaction against its corruption.

The last great Catalan troubadour was Cerverí de Girona, who wrote 119 poems and a book of proverbs, signed as Guillem de Cervera. This impressive amount—the largest corpus extant—covers an astonishingly wide range of tones, though particular attention should be paid to Cerverí's virtuosity in the domain of the *trobar ric* (poetry with rare and difficult words and meanings) as well as to his popular style. This body of material leads us to the second half of the thirteenth century. In it, one can also place an unknown Guillem de Gironella and realize again how strongly poetry was linked to the royal family. Pédro II the Great (1276–1285) used to debate with his *joglars* (minstrels) Peironet and Pere Salvatge (perhaps the same person), and committed the latter and himself to writing verse propaganda against the French invaders. In addition, Jaime of Sicily, afterwards king of Aragón (1291–1327), composed a religious *dansa* (poem with dance rhythm) against the pope and, years after, his brother Frederic defended his rights to the island in a *sirventes* metrically modeled on Guillem de Berguedà, and answered, in turn, by Ponç Hug d'Empúries. Finally, apart from the poetry of an illegitimate member of the royal family, one should mention, still related to Jaime II, Amanieu de Sescars's *ensenhamens* and

love verse epistles. However, what really gives an eye to the future is that Jaime himself ordered Jofre de Foixà to write the *Regles de trobar* (1289–1291), soon after followed by Berenguer d'Anoia's *Mirall de trobar* and other fourteenth-century language treatises: from then on, the gradual admixing of Catalan would be the key to the difference between troubadour and post-troubadour poetry.

TUDENSE, EL See LUCAS OF TÚY

TURMEDA, ANSELM

Moralist born in Palma de Mallorca (ca. 1350) and died in Tunis (1430); wrote in Catalan and Arabic. He joined the Franciscan Order, and as a novice went off to study theology in Bologna in 1370. According to his supposed autobiography (later written in Arabic as the *Tuhfa*), Nicolau Martel, Turmeda's master in Bologna, taught him that Muḥammad, the prophet of Islam, was the Paraclete. In 1385 Turmeda, by then a friar, traveled to Tunis and solemnly abjured the Christian faith; he married a rich heiress and became 'Abdallah al-Taryuman al Mayurquī, a high officer of the Tunisian customs service. Turmeda's *Tuhfa* (*The Present of the Believer against the Followers of the Cross*) contains true historical data and a traditionally Islamic refutation of Christian dogma, but it has been proven that the extant version from the seventeenth century has been considerably altered. The *Tuhfa* assured Turmeda a brilliant reputation among Muslims. On the other hand, writing Catalan works from a Christian point of view—while living in Tunis—Turmeda also attained great prestige in the Crown of Aragón: King Alfonso the Magnanimous asked him to return, and Pope Benedict XIII even assured him that he would be pardoned for his apostasy. The *Llibre dels bons amonestaments* (1398) is a Catalan verse translation of a popular catechism written in Italy in the thirteenth century to which Turmeda sometimes adds a bit of his own cynical advice. This work was later printed, and in Catalonia it was read as a children's schoolbook until the nineteenth century. The *Cobles de la divisió del regne de Mallorques* (1398) is a narrative strophic poem in which Turmeda explains the magical and as-

trological reasons for the internal conflicts among the citizens of Mallorca. The author presents himself as a wise man who has mastered the three religions. The *Disputa de l'ase* (1417–1418) is a prose work indebted to Arabic sources, whose Catalan original text has been lost. The extant sixteenth-century French version is in the form of a discussion between a speaking donkey and Turmeda about the dignity of humankind and animals. It is only because Christ was embodied in a man that Turmeda manages to defeat his opponent. At the end the donkey makes a prophecy about the future of the church.

Turmeda wrote some other prophetic works that were much appreciated by his contemporaries. The frequent colorful autobiographical allusions in Turmeda's

writings made him a popular character and probably contributed to his legendary fame among both Christians and Muslims. 'Abdallah's tomb in Tunis is still venerated.

ÚBEDA, BENEFICIADO DE

We know very little about the author of the rhymed version of the *Vida de San Ildefonso*, dated—by contradictory and ambiguous references—between 1303 and 1349.

In the oldest copy (found in a *flos sanctorum* from the fifteenth century) the poem consists of 279 stanzas, in which there can be apparently detected a tendency to the regularity of the canonic *cuaderna vía* (monorhymed Alexandrine cuartets). The Beneficiado de Úbeda has been linked more often with Gonzalo de Berceo than with his contemporary authors, probably because of the metrics and his straightforward moralization. In fact, the characters and the structure serve the typical aim of hagiography, the exemplarity of the saint, though in a very particular sense here, since St. Ildefonso is above all a model of devotion and loyalty to the Virgin. However at least one other intention exists in the poem: the praise of the city of Toledo as cradle of saints, which might be interpreted as propaganda of the archdiocese of this town. It could be connected with a statement in stanza 276: the author had written a lost poem dealing with the Magdalen while being beneficiary of Úbeda, but he “lived in another status,” probably in some ecclesiastic charge in Toledo, when he wrote the poem devoted to St. Ildefonso.

ULFILAS, BISHOP *See* WULFILA, BISHOP

UMAYYAD DYNASTY

The Umayyads of Spain were a dynasty of Muslim emirs and caliphs who ruled from their capital in Cór-

doba from 756 to 1031. Their founder, ‘Abd al-Raḥmān I, was a grandson of one of the great Umayyad caliphs of Damascus, Hishām I. When the ‘Abbāsids overthrew the Umayyads in Syria in 750, they apparently killed all the members of the royal family except for ‘Abd al-Raḥmān, who escaped to North Africa. From there he entered Spain and took power from the local governor with the help of those still loyal to the Umayyad cause. His strength grew as Umayyad supporters from all parts of the Islamic world migrated to Spain; but ‘Abd al-Raḥmān and his descendants never gained enough power to seriously challenge the ‘Abbāsīd caliphs in Baghdad.

‘Abd al-Raḥmān I proclaimed himself emir of al-Andalus in 756 and ruled until 788. Although the general principle of Arab tribal culture is that any capable male from the agnate line can succeed to the throne, power in Muslim dynasties usually passes from father to son. ‘Abd al-Raḥmān I’s son, Hishām I, ruled from 788 to 796 and was followed by his son, Al-Ḥakam I, who ruled from 796 to 822. His son, ‘Abd al-Raḥmān II, who ruled from 822 to 852, was the first to consolidate Umayyad power throughout the Muslim-held territories and to establish a court and culture in Córdoba that quickly rivaled any in the Islamic world at that time. He was followed by his son, Muḥammad I, who also had a relatively lengthy reign, 852–886. His son, Al-Mundhir, only ruled for two years, 886–888, before being killed in a battle with rebels in Bobastro. His brother ‘Abdallah, another son of Muḥammad I, ruled from 888 to 912.

‘Abdallah’s grandson, ‘Abd al-Raḥmān III, succeeded him as emir in 912. After fourteen years of consolidating power that had been lost to the provinces, in 926 ‘Abd al-Raḥmān III proclaimed himself caliph of al-Andalus, and commander of the faithful. Muslim Spain reached its zenith of political and economic stability, territorial expansion, and cultural flowering during his lengthy reign. This prosperity continued, especially in terms of cultural development,

under the rule of his son, Al-Ḥakam II, who ruled from 961 to 976. Al-Ḥakam II was succeeded by his son Hishām II, who ruled from 976 to 1009, and it was during his rule that Umayyad power began to seriously decline. From 1009 until 1031 the caliphate changed hands many times. The powerful *ḥājib* (prime minister), Ibn 'Abī 'Āmir (also known as al-Manṣūr), and his sons ruled behind the scenes from 1009 to 1016, and after that, the various ethnic groups in and around Córdoba championed their respective pretenders to the throne. After 1031, political power dispersed among the various provincial powers, and the period known as the *tā'ifa* kingdoms began.

The Umayyads of Spain are known sometimes as the Marwānids (because of their descent from the caliph Marwān in Damascus). In addition to the titles of *emir* and *caliph*, they also used *mālik* (king) and *ibn al'umaya* (son of the Umayyads).

UNIVERSITIES, CHRISTIAN

I. Introduction

I.1

The origin and evolution of the university is an essential cultural phenomenon of the Late Middle Ages in Europe. It is linked to the growth of urban culture and of commerce; to the industrial revolution responsible for the availability and reception between 1120 and 1250 of the works of Aristotle, Galen, Hippocrates, and Avicenna; to the Roman Church's interest in disseminating canon law as codified by Gratian; and to the monarchy's support in spreading Roman law, which was a crucial instrument of royal power.

Universities in the Iberian Peninsula reinforced the cultural tendencies of the urban and cathedral clergy, setting aside the ways of traditional monastic education. The university introduced new juridical programs and institutionalized medical knowledge (in the hands of Jewish and Arabic experts in Spanish kingdoms). Like other European institutions, Spanish universities were centers of higher education whose degrees were valid throughout all Christian lands by virtue of the special privileges conceded by the pope in the *licentia ubique docendii*. Besides this papal bull, there were other essential factors in the development and legitimization of the university. For one, royal and municipal leaders took special legal measures to provide benefits, tax exemptions, and jurisdictional protection that would attract students and professors to a particular institution; the good (and determined) will of those in powerful positions was also necessary in order to finance a *studium generale*. (Initially, *universitas* was a generic term applied to guilds of professors, scholars, businessmen, clergymen, etc., and until the fifteenth century was not used in the modern sense.) Strictly speaking, the only universities in medieval Iberia were: Lisbon-Coimbra in Portugal; Lérida and Huesca in Catalonia/Aragón, in addition to Perpignan; Palencia in Castile, and Salamanca in León (before the union of those two kingdoms); and Valladolid in the newly united kingdom of Castile and León.

Several different centers of higher education apart from the university operated during the Middle Ages. The church, which had renewed its efforts to control and educate its clergy after the Third and Fourth Lateran Councils of 1179 and 1215 (and after numerous provincial synods), responded to the growing presence of the university by either maintaining the cathedral schools of the twelfth century or creating new ones (such as Santiago de Compostela, Burgos, Sevilla, Toledo, Zaragoza, etc.). Interestingly, however, the constitutions of different thirteenth and fourteenth prelates allude to elementary studies of *grammatica* in these

church schools: such studies likely incorporated some of the disciplines of the seven liberal arts (*trivium* and *quadrivium*) in the most accomplished institutions, like those in Santiago, Zaragoza, Valencia, and Seville. In other instances, the monarchy or municipal authorities mandated the organization of educational institutions: Alfonso X, for example, requested that Eastern languages be taught in Seville, while Barcelona, which took pride in its higher education in 1346, nourished the study of medicine and the arts. Nevertheless, these schools (and others like them that were administered by religious orders) had little to do with the *studium generale*, although some universities did have their roots in cathedral schools.

Many medieval centers of learning did not reach university status until the sixteenth century because they still lacked the papal document that would give their degrees recognition throughout Christianity. In other cases, the project failed due to lack of funding or to disagreement between those with vested interest in the institution: the monarchy, the papacy, the cathedral clergy, municipal leaders, and the university authorities themselves. Among other failed attempts that never materialized during the Middle Ages, the following deserve citation:

- Alcalá, which was granted foundational privileges by Sancho II at the end of the thirteenth century.
- Valencia, which received the papal *licentia* in 1246.
- Seville, which Alfonso X granted a letter of permission in 1254.
- Zaragoza, which had a prestigious cathedral school and received support from Pope Sixtus IV in 1476–1477.
- Girona, which received support from Alfonso V the Magnanimous in 1446.

Some cities were hesitant to allow communities like the university, over which municipal authorities had little control, in their midst. Barcelona, for example, rejected the offer made by Martín el Humano in 1398 to establish a university; despite this, the city changed its position and obtained privileges from Pope Nicholas V in 1450, but until 1498 the higher schools were still subordinate to the Chancellor of Medicine's authority.

I.2

Iberian universities share many characteristics with their European counterparts, including the organization of courses, the disciplines studied (except theology), the conferral of degrees, university government, the university community's love of autonomy, the struggle between, or collaboration of, different public authorities (the church, the crown, the urban middle

class) to control the *estudio*, and the student lifestyle. The differences between Spanish and European universities are rooted largely in quantitative rather than qualitative aspects. There are, however, some significant differences: with the exception of Salamanca, peninsular universities are founded later than the European institutions they imitate; their scientific contributions were more limited; they are less cosmopolitan, with fewer foreign students and professors; finally, although all universities were burdened with economic problems, Hispanic estudios suffered especially, due to civil wars, the Reconquest, and the relative economic weakness of the urban bourgeoisie.

II. History

The earliest peninsular university was Palencia, which was linked to the city's cathedral school and was active at the end of the twelfth and beginning of the thirteenth century under Alfonso VIII of Castile; its biggest supporter was Bishop Tello. Among its students were likely Gonzalo de Berceo and, according to tradition, Santo Domingo de Guzmán; several Italian teachers were counted among its faculty. Palencia specialized in law, as did other subsequent Hispanic universities. The university had always struggled with scarce funds, among other problems; Pope Urban IV tried to revive the school in 1263, but it had been dormant for some time, and died out before the end of the thirteenth century.

The University of Salamanca was founded by Alfonso IX of León in 1218. In 1243, thirteen years after the union of Castile and León, Fernando III bestowed his protection on the students and professors of the estudio. Subsequent monarchs conferred tax exemptions and personal benefits and confirmed the university's juridical independence. Alfonso X was Salamanca's great protector: in 1254 he endowed chaired professorships, gave the university a foundational ordinance, and influenced Pope Alexander IV, who in 1255 approved Salamanca's *licentia ubique docendi*, giving the institution's degrees validity throughout all Christian lands except Paris and Bologna (a restriction that may have been lifted in the fourteenth century). As he had done with Bologna and Toulouse, in 1298 Pope Boniface VIII sent the university the *Liber sextus*, a collection of pontifical decretals and constitutions. Benedict XIII, another important supporter of Salamanca, authorized new constitutions (1381 and 1411), which were revised by Martin V in 1422. These served as groundwork for the splendor the university reached under Juan II (1406–1454), and for the educational stimulus put into effect by the Catholic Monarchs at the end of the century.

There are a few documents referring to an estudio at Valladolid at the end of the thirteenth century, likely connected to the Colegiata de Santa María. Municipal and royal interests were focused on Alfonso XI's petition to Clement VI, who converted the schools into a studium generale with a 1346 papal bull. Subsequent rulers granted privileges and exemptions for professors, and also set apart the necessary funds to assure the university's survival. Valladolid began to gain importance in the fifteenth century: Benedict XIII awarded it the Salamanca statutes in 1411, and Martin V authorized the conferral of theology degrees in 1418. At the end of the century the Colegio de Santa Cruz began to operate.

King Dinis supported the creation of the Portuguese university in Lisbon in 1290; the clergy had solicited papal support earlier in 1288. In 1308, however, the university was translocated to the more peaceful Coimbra. Dinis also conceded privileges of protection and jurisdiction to students and professors, showing special concern for student housing. In 1338 the university returned to Lisbon, only to relocate to Coimbra from 1354 to 1377. In 1384, João I promised not to move the institution from Lisbon, where it remained until the earthquake of 1531. In 1537 it settled in Coimbra for good. Like Castile, Portugal lacked a theology program at the beginning, and its degrees were not valid in Paris and Bologne.

After petitions from the citizens of Lérida, Jaime II established an estudio general in the city in 1300, due to the support of Pope Boniface VIII, who had also bestowed privileges on Toulouse in 1287. From the beginning the pope gave all members of the university community royal protection, tribute exemption, and rights to self-jurisdiction. The estudio settled into well-defined parishes (San Martín, San Andrés, San Lorenzo). In 1310 the cathedral chapter took part in university administration in exchange for its contributions to the institution's financial support, which was always lacking. In 1376 the Colegio Mayor de Santa María was founded; this was the first residence hall in the peninsula, preceding even the Colegio de Pan y Carbón in Salamanca. Early university statutes underwent significant reforms in 1399 (Martín I), 1432 (María de Aragón, wife of Alfonso V the Magnanimous), and 1447 (Bishop García Arnáez d'Anyon). Competition with Huesca, the civil war, and the siege of 1464 contributed to Lérida's decline. As with other peninsular universities, Lérida did not teach theology until the fifteenth century. The university's medical program, however, was superior to Salamanca's—among its distinguished faculty were Bernat Bonhora, of Jewish descent (1311); Juan Amel, a court physician from Montpellier (1313); and the famous

Jaime d'Agramunt (1345). In 1391 Juan I gave the university permission to perform autopsies.

Pedro IV established the University of Perpignan in 1349 to compete with Montpellier, where many of his subjects attended. However, its degrees were not recognized in the Christian world until Pope Clement VII gave them the proper documents in 1397. Degrees in art and theology were offered at Perpignan, though its most esteemed programs were law and medicine.

Pedro IV conferred the same privileges to Huesca in 1354 that had been granted to Lérida. The University of Huesca's theology program was noteworthy in the beginning, but financial difficulties soon brought about its downfall. In 1465 the university was reinvigorated with a papal bull from Paul II which confirmed the privileges granted by the king. Huesca functioned according to the Lérida model, and the government of the university was in the hands of the prior of Pilar and the abbots of Montearagón and San Juan de la Peña.

III. Institutionalization

III.1

Bologna served as a model for the government and administration of Iberian universities. In the Castilian schools, the intervention of the monarchy was important, though their power was tempered by the king's lack of resources: the approval of the pope, who was far away and delegated his participation to the local cathedral chapters, was crucial for financial support of the university. The balance of powers gave a certain level of autonomy to the members of the university community. In Portugal, on the other hand, royal intervention was much more pronounced. In spite of everything, though, Portuguese and Castilian universities flourished by the end of the fifteenth century, thanks to the protection offered by the monarchy, which tried to use the university as an instrument to their advantage. In this respect, the Catalan/Aragónese universities functioned quite differently: in Lérida and Huesca, and in later institutions in the region, local powers took on the responsibility for maintaining the estudio, participating decisively in its operation.

The balance of power in Bologna between different university groups was also imitated in Spain, with certain differences that are apparent in the pontifical constitutions of Salamanca in 1411 and 1422, the Coimbra privileges granted by Dinis in 1309, and the Lérida privileges of 1300.

In Salamanca, the pope was represented by the *maestrescuela*, a doctor or teacher of theology who held the authority to confer degrees and exercised jurisdiction over professors and students. At first, the

maestrescuela was elected by the bishop and the cathedral chapter, but later the university was able to gain control of the election. In Lisbon, the bishop functioned as chancellor and was responsible for the conferral of degrees: jurisdiction was shared with two royal representatives. In Lérida the chancellor was the papal representative and the highest university authority; he was required to be a canon of la Seu (the cathedral), and his position was a lifetime appointment. Although he did award degrees, he did not hold jurisdictional rights.

Students were organized in *naciones* (nations). In Salamanca there were several such organizations (León; Galicia and Portugal; Castilla la Vieja and País Vasco; Castilla la Nueva, Toledo, and Andalucía). Every year, each nation elected two *consiliarios*—the elected representatives were responsible for electing the rector and the professors. The rector was the highest authority in the *escuelas* and was responsible for the selection and assignment of doctoral readings. Although the university administrator was appointed by the church, he answered to the rector and the *consiliarios*. In Portugal there were two rectors—both elected by the students—that governed the university. In Lérida, as in Salamanca, students were grouped into nations which took turns electing the rector. Unlike in Coimbra and Salamanca, in Lérida the rector had the responsibility of working with (and answering to) the king, the bishop, and city officials to assure that the university's privileges were observed. He also worked to resolve problems that arose between student groups, or with students' families. Normally, the requirements for the rectorate were quite general: the rector could not be a native of the city where the estudio was located, and once elected, he had to reside continually in that city (this condition, however, was often violated).

Professors' main responsibilities were to read their lectures and participate in exams. In Salamanca they were elected by the students, and in the fifteenth century they began to organize faculty meetings with the rector. Unique to Salamanca was a committee of *diputados*, created in 1422 to coordinate the different sectors of the university community and to direct everyday matters of university life. This committee was formed by the *maestrescuela*, the rector, ten students, and ten professors. In Lisbon professors were appointed by the king, with guidance from the university. In Lérida, unlike Salamanca and Portugal, the faculty was hired annually by the municipality, and had little say under the jurisdiction of the *maestrescuela* and the rector.

III.2

The estudio also required additional employees for its operation. In Portugal a *conservador real* shared juris-

diction with the chancellor. Salamanca also had *conservadores reales*, which represented the monarchy in university affairs. In Lérida the chancellor was the royal representative; the *clavarios*, university tax collectors, were important figures beginning in 1364. Two other important positions should be emphasized. The first is that of the *bedel* (porter), an essential employee in the Middle Ages, who also performed some secretarial functions. In Lérida the *bedel* was sometimes appointed by the university, and sometimes by the king. The second is that of the *estacionero*, bookseller of the university, who was responsible for the selling, lending, and copying of university texts.

III.3

Hispanic universities of the Middle Ages suffered an endemic scarcity of resources. Portuguese and Castilian institutions, impeded by the king, could pay their professors with the *tercias reales*, the two-ninths of the ecclesiastical tithe collected by the crown. Even though the monarchy granted permission for the establishment of the university, the financing of the institution depended on church funds, especially in Castile. Financial support from municipal authorities was minimal, except for the occasional gift of food or other goods during hard times. In Aragón, on the other hand, the city was responsible for the economic welfare of the *estudio*, even though it did not have sufficient funds. Consequently, from the beginning the king imposed several taxes on Lérida: the *lliura del vi* (a wine tax) in 1319, followed shortly by the *lliura de la carn* (a meat tax) and the *bancaje*, a tribute that students paid for seating. (Actually, this was a gratuity similar to the Bolognese *colecta* paid to the professor, which was in use at certain times in Salamanca and Portugal.) If the crises of the fifteenth century had especially harsh repercussions in Portugal, Salamanca, or Valladolid, the civil war almost destroyed the *estudio* at Lérida in 1464; between 1467 and 1472 the travails of the professors were so overwhelming that they refused to start courses.

Also among the setbacks and problems that medieval peninsular universities endured were the defects associated with classroom buildings, which were often either unfit or on loan. Salamanca, for example, did not have its own classrooms until the fifteenth century.

University students frequently took on minor ecclesiastical orders, and often financed their studies with the associated benefits. This system of ecclesiastical student benefits became essentially a kind of protectorate. Between the church's funds for professors and its benefits for students, it is not surprising that the papal bull ratifying the university was so important; nor should it be hard to believe that *Cánones* [canon

law] was the largest university department of Castile until the eighteenth century, or that the layperson had little presence in the *estudio* until the end of the fourteenth century.

III.4

Most professors were of local origin—the peninsular university's low salaries and economic instability were not attractive to the great European teachers of the time. Whether they were appointed by the king (Portugal), chosen with the participation of the municipality (Lérida) or selected by student votes as designated by statutes (Salamanca), the election of professors was often accompanied by protests, scandals, and dissatisfaction. Whether they were hired annually (as in Lérida) or paid a fixed rate (as in Salamanca), professors received variable salaries, depending on the subject taught. The highest paid discipline was law, the lowest *Gramática*. Professors of medicine at Lérida were paid as high as law professors by the end of the fourteenth century.

The names of many Iberian professors are known: none were famous authors, excepting some of the medical professors of Lérida or the professors of canon law at Salamanca. University departments were filled with professors with insufficient training or with those that had other income. Graduates were often more attracted by the benefits of church or court positions, while those notable Hispanic academics in Bologna or Paris had either received training in foreign universities or had performed extraordinarily to receive their degrees.

III.5

Hispanic universities had fairly small, and mostly local, student populations (at the beginning of the fifteenth century, Salamanca had roughly 300 students, and Lérida 170). Contact and exchange between individual Iberian universities was sparse, excepting the few Portuguese that went to Salamanca. Those who left home preferred to settle in Paris, Bologna, or Avignon in search of work, or in Montpellier if they studied medicine. The first posters/announcements of student petition for papal benefits date from the end of the fourteenth century. These confirm that some students attended the university with exemptions; that generally students preferred pursuing professional activity to staying at the university; that the lay population was greater in Lérida than in Castile, though the presence of the layman in the latter would increase in the fifteenth century; and that in Catalonia/Aragón, more students graduated in *utroque* (both civil and canon law, simultaneously). In conclusion, the medieval university shaped and trained professionals who needed the

church and the Crown, and students who relied more on positions and benefits than on knowledge.

IV. Academic Aspects

IV.1

There were few academic subjects until the fifteenth century, when they grew somewhat in number. In Salamanca, Alfonso X had endowed two professorships for law, logic, grammar, and physics, and one each for organ and decretals. Theology was introduced in the late fourteenth century. In Martin Pope V's statutes (1422), there are one professorship for theology, one for decretals; eight for law, four each for morning (*de prima*) and evening (*de víspera*) classes; one for a *licenciado* in Law (*de vísperas*); one (*de vísperas*) in medicine; one (*de prima*) in physics; two in grammar and one each for logic, natural philosophy, music, Hebrew, and Chaldean. The development of the quadrivium (the natural arts) was a European constant of the fifteenth century. In 1398 Valladolid had seven *cátedras*: decretals, canon law, law, natural philosophy, physics (medicine), and two for logic. After 1418, it also had a department of theology. In Lérida and Coimbra a similar development occurs—both are universities steeped in juridical tradition, though medicine in the Catalan/Aragónese kingdom is also important. Medicine begins to become more present in Salamanca in the fifteenth century, and enjoys a sort of symbiotic relationship with the arts (also witnessed earlier in Lérida) that lasts longer than the Middle Ages. As mentioned, the importance of each subject is reflected in the salary received by the corresponding professor, as is evident in Alfonso X's dispositions and in the statutes of Lérida (1300) and Salamanca (1422).

IV.2

Students entered the university with a convenient knowledge of Latin that was acquired in a cathedral, municipal or convent school, or with a private tutor. Although plenty of older students (often clergymen wishing to be promoted) and younger children enrolled in the university, the normal age for the entering student was fifteen or sixteen years old. Schoolwork, imitating other European universities, consisted in the professor's readings and glosses of texts chosen by the university, and in academic disputes.

University coursework required several successive steps:

1. All students had to enroll in the *Facultad de Artes* and attend (*oír*) classes of logic, natural philosophy, and moral philosophy. Initially the university mandated four or five years of coursework, but this requirement was frequently reduced to three

years during the fifteenth century. After demonstrating that they had attended sufficient classes, students moved on to the next cycle. It was not necessary to obtain a *bachillerato* in *artes* as long as the student did not aspire to a *licenciatura* in the same department, although an initial degree did shorten the requirements for the *licenciatura* in other departments by one year.

2. To receive the degree of bachiller, the candidate moved up to a higher *facultad*. For a *bachillerato* in Law, the student attended six years of *corpus iuris* and *glossators*; for canon law, courses on gratian and the decretals of Gregory IX; for medicine, four years of Hippocrates, Galen, and Avicenna; for theology, three years of Peter Lombard (*Quatuor libri Sententiarum*) and two years of the Bible. The *bachillerato* was awarded in a simple ceremony: a *doctor* conferred the degree to the candidate and stated before the bedel and the rector that he had fulfilled the necessary requirements.
3. Finally, the student who pursued the *licenciatura*, (the *licentia docendi*) was required to lecture (*leer*) for several years in the corresponding department (either in *repetitio* or as a substitute). Medicine required four years of lecture, as well as four months of practice; arts required three years; canon law, five; theology, four.
4. The doctorate did not represent a higher level or degree than the *licenciatura*, but rather demonstrated that the candidate disposed of enough money to pay for the costly ceremony in which the doctoral insignias were conferred.

Not all universities required the same coursework. Salamanca registered complaints that Valladolid did not require sufficient years of study. Huesca and Lérida only required five years of coursework for the *bachillerato* in law, while Perpignan required more than the norm for medicine. On the other hand, the *rogue* with a degree was not an uncommon sight.

IV.3

One must turn to European sources and to the constitutions of Lérida (1300) or Salamanca (fifteenth century) to have some idea of university student life, which was a mixture of notable privileges and strict regulations (for clothing, housing, and behavior). Courses lasted from October to September, with numerous holidays throughout the school year. The academic schedule was cumbersome: one class first thing in the morning, followed by mass and breakfast; repetitions and debates until lunch; two more classes, new debates, dinner, and more repetitions. In addition, students had to

order, study, and take care of their texts, which was no insignificant task, considering that they sat on the ground without heat or electricity during the cruel Iberian winter.

UNIVERSITIES, MUSLIM

For most of the history of al-Andalus, Muslim advanced education centered around the cathedral mosque. The most famous of these was the great mosque of Córdoba, founded in the middle of the eighth century and attaining its utmost level of splendor in the tenth century. In the post-caliphate period (after 1031), the central importance of this mosque declined and teaching mosques in Seville, Zaragoza, Denia, Granada, and other cities rose in prominence. In all of these mosques, students took specialized courses with individual teachers in specific areas of study. Curriculum centered on religious subjects, such as the various fields of Qur’anic textual and exegetical study, prophetic tradition (*ḥadīth*), and Islamic law (*fiqh*). Nevertheless, coursework also included profane subjects that were regarded as necessary ancillaries to a well-rounded religious education, such as the Arabic grammar and lexicography, literature and poetics, history,

and geography. Advanced study in other areas, including medicine, philosophy, the exact sciences, or in the scribal arts of the chancellery, occurred in private classes with experts in these fields. The most sophisticated level of education usually involved often lengthy apprenticeship with scholars in one’s chosen field and frequently included extensive travel to study with famous scholars, whether in al-Andalus, North Africa, or the Eastern Islamic world.

In centering advanced education around the institution of the mosque, al-Andalus followed the educational pattern established from early times in the Muslim East. By the eleventh century, these institutional patterns in the East were changing. As a result, the teaching college, or madrasa, which was founded and sponsored by rulers and enriched through endowments known as *hubūs* or *waqf*, became increasingly significant. The madrasa system gradually made its way to the West and became influential in Morocco by the fourteenth century, when the Marīnids established prestigious and beautiful madrasas in Fez and Salé. Nevertheless, it remained of minor importance in al-Andalus, appearing only when the Naṣrid ruler Yūsuf I Abū ‘I-Ḥajjāj (d. 1354) founded his college in Granada in 1349.

A major advantage of the madrasa system and one reason for its general success outside of al-Andalus was that its endowment provided regular stipends for teachers and students alike. Prior to this, such support in al-Andalus was more informal. Compensation for instruction was essentially private; students paid individual fees to their teachers. Occasionally, a scholar received a royal or government stipend or was provided with a salary through the mosque in which he taught, but evidence suggests that such instances were not the rule, especially early on. Some teachers helped to support themselves by taking supplemental employment, becoming the *muezzin* or *imam* of a mosque, for example. Gradually, the tradition of dedicating religious bequests to mosques developed. One purpose of such donations was to provide regular stipends for faculty and advanced students, and as a result the level of institutional support increased.

In order to comprehend the rationale of the structure of Islamic education as practiced in al-Andalus, it is essential to grasp the centrality awarded to the process of oral transmission of knowledge. One way to do so is to examine the model of *ḥadīth*. In transmitting the accepted corpus of prophetic tradition, oral communication was more highly valued than merely studying written *ḥadīth* collections. Numerous written versions existed in plenty from the ninth century, but specialists in *ḥadīth* regarded these as secondary aids to commanding a store of information whose most valid form consisted of knowledge learned and memo-

rized through oral instruction. In this way, specialists in ḥadīth transmitted the prophet Muḥammad's very words from one generation to the next without dilution or alteration. As such, the voice of the prophet echoed through the centuries to reach each new generation of Muslims with a force that replicated, to the extent possible, its original verbal authenticity and spiritual force.

Similar epistemological models existed in the other traditional sciences, whether linguistic, literary, or religious. For this reason, Muslim biographical dictionaries devoted to the lives of scholars focus on two areas: (1) the place the individual under consideration holds in this chain of transmission, (that is, the identities of his teachers and his students), and (2) the rank he holds in regard to his mastery of his fields of specialization. By knowing the identities of a particular scholar's teachers and his own professional reputation, readers are able to evaluate his trustworthiness as a transmitter of knowledge. Attestation of such competency was demonstrated by his receiving a certificate of mastery (*ijāza*) from a well-known teacher that testified that on the ideal, and often enough on the practical, level the scholar had committed the book studied to memory, and thus truly knew it.

Despite this ideal reliance on oral education, books were also plentiful. Booksellers abounded, and their markets served as meeting places for scholars. Other important venues for learned interchange were scholarly circles, assemblies, and soirees. These were regular meetings held in mosques or in private homes, sponsored by wealthy intellectuals or members of the court in which scholars from individual or diverse fields gathered to discuss and display their mastery. Although these groups might consist of friendly study groups and seminars in which social interaction was an important element, it was not unusual for professional competitiveness to infuse into them a strong degree of personal confrontation and disputational asperity.

Since scholars existed in a realm of private education in which it was normal for them to earn their livelihood from the fees paid to them by their students, social affluence played an important role in higher education. Most scholars and their students came from families wealthy enough to afford instructional fees and tuition. This meant that if the surplus social wealth that underpinned education decreased, so did the number of students and subsequently the number of teachers and scholars. It took decades for Andalusian society to establish the thriving network of rich and flourishing cities that was necessary to accumulate this wealth. Once achieved, however, the large number of important cities and their relative proximity to one another provided a firm base to support a rich intellectual and cultural tradition, even in the face of the political frac-

tionalism and tumult of the tā'ifa, Almoravid, and Almohad periods. The loss of Muslim political control of much of al-Andalus to Christian states by the mid-thirteenth century, however, undercut the economic and social foundations of centers of learning. As a result, outside of Granada traditions of advanced education fell quickly into decline. Even in Granada, where a high level of sophistication of culture and knowledge was maintained, the small size of the Naṣrid territories was insufficient to provide a broad enough base for many significant new intellectual endeavors. As a result, the center of gravity for Muslim education moved to North Africa, while the focus of Jewish and Christian education moved to the increasingly important cultural centers of Christian Europe.

Finally, the importance in al-Andalus of classical Arabic as the universal linguistic medium of advanced educational and sophisticated cultural exchange deserves mention. Arabic was the primary language of educated individuals regardless of their ethnic allegiance or religious affiliation. It united the Muslim community, no matter whether they viewed themselves as Arab, Berber, or *muwallad*. And it was adopted by Andalusian Jews and Christians whenever they wanted to participate in common public cultural discourse in the realms of science and literature. Arabic also dictated where Andalusians pursued knowledge within the Islamic world; few Andalusian scholars sought knowledge in Muslim regions where Arabic was not the dominant language of culture (in Iran after the tenth century, for example). Eloquence in classical Arabic was a highly prestigious mark of cultural competency for educated individuals and remained an important cultural ideal for educated Muslim Andalusians throughout their history. Its loss of prestige among Christians and Jews after the thirteenth century is a striking indication of the decline of Muslim cultural dominance in Iberia.

URBANIZATION

Urbanization in the Iberian Peninsula during the Middle Ages was prolific due to different cultures that often succeeded in living together; the settlements

founded were the base of the current urban network. Many vestiges of early urbanization still survive in the centers of Spanish cities. It is a rather difficult task to estimate the level of urbanization in the Middle Ages because of the lack of population records and because the urban settlements' extensive, nonurban lands were also included.

Up to the sixth century, urbanization was weak, although different stages can be differentiated. Before the sixth century urbanization was characterized by a relative continuity in the Roman urban settlements, mainly located in the peninsula's southern lands, Mediterranean coast, and the Ebro River valley, which had decayed during the Roman Low Empire.

In addition, the Barbarian invasions provoked the Hispano-Roman retreat to the cities that were assaulted. The Vandals ravaged Seville (425), and the Swabians attacked Mérida, Braga, Lisbon, and Coimbra. This trend changed with the establishment of Toledo (554) as the Visigothic realm capital and the foundation of new cities with military and residential functions such as Recópolis, Victoriacum, and Oligitis. Furthermore, the church built churches in the cities where councils were held or in those with episcopal sees.

In the eighth century Witiza promulgated a law that introduced an urban hierarchy differentiating from the administration concerns, *civitas*, *castellum*, and *vicus*. Leovigild created throughout his kingdom the city count figure (*comites civitates*). The urban settlement continuity was unequal in the peninsula. The most dynamic cities were those located in Baetica (Andalusia), Lusitania, and along the Mediterranean coast, that is, in the oldest settled regions.

Islamic civilization stressed urbanization contrasts. From the eighth to tenth centuries only the regions that had been occupied by the Muslims knew significant forms of urbanization. The peninsula showed a sharp contrast between the Christian rural north and the very urbanized Islamic southern lands. The Muslims transformed the seized cities' structures according to the Qur'anic principles and organized economic, political, and religious urban life. They took up again the trade relationship with the Orient and were quite tolerant of Christians and Jews. They founded about twenty cities of military and commercial significance, such as Tudela on the river Ebro, Madrid protecting Toledo, and Almería, which served as the main harbor.

The main Islamic cities according to population size were Córdoba (100,000 inhabitants in the tenth century), and Seville, Toledo, Almería, Granada, Palma de Mallorca, Zaragoza, Málaga, and Valencia with more than 15,000 inhabitants. This situation continued during the ta'ifa period, and a century later Al-

Idrīsī's *Geography* distinguished three types of cities according to their size.

In the Christian kingdoms urbanization started in the eleventh century, principally in cities such as León (1,500 inhabitants in 1000) and Burgos. Urban life was subjected to the Reconquest and its bases were demographic growth, market development, and fairs. Urban settlements were small and scarce up to the thirteenth century, but it is worthwhile mentioning León, Oviedo, Santiago, and the urban settlements located alongside the pilgrimage roads.

The frontier's advance toward the south and the intensification of the repopulation formed the urban network. Some cities had a defensive character while others were founded according to the laws of the frontier. A city's dynamism could be due to several factors: the extension of its boroughs (*alfoces*), its location on communication paths (Valladolid), or the grant of privileges (Cuenca). Furthermore, the consolidation of Christian kingdoms allowed the establishments of littoral urban settlements with important relationships beyond the Pyrenean lands. The Reconquest of the lands of the southern mountains system and the valley of the Ebro River led to the overlapping of Islamic and the Christian cities. Cities kept the Islamic urban structure and many economic features, but they were occupied by a new society, and the cities were organized according to distributions in quarters ruled by parishes, often located on the site of former mosques.

The Reconquest and further repopulation marked urban dynamism up to the thirteenth century. Afterward, the economy of urban settlements depended on the vanishing of the seignorial bond, the consolidation of citizen councils, and social specialization. The concept of the urban network was transformed from a legal character into a ranked socioeconomic one.

URGELL, COUNTY OF

The rural upland valley of Urgell formed by the upper Segre River constituted an outlying *comarca* of the larger Hispanic march of the Carolingians and was ruled from Carcassonne across the Pyrenees through

Andorra, and then by the mid-ninth century by the nascent dynasty of Aragón (Asnar I and Galí II, 820–ca. 838) and rival petty lords from neighboring comarcas: the Conflent, Osona, and Cerdanya. Its first cathedral, a modest Romanesque structure, was dedicated in 839. Count Guifré I's intervention from Ripoll brought Urgell into the sub-Pyrenean fold, but its natural isolation favored autonomy. Count Sunifred (897–948) consolidated the territory but failed to firmly establish his own dynasty. This awaited the intervention of Count Borrell II of Barcelona (942–992), the father of Count Ermengol I of Urgell (992–1018), who in 1010 participated in the daring Catalan raid against Córdoba. His dynasty continued through Countess Aurembaix (1209–1231), during which time Urgell played a major role in the Reconquest.

Although constrained by parallel southern expansions of Solsona and Osona, Urgell pushed its borders past the Segre stronghold of Oliana to a string of frontier castles facing Muslim Lleida and the rugged steppes above Tarragona: Pons, Artesa de Segre, Cubells and Camarasa, Guissona, and Agramunt were all fortified between 1000 and 1050 under Counts Ermenegol II (1018–1040) and III (1040–1065), and this frontier was resettled by their successors in league with the counts of Barcelona. Although the territory of Gerb was easily annexed, strongmen like Arnau Mirde Tost almost established semiautonomous domains in the frontier. Also influential was a viscomital line that can be traced from Miró I (d. 975) to the first Viscount of Castelbó, Pere I (d. 1150).

A more direct encroachment on Muslim lands began in the twelfth century, with Urgell by 1105 directing its effort at the walled city of Balaguer. Despite the fall of Zaragoza to the Aragónese in 1118, success beyond Balaguer was halted by the Almoravid intervention, and a Christian coalition including Urgellian troops was soundly defeated in 1124 outside the Muslim outpost of Corbins above Lleida. A second wave of sieges and castle rebuilding occurred thereafter, at Farfanya and Algerri in the 1130s, and again at Balaguer and Agramunt, in preparation for an allied assault on Lleida, which fell in 1149. Ermengol VI (1102–1183), whose long-lasting rule was responsible for this persistence, was awarded with a third of the reconquered city of Lleida.

The reconquest of this Ebro citadel brought Urgell into closer ties with Barcelona and an integral part of the Crown of Aragón. Urgell county proper consisted of 129 sites, but its influence continued to extend beyond the highlands. A scriptorium flourished at Seo d'Urgell, where short chronicles were compiled amid a much more impressive documentary production and a continuous development of cathedral archives. Cadet

branches of the Ermengolian Dynasty, especially the Cabrera family, ruled during the interim (1220–1228) before a second comital dynasty gained control in 1231 with the ascent of Ponc I. His line lasted until the death of Ermengol X (1267–1314), after which the inheritance passed to the royal family through Alfons the Benign, count of Urgell from 1314 who became Alfonso IV of Aragón-Catalonia (1328–1336). This third dynasty, descendants of the prince, Count Jaume I, and a subbranch of the family of Barcelona, governed through 1433 and had female descendants until 1455. Recognition of Urgell as an autonomous political entity blurred after the reign of King Jaime I (d. 1276), but because of the county's natural enclosure a separatism and regionalism continues to characterize its highland culture.

URRACA, QUEEN OF LEÓN AND CASTILE

Succeeded to the throne on 30 June 1109, upon the death of her father. The three major (interrelated) problems of her reign centered around the preservation of the integrity of the kingdom, swollen by the conquests of her grandfather, Fernando I, and her father. The first of these was due to her marriage in 1109 to Alfonso I el Batallador of Aragón. The marriage had been arranged by her father but was widely opposed by her subjects, some of whom secured its condemnation by Pope Paschal II in 1110 on the grounds that the couple shared the same great-grandfather, Sancho el Mayor of Navarra. The papal action, the failure of the queen to conceive an heir, and perhaps personal incompatibility led Urraca to abandon the marriage definitively in 1112. Yet Alfonso of Aragón continued to press his claims to the kingdom and actually held de facto control of large portions of it, including La Rioja, most of Castile, and a small area of León at the time of Urraca's death on 8 March 1126. The two had not been actively at odds since 1117 when a truce was arranged

that was subsequently renewed at three-year intervals until her death.

The truce was desirable for Urraca because it freed her hands to deal with the ambitions of her half-sister, Teresa of Portugal (1096–1128). The latter was the natural daughter of Alfonso VI and a daughter of a noble of the Bierzo and had been married by her father to Count Henry of Burgundy, probably in 1096. The king then made them the administrators of the border county of Portugal. After Alfonso's death the two hoped themselves to succeed to the throne of León-Castile, and sometimes cooperated with Alfonso of Aragón in the early stages of the civil war there to achieve that end. After the death of Count Henry in 1112 Teresa could no longer pursue that policy actively. In 1117 she began to style herself "queen" in Portugal and to attempt to annex as large a portion of southern Galicia as possible. By constant struggle, Urraca was able to limit Teresa's gains to the lower valley of the Miño between 1117 and 1126.

The queen's third major problem arose from the use of her son by a previous marriage, the future Alfonso VII, against her by his guardians, Bishop-Archbishop Diego Gelmírez of Santiago de Compostela and Count Pedro Froilaz of the Trastámara family of Galicia. Urraca had been married about 1090 to Count Raymond of Burgundy, cousin of Count Henry, and the two had been entrusted with the administration of Galicia and Portugal by Alfonso VI about the same date. In 1105 a son, Alfonso Raimúndez, had been born to the pair. Then, in late 1107, Count Raymond had died and a royal council in León had provided that the boy would inherit the realm of Galicia should his mother subsequently remarry. In 1110 Gelmírez and Count Pedro would urge this claim against the Aragónese marriage and, at times, attempt to supplant Urraca entirely in favor of her son. From 1110, therefore, the queen had to cope with powerful, sometimes even rebellious, opposition in Galicia and the realm generally. In 1117 she recognized her son as eventual heir and then at least nominal sovereign of the territories to the south of Toledo, but her difficulties with the nobility of Galicia continued.

Fortunately, during her reign the power of the Almoravid empire in North Africa was beginning to fail and the "threat" of Islam in central Iberia was waning. In 1124 Urraca was able even to retake the fortress cities of Atienza and Sigüenza in the highlands north-east of Toledo from the Muslims.

USATGES DE BARCELONA

The *Usatges*, or usages of the court of Barcelona, is a twelfth-century hybrid compilation of discordant laws, customs, precedent-setting cases, interpretations and commentaries, and oral tradition that went through multiple revisions in a century-long attempt to form a coherent collection or code that accommodated written Roman law and, to a lesser extent, Visigothic law, and to create some continuity between local customs and past practice with new legislation and interpretations. Sources identified include the Justinian *Corpus Iuris Civilis*, possibly through Gratian's *Exceptiones legum Romanorum*, and the *Breviarium Alarici*; the *Lex Baiuvariorum*; the *Eytomologiae* of Isidore of Sevilla; legal fragments from the so-called *Book of Tübingen*; the Lombard *Consuetudines*; the Visigothic *Liber iudicorum* (*llei usuaria* or *Fuero juzgo*), which was being weeded by Catalan judges to retain Roman legal foundations but root out such practices as judgment by battle; canons from the Council of Clermont; canon law commentaries by Ivo of Chartres; pronouncements of the Peace and Truce of God; various collations or *reperitoria* of baronial customs; and the overlaid royal constitutions of kings Alfons II, Pere II, and Jaume I.

The oldest extant manuscripts date to the early twelfth century, but because such compilation activity dealing with the old *Usalia* of Barcelona can be traced to more than a century earlier, the credit for the project's initiation is often given to Count Ramón Berenguer I and Countess Almodis, as it was by the authors of the *Gesta Comitum Barcinonensium*. However, the fuller promulgation of the *Usatges* can be placed more properly in the reign of Ramón Berenguer IV (1131–1162) in anticipation of the union between Catalonia and Aragón. Such work continued a tradition of *compendia* production, of which the *Caesaraugustana* was one of the most influential, that already attempted to blend Roman, Visigothic, Qu'rānic, and Canon law with various customals after the reconquest in 1118 of Zaragoza. The most systematic work at Barcelona for a comprehensive synthesis dates to the unified administration under Alfonso II (1162–1196), when scribes required a coherent, uniform law code to form a more durable bureaucracy. Their activity was commensurate with other codification and organization of records in formal archives. The *Usatges* appear in regional variations as the laws promulgated at Tarragona circa 1128; the *Costumes* of Girona, Lleida, Tortosa; and the *Furs* of Valencia. Ultimately Jaime I after 1243 refused the use of any other code in the Crown

of Aragón courts. The main redaction dates from his reign, especially their codification after the cortes of 1251. Royal judges insured its widespread application thereafter. The *Usatges* thereby evolved into the law of the land, and ever since then have underpinned the Aragón–Catalan sense of regional autonomy and local freedoms.

V

VALENCIA, KINGDOM AND CITY OF

The regions of Mediterranean Spain below the Tortosa region of the Ebro River delta and above the region of Murcia constituted the crusader kingdom of Valencia after its conquest from Islam by Jaime I of Aragón-Catalonia. In modern times Valencia comprised, from north to south, the Spanish provinces of Castellón, Valencia, and Alicante; currently it is one of Spain's "autonomies" as the *Comunidad Valenciana*, popularly also called the *País Valencià*. The mountain barrier at its back fairly isolates it from neighboring Aragón, Castile, and formerly Granada, facing it out to sea at its port cities. The strip of littoral and its hilly hinterland consequently had a north-south orientation and a maritime-international character. Its agriculture divided between intensely irrigated *huertas*, or mini-farm green zones, and dry-farming uplands of olive and vine, with transient as well as local flocks and stock raising on the larger estates of the north. Roughly the size and shape of the crusader Holy Land at the facing east of the Mediterranean, Valencia increased King Jaime's mainland holdings from 87,000 to over 104,000 square kilometers. Jaime wrote of almost fifty Islamic "castles," or strongholds and towers, defending it. In 1635 the Dutch mapmaker of Valencia described the realm as "about sixty leagues long, and seventeen wide at its widest point; it contains within its circuit four cities, sixty towns surrounded by walls, and a thousand villages; it is watered by thirty-five rivers, large and small [and] . . . it holds about 100,000 families."

Valencia's eighth-century conquest by Islam had broken radically the previous millennium of evolution, which had itself culminated in a Roman and then Visigothic-Roman civilization. Even a Mozarabic continuity was lacking after the Muslim conquest, since the bishop's flight and a fairly pagan countryside inhibited the development of semiautonomous *dhimma* status; northern immigrants and merchants did constitute some Christian presence until the harsh Almohad rule at the last. This distant eastern or Sharq al-Andalus

frontier of Islamic Spain had an idiosyncratic development; its final and thorough Arabization and Islamization seems to have been engineered relatively late, as the central government's response to the Shi'ite Fāṭimid threat, both military and ideological. A current dispute, based largely on ambiguous toponymic and linguistic fragments, centers around the dominance of steady Berber immigration over the land, with its peculiar clannic and economic organization, as against a more cosmopolitan population with only Berber fringe-settlement and at the end the innovations of Almoravid-Almohad Berber dynasties.

At the time of Jaime's conquest, Valencia had remained a last outpost of Almohad rule in Spain under the *sayyid* Abū Zayd; but the adventurer Ibn Hūd was seeking to absorb Valencia from the south, while Zayyān internally had taken its central region and capital by civil war. Fending off Castilian ambitions of conquest here, Jaime joined Abū Zayd as ally and then replaced him, in a lengthy war of maneuver, negotiation, and surrender from 1232 to 1245, which left in place the Muslim majority as semiautonomous *Mudéjars*. The sieges of Burriana (1233) and Valencia city (1238), the pitched battle of Puig (1237), and the flanking naval operations were highlights, all described at lively length in Jaime's autobiographical *Llibre dels feyts*. Though historians see a series of post-conquest *Mudéjar* rebellions, with aid from Granada and North Africa, it is more exact to say that a crisis in Jaime's southern French realms forced him to patch up a truce in 1245 with the Muslim leader Al-Azraq and then renew his crusade from 1247 to 1258, coping with *Mudéjar* revolt mildly in the 1260s, and on a major scale in 1275 to 1278.

The second half of the thirteenth century witnessed the reconstruction or acculturative absorption of Valencia, complicated by the circumstance that Aragónese and Catalans imported different law codes, languages, administrative and institutional traditions, economic mechanisms, calendars, moneys, and men-

talities. A monarchical-feudal, rural, and agricultural-stock-raising people confronted a comital-urban, maritime-commercial people. Jaime met the challenge by setting up a separate kingdom, with its new money (*solidi regalium*), parliament (*corts*), law code (*furs*), and enumeration of kings. He used the church to transform the public mood and perception: Gothic churches in the main cities, military and religious orders of every variety (Mendicants, Cistercians, ransomers, hospital groups), a papal university at the capital and proselytizing Dominican schools of Arabic at Valencia and Játiva, a tithe program, a network of parishes even where Christians were few, elaborate episcopal-chapter arrangements, and all the symbolic world of sight and sound, bells, and processions remembered from the settler's homelands.

Starting with his books of land division, the *Repartiment*, and continuing with a flood of charters, Jaime allotted farms, public monopolies from salt and baths to windmills and bakeries, merchant fonduks or caravansaries, rows and streets of shops, town markets, tax franchises, and notarial posts. He arranged for two dioceses: Valencia, the more southernly (over which he fought a protracted court battle against Castile), and Tortosa, which expanded over the north. He resisted with unequal success the intrusion of a Castilian enclave diocese at Segorbe. To these he appointed clerics high and low. Jaime kept nearly all the cities and much land for the crown, generously awarding lands to his nobles, burghers, Jews, the municipalities themselves, and religious groups. He expanded the irrigation network, built new bridges and roads, and reorganized the countryside into castle-and-town units, setting up the larger towns as semiautonomous communes with their elected jurates as executive, bailiff for taxes, council for legislation, and justiciar for judiciary. He converted the world-famous paper manufacturers of Játiva into a crown monopoly, and with the cheap paper began to amass the registers of outgoing charters so unique for their volume and variety.

In administering the kingdom as a whole, he used the Júcar River as the main division. (Jaime II at century's end would extend the southernmost boundary considerably [1304], encouraging a third division below the Jijona River.) Now and through the next two and even three centuries, the distinguishing characteristic and major problem of Valencia continued to be its uniquely large parallel society of Muslim communities, still pan-Islamic in sentiment, feared and restricted by the townsmen through crown and church but valued and protected by the rural lords. The Jews, whom Jaime recruited at home and abroad for his new kingdom, formed a large and important segment of the population, mostly artisans and merchants but with small

consumer-loan activity to locals. Their main communities were at Alcira, Burriana-Castellón, Játiva, Murviedro (Sagunto), and Valencia city.

The fourteenth century was Valencia's *via dolorosa*, filled with war, plague, famine, and struggle. Agustín Rubio Vela divides this tragedy into three phases: "from expansion to crisis" (1304–1347), "difficult times" (1347–1375), and "slow recuperation" (1375–1410). Though stable and prosperous, unendingly receiving immigration, Valencia now suffered a mysterious agricultural crisis. Granadan invasions of 1304, 1331, and 1332; Moroccan attack in 1337; the Almería crusade of 1309; and endemic frontier banditry and sea piracy throughout the century evoked lasting paranoia against the Mudéjars, who now began large emigration. In this first period, however, Valencians played a major role in the Catalan conquest of Sardinia (1323–1324). The terrible middle period saw constant war with Castile (1356–1375), with six other nations joining in but with Valencia the main theater, occupied and ravaged. The Black Death, in recurrent waves, proved even more damaging. The "Union" crisis pitted townsmen against the crown's tendency to subordinate and provincialize the kingdom (1347–1348); bloodily suppressed, it nevertheless gained its point. (The Aragónese Union struggle had also gained a point for its nobles: Aragónese law could be used in Valencia for the diminishing minority who clung to it.)

In the recuperative phase of the century, commerce spectacularly expanded its international role, while production of rice, sugar, cereals, the ceramics of Manises, and especially textiles flourished. Anti-Semitism, however, burst out in the pogroms of 1391. During this tortured century, Valencians forged their identity as not merely Catalans but as a "nació valenciana" with a "Valencian" language (first reported respectively in 1391 and 1395). Notable Valencians of this era included Vincente Ferrer (1350–1419), arbiter of the Great Schism and contributor to Valencia's language and to its growing anti-Semitism; Joan Gilabert Jofre (1363–1417), creator of Europe's first psychiatric clinic and a modern approach to mental illness; and in letters, Francesc Eiximenis (1327–1409).

The fifteenth century was Valencia's apogee. Historians warn that the traditional contrast of fourteenth-century catastrophes with this century's triumphs is easily overdrawn. Plague and famine continued to be a problem; demographic stability was not the same everywhere, and the countryside suffered as a dispersed population of high mobility concentrated ever more in the capital and other nuclei. The demands of Alfonso the Magnanimous for his Italian wars and of the dynastic crisis and Catalan civil war at mid-century

were onerous. And the fragmentation and instability of the nobility on their very small holdings destabilized society to a degree. Nevertheless Valencia became Spain's premier city in this century and a world emporium to rival Venice. Giddy affluence transformed it with mansions and churches.

The celebrated municipal bank, *Taula de Canvis*, was established (1407) and the merchants' exchange, or *Llotja*, constructed in its present splendor (1483–1498). In 1419 the kingdom was given its own archives. Agriculture became so speculative that most foodstuffs, especially wheat, had to be imported; municipal authorities subsidized foreign producers from Flanders to Sicily. A gulf opened between the famously hedonistic mercantile rich, with their tourneys and play at knighthood, and the moralistic lesser classes. Abroad Calixtus III sat the papal throne (1455–1458); and his "bad Borgia" relative, the future Alexander VI (1492–1503), was Valencia's archbishop. The 1456 sack of the *moreria* by mobs was one omen of trouble ahead. Even in piracy and privateering, large-scale entrepreneurs were forcing the small operators out of business by 1477. Surprisingly, Mudéjar merchants were fully integrated economically, and the reduced Jewish community still clung to its artisan and intermediary merchant activities. When protectionism failed as a policy, the municipality recruited German, Italian, and French immigrant communities, exploiting their skills and capturing their technologies. The Genoese, for example, revived the flagging paper industry. The price of this policy was harm to local producers and such an increase in the number and affluence of the middle-merchant class as to pit them against aristocrats and artisans, causing electoral reforms, crises, crown arbitration, and an ominously unbalanced social structure.

This was Valencia's literary golden age. Antoni Ferrando conceptualizes the kingdom's literature as falling into a "national" period (1232–1383) and a "classic" era (1383–1523). The latter divides into "consolidation" (1383–1425), "plenitude" (1425–1497), and "crisis," or Renaissance frustrated (1497–1523). During the classic period all the elites converged to support letters, from crown and church to nobles and townsmen, while both French (Paris, papal Avignon) and Italian (Alfonso the Magnanimous's central court now at Naples) flowed in, with wide translating. In the troubadour contest of 1474, forty professionals contended. An aristocratic and a realistic-satirical current in letters moved parallel. Great names include Ausiàs March (1397–1459), Joan Roís de Corella (1433–1497), Jaume Roig (1434–1478), the novelists Joanot Martorell (1413–1468), Joan de Galba (ca. 1420–1490), and Isabel de Villena

(1430–1490). Into this atmosphere was born the great humanist Joan Lluís Vives (1492–1540). Music culminated here in the theoretical treatises of Guillem de Puig (fl. 1480). But now an autocratic Fernando the Catholic was looming over urban administration (occasioning the 1502 revolt), while American gold and taxes for Italian wars would soon end Valencia's leadership.

VALENCIA, UNION OF

To understand the relative success of the Valencian Union and the nature of the revolt that took place in 1347–1348, it is necessary to go back to the late thirteenth century. At that time the powerful Aragónese nobility had enlisted the support of the people from the surrounding *vilas* against the king, ostensibly to defend what they regarded as the erosion of their privileges. The main point at issue was a custom by which a monarch on accession to the throne, was required to take a separate oath of allegiance to Aragón and swear that he would uphold their rights and privileges. No occasion had arisen since the beginning of the fourteenth century to cause the nobles to assert their rights but in 1346–1347 Pedro III, who at that time had no male heir, tried to get his daughter, Constança, accepted as the heiress to the Crown of Aragón.

Using the question of the succession to the throne as a pretext, the Valencian nobles allied with the *Consell* enlisted the help of the king's brother, Jaime who, if Constança was accepted as queen, would himself be unable to succeed to the throne. He had allies among the Aragónese nobles, always ready to defend their privileges, and together with some four Aragónese towns they joined the Valencian Union. The union upheld the claims to the throne of Jaime of Urgell, the king's brother, against those of his daughter, Constança, and the death of Jaime in Barcelona in 1347 merely meant that the king's more formidable half-brother, Ferran, who could count on Castilian support, replaced him as the potential heir to the throne.

In 1348 civil war had spread throughout Aragón, and Pedro was forced to recognize Ferran as his heir and to go to Valencia where he remained a virtual prisoner from April until June of that year. The advent of the Black Death gave him an excuse to escape, not without ensuring that those who had been directly involved in the armed uprising, nobles and townsmen, were severely and cruelly punished. The loyalty of Catalonia to the crown, however, together with negotiations with Alfonso XI and the military victory at Epila in July 1348, changed the situation. In October of the same year, at a meeting of the Cortes in Zaragoza, the Aragónese Union was destroyed. Two months later, a similar fate befell the Valencian Unionists and from then on Pedro III was obliged to respect the privileges of the kingdom of Aragón and Valencia. A general amnesty was finally granted, and in the Corts of Valencia in 1349 the privileges of the union were overturned thanks to the decision of the middle classes to reaffirm their allegiance to the king. In essence the Valencian Union succeeded in reaffirming the *furs* (codes) and forcing the king to respect their privileges.

VALERA, DIEGO DE

According to Valera himself, he was born in 1412 and lived to a ripe old age, probably dying late in 1488. His father, Alonso Chirino de Guadalajara, was the chief royal physician to Juan II of Castile and author of at least two medical treatises, one of which was printed in Seville in 1506. In 1427 Valera joined the royal court at the age of fifteen and served as one of the *donceles* of Juan II, and then Prince Enrique (the future Enrique IV). He was present at the Christian victory of La Higuera just outside the Nasrid capital of Granada in 1431, and was made a knight at the conquest of Huelma.

In 1437 Valera began a series of travels and adventures throughout western Europe, being included by Fernando del Pulgar in his *Claros varones de Castilla* among a select list of famous knights errant "que con ánimo de cavalleros fueron por los reinos estraños a fazer armas con qualquier cavallero que quisiese fazerlas con ellos, e por ellas ganaron honrra para sí e fama de valientes e esforçados cavalleros para los fijosdalgos de Castilla." He was present at sieges, which Charles VII of France directed against the English,

traveled to Prague, helped Albert V in his campaigns against the Hussites, and was rewarded by being made a member of several chivalrous orders. Returning to Castile, it was not long before Valera was on his travels again with the king's backing and accompanied by a royal herald, this time visiting Denmark, England, and Burgundy, taking part in a famous tournament near Dijon, and returning subsequently on yet another mission to the court of Charles VII of France.

Valera took part on the royal side at the battle of Olmedo in 1445, but he was soon to fall out of favor due to his habit of proffering unsolicited advice in letters addressed to Juan II and then, subsequently, to Enrique IV. As a result he passed into the service of the count of Plasencia, Pedro de Estúñiga, for several years. By his own detailed account in his final chapter of the *Crónica abreviada*, Valera played an important role in the downfall of Álvaro de Luna, who was beheaded in Valladolid in 1453.

Apart from short periods of judicial office in Plasencia and Segovia as well as some service in the noble house of Medinaceli, Valera spent most of his later life in Puerto de Santa María, from where he continued to write letters of political and military advice, in particular to Fernando the Catholic.

Valera was a prolific author whose main interests were devoted to chronicles and short treatises of a chivalrous, political, or moral nature. Carriazo established a chronological list of his works as follows: *Arbol de las Batallas*, a translation of the famous French treatise on the laws of arms by Honoré Bonet, done for Álvaro de Luna (prior to 1441); *Espejo de Verdadero Nobleza*, a treatise on the origins and nature of nobility, dedicated to Juan II (ca. 1441); *Defensa de virtuosas mugeres*, dedicated to Queen María of Castile (prior to 1443); *Exhortación a la paz*, addressed to Juan II (ca. 1448); *Tratado de las armas*, for Afonso V of Portugal (ca. 1458–1467); *Providencia contra Fortuna*, dedicated to the marquis of Villena (ca. 1465); *Ceremonial de Príncipes*, also dedicated to the marquis of Villena (ca. 1462–1467); *Breviloquio de virtudes*, for Rodrigo Pimentel, count of Benavente; *Origen de Roma y Troya*, for Juan Hurtado de Mendoza; *Origen de la casa de Guzmán*; *Doctrinal de príncipes*, dedicated to Fernando the Catholic (ca. 1475–1476), perhaps one of Valera's more original works; *Preheminencias y cargos de los oficiales de armas*, for Fernando the Catholic; *Genealogía de los Reyes de Francia*, dedicated to Juan Terrin; *Crónica abreviada de España* (1479–1481); *Memorial de diversas hazañas*; and *Crónica de los Reyes Católicos*.

In addition Carriazo listed another two works, a lost work on the Estúñiga family, and another of dubious attribution, also lost, on *Ilustres varones de Es-*

pañā. In between all these works, the extraordinarily productive Valera also managed to write a considerable number of short poems of a moralistic or courtly love nature.

VALLADOLID, ALFONSO DE

Alfonso de Valladolid, originally known as Abner de Burgos, occupies a pivotal place in the history of medieval Jewish-Christian relations. As an especially able convert from Judaism to Christianity, he influenced not only his contemporaries but also successive generations with his philosophical treatises and polemical diatribes. Born around 1270, Abner/Alfonso wrestled with doubts regarding his faith for nearly twenty-five years. In the opening folios of his most important work, the still unedited *Mostrador de justicia* (*Teacher of Righteousness*), Alfonso provides a highly personal account of the circumstances ultimately leading to his conversion. Although hardly spontaneous, Alfonso's conversion appears to be genuine and unforced; nonetheless, some of his former coreligionists impugned the deed as mere opportunism. Alfonso subsequently served as sacristan in the cathedral of Valladolid. Toward the end of his life, Alfonso was instrumental in having King Alfonso XI proscribe putative insults against Christians in Jewish liturgy. Alfonso also inveighed against Jewish physicians, who, he claimed, sought to harm Christians. Until his death (ca. 1346), Alfonso was assiduous in his proselytizing efforts. In both Hebrew and Spanish treatises, he engaged in acrimonious polemics with the leading Jewish sages of his time, notably Isaac Polgar and Moses ben Joshua of Narbonne. Indeed, his writings continued to influence *converso* polemicists well into the fifteenth century. Alfonso's impact is perhaps most obvious in the widely diffused *Fortalitium fidei* (*Fortress of Faith*), where excerpts from Alfonso's nonextant *Milhamot ha-Shem* (*Wars of the Lord*) aptly served Alonso de Espina's own polemical designs. There exist Spanish versions of a number of Alfonso's Hebrew works, including the *Minhat Kena'oth* (*Offering of Zeal*), *Shalosh Iggarot* (*Three Epistles*), *Sefer Teshuvot ha-Meshuvot* (*Reply to the Responses*), and *Teshuvot la-*

Meharef (*Refutation of the Blasphemer*). The following works have also been attributed to Alfonso: *Concordia de las leyes*, *Libro de las maldiciones de los judios*, *Contra los que dicen que ay fadas et ventura et oras menguadas*, and *Libro de las tres creencias*, often erroneously cited as *Libro de las tres gracias*.

VANDALS See GERMANIC INVASIONS

VARA DE JUDA

Title of the Amsterdam Spanish translation of a popular and influential work of Jewish history by Meir de León (first edition, 1640; printed “en casa de Emanuel Benbeniste” in a later edition in 1744). There is a later translation in Aljamía by David and Moses Alkalay (Belgrade, 1859). Subsequent Spanish quotations from the work and translations depend on these. The original seems to have been published no earlier than 1550. It is generally attributed to Solomon ibn Verga, a Castilian Jew who is documented in 1490 as having taken part in the redemption of the Jewish captives of Málaga.

Part of the book is divided into “eras of persecution,” which extend from the period of the Second Temple to the Lisbon massacres of judeoconvertos in 1506. Its distinctiveness from other Hebrew chronicles of persecution is immediately evident because of stylistic innovations that include the use of dialogue, stories, letters, and orations. This distinctiveness and its engaging tone have attracted the attention of a number of students of Jewish historiography who attempted to emphasize different aspects of the work and define it in various ways: as a repository of Jewish folklore (Loeb); as a work reflecting both the reactions to the problem of the Jewish diaspora in general in the wake of the Expulsion from Spain on the one hand and on the other the frivolity and humor of the Italian novellae that had influenced it (Baer); as a work of typically Renaissance ironic criticism of the Jewish counterpart of medieval scholasticism (Schohat); as an expression of the search for radically different, “modern” answers to the problems of Jewish history following the deep psychological impact of the Expulsion (Neuman); and as a vehicle for expressing a Jewish “aristocratic” so-

cial ideology with its positive appraisal of the role of the Christian monarchs in Jewish history (Yerushalmi).

Whereas the search for sources and analogues by Baer and certainly by De Prijs gave more prominence to general Jewish analogues or antecedents to ideas in the book, more recent research has tried to emphasize the book's context (Jewish, *converso* or Christian convert), and Christian-Hispanic mentality of the fifteenth and sixteenth centuries). It has been suggested that its stylistic strategies (the use of orations and dialogue, the care taken in dilating exempla into relatively well-developed stories, introducing historical individuals into the fictional universe of the book, quotations from nonexistent works), its ideas on wealth, lineage, the conversos, women, education, monsters, and its ambiguities (author's position on various issues as well as the putative unity of the authorial point of view versus editorial additions) all have contemporary Hispanic analogues, particularly in the works of Antonio de Guevara.

VASPASIANO

The legend of the destruction of Jerusalem by Vespasian in gratitude for his cure from leprosy by the image of Christ on St. Veronica's miraculous towel was widely diffused in medieval Iberia in a number of separate versions, in both prose and verse. The most common branch is that represented by the late "Estoria del noble Vaspasiano," the Castilian text of which (printed ca. 1491–1494, 1499, and later; a seventeenth-century manuscript) was the source of the Portuguese translation (printed 1496). These texts are close to, and may derive from, one of several variant Catalan prose manuscript versions of "La destrucción de Jherusalem," which contains an allegorical dream, based on "L'Estoire del Saint Graal," in which the mystery of the Virgin Birth is explained to Vespasian. "Vaspasiano" is customarily classed with Iberian Peninsular romances, often with the Arthurian cycle, by critics; in fact, it is, as some have noted, a popular religious narrative. One version was printed with other pious pseud-epigrapha in Catalan and Castilian editions of "Gamaliel," while the Portuguese shipped one hundred copies to "Prester John" in Ethiopia in a consignment of religious books in 1515. The legend depicts a cruel re-

venge for the Crucifixion: Vespasian sells the Jews in batches of thirty for a penny; many are massacred, but enough are spared for future generations to revile. Pontius Pilate is tried, imprisoned, and dragged off to Hell by demons. Converts from Judaism, though, are favorably treated. The deliberate circulation of "Vaspasiano" in the context of the expulsions of Jews from Spain in 1492 and from Portugal in 1496 is a distinct probability.

VICENTE, GIL

Gil Vicente (ca. 1465–ca. 1536) is the first Portuguese dramatist whose plays have come down to us. Both the date and place of his birth are unknown, as are those of his death. We know only that for some thirty years he wrote and staged plays for the court of King Manuel the Fortunate (1469–1521; r. 1495–1521) and his son Juan II (1501–1557; r. 1521–1557). He has sometimes been identified with a goldsmith of the same name who worked for the court during the first two decades of the sixteenth century, but the identification of goldsmith with dramatist has not been accepted by all scholars.

Only one of Vicente's plays, the *Auto da Barca do Inferno* (*The Ship of Hell*), was printed in his lifetime (1518); it survives in a single copy, now in the Biblioteca Nacional in Madrid. Most of the others were first printed in the collected edition (*Copilaçam*) printed in Lisbon by João Alvarez in 1562, nearly thirty years after the playwright's death. The chronology of the plays cannot be established with certainty; the dates and places of first performances given in the *Copilaçam* are often demonstrably incorrect. The texts of the plays, too, are often unsatisfactory. I. S. Révah has argued that their deficiencies are due solely to the "carelessness, stupidity, and bad taste" of Vicente's son Luís, who prepared the *Copilaçam* for the press; others believe that Vicente's text was altered by the censors appointed by the Inquisition.

Eleven of Vicente's more than forty plays are entirely in Spanish while only fifteen are entirely in Portuguese; in the rest some characters use one language, some the other. Many other sixteenth-century Portu-

guese writers also composed much of their work in Spanish. Portuguese readers in this period read Spanish books more often than Portuguese ones, in part because there were more Spanish books to read. Many of Vicente's sources are Spanish. He draws upon the shepherds' plays of Encina and Fernández, together with the Spanish version of an Italian romance of chivalry for the *Auto de la sibila Casandra* (*The Play of the Sibyl Cassandra*) and on a Spanish romance of chivalry for *Don Duardos*. But Vicente is not just an imitator of foreign models. *Casandra* is richer and more subtle than any of its Spanish predecessors, while in *Don Duardos* a run-of-the-mill prose romance serves as a point of departure for one of his most original and most poetically satisfying works.

Almost all of Vicente's plays were intended for a single performance at court, often as only one element, perhaps a subordinate one, in some court entertainment. Some celebrate one of the great feasts of the liturgical year, like Easter or Epiphany, or, most often, Christmas. Others celebrate a particular occasion such as the birth of a prince or princess or a royal wedding. Many show similarities to the court masques of other countries, like those Ben Jonson wrote in collaboration with the scene designer Inigo Jones, though there are also important differences. Spectacular stage effects, so important in the English masques, play a much smaller role in Vicente's court entertainments. In the absence of the kind of stage machinery Jones employed to produce the "wonders" of the Stuart masques, Vicente had to rely on verbal description. The procession of courtiers and their ladies transformed into fishes and other sea creatures in *Cortes de Júpiter* (*Jupiter's Court*) was not staged but merely described; the description accounts for nearly half the total number of lines in the play.

The presence of popular elements in Vicente's plays, particularly the exquisite songs found in some of them, confirms rather than contradicts their essentially courtly character. Other contemporary poets and musicians who, like Vicente, depended on court patronage show a similar affection for folk songs. It is usually impossible to say whether a given song is Vicente's own creation or taken from popular tradition, perhaps with modifications to make it fit the dramatic action; Vicente often uses songs to advance the plot or reveal the personalities of the characters who sing them, as in the delightful and moving *Auto de la sibila Casandra*.

VICENTIVS HISPANUS

Vicentius Hispanus was born in Portugal, though the exact place and date are unknown; he died in 1248. He probably arrived at Bologna as a student around 1200, and Silvestre Hispano, Lorenzo Hispano, and Juan Galense were likely his professors. In civil law he was a disciple of Azzo. From 1210 to 1215 he was a professor in the same institution where he studied, the University of Bologna. In one of the manuscripts of his works, the words *bonus et hilaris* (good and funny) appear next to his initials, which is in harmony with various passages of his works that demonstrate a fine sense of humor. He was archdeacon in Lisbon. The following are his known works:

1. Glosses to Gratian's *Decretum*
2. *Apparatus* to the *Compilatio prima antiqua*
3. *Apparatus* to the *Comilatio tertia antiqua*, which he worked on from 1210 to 1215
4. Isolated glosses to the *Compilatio secunda antiqua*
5. *Apparatus* to the constitutions of the fourth Lateran Council of 1215
6. *Casus* to the *Compilatio tertia antiqua*, which only consists of a few isolated titles
7. Possible authorship of some *Casus* to the fourth Lateran Council, which have recently been edited
8. *Casus* to the Decretals of Gregory IX
9. *Apparatus* or *Lectura* to the Decretals of Gregory IX
10. Glosses on the *arbores consanguinitatis et affinitatis* (trees of consanguinity and affinity)
11. *Summula* or *Quaestiones de exceptionibus*
12. *De discordia testium et de consonantia et qualiter debeant recipi et repelli.*

VICH (VIC), CITY OF

Vich (or, as it is now officially spelled, "Vic"), is a small city lying inland, sixty kilometers north of Barcelona. It dominates a small, relatively fertile plain, a strategic point within the complicated landscape of

hills and narrow valleys south of the Pyrenees. The Plain of Vich is bordered by Montseny near the coast and a series of hills to the west that separate it from the comarca of Bages. The valley formed part of an important route leading from Barcelona to Cerdanya, and through the Pyrenees to Foix and Languedoc. Vich was an important ecclesiastical and cultural center during the tenth and eleventh centuries, and a prosperous commercial and industrial town in the late Middle Ages.

In Roman and Visigothic times what is now Vic was known as Ausona (whence the name of the modern surrounding comarca of Osona). A Roman temple was built on a hill overlooking the Meder River. A bishop of Ausona is first mentioned in the early sixth century. In the aftermath of the Muslim invasions and only partially successful Carolingian reconquest, Ausona appears to have been largely deserted. After an anti-Frankish rebellion in 826 to 827, official attempts to resettle the district were abandoned until shortly before 886 when the diocese was reestablished. The new cathedral was built at some distance from the Roman town. As often would happen in medieval towns, two urban agglomerations existed next to each other, one military, one ecclesiastical. The remains of Roman Ausona were held from the count of Barcelona by a viscount of Ausona (first mentioned in 879), who fortified the temple ruins as a castle. A new episcopal town grew up around the cathedral, expanding rapidly, especially with the foundation of a market in the early eleventh century. The suburb or "vicus" of Ausona eclipsed the former center. The town was known for a time as the "vicus Ausonae" but by 1100 the entire complex was commonly referred to simply as "Vich."

A Romanesque cathedral was constructed in the eleventh century by Bishop Oliba. Its campanile and crypt survive. Vich was associated with the monastery of Ripoll and other cultural centers of Old Catalonia in the tenth and eleventh centuries, and with the Truce of God movement that culminated in the provincial and diocesan councils of the mid-eleventh century.

The bishop of Vich held extensive rights of secular lordship over the town from the tenth to fourteenth centuries. His judicial power and revenues from mints, tolls, and markets were supposedly based on a privilege from King Odo of France, dated 889, but this document contains substantial later interpolations. Counts of Barcelona tacitly or explicitly recognized episcopal powers during the tenth and eleventh centuries, but these came under increasing attack from the lords of the upper town who succeeded the defunct viscounts of Ausona. Under the family of the seneschals of the counts of Barcelona, who married into the Montcada lineage, episcopal lordship was chal-

lenged and its revenues often undermined or arrogated. Disputes often exploding into violent confrontation characterized the period shortly after 1200. A substantial class of merchants and other prominent townsmen took advantage of the weakening of ecclesiastical control. Although their movement to elect an independent municipal government was suppressed (ca. 1185), townsmen received a measure of immunity from taxation and arbitrary treatment shortly thereafter and formed guilds, charitable foundations, and other sources of power in the late Middle Ages.

King Jaime II bought out the secular lordship of the bishops of Vich over the town in 1315. The Montcadas and their successors, the counts of Béarn and Foix, continued to assert rights over their part of the city until they too were liquidated by the king in 1450.

VIDAL MAYOR

We have basically two works approved at the Huesca cortes (courts) in 1274: a shorter one, or *Compilatio minor*, and an enlarged one, or *Compilatio maior*.

From the last one there were at least two versions, one in Latin, another in Romance. The Latin version is named by the medieval forists as *Liber In excelsis, Fori Antiqui, Compilatio Domini Vitalis, Compilatio Magna*, and so forth. From this version—doubtless the original and already rare in the fifteenth century according to Miguel de Molino, 1513—we are not aware of manuscripts and only its prologue is known, preserved in MS 7391, Biblioteca Nacional, Madrid, and fragments preserved in quotations by Jaime de Hospital, Martín Díaz de Aux, Antich de Bages, Martín de Pertusa, Miguel de Molino, Jerónimo Blancas, and others.

The Romance version, known as *Vidal Mayor*, is preserved in a precious manuscript actually kept at the J. Paul Getty Museum, Santa Monica, California. Edited by G. Tilander in 1965 together with an introductory study and vocabulary, this manuscript has been recently reproduced in facsimile by the Diputacion Provincial and the Instituto de Estudios Altoara-

goneses of Huesca, together with a volume of papers related to several aspects of the work. It is a copy made in the second half of the eighteenth century by the Navarrese notary Miguel López de Zandiu from a Romance version of the original Latin carried out by an individual not quite skilled in law who sometimes allows himself to interpolate the text explaining the meaning, in Romance, of some juridical terms. The work appears as a juridical body approved at the Huesca Cortes, 1247, whose redaction and division in nine books, commissioned by King Jaime, belongs to Vidal de Canellas. It was promulgated as the only legal code in the kingdom of Aragón, indicating to resort to the natural sense in case of legal loopholes. Looking at the transmitted manuscript we could imagine that it is partially mutilated. This Romance version could be basically coincidental with the original Latin version in spite of some disagreements between the Romance text and the Latin fragments preserved.

The *Compilatio minor* is a much shorter work, known also as *Fori novi*, which only covers the dispositive part of the *fueros*, leaving out the reasonings to which the *Compilatio maior* pays great attention. The Latin version has been transmitted in ten manuscripts (none original, not even from the thirteenth century) and eleven editions that do not seem to reflect its original stage, but the stage acquired around 1300 after some modifications that in the end became the official text for allegation in the courts. Four versions more or less complete are preserved in Romance, and two fragmentary ones. Some of them show an evolutive stage prior to the Latin version actually known.

VIKINGS

Both Christian and Muslim Spain suffered from Viking raids a number of times in the ninth and tenth centuries. The *Chronicle of Alfonso III* reports two attacks, one during the reign of Ramiro I (842–850) and the other during that of Ordoño I (850–866). According to the chronicler, Ramiro was able to repel this "pagan and extremely cruel people previously unknown to us"

with his army near La Coruña. The account goes on to report that the Northmen subsequently headed south, where they attacked Seville and killed many Muslims. Apparently Ordoño was not as successful as Ramiro had been in defending Asturias: the chronicler simply noting that the Northmen ravaged the coasts of Spain with sword and fire, before heading for Morocco and then Greece.

Arabic sources corroborate these raids and allow us to pinpoint them to 844 (during the reign of 'Abd al-Rahmān II) and 859 (Muḥammad I). First sighted in Lisbon, the Vikings made their way south to the mouth of the Guadalquivir River, where they established a base on Isla Menor. From there they worked their way upriver to Seville, which they pillaged for an entire week. Many Muslims were killed and the principal mosque was put to the torch. From there the Vikings extended their raids on horseback until they were finally turned back by the emir's forces and forced out to sea. Some Arab histories (though significantly not the earliest ones) report that 'Abd al-Rahmān received a Viking embassy after the first attack and sent one of his own to the Danish king in turn. The second attack in 859 found the Muslim forces better prepared but still unable to defend Algeciras, where many of the inhabitants were slaughtered. From there the Vikings proceeded north, wintering on the southern coast of France and reportedly capturing and ransoming King García of Navarre.

Arabic sources indicate that there were two more Viking raids in the tenth century. In 966, they were repelled by an Andalusian fleet off of Lisbon. In 971, they seized Santiago de Compostela and were once again resisted by the Muslim fleet further south.

VILANOVA, ARNAU DE

Arnau de Vilanova is a figure of unusual interest for his role in medieval intellectual history. Though he called himself "Catalanus" and grew up in Valencia, it seems likely that he came there with his parents from a village outside Daroca (in Aragón) during the Christian resettlement of the city after its reconquest in 1237/8. We can infer his medical training at the *studium* of Montpellier in the 1260s, but it is only with the 1280s that we can begin to reconstruct his biography in detail. During that decade he was in Barcelona in medical

attendance on the kings of Aragón-Catalonia, first Pedro III el Gran and then Alfonso III. It was in this same period that his translation of Galen's *De rigore* from Arabic into Latin was finished (Barcelona, 1282); Arnau had presumably learned Arabic growing up in Aragón or Valencia. His other medical translations—of Avicenna's *De viribus cordis* and of Abulcasis's *De medicinis simplicibus*—though undated, may also have been completed in these years.

During the 1290s Arnau was apparently back at Montpellier, this time as a regent master, though occasionally he can also be found advising the new king, Jaime II, on his family's health. This was a period of great intellectual fruitfulness. Arnau composed a number of scientific works in these years, in which he developed aspects of medical theory. Simultaneously, his personal theological views were maturing along Joachimite lines; like the spiritual Franciscans with whom he was also beginning to establish close ties, he viewed the contemporary church, its institutions and orders, as corrupt, and he took that corruption to manifest the coming end of a historical age. When Jaime II sent him to Paris and to King Philip le Bel in 1300 to negotiate the status of the disputed Vall d'Aran, Arnau took the opportunity to defend these views as set out in his *De adventu antichristi* before the theologians of the Sorbonne: as a result, he was imprisoned as a heretic and released only at the intervention of the French monarch.

Seeking vindication, Arnau went now to Pope Boniface VIII, treating the pope successfully for the ailment of a stone and winning his agreement that Arnau's views, while rash, were not heterodox. With this assurance, Arnau renewed his attack on his adversaries, the scholastic theologians—Dominicans, in particular—whom he accused more harshly than ever of faithlessness, of having abandoned the study of the Bible for secular sciences. The installation of a friend as Pope Clement V in 1305 gave Arnau still more support and allowed him the calm to return to intellectual reflection and composition, in both his fields of activity. His most careful work on clinical *medicinae*, the *Regimen sanitatis* prepared for Jaime II, was written at this time, as was his *Speculum medicinae*, an ambitious attempt to draw current medical theory together synthetically. Yet simultaneously (1306) he was composing his *Expositio super antichristi*, doctrinally the most complex of his theological writings. He looked now to Clement as the authority destined to lead the reform of the church and society that would enable them to confront the Antichrist, and he believed that he had won over Jaime II and his brother Frederigo III of Sicily (Trinacria) to his program. But in 1309 Arnau went too far in his claims about Jaime, who thereupon broke completely with his former advisor and friend. Frederic, however, continued faithful, implementing

Arnauldian spiritual principles in his kingdom even after Arnau's death in 1311.

On balance, Arnau enjoyed more success as a physician than as a theologian and reformer. A council at Tarragona condemned a dozen of his theological works in 1316, and most of the several Beguine communities inspired by his ideal of a lay spirituality dwindled away where they were not suppressed outright. The taint of heterodoxy may have contributed to the later ascription to Arnau of many alchemical works, none with any verisimilitude. His genuine medical writings are numerous, however, and enjoyed great popularity down to the sixteenth century—particularly his *Regimen sanitatis* for Jaime II and the *Medicationis parabole* dedicated to Philip le Bel in 1300. Arnau's more abstract scientific writings are often original attempts to develop some particular aspect of medical theory and to imbed it within a broader naturophilosophical framework, and—like his *Aphorismi de gradibus*—they show considerable breadth of knowledge and imagination. Often harshly critical of his academic colleagues, he was particularly severe on their overdependence upon Avicenna's *Canon*, which had been the dominant authority behind the thirteenth-century schools. (To be sure, his own works are heavily marked by Avicennan problems and conclusions.) In 1309 he was one of three advisors who helped Clement V draw up a new curriculum for the medical faculty at Montpellier, one that made the works of Galen rather than Avicenna the core of medical instruction at that school. Attempts have been made to see his theological and medical positions as unified, but in many respects he seems to have been able to keep his two lives/passions compartmentalized.

VILLENA, ISABEL DE

Elionor Manuel de Villena was born in 1430. She was the illegitimate daughter of the famous writer, Enrique de Villena, who died when she was a child. Her aunt, María of Castile, the queen of Aragón, raised her at the court in Valencia and probably encouraged her to

become a nun in her teens. Taking the name Isabel, she entered the Trinidad of Valencia, an old monastery that the queen had just converted into a convent. Not without opposition, she became its abbess in her thirties. She died there in 1490 as a result of an epidemic of plague.

Isabel de Villena's only extant work is the *Vita Christi*, a lengthy book she left unfinished. Her successor as abbess, Aldonça de Montsoriu, had it printed in 1497, when Queen Isabel of Castile requested a copy. Isabel de Villena kept in touch with many important writers of her time, some of whom dedicated works to her. Scholars believe her book to be a response to the misogynist works of some of her contemporaries. Among the many feminist features mentioned are the great predominance of women characters and the defense of their moral superiority. This *Vita Christi* undoubtedly is unlike the other works of its kind.

In effect, the work begins with the immaculate conception of the Virgin and ends with her miraculous assumption to heaven, the life of Jesus being only its central part. Before and after the life of Jesus, there are lengthy allegorical scenes in which women play very important roles. During Jesus' life, Magdalene is presented as his true spiritual companion, the coprotagonist of this part of the work. The detailed description of their platonic love relationship is strikingly beautiful. Whereas other authors say Magdalene was frivolous, Isabel de Villena writes that common people always enjoy gossiping about rich women. Her passionate defense of Magdalene is perhaps a defense of her own mother and, ultimately, of herself. After all, Isabel apparently suffered due to the circumstances of her birth. Indeed, she probably was forced to become a nun, and had difficulties becoming an abbess, due to her irregular status. Like many other medieval women writers, Isabel de Villena invoked God's favor to strengthen a precarious position in an unfriendly world.

VIOLANTE

Violante (1235–1300), wife of Alfonso X of Castile-León (1252–1284), daughter of Jaime I of Aragón (1213–1276) and Violante of Hungary. Violante's be-

trothal to Alfonso took place in 1243, but because of her age the marriage was not celebrated until 1249. Violante eventually bore Alfonso six sons and four daughters: Fernando, Sancho, Pedro, Juan, Jaime, Enrique, Berenguela, Isabel, Leonor, and Violante. She is better known for her intercessions into Castilian diplomacy. Violante played an active role in improving Alfonso's relations with Aragón during the unsuccessful 1254 revolt by the Infantes Enrique and Fadrique.

The Infantes and their allies, the Haros, had entered into an alliance with Jaime I that endured until Violante appeared before her father and begged for mercy for herself and her children. Jaime later claimed that consideration for the well-being of his daughter and grandchildren caused him to break the alliance. Violante strove to strengthen her family's position, and to this end she at first maintained political relations with her siblings and tried to arrange their marriages. As her children got older she served as an intermediary in their quarrels. At the *cortes* (parliament) of Seville in 1264 the towns of Extremadura petitioned her to intercede with the king over their taxes, which she accomplished successfully; at the cortes of Burgos in 1272 she was part of the committee that received noble and ecclesiastical petitions; and she negotiated peace between Alfonso and his brother, Felipe, after the latter's revolt in 1272 to 1273. During the crisis of succession caused by the death of her oldest son, Fernando de la Cerda, in 1275, Violante brought his children, known as the Infantes de la Cerda, and their mother, Blanche, out of Castile to her brother Pedro III of Aragón in January 1277, only returning to Castile at the request of Sancho in the summer of 1279. She abandoned Alfonso X during the 1282 civil war to support Sancho, and was present during the Cortes of Valladolid in 1282 that degraded Alfonso and named Sancho ruler of Castile. Violante died while on pilgrimage to Rome at Roncesvaux in 1300.

VISIGOTHIC KINGDOM, TOULOUSE AND TOLEDO

In 418 the Roman Empire, represented by the master of the soldiers and effective military dictator of the West, Constantius (d. 421), made a treaty with the Visi-

goths under their king, Wallia (r. 416–419). By this they were to be established as “federates” in the province of Aquitania Secunda, a region extending approximately from the Garonne to Carcassone, and to receive maintenance from the empire. Details of the nature and purpose of this arrangement remain uncertain and have generated much historiographical controversy recently. It has been argued that Aquitaine was chosen as the area of settlement to enable the Visigoths to defend western Gaul from the threat of the *Bagaudae*, peasant rebels and bandits who had been active north of the Loire until 417. Under the circumstances this is not entirely credible. Equally unclear is the nature of the system, known as *Hospitalitas*, by which the imperial government proposed to reward its new allies. Traditionally, this was seen as involving a redistribution of the estates, woodlands, and slaves of the principal Roman landowners of the region, with a third or more of the property being given to the German “guest.” More recently and convincingly it has been argued that what was redistributed was not real estate but the tax revenue owed to the central government.

Wallia’s successor, Theoderic I (r. 419–451), who established his capital at Toulouse, was less willing to cooperate with the empire than his two predecessors, and changes in the imperial government after 425 also led to an alteration in attitudes on the Roman side. Under the direction of the master of the soldiers, Aetius (d. 454), imperial armies tried to destroy the Visigothic kingdom. In 437 Toulouse was besieged, but the Roman commander Litorius was overconfident, and was defeated and killed. In 451, when the Huns under Attila invaded the western half of the empire, Aetius was forced to turn to the Visigoths for aid. They contributed most of the army that defeated Attila at the battle of the Catalaunian Plains. In this victory Theoderic I was killed, and was succeeded by his son Thorismund (r. 451–453). He soon fell victim to a conspiracy among his brothers.

Under Theoderic II (r. 453–466) the territory of the Visigothic kingdom rapidly expanded. His alliance with the new western military dictator Ricimer (d. 472), himself of Visigothic origin, led to an invasion of Spain in 456. The Suevic kingdom centered on Mérida was almost destroyed, and the southern provinces of Spain came under Visigothic rule. Theoderic’s brother Euric (r. 466–484) completed the process in the 470s when his armies crossed the Pyrenees and conquered the remaining Roman territory in the northeast. Under this king, who had obtained the throne by murdering his brother, further territorial gains were also made in Gaul. The Auvergne, the last Gallic region under direct imperial rule, was ceded to the Visigoths in a treaty made with Emperor Julius Nepos in

475. By the time of Euric’s death the Visigothic kingdom, still centered on Toulouse, extended from the valleys of the Loire and the Rhône to the southern coast of Spain. The only territory in this that was not under its rule, but subject to its influence, was the Suevic kingdom in the northwest of the peninsula.

Euric had been a committed Arian, and, like some of his predecessors, distrustful of the political loyalty of some of his principal Roman subjects. Under his son Alaric II (r. 484–507) a much closer integration between the two populations began to develop. In 506 a council representing the whole of the Catholic Church under Visigothic rule was held at Agde, and in the same year the king issued his *Breviary*, a substantial code of Roman law, which may have been intended to apply to all his subjects. However, the rise of the Merovingian Franks in northern Gaul in the 490s and 500s threatened the kingdom. Conflict broke out in 507, and in the Battle of Vouillé near Poitiers the Visigothic army was defeated and the king killed. In the aftermath virtually all of the Visigothic kingdom in Gaul except for Septimania, the Mediterranean coastal region in the southwest, fell into the hands of the Franks and their Burgundian allies.

According to a sixth-century chronicle, probably compiled in Zaragoza, the Visigoths had been establishing settlements in Spain in the 490s. This may help explain the ease of their eviction from Gaul and lack of resistance. Even so, many Visigoths may have remained in Gaul and passed under Frankish rule, in due course losing their Gothic identity. The numbers of Visigoths in Spain may in consequence have been quite limited. The center of royal government was moved from Toulouse to Narbonne, but after another defeat at the hands of the Burgundians in 511, which led to the overthrow of Alaric II’s illegitimate son Gesalic (r. 507–511), it was transferred south of the Pyrenees to Barcelona.

The Visigothic kingdom was preserved at this point by the intervention of the powerful Ostrogothic ruler Theoderic the Great (ca. 454–526), whose kingdom in Italy dominated the western Mediterranean at this time. His armies intervened, and a regency was established for his infant grandson Amalaric, the son of Alaric II’s marriage to Theoderic the Great’s daughter Theodegotha. Little is recorded of this period of Ostrogothic domination, which remained centered on the northeast of Spain. Amalaric attained his majority in 526, the year of his grandfather’s death, but he was probably murdered by his own men in 531 after yet another humiliating defeat at the hands of the Franks. Power was then taken by Theudis, one of the Ostrogothic generals who had previously dominated the kingdom.

For much of the sixth century, a poorly documented period in the Iberian Peninsula, there seems to have been little integration between Hispano-Romans and Goths. On the other hand, prior to the 580s there is not much evidence of the kind of mutual intolerance that had marked some of the late fifth century, and the Catholic Church was able to hold a number of provincial synods under Theudis. The decline of the Frankish threat in the middle of the sixth century seems to have led to more interest being paid by the kings to affairs in the south. Under Theudis the Visigoths established an enclave in North Africa centered on Ceuta, but were expelled from this by imperial forces around the year 546. Theudis's successor, Theudisclus (r. 548–549), set up his court in Seville prior to his murder in an act of private vengeance.

The difficulties of what was still rule by an army of occupation are very apparent in the next reign, that of Agila (r. 549–554), who so offended the citizens of Córdoba that they successfully rebelled against him, defeated his army, and captured his treasure. Following this humiliation he was overthrown in a civil war with Athanagild (r. 554–568). One or other of the two, the sources being divided on this, appealed to the emperor Justinian (527–565) for help. The imperial forces took control of a strip of land along the southeastern coast and set up an administration in Cartagena. From this they were not finally expelled until 626. Athanagild began the process of trying to recover this territory, and it was continued by his successor Leovigild (r. 569–586). It was also Athanagild who first established the center of royal government at Toledo in the very middle of the peninsula. Leovigild followed him in this, and it remained the capital until the fall of the kingdom in 711.

Leovigild transformed the standing of the Visigothic monarchy by a series of campaigns in the 570s that ended the rebellion of Córdoba (572) and brought virtually all of the north of the peninsula under his control. This was completed by the conquest of the tiny Suevic kingdom in 584. In the meantime Leovigild had had to face new problems in the south, with the revolt of his son Hermenegild in Seville in 580. This was crushed in 583 to 584, and the military unification of the peninsula under the Visigothic monarchy was virtually complete by the time of Leovigild's death.

His son Reccared (r. 586–601) added a crucial new dimension to this by his personal conversion to Catholicism in 587, and the holding of the Third Council of Toledo in 589, which formalized the rejection of Arianism throughout the kingdom. In consequence, a unitary church emerged that proved the most enthusiastic supporter of the Visigothic monarchy. It also became possible for remaining cultural conflicts be-

tween the Roman and Germanic elements in the kingdom to be resolved, and by the late seventh century there existed a real possibility that a new common ethnic identity was coming into being that would embrace all of the inhabitants of the realm. Thus Hispania could have turned into Gothia in the way that Gaul became Francia/France.

Although the evidence relating to personalities and events in seventh-century Spain is very limited, it is clear that the kingdom continued to develop, despite occasional periods of political instability. Military threats from beyond the frontier became fewer, and in consequence the general preparedness of the army to face invasion from Africa in 711 by Arab and Berber forces was not great. At the same time it seems probable that a civil war was raging in consequence of the unexpected death of King Wittiza in 710 and the contested seizure of power by Roderic (r. 710–711). With the defeat of the latter by the Arabs under Tarif and the subsequent fall of Toledo, centralized resistance ended and the kingdom fell. Two last Visigothic kings, Achila (ca. 710–713) and Ardo (713–720), held out in Catalonia and Septimania until the Arab conquest of Spain was completed in 720. For all of its problems, though, the Visigothic period had created the idea of the unity of Spain, and many of the dominant features of its culture were revived in the Christian states in the north of the peninsula that emerged in the aftermath of the Arab conquest.

VISIGOTHIC KINGS

The institution of kingship was apparently unknown to the Visigoths prior to the election of Alaric in 395 as the leader of a large section of the people. The subsequent history of this group not only established the permanency of their separate ethnic identity, but also made the role of king central to their political organization. According to the historians—Roman in culture if not always in race—who wrote about the history of the people, Alaric and his family were Balts, descendants of a dominant lineage of the period prior to the Visigothic entry into the Roman Empire in 376. This

claim needs to be treated with caution. Even if true, Alaric I (r. 395–410) was succeeded by his brother-in-law Ataulph (r. 410–416), and his successors Wallia (r. 416–419) and Theoderic I (r. 419–451) may have had no family relationship with the previous kings.

This was a continuous theme in the history of Visigothic kingship. For whatever reasons the first king of a new royal line was chosen, it was rare that his heirs were able to retain the throne for more than two or three generations. Thus the line of Theoderic I died out with his great-grandsons Gesalic (r. 507–511) and Amalaric (r. 526–531). The next dynasty, that founded by Liuva I (r. 568–573) and his brother Leovigild (r. 569–586), expired in the third generation with Liuva II (r. 601–603). In the seventh century Sisebut (r. 612–621) and Chintila (r. 636–639) passed the throne to infant sons, who were deposed or killed very rapidly. More successful were those who associated their sons as joint rulers during their own reign, as did Chindasuinth (r. 642–653) and Egica (r. 687–702), but their dynasties extended no further.

The problem was not one of political instability, in that, apart from the years 710 to 711, changes of dynasty were accomplished by palace coup and were not accompanied by civil war. The issue seems more to have been one of credibility. From its inception Visigothic kingship was related to war leadership. Children could not exercise this, and in consequence they were vulnerable to deposition. Although it is often said that Visigothic kingship was elective, and a formal elective process appears to have been carried out to validate royal successions, in practice this was no more than a ritual, and was functionally similar to the electoral procedure followed in the consecration of late Roman and Byzantine emperors. The vested interests of the supporters of the previous ruler normally guaranteed the succession of his heir, but in the event of weakness being displayed, due either to incompetence or mere youth, the king's own backers might conspire to remove him, to prevent more fundamental threats developing from opposition groups. A confrontational change of ruler might affect the economic standing and status of a wide body of office holders.

On occasion, though, a regionally based challenge to the central authority might develop. Thus the successful revolt of Sisenand (r. 631–636) against Suinthila (r. 621–631) began on the northeastern frontiers. Count Paul of Narbonne attempted to do the same in 672 against Wamba (r. 672–680), who had been chosen king by the court nobility. In 710 or 711 Achila II (r. 710–713) had made himself master of the same region in opposition to the centrally chosen Roderic. Other such regional rebels are not recorded in literary sources, of which there are few, but are known of from

coins. Thus, a certain Ludila seems to have established a short-lived regime in Mérida and the South in the early 630s.

These coups and revolts have tended to make modern historians see the Visigothic kingdom as fundamentally unstable. However, far more striking is the fact that the kings preserved a unitary kingdom in the Iberian Peninsula from the sixth century to the Arab conquest. This is not true of the Franks, the Anglo-Saxons, or the Lombards. This achievement in forging and maintaining a politically united Hispania was unmatched in the West at this time. It also left an ideological legacy that later generations of Christian rulers in the Asturias, León, and Castile frequently attempted to manipulate.

The credit for much of this rests with the church. Following the Third Council of Toledo in 589, a relationship developed between the kings and the bishops that was unparalleled elsewhere in this period. A series of councils were held throughout the seventh century that dealt not only with matters of ecclesiastical observance and discipline, but also extended themselves into areas of government and law. In particular, a series of canons were issued by the Fifth (636) and Sixth (638) Councils of Toledo threatening the use of spiritual sanctions against those who plotted against the king, and also attempting to protect the interests of his supporters after his death. In practice, however, seizure of the throne by a coup, such as that of Chindasuinth in 642, did not lead to the threatened imposition of excommunication, as his success was proof of the new king's legitimacy and divine approval. Ecclesiastical censure was reserved for those who conspired and failed.

By the time of the Eighth Council of Toledo in 653 the church was going further by trying to mold the character of kingship and define the qualities needed in a ruler. The questions of legitimacy and opposition to regional attempts to subvert central authority were refined in the work of Bishop Julian of Toledo (680–690), who emphasized the need for formal procedures of investment, above all of anointing, to take place in Toledo. From the 680s until 710, succession was much more carefully managed within a framework of designation of the heir by the existing ruler and the formal preservation through intermarriage of dynastic continuity. This concern with consensus was disrupted by Roderic's seizure of power in defiance of the claims of his predecessor's family in 710.

It was also the church that developed and articulated the ideology of the *gens et patria* (people and homeland). This emphasis on the unity of the people and of the "country" underpinned the political reality of centralized rule of the kingdom on the part of the

Visigothic kings, and was intended to counteract the strongly centrifugal character of the society of the peninsula, which was the product of its geography and much of its history. In the upper levels of society at least a sense of common identity was actively being fostered at the time the kingdom came to its abrupt end.

A concomitant feature of this emphasis on unity centered on common adherence to the Catholic faith and a Gothic ethnic identity, and rule from Toledo by divinely selected kings was the rising persecution of the Jews in the kingdom. As religious uniformity was probably the strongest of the elements being used to express the unity and cultural cohesion of the kingdom, those who clearly could not conform in matters of faith also became subject to suspicion as to their political loyalty. Various kings attempted to remedy this, not always with the full support of the church. Sisebut (r. 612–621) attempted a conversion by force, which was deemed inappropriate. Conversion had to be genuine, though in practice later attempts at conversion were largely based on coercion and the imposition of legal liabilities on those who resisted. In the second half of the seventh century, kings and bishops came to doubt the genuineness of new converts' adherence to Christianity. What began as the persecution of a religion became increasingly that of a race. This culminated in the decree of King Egica (r. 687–702), enslaving most of the Jewish population of the kingdom. In part this measure may have been one prompted more by fiscal than by ideological motives. The enslaved Jews and what they themselves had owned became royal property.

The financial resources of the Visigothic monarchy may not have been sufficient for its needs at this time. Inadequate evidence survives relating to taxation in this period to make any firm pronouncements about it, but royal revenues may have derived primarily from land owned by the kings both by virtue of their office and by inheritance. A clear distinction was made in both secular and ecclesiastical legislation between royal lands and the family property of the king. The latter did not remain in the hands of the fisc after the ruler's death. Thus, nondynastic successions could present financial difficulties for a new ruler, and the solution was often the appropriation of the possessions of those who had supported the previous king. This certainly seems to have happened after Chindasuinth's seizure of power in 642.

Little is known about the mechanics of royal government, in that only a fragment of one document produced in a royal chancery has survived from the Visigothic kingdom. The existence in the major towns of royal officials, called counts, responsible for justice

and maintenance of local order is certain. Other royal appointees held the office of "duke." There may have been only one of these for each of the six provinces, and their responsibilities were primarily military. They probably commanded the levies raised from local landowners. The king himself was surrounded by a permanent armed following, his *Comitatus*, which provided the nucleus for the royal army. The probable death of the king, the destruction of his *Comitatus*, and the rapid seizure of Toledo—the ritual and administrative center of the kingdom—explain the fatal paralysis that affected Visigothic Spain after the victory of the Arab invaders over Roderic in 711.

VISIGOTHS

It is perhaps too easy to imagine the Visigoths as a unitary people, migrating over the course of half a millennium from an original home, located in the region of the southern Baltic, to a final one in the Iberian Peninsula. Older maps of the "Age of Migrations" link these two with a line of movement that takes the Visigoths from the Baltic to the steppes of southern Russia, across the Danube, around much of the Balkans, into and out of Italy, through France, and across the Pyrenees.

This implies a continuity in ethnic identity that is fallacious. Of the history of the already mixed body of population known up to the 370s as the *Theruingi* little is known, and that only from Roman sources. It is probably safer to say that a mixed confederacy of Germanic and Uralo-Altaic peoples established themselves in a region extending from the north shore of the Danube to the River Dneestr in the late third century. This lacked a unitary political structure, but the dominant cultural elements in it were of essentially Germanic origin. In the early 370s this society disintegrated, ostensibly as the result of attacks on it by the nomad confederacy of the Huns. This, though, should probably be seen as itself a symptom of significant ecological change in this region that made the maintenance of a settled agricultural economy less feasible.

In consequence, there occurred a large-scale movement of population out of this region and toward the frontier of the Roman Empire along the Danube. In 376 Emperor Valens (r. 364–378) permitted many of these refugees to enter the empire and settle themselves in the northeast of the Balkans. Ill-treatment at the hands of local Roman officials led to their revolt in 378, and the attempt by the government to suppress this led to disaster when the Roman army was defeated and Emperor Valens killed at the battle of Adrianople. The new emperor, Theodosius I (r. 379–395), who was of Spanish origin, was able to make a new agreement with the leaders of the rebels in 381, and for the rest of his reign they provided much of the military manpower that he used in his wars. In this period from 376 to 395 a new ethnic identity began to be forged, and the people thenceforth known as the Visigoths took shape. It was at this time that they converted as a group to Christianity, albeit of the then dominant Arian persuasion. With the death of Theodosius I a period of internal conflict and weakness developed in the empire, and a significant group of the Germanic soldiery united under the leadership of Alaric, the first king of

the Visigoths. His confederacy, which was drawn from people of a wide range of tribal origins, was Gothic in that this was its predominant cultural component. However, it is important to note that other elements of population of Gothic origin remained behind in the Balkans when Alaric led his confederacy into Italy in 408. This event and the movement of this body of people through Italy, into Gaul, in 412, briefly into Spain in 416 through 418, and its establishment by treaty in southern Aquitaine in 418 really marked the decisive points in turning what could have been a short-lived and shifting confederacy into a coherent and self-conscious ethnic entity.

W

WALLĀDAH BINT AL-MUSTAFKI

Wallādah, who lived in Córdoba in the eleventh century, was the daughter of Caliph Muḥammad al-Mustakfi. Her house was a meeting place for writers. She had a tempestuous relationship with the famous poet Ibn Zaydūn, who dedicated many of his poems to her. Wallādah accused him of sleeping both with her slave and his own secretary, a man by the name of ‘Ali. In turn, she had affairs with Muhya, a woman poet, and with the vizir. Her relationship with Ibn Zaydūn ended badly. Most of her nine extant poems are about him. Some are delicate love poems, such as: “Expect my visit at dusk, for I find that night is the best time to hide secrets. What I feel for you is such that by its side the sun would not shine, the moon would not rise and the stars would not begin their nocturnal journey.” Some are obscene satirical poems: “You are called the hexagonous, a name that will endure beyond your life: faggot, buggerer, philanderer, fucker, cuckold, thief.”

Although Wallādah’s lifestyle was unconventional, her poetry was not. In addition to panegyrical poems, a genre she seems not to have cultivated, satirical and love poems were very popular among the poets of al-Andalus. The works of women poets, for the most part, took the form of a dialogue with their male counterparts. In accordance with this fashion, Wallādah’s love and satirical poems consist of dialogues with Ibn Zaydūn. However, if she followed established genres, she did so with originality and flair. Wallādah held her own against the best male poets of her time. Indeed, she was considered brilliant.

It is said that Wallādah had the following two verses embroidered on her tunic: “By God, I was made for glory and I proudly follow my own path” and “I offer my cheek to whomever loves me and give a kiss to whomever desires me.” She seems to have followed her mottos, because she became a legendary poet and lover who has excited the imagination of readers for centuries.

WAMBA

Of Wamba’s origins and early career nothing is known. He was elected king by the members of the court nobility assembled at Gerticos following the death of Recesvinth in September 672, and it is probable that he was one of their number. He was faced with opposition in the provinces of Narbonensis and Tarraconensis following his consecration at Toledo, a Count Paul was proclaimed king in Narbonne. After a brief campaign against the Basques in the upper Ebro River valley, Wamba crossed the Pyrenees and crushed Paul’s revolt early in 673, capturing him at Nîmes. These early episodes are recorded in detail in Julian of Toledo’s *Historia Wambae*, but the rest of the reign is less well documented. Wamba annoyed the church by a policy of establishing new dioceses, including one in the suburbs of the capital city, but no criticism was voiced in the Eleventh Council of Toledo of November 675, the only one held during his rule. From the inscriptions recorded in the *Chronicle of 754* it is clear that the walls of Toledo were restored by Wamba in 675. Other signs of military activity come from the law in the *Forum iudicum* attributed to Wamba, which lays down penalties for landowners, lay and clerical, who fail to turn out for army service. In 680 the king fell so ill that his death seemed inevitable, and he therefore assumed a penitential state, but he subsequently recovered. Bishop Julian of Toledo, doubtless with the support of some of the nobility, insisted that by canon law he could not resume his secular office, and forced him to retire to a monastery. A conspiracy between Julian and the new king, Ervig (680–687), has sometimes been suggested, and the Asturian chronicles see the latter’s achievement of power as a usurpation. In the Roda version of the *Chronicle of Alfonso III*

Wamba, here said to be his uncle, is later made to advise King Egica to break free of his marriage to Ervig's daughter. However, it seems more probable that Wamba died before the holding of the Thirteenth Council of Toledo in November 683.

WEIGHTS AND MEASURES

The ancient Roman system of weights and measures was likely introduced into Spain following the conquest initiated in the third century B.C. This system evidently remained operative in the Romanized parts of the Iberian Peninsula during the Visigothic era. In book 16, chapters 25–26 of his *Etymologies*, Isidore of Seville (ca. 560–636) discussed weights and measures. To some extent his purpose seems that of the antiquarian but the general import of what he says leads one to conclude that the ancient system was still in use.

The basic Roman weight was the *libra* (.722 of a pound) consisting of twelve Roman ounces. The subdivisions of the *libra* were: *sescunx* (1/8), *sextans* (1/6), *quadrans* (1/4), *trieme* (1/3), *quincunx* (5/12), *semis* (1/2), *septunx* (7/12), *bes* (2/3), *dodrans* (3/4), *dextans* (5/6), and *deunx* (11/12). The Roman ounce (*uncia*), 1/12 of a *libra*, or .96 ounces, was divided into *semuncia* (1/2), *duella* (1/3), *siculum* (1/4), *miliarum* (1/5), *solidus* (1/6), *semi-sextula* (1/12), *scripulum* (1/24), *obolus* (1/48), and *siliqua* (1/144). Measures of volume or capacity were the *sextarius* of .53 liters and its subdivisions: *quartarius* (1/4), *acetabulum* (1/8), *ligula* (1/48), and *hemina* (1/2). Multiples of a *sextarius* were *congius* (6), *modius* (16), *urna* (24), and *amphora* (48). Isidore mentioned many but not all of the weights and measures given above. The foot (*pes*) as a measure of length equalled 11.64 inches and was subdivided as follows: digit (*digitus*), 1/16 of a Roman foot, or .73 inches; inch (*uncia*), 1/12 of a Roman foot, or .97 inches; palm (*palmus*), 1/4 of a Roman foot, or 2.9 inches; *palmipes* of 14.5 inches; cubit (*cubitum*) of 17.4 inches; step (*gradus*), 29 inches; pace (*passus*), 5 Roman feet, or 58 inches; rod or pole (*decempeda*), 10 Roman, or 9.7 English feet; stade (*stadium*), 625 Roman, or 604 English, feet; mile (*mille passus*), 1000 paces, or .918 of a mile.

A major change transpired as a consequence of the Islamic invasion of Spain in the eighth century. The system of weights and measures devised during

the first century of Islam was later imported into the peninsula. The standards for weight were the *ritl* (in Spanish, *arrelde*), or pound, consisting of 16 ounces (*ūkīya*). Multiples of the *ritl* were the *qintār* (in Spanish, *quintal*) of 100 pounds, and the *rub'* (in Spanish, *arroba*), a quarter of a *qintār*, or 25 pounds. Islamic sources do not always give the same values for each of these weights. For metals the weights were the *mith-qāl* for gold (4.72 grams) and the *dirham* for silver; the *qirat* (in Spanish, *quilate*), or carat, was half a *dirham*. Dry measures of volume or capacity were the *mudd* (in Latin, *modius*; in Spanish, *almud*) of 15 *ritl*; the *sa'*, a quadruple of a *mudd*; the *qafiz* (in Spanish, *cahiz*) consisting of 60 *ritl*, 18 *rub'*; the *fanika* (in Spanish, *fanega*) was half a *qafiz*. The *kada*, a measure for wheat, was 15 to 30 pounds depending on the region. Liquid measures were the *thumn*, 1/8 of a *rub'* or 2 *ritl*; the *kulla* was 12 *thumns*; the *kulaila*, a small jug of 112 ounces; *khabiya*, a jar of 20 *rub'*. Measures of length included: the *dhirā'*, or cubit, of .71 meters; *shibr* of 237 millimeters; *qabda*, or palm, of 79 millimeters; the *kala* was seven cubits; the *kasaba* was 4 cubits. Distances were calculated in terms of a day's journey or *marhala*, and the *mil*, or mile, of 3000 cubits. The usual agrarian measure was the *mardja'* (in Spanish, *marjal*) of 25 square cubits and the *zawrj* of 1000 square cubits. This system continued after the collapse of the caliphate through the years of the kingdom of Granada.

In the course of time the Arabic system was largely adopted in Christian Spain. The *fueros* (municipal codes) of the eleventh and twelfth centuries indicate acceptance of such Arabic terminology as *arroba*, *cafiz*, and *quintal*. At the assembly of Jerez in 1268 Alfonso X attempted to establish uniformity by identifying specific weights and measures. For wheat he required the use of the *cafiz* of Toledo (about 18 bushels), consisting of 12 *fanegas* (about 1.60 bushels); each *fanega* contained 12 *celemines*, each subdivided into 12 *cucharas*, or tablespoons. The *arrelde* of Burgos (4 pounds) could also be used as a dry measure. The measure for wine was the *moyo* of Seville (258 liters, or 2.2. barrels), divided into sixteen *cántaras* (each about 4 gallons). The standard for weights was the *marco alfonsí* of 8 ounces. Two *marcos* equaled a *libra*, or pound (16 ounces), 25 *libras* an *arroba*, and 4 *arrobas* a *quintal* (100 pounds). The measurement for cloth was the *vara* (about 2.8 feet). Copies of these weights and measures were sent to each town where municipal inspectors were required to see that honest and true standards were maintained and to fine violators (*Fuero Real*, 3, 10, 1; *Partidas*, 7, .7, 7).

The usual land measurement was the *yugada* (in Latin, *juger*), the area that a yoke of oxen could plow

in a day, or about 74 acres. In Andalusia vineyards, olive groves, and orchards were measured by the *aranzada*, about 1.23 acres.

Reiterating the need for uniformity, Alfonso XI laid down additional standards in the *Ordenamiento of Alcalá* (cap. 58) in 1348. He declared that coins should be weighed by the mark (*marco*) of Cologne (8 ounces). Other metals, liquids, and wool, sold by weight, should use the mark of Trier (8 ounces); 2 marcos equaled a libra; an arroba would be 25 libras; the quintal of oil in Seville would consist of 10 arrobas. Where the *arrelde* was in use, it would equal 4 libras. Wheat and wine and other things sold by measure would use the Toledan fanega (12 *celemines*) and the *cántara*, consisting of 8 *azumbres*. Cloth would be sold by the *vara*. At the close of the Middle Ages Fernando and Isabel once again required the use of uniform weights and measures.

WHITE COMPANIES

Known also as the Great Companies and the Free Companies, these bands of mercenary soldiers provided valuable and professional military assistance to feudal lords and kings in times of war and lived off plunder and pillage in times of peace. The earliest medieval form of these professional armies-for-hire made its appearance in the mid-twelfth century, when international armed groups were assembled to assist in the crusading effort in the Holy Land. In spite of official attempts to disband them once the period of useful service was over—including a formal papal sanction in the thirteenth century—they remained a serious threat to safety and public order.

The frequent wars of the fourteenth century, especially the protracted conflict between England and France known as the Hundred Years' War, revitalized Western Europe's mercenary armies; increased their importance, number, and size; and resulted in serious threats to the safety and stability of many regions. When a truce or peace rendered them unemployed, they supported themselves by theft and pillage, generally choosing their victims from a kingdom's prosperous centers.

When the companies that had fought for the French against the English and the Navarrese in the 1360s found themselves at liberty, they became a seri-

ous nuisance to French authorities. In 1364, Pope Urban V excommunicated them; they were encamped on the ramparts of Villeneuve-lès-Avignon, near the papal residence, and they were both intimidating and embarrassing. At the same time, a series of political and military conflicts evolving in the Iberian Peninsula created a need for their military services.

Pedro I of Castile (r. 1350–1369) was pursuing an ambitious territorial war against neighboring Aragón whose king, Pedro IV, was unable to stop him without outside military help. Pedro's domestic policies, moreover, had alienated an important sector of the Castilian aristocracy, and they rallied around the claims of Pedro's half-brother, Enrique de Trastámara, to the Castilian throne. Enrique needed military support to unseat Pedro and looked for it in France, first from King Jean II, and after 1364, from his successor, Charles V.

The international situation also contributed to the company's deployment in Spain. Pedro, in a departure from his father's policy of relative neutrality in the Hundred Years' War, had antagonized the French, defied the Avignon papacy, and leaned toward a military alliance with the English. Pedro was a danger to France, thus their willingness to help Enrique, whose efforts—begun in 1362—came to fruition in 1365. Pope Urban, King Charles, and King Pedro of Aragón agreed to finance the companies' intervention in Castile with the ostensive purpose of helping Enrique take the throne. The French entrusted the task of removing the soldiers from Avignon and preparing them to cross into Spain to the accomplished mercenary captain Bertrand du Guesclin.

The companies, some ten thousand strong, entered Castile from Navarre, after crossing Aragón. They were an international group made up of French, Italian, German, English, and Gascon soldiers including such renowned captains as Hugh Calveley, Matthew Gournay, and William Elmham. They succeeded in forcing Pedro out of Castile in 1366 and went back to France. Pedro returned to Castile, assisted by the Black Prince and an army that included many of the English and Gascon mercenaries who had fought earlier for Enrique. Pedro and the English won at the Battle of Nájera in 1367 and Enrique fled, returning the following year with a new contingent of troops led by du Guesclin. By then Pedro's alliance with the English had collapsed. At the Battle of Montiel in 1369, Enrique's side prevailed; he killed Pedro and ruled as the uncontested king of Castile until 1379.

The companies returned to France when hostilities between the English and the French broke out again in 1369. They remained a problem for the French crown until the middle of the fifteenth century, when most of the mercenaries were incorporated into the

royal military levy and the rest expelled from the country.

WINE AND WINE PRODUCTION

Now nearly extinct in their sylvan state, grapes (*vitis vinifera*) grew throughout the ancient Mediterranean. In Italy, grape vines were cultivated both in the north by the Etruscans and in the south by Greek colonists. The earliest known work on wine and agriculture was written in Punic. After the destruction of Carthage in 146 B.C., the Roman Senate decreed that this treatise be translated into Latin, and it subsequently became an important source for all Roman writing on viticulture. Cato's *De agri cultura*, the earliest surviving work in Latin prose, provides the first comprehensive survey of Roman viticulture. In it, he discusses the production of wine on large slave-operated villa estates, which suggests the importance of vine cultivation in an agrarian economy that traditionally had been one of subsistence farming. By 154 B.C., according to Pliny, wine production in Italy was unsurpassed. By the time Pliny wrote, Iberia had also become an important producer of wine in the Mediterranean. That same year, the cultivation of vines was prohibited beyond the Alps in order to protect Roman viticulture. In his *Republic*, Cicero states that the Roman Senate banned wine production in Iberia so as to improve the export potential of the Italian Peninsula. For the first two centuries B.C. wine was exported to the provinces, especially to Gaul, in exchange for slaves whose labor was needed to cultivate the large estate vineyards. In part, the wine trade with Gaul and Iberia was so extensive because its inhabitants, according to Pliny, were besotted by wine, which was drunk undiluted and without moderation.

Roman taste leaned toward *mulsum*, a weak beverage. *Mulsum* was a cheap Roman wine sweetened with honey that was often freely distributed to the plebs at public events to solicit political support. By the first century A.D. the domestic market for it had become so demanding, however, that wine again had to be imported from Iberia and Gaul. Galen, a physician at a gladiatorial school in Pergamum before becoming the personal physician of Marcus Aurelius in A.D. 169, commented upon the medicinal uses of wine. He said he had used wine to bathe the wounds of gladiators and mixed potions of wine and theriacs (drugs) to protect the emperor from poisons.

Cultivation of the *vinifera* grape in ancient times was probably first introduced into Iberia by the Greeks. Wine growing held little importance for the Romans during the early years of the Republic, since they were busy fighting to expand their domination of the Iberian Peninsula. By the middle of the second century B.C., however, Rome controlled the Mediterranean, and there was wealth to be had in vineyards and in the wine trade from the provinces. Roman authors praised the quality of Spanish wines, especially those of the Ebro River valley and the southern part of the peninsula known as *Betica*. Most vineyards there were situated near the sea coast or along navigable rivers to facilitate transportation of the grapes and the wine produced from them.

Since the earliest times, vines were pruned and tended, and the grapes harvested and brought in baskets to be trodden or crushed in the wine press, which the Romans had developed and which could produce a second, inferior run of must or juice from the dregs. The must then underwent fermentation and maturation. Weaker wines were aged in large clay containers partially buried in the ground. The more full-bodied wines were fermented in the open air to promote the oxidation characteristic of a mature wine. The wine was then racked either for storage, sometimes in a warm, smoky loft to promote aging; or for transport, usually by sea since it was cheaper to ship wine from one end of the Mediterranean to the other than to haul it even short distances overland. The daily drink in the *taberna* or tavern, was usually red wine not more than a year old, drawn from supplies stored in skins and drunk from earthenware mugs.

Wine almost always was mixed with water for drinking. Drinking undiluted wine was considered provincial and even barbarous. The Romans usually mixed one part wine to two parts water (sometimes hot or even salted with sea water). The Greeks tended to dilute their wine with three or four parts water, which they always mixed by adding the wine. Many of these practices persist in the Mediterranean into modern times. Distillation was unknown in the ancient world and would not be discovered until the early Middle Ages. In Iberia in the thirteenth century, the Catalan physician, intellectual, and alchemist Arnau de Villanova commented on the distillation of wine in a treatise he wrote on the subject of flavoring of *aqua vitae* with various herbs and spices. He especially praised the restorative and life-giving properties of libations derived from distilled wine. Ramón Llull likewise asserted their vitality and believed their production by distillation was a divinely inspired gift from Heaven.

The cultivation of grape vines during the High Middle Ages became a cornerstone of Iberian Christian

agricultural expansion into newly conquered territories. Their diffusion entailed a complicated interweaving of cultural, climatic, and economic processes. That the diffusion of the grape was intimately linked to that of monasticism is beyond doubt; the Benedictine rule specified that monks should drink approximately one liter of wine per day. During the Middle Ages, wine making was associated with practically all the monasteries of the Iberian Peninsula. In the Rioja region, for example, documents from the archives of San Millán de la Cogolla, San Martín de Albelda, San Prudencio de Monte Laturce, and other monastic houses, attest to the importance assigned to grape growing. Cultivation increased greatly during the high Middle Ages and plantings increased significantly with the gradual Christian conquest of the Muslim lands of the peninsula, although wine had been drunk and was sung about in Muslim Iberia from earliest times. Documentary references to vineyards in both La Rioja Alta and Baja abound from the second half of the eleventh century on. The cartularies make continuous references to specific vineyards and inventories, deeds of land, bequests, trades, and other transactions regarding wine.

One of the first monastic records to mention viticulture in the Iberian peninsula is the *Cartulario de Longares*, authorized by the Bishop of Nájera and the Prior and the monks of the Monastery of San Martín de Albelda in 1063. In it, the local population is obliged to dedicate two days per year to the monastery for the purpose of ploughing and tilling the land, pruning the vines, and harvesting the grapes. Additionally and in general, the transportation of grapes and wine to the lord's residence was a feudal obligation throughout Castile.

Some Castilian kings are known to have implemented sanctions to protect wine production. Sancho IV, his son, Fernando IV, and his grandson, Alfonso XI, for example, all forbade the importation of wine from Navarra and Álava. At one point, there were strong protests from the citizens of Vitoria who were enraged by the sight of carters transporting wine from Logroño. The sight of several of them was said to have provoked the angry protests of the citizens of Vitoria, who tore open the wineskins that were being transported and spilled their contents in the dust. Alarmed by the gravity of the offense, the town council of Logroño, petitioned help from the king in the form of a royal order that would suspend the actions of the offenders.

Until the end of the twelfth century, the growing demand for wine in Iberia resulted in the progressive conversion first of wasteland, then of cereal land, into vineyards. As grain production increased, the value of vineyards rose. Cultivation of grapes was especially

attractive to the small free proprietor, who could work a vineyard without recourse to a plow and sell any surplus, placing him in better position to maintain his freedom than the small cereal farmer, who was dependent on others for tools and milling. Grapes became commonplace all over Iberia. The standard references to *vineas* in lists of appurtenances, however, frequently refer to backyard vines rather than to medium- to large-scale agricultural operations involving commercial crops. Nevertheless, more and more land was changed over to grapevines, as demand rose. In Castile-León vineyards were probably converted primarily from cereal-producing land. In Catalonia, where extensive terracing was practiced from the tenth century on, vineyards tended to spread over hilly country at the expense of wasteland. Because of limited transportation, the scant commercialization in a society with virtually no towns, and the unwillingness of peasants to invest in vineyards too close to the frontier, grapes were grown in many places where their cultivation ceased after the crop was commercialized: throughout León, where grapes were the most important crop, despite the acidity of the soil; in the Arlanzón-Upper Ebro region of Old Castile, where it is now considered too high and too cold for grapes, but where in the High Middle Ages they were grown anyway; in Catalonia, in the Pyrenaic foothills of the Upper Segre, the valley of Ribes, and the plain of Cerdaña, where in defiance of natural conditions they were grown for three hundred years. The spread of grape cultivation in Upper Aragón in the eleventh century is of particular interest, especially in view of the marginal climatic and soil conditions there, but most especially because of the highly reputed wines produced in the neighboring Islamic kingdom centered in Huesca. It may well have been the case that although the Muslims grew grapes in great supply, they produced only enough wine for the local trade, responding to what must have been a lower per capita consumption than was current among Christians. The abundance of contracts for new vineyards in Aragón between 1150 and 1180 could only have meant that wine was being exported.

Contrary to what might be expected given the Qur'ānic prohibitions against the consumption of wine, the spread of Islam not only failed to eradicate the grapevine, but in fact increased its cultivation owing to the inventiveness of Islamic horticulture. In spite of indications in the literature of *Repartimiento* that grapes were not widely grown in certain areas of southern Iberia where vineyards later flourished—Seville, for example—the Arabic sources indicate that grape-growing, wine production, and wine drinking were widespread. Although one may assume that wine production was attuned to a certain degree to the needs

of the Christian and Jewish communities (in the time of al-Hakam I there was a state-operated wine market in the Secunda district of Córdoba, where many Christians lived), there was a tremendous market for grapes, raisins, and wine among Muslims as well. This is the result of Iraqi and not Christian influence. Abū Hanīfa's dictum declaring the legality of drinking date wine was extended by Andalusī jurists to include all wines. Widespread wine drinking was common during the wave of Iraqi cultural influence during the reign of 'Abd al-Rahmān II and was said to have been introduced by Ziryāb, the famous singer and arbiter of style who is credited with the invention of toothpaste. Al-Shaqundī reports that in Málaga the vineyards stretched on over the countryside, and that in Úbeda (a place not associated with Christian minorities) grapes abounded to the point where there was no market in them. A well-known Andalusī variety was the *qanbanī* grape of the Córdoba campiña, perhaps the most productive dry-farming area in the country.

WISDOM LITERATURE

Wisdom literature is the genre in Romance languages that gives advice on conduct in brief utterances (called *proverbios*, *exemplos*, *palabras*, *castigos*, *dichos*, *sentencias* and their cognates), paratactically arranged: the literal indicative *maxim* may be distinguished from the metaphorical *proverb* and the imperative *instruction*.

Ethos

Generally speaking, its ethos, like that of biblical wisdom and the *refranero*, is hardheaded and conservative, valuing silence and secrecy (*poridat*) over speech (typically hasty), testing over trusting, protecting over offering. Accordingly a strain of obscurantism is present. The quality it exalts is cunning (*buen/mucho seso*, *manera/maña*, *recabdo*), conceived of as a weapon of defense rather than offense, which heads a scale of values, with knowledge/learning in the middle rank and strength/riches/social status at the bottom: cunning is proof against fortune. Thus this is an intellectual, elitist, and ascetic genre. Revenge is positively pre-

sented, synonymous with righteous punishment. The attitude expressed toward flattery is ambiguous: it is recommended as preferable to force, but in others is regarded with suspicion.

Style

The corpus uses all the rhetorical figures of brevity (sometimes verging on the enigmatic) and certain forms typical of international aphoristic style (antithesis, paradox, "A better than B"). The choice of images is consistent within the corpus: wisdom is praised in luminous, medical, and architectural terms (wisdom is the cure, sin/folly the sickness; it is a wall, a fortification, a pillar, and a foundation); cause and effect are rendered by vegetable (root and branch, fruit) and spatial (road) images.

Sources

Its sources in the Iberian Peninsula are four.

ARABIC

Two translations of Arabic collections that derive from ancient Greek collections, possibly via Byzantine redactions: the *Libro de los buenos proverbios*, from the *Kitāb adab al-falāsifa* of Hunayn ibn Ishaq (809–873), and *Bocados de oro*, from the *Mukhtar al-hikam* (ca. 1048–1049) of Abū-al-Wafā' al-Mubashshir ibn Fatik. Although their Arabic originals are cited by Jewish writers in twelfth-century Aragón, *Buenos proverbios* and *Bocados* make their first Spanish appearance at the court of Alfonso X around 1260; they are then used in texts emanating from Castilian court circles: the work of Juan Manuel and the *Libro del consejo* by a "Maestre Pedro," probably Pedro Gómez Barroso.

In Catalonia, prose works such as Jafuda Bonsenyor's *Llibre de paraules e dits de savis e filosofes* (also available in Spanish translation in the *Cancionero de Ixar*), commissioned by Jaime II (r. 1291–1327), and the *Llibre de saviesa*, commissioned by a King Jaime (probably, Jaime II), are related to *Bocados* and *Buenos proverbios/Poridat*, respectively: but whether the Catalan texts use the Arabic directly and whether they influence or are influenced by the Castilian is unclear.

Also translated from Arabic is the *Historia de la Donzella Teodor*, a battle of wits in which the wise maiden confounds a team of male antagonists. (The Portuguese translations of the seventeenth and eighteenth centuries are a rare example of wisdom literature in Portugal.) The Catalan and Latin text "Ex proverbii Arabum" (Tarragona, Biblioteca Pública, MS Santes Creus 108 [olim 201], ff. 107–117) includes some material of Oriental origin.

The *Libro de los doze sabios* (c. 1327) and *Flores de filosofía* (the only clue to its origin is its use in Zifar, III) are probably modeled on *Buenos proverbios* or *Bocados* rather than translated from lost Arabic sources.

CLASSICAL

The earliest Hispanic sapiential text to draw, albeit indirectly, on classical Latin material seems to be *Rams de flors*, commissioned by Juan Fernández de Heredia (1310–1396): its main source is a Catalan John of Wales.

The *Dichos de sabios e philosophos*, translated from a lost Catalan original in 1407 by Jacob Zadique de Uclés, is unusual in the Castilian corpus in that it uses classical sources (doubtless via florilegia) in broadly equal proportions with biblical matter: in this respect it shows its Catalan origins.

The fifteenth century sees translations from preexisting Latin florilegia. The *Proverbios de Séneca* were translated and glossed by Pedro Díaz de Toledo for Juan II. The fragmentary Portuguese Ps-Seneca, *Liber de moribus* and *Formula vitae honestae* (Braga, Arquivo Distrital, Pasta de Fragmentos [olim Caixa 287], n. 1]), is the only known vernacular Old Portuguese wisdom text. The *De vita et moribus antiquorum philosophorum* of Walter Burley (1275–1345?) in its Spanish version (not later than 1435) provided the prose sayings with which Santillana precedes his verse *Bias contra Fortuna* (ca. 1448). The *Floresta de los philosophos* (not before 1448), probably prepared for Fernán Pérez de Guzmán (d. 1460?), is abstracted entirely from vernacular versions. The *Dichos de Quinto Curcio*, attributed to Alfonso de Cartagena, may well have been translated from a Latin epitome.

BIBLICAL

Old Testament wisdom contributed the model for fatherly advice, as in the *Proverbis* (ca. 1180) of Cerverí de Girona, alias Guillem de Cervera, and Santillana's *Proverbios* (ca. 1437); Hebrew parallelism was not widely imitated. The most biblical of the Old Spanish corpus, in style and imagery, are the verse *Proverbios morales* of Santob de Carrión. Some biblical material is interpolated in *Buenos Proverbios* in MS Escorial h-III-1, f. 129. The verse *Proverbios de Salomón* and prose *Proverbis de Salamo* seem not to be drawn in full from the Bible.

The aphoristic works of Ramon Llull in Catalan and Latin, although they have no identified source, belong in the tradition of scripture-based ascetic florilegia typified by the *Sententiae*, alias *De summo bono*, of St. Isidore.

MEDIEVAL LATIN AND VERNACULAR

Castilian and Catalan (but apparently not Portuguese) also have their own translations of texts that were known throughout Europe: the Latin *Distichs of Cato* (a major source for Cerverí; several independent versions), the *Dialogue of Secundus and the Emperor Hadrian*, the Western counterpart of *Donzella Teodor* (one Castilian version was translated for Alfonso X from Vincent of Beauvais), *The Letter of Saint Bernard on the Care of the Household*, and the Italian *Fiori di virtù*. (There seems to be no Hispanic version of the Latin *Dialog of Solomon and Marcolf*.)

Arrangement

Bocados, *Buenos proverbios*, and *Bias* (following their sources) frame their aphorisms in the exemplary biographies of the sages (a Greek format). Thus contextualized, the occasional judgments and *obiter dicta* may characterize the sardonic, often crankily misogynistic and wisecracking sage. (The individualistic sage, pronouncer of practical rules, should be distinguished from the systematic philosopher who writes and founds a school: see Augustine, *The City of God*, VIII:2.) The contest of wits similarly forms the structure of *Teodor* and *Secundus*.

Floresta de philosophos, like many Latin compilations, follows the text order of its sources.

The predominant arrangement is by topic (Cerverí, *Libro del consejo*, Bonsenyor, *Flores*, Zadique de Uclés, Santillana): this is symptomatic of medieval mental schemata (virtues and vices, etc.) rather than an indication that these are reference tools.

Transmission

The most influential texts were *Bocados* and *Buenos proverbios* (fourteen and eight extant manuscripts, respectively): their utilization by authors up to the fifteenth century constitutes a rare example of a continuous vernacular prose tradition. (There are twelve extant manuscripts of the Latin translation of *Bocados* attributed to Giovanni da Procida.) Stylistic development is small or nil, largely because the rhetorical repertoire of wisdom is rigid between cultures and ages. In content, a tendency away from cynicism toward idealism may be detected. The medieval texts vary considerably in their periods of survival: leaving aside modern scholarly editions, some, like *Flores* or *Buenos proverbios*, were never printed; some made little incursion into the sixteenth century (*Bias* last printed 1511, in chapbook form); some were in print up to the end of the sixteenth century but not beyond (*Bocados*, ca. 1550; Santillana's *Proverbios*, 1594). Exceptionally, *Donzella Teodor* is found as a chapbook as late as the

nineteenth century; an edition of 1833 was the basis for a number of translations into Mayan.

WITCHCRAFT

Witchcraft, like magic, is concerned with producing effects beyond the natural powers of human beings. Witchcraft, however, is distinguished from magic by the idea of a diabolical pact or at least an appeal to the intervention of evil spirits in order to produce these effects. In such cases, supernatural aid is usually invoked either to effect someone's death, awaken passion and desire in others, call up the dead, or bring calamity or impotence upon enemies, rivals, and oppressors. In traditional belief, witches or wizards who pursued these practices entered into a pact with Satan, renounced Christ and the Sacraments, observed "the witches' sabbath"—performing rites that often parody the mass or the offices of the church—or paid homage to the devil. In return, they received preternatural powers from the Prince of Darkness, such as the ability to leave their bodies and move through the air, transporting themselves magically over great distances in short periods of time, assuming different shapes at will, and tormenting chosen victims. Often an imp or "familiar spirit" was placed at the witch's disposal, able and willing to perform any service that might be needed to further the witch's nefarious purposes.

Belief in witchcraft and its practice has existed since the earliest recorded history. Since ancient Egypt and Babylon it has played a conspicuous part in the history of human spirituality. References to witchcraft in Scripture are frequent and usually in the form of proscriptions. It is strongly condemned in both the Old and New Testament (Exod. 22:18; Lev. 20:27; Deut.

18:11–12; Kings 28; Acts 8:9; 13:6; Gal. 5:20; and Apoc. 21:8; 22:15). Roman Imperial law also assumed the reality of magical powers, and Horace's frequent references to Canidia, the sorceress, permit us to see the fear witches could inspire in ancient Rome. Under the empire in the third century the punishment of burning alive was prescribed by the state for witches who plotted another person's death through enchantment. Early church legislation followed much the same course. In the Iberian Peninsula, as early as the Council of Elvira (306), the withholding of last holy communion was prescribed for anyone who had killed by spell (*per maleficium*) and adds that such a crime could not be committed "without idolatry," which implies without the aid of some material artifice or malevolent intervention, since devil worship and idolatry were considered synonymous. Later, during the reign of the Visigothic king Chindaswinth the law code known as the *Fuero juzgo* records several statutes that proscribe all practitioners of magic, including diviners, fortune-tellers, enchanter, and those who give poisons and herbs to others. It goes on to condemn those who use written or verbal spells and disturb minds by invoking the devil, and to denounce sorcerers and rainmakers who ruin the crops by means of curses and nocturnal sacrifices to the "evil one." Beyond these specific references, the early documentation for Iberia remains scant, although several practices and beliefs in Galicia and the Basque country, which have survived into the current day through folklore, must have existed in the Middle Ages as well. We know from other more copious sources, however, that witches abounded all over Europe in the high and low Middle Ages, especially in neighboring Gaul, where Charlemagne urged his subjects to forsake their superstitious beliefs and condemned all kinds of witchcraft. Later, Ivon of Chartres incorporated a canon against witches from the Council of Ancyra into his collection that can also be found in the *Decretum* of Gratian, a major legal authority for all of Christendom, while allusions to witchcraft can also be found in Vincent of Beauvais's *Speculum Morale*, and other works.

By the thirteenth century, among the heretical Cathars in the Rousillon, who had close ties to Catalonia and the Iberian Levant, we find the most reliable documents concerning witchcraft for this period. The Cathar's dualistic beliefs were instrumental in the development of the Inquisition and inquisitorial ideas about witchcraft, and they led to the crusade against the Albigensians (the group of Cathars centered at Albi). In their interrogations, the inquisitors outline the dualism of Albigensianism in such a way that its practitioners would today doubtless be referred to as sorcerers and witches. At any rate it was at Toulouse, a hotbed of Catharism, that in 1275 the earliest example of a witch

burned to death after judicial sentence of an inquisitor is found. The woman had confessed to having given birth to a monster after intercourse with an evil spirit and to having nourished it with babies' flesh she procured during nocturnal expeditions. The possibility of carnal intercourse between human beings and demons was accepted by some of the great schoolmen of the age, St. Thomas Aquinas and St. Bonaventure among them.

In Iberia proper, Gonzalo de Berceo, a cleric at San Millán de la Cogolla in La Rioja, told the tale of Theophilus in his *Milagros de Nuestra Señora*, in which he relates how this character had a nocturnal encounter with the devil at a crossroads and entered into a pact with him and the *uest antigua*, (the host of the damned) to sell his soul. At about the same time, the *Fuero of Cuenca* states categorically that "a woman who is a witch or a sorceress shall either be burnt or saved by iron." Other legal documents of the thirteenth century show that enchantment practiced with good intentions could be considered respectable and even praiseworthy. This was the view of Alfonso X, who outlined the case for so-called white magic in his *Siete Partidas* just as he condemns and defines the black arts and its practitioners: "los que encantan los espíritus malos e hacen imágenes y otros echizos, o dan hierbas para enamoramiento de los ombres y de las mugeres," ["those who invoke bad spirits and make images and other talismans, or give herbs as love potions to men and women"].

By 1334 there was a large-scale witch trial carried out at Toulouse in which eight out of sixty-three persons accused of offenses were handed over to the secular arm to be burned and the rest were imprisoned either for long terms or life. Two of the condemned, both elderly women, after repeated torture, confessed that they had attended witches' sabbaths, worshiped the devil, had been guilty of indecencies with him and other persons present, and had eaten the flesh of infants whom they had carried off by night from their nurses. Later, the Catalan Dominican, Nicolas Eymerich (1320–1399) points to the existence of three types of witchcraft in his *Directorium inquisitorium* (ca. 1376): (1) Consorting with the devil; (2) devil worship without direct association; and (3) those who conjure the devil to assist them with malevolent plots and transformations. Shortly thereafter, in the first part of the fifteenth century, the polymath and intellectual, Enrique de Villena (1384–1434), was reputed to be a sorcerer on the basis of his interest in science and the preternatural. After his death, Juan II of Castile ordered Villena's confessor, Fray Lope de Barrientos, to burn Villena's library. Barrientos, who was not averse to Villena's interests, put the library to good use composing his *Tractado de especies y adivinanzas*.

By the end of the fifteenth century charges of witchcraft were often entertained by the Inquisition in Castile and Aragón in innumerable depositions, documents, and trials. However, it is a fictional character, Celestina, the main protagonist of the work of the same name by Fernando de Rojas (1499), who perhaps best exemplifies witchcraft in late medieval Iberia. She is an aged former prostitute whose beauty is spent and in later years has become a procuress. She oversees a small brothel in her home, watches over more exclusive courtesans, consorts with pimps, and makes cosmetics, perfumes, and other potions and philters in a laboratory in her attic, as well as practices minor surgery restoring lost maidenheads. Most importantly, she engages in erotic sorcery and conjures the devil through talismans to assist her in conquering others' objects of desire. While Celestina is a character from fiction, legal and inquisitorial documents from Toledo, Salamanca, and Seville from the period in which the work was first published show she was close to the real thing.

In conclusion, the evidence points to a sustained belief in Iberia and neighboring kingdoms during the Middle Ages that certain individuals, mostly women, could change themselves and others at will into animals; that they could fly through the air and enter secret places by leaving their body behind; that they could cast spells and make potions to inspire hate or desire in others; that they could conjure up storms, illnesses in humans and animals, and strike fear into enemies or mock them by playing terrifying jokes upon them.

WOMEN

Despite the Christian Church's assertion that a woman's claim to eternal salvation was the same as any man's, on earth women were nevertheless not considered equals. In medieval Iberia, their subordinate status

is respected throughout the law codes of the different centuries and gave rise to laws clearly prejudicial to women.

In practical terms, women were nevertheless expected to be as strong and responsible as men. Men were the family members most often absent from the home and the nation. Women, especially wives, while physically less mobile, were capable of assuming continuous supervision over the family's possessions. In medieval Spain, women formed, along with the clerics, the more stable element of society, usually remaining behind to deal with, and bear responsibility for, the running of everyday life. Women administered estates, thereby allowing men the freedom, or obligation, to wage war; they raised children; cared for the sick and the destitute; and practiced crafts that helped keep the towns alive as centers of trade and commerce. Secure in the knowledge that they were in fact a much needed and appreciated segment of society, the somewhat destructive image of women left to literature was, no doubt, of little importance to women in the Middle Ages. They were not too concerned about the apparent inequalities of the law and the transparency of church dogma versus practice. They were too busy surviving.

As in all societies, every child born into the medieval world, aristocrat or peasant, male or female, Christian, Jew, or Muslim, received some form of instruction. In a threatened civilization, such as in medieval Spain, it was vital not only to maintain biological reproduction to assure physical survival but also to ensure cultural continuity. Each civilization and generation has to transmit its cultural identity to its young.

There were varying attitudes toward the formal education of women in medieval Europe. The *Siete Partidas* are quite clear in this regard, stating that girls be taught to read, to pray, and to sew. Early in life, the children of the nobility were put into the care of a tutor or governess after leaving the wet nurse. Approximately the first seven years of a boy's life were spent with women. Much attention was given to the choosing of a tutor for he would form and educate the boy, being his constant companion and adviser. No such requirements or guidance is given for the choice of a governess for a female child. Young noblewomen lived isolated from society, protected from the sight and sound of social evils. When the husband's duties called him away, the management of both the inner and outer economy of the estate fell to the wife. Herlihy has shown that in Spain between 700 and 1200, in comparison with the rest of Europe, a higher percentage of women and their heirs appear on documents as contiguous owners of land. Similarly, there is a higher percentage of women shown as principal alienators—donors or sellers—of land. This is no doubt

due to the continued use in Spain of Visigothic laws and customs that permitted women—in contrast to the rest of Europe—to own land and to hold land for their minor children in their own names. It is also possible that, due to the husband's frequently long absences, and to avoid confusion and complication, conjugal lands were recorded in the wife's name only. Because a large part of the lands were sold or given to monasteries, this is also possibly indicative of more piety and generosity toward churches on the part of women in Spain.

The Arabs in Spain had schools for girls as well as for boys, with male and female teachers. The only limitation put upon female teachers was that they should be unmarried or, if married, be past the age of childbearing and rearing, such that they could be entirely dedicated to their students. The *Siete Partidas* contain many laws referring to instructors, schoolboys, and their studies, but there is not one reference to the presence of women as teachers or pupils. This is not to say that women were uneducated, or that they did not act as teachers. Queen Berenguela is referred to as the educating queen, since she taught not only her son Fernando III, but also her grandson Alfonso X. Alfonso X in fact had two other tutors, García Fernández de Villademiro and his wife, María Arias. Most girls did not attend any kind of organized school; they were brought up at home, with a neighbor or relative. In fact, the extension of schooling for girls would not become common until the late eighteenth and early nineteenth centuries.

Women were not prevented in the Middle Ages from acting in a "masculine" fashion. Virility, in fact, was considered by many to be an enviable quality in a woman. All medieval women worked. Most women wove all the fabrics necessary to their households. Weaving was considered a very worthy occupation, even for the upper classes. Some wives living in a city helped their husbands sell goods at the markets and fairs, while others helped run shops. A literate wife was an essential asset to a merchant family, for the nascent capitalism of the Middle Ages could not afford to neglect the resources these capable women offered. In their husbands' absences, wives often ran family businesses, acting as agents. Others worked with their spouses as partners. Indeed, some women were trained by their fathers or husbands and themselves specialized in certain crafts. If the head of a family died prematurely, so as to guarantee the possession of the business to his heirs and to prevent a possibly tragic financial situation, women were allowed by the guilds to continue in their husbands' trade. They were given most of the prerogatives of master craftsmen. Most occupations open to women dealt with the cloth trade, clothing, jewelry, food preparation, and brewing. Usually

working women founded their own all-women guilds. Before the thirteenth century, unmarried women could not become master craftsmen. After this time, provided they were over twenty years of age and had opened a shop or had the funds to do so, they were granted the privileges of a master and were allowed to hire journeymen and train apprentices. Peasant women worked in the fields beside their men. Like all working people in the Middle Ages, their lives were not idyllic; because they were vulnerable, women were perhaps exposed to more oppression than men.

For some children, religious vocation offered the chance to follow in paths quite different from those of their parents. The choice, though, was not always made by the child concerned. Technically, the practice of oblation became illegal in 1216. Nevertheless, in Spain children were put into convents, against their will at times, well before the mandatory age of fifteen. Monasteries were not only havens for those seeking to glorify God, but, not surprisingly, also served as places where parents could rid themselves of a crippled or burdensome child. The monastic ranks were replenished increasingly, not by individuals seeking perfection but by parents seeking a temporal vocation—similar to an apprenticeship—for their children. The incidence of religious calling among upper class women must have been quite high. Because girls were normally married at the age of fifteen or sixteen and widows were expected to remarry without undue delay, an unmarried woman was considered an anomaly in secular noble society. Great families felt bound to make provisions for girls unable or unwilling to marry and for those widows with important connections and an established place in society who could not be coerced into disposing of themselves and their property otherwise than as they wished. The convent served this purpose. This same refuge was sought by women whose marriages had been annulled and by repudiated wives. Convents then were apt to be exclusive, housing ladies and the daughters of the rich bourgeoisie. The poor and the low-born lived in the convents as servants. Unmarriageable rich girls were unproductive within their society and could easily be unburdened on convents, which required less dowry than a husband of their class. Poor girls, if unmarried, were still productive. They could stay at home and work in their brothers' homes and fields, or they could work outside the home as a domestic servant or in a trade. Convents also housed political prisoners, criminals, adulterous wives, unwanted mistresses, troublesome sisters, and the illegitimate offspring of nobles.

In the Middle Ages, one function that the monasteries and convents assumed was the operation of hospitals for the sick, the poor, the aged, and the destitute. Alfonso VIII of Castile recognized this need and

founded such a hospital in Burgos. The women and men who cared for the sick there were probably nuns and monks from the nearby monastery as well as lay people. Working in a hospital must have been considered a form of penance for both lay and religious people. Many of the donations received by the religious orders were given with the proviso that the donor be cared for in old age. Before the separation of the sexes in the monasteries, elderly couples could both enter, either to care for the sick or to be cared for. Those with money received better treatment in the monasteries; those without means were given as much as possible in the hospitals. It would appear that these hospitals not only cared for the transients who became ill and for the chronically ill, but also for the majority of those rejected by society.

Women kept busy in many other walks of life. Certain "occupations" were not considered legitimate for men or for women. Minstrels, publicans, hagglers, and procuresses were considered *viles*. Some law codes demanded that female practitioners of certain "professions," such as herbalists, witches, and go-betweens, be burnt at the stake. There must have been a considerable number of these adventurers, both male and female, wandering the roads of the Iberian Peninsula, living off their wits, charity, or crime.

Abandoned or impoverished women formed the most vulnerable segment of society. These included women with or without children, family, or relatives willing to lodge and feed them; those unable to exercise a craft or art; and those ineligible or unwilling to enter a convent. In an effort to survive, many of these unfortunates became prostitutes.

As full participants, medieval women were expected and trained to be useful in the development of their society. Whether managerial, practical, or servile, their contributions were essential to the medieval world. In the castles, monasteries, shops, and fields of medieval Spain, women worked beside their men as equal partners.

WULFILA, BISHOP

Wulfila, or Ulfilas, was of mixed Gothic and Roman parentage, his grandparents on his mother's side being inhabitants of Cappadocia who were taken captive by the Goths in about A.D. 264. (He himself was born

around the year 311.) He seems to have been one of a small number of Christians among the Goths in the early fourth century, and he devoted himself to evangelizing his people. In the early 340s he was made a bishop while on a mission to Constantinople, but was forced to flee to the Roman Empire in 348, when Athanaric began a persecution of Gothic Christians. He and other Gothic Christians were settled by Constantius II (r. 337–361) in the province of Moesia. Wulfila ruled this community as both bishop and political leader until his death in Constantinople, probably in 382. As during this period Arian theology was dominant in the imperial court and in many parts of the empire, it was this that Wulfila taught, and this contributed to the Visigoths accepting this form of Christian belief and converting *en masse* around the time of their entry into the empire in 376. At some unspecified stage in his

career Wulfila translated a Greek version of the Gospels into Gothic. This is not preserved in full, in that the only substantial manuscript of the Gothic Gospels, the sixth-century *Codex Argenteus*, shows the influence on it of subsequent revisions based on Latin texts of the Bible. Gothic versions of the Epistles and of all or parts of the Old Testament are known only from fragments, but were probably not written before the fifth century.

Y

YEHUDA HA-LEVI

Yehuda (Judah) ḥa-Levī (ca. 1075–1141), a physician and theologian, was chronologically the last of the four luminaries of the Andalusian school of Hebrew poets. He immigrated to al-Andalus from Christian Spain while a young man, but also spent considerable time in Toledo and in other towns along the fluctuating border between Islam and Christendom. Ḥa-Levī's brilliance as a lyric poet won him the acclaim and envy of Jewish literary intellectuals. By midlife he had become a highly respected communal leader. But after a glorious career as the darling of Jewish courtly society, Ḥa-Levī spent the last fifteen years of his life attempting to turn his back upon the culture and society that had nourished him. He began to formulate a plan to abandon Spain for a life of religious devotion in Palestine. After years of hesitation, and apparently against the counsel of his circle of friends, Ḥa-Levī finally set sail for Egypt in 1140, en route to Palestine, where he disembarked in 1141. He died shortly thereafter.

Ḥa-Levī's contribution to medieval Jewish religious thought is known as *The Kuzari*. This book of apologetics, the product of many years of work, underwent several revisions before its completion on the eve of Ḥa-Levī's departure for the East. Written for Jewish doubters, *The Kuzari* is the classic medieval defense of rabbinic Judaism against Christianity, Islam, Karaite Judaism, and, in particular, the Aristotelian philosophy that came into vogue in twelfth-century Muslim Spain. Constructed as a series of dialogues between a pagan king-turned-generic monotheist and representatives of philosophy, Christianity, Islam, and Judaism, *The Kuzari* endeavors to explain the apparent contradiction between the sociopolitical reality of the twelfth century and the claim of Judaism to be the supreme faith.

An unmistakable voice, a unique lyric sensibility, and vivid imagery characterize Ḥa-Levī's secular and liturgical verse. His masterful employment of quantitative meters to achieve poetic effects and his skill in cultivating the *muwashshah* form earned him the repu-

tation as the most gifted and adept poet of his age. Furthermore, Ḥa-Levī created new genres of Hebrew poetry and transfigured conventional motifs with his cycles of "sea poems" and "Zion poems." Early in his career he seemingly perfected the art of translating the worldly values of Andalusian courtly society into words of Hebrew poetry. Later, Hebrew verse became a vehicle for the expression of the poet's devotional longings and his religious disdain for Andalusian Jewish culture and society. The expressiveness and innovative content of Ḥa-Levī's poetry signal the beginnings of a break with many of the conventions of courtly tradition and the transition to the post-Andalusian age of Hispano-Hebrew poetry.

YOSEF BEN MEIR IBN ZABARA

Yosef (Joseph) ibn Zabara (born ca. 1140) was a physician, Hebrew literary intellectual, and Jewish communal notable active in twelfth-century Barcelona. Little else is known about Ibn Zabara's life. He is principally known as the author of *The Book of Delight* (in Hebrew, *Sefer sha'ashu'im*), an artful and engaging book-length fantasy of self-discovery. In *The Book of Delight* a mysterious stranger lures Ibn Zabara's persona into traveling with him to distant and exotic lands. Along the way Yosef and the stranger experience unusual adventures and become locked in a battle of wisdom, wits, and will. They exchange information on an array of humanistic and scientific topics and entertain and test one another with countless poems, stories,

anecdotes, parables, and maxims. At the end of their journey it becomes clear that the protagonist-stranger is actually Yosef's alter ego, with whom he must come to terms in order to return to his former life and station. There is some evidence to suggest that the idea for the story may have been based upon an event in Ibn Zabara's life.

Written in rhymed prose and interspersed with lines of poetry that enrich the narrative in various ways, *The Book of Delight* otherwise bears only the most superficial resemblance to Arabic and Hebrew *maqāma* literature. *The Book of Delight*'s frequent and extensive digressions and its incorporation of abundant miscellaneous scientific and literary material, much of it drawn from the corpus of international lore, on a wide array of subjects recalls the style of Arabic courtly prose literature (*adab*). On account of its rich and carefully plotted imaginative structure as well as its artistic quality, *The Book of Delight* stands out as a unique text in Hispano-Hebrew literary history.

Apart from *The Book of Delight*, Ibn Zabara appears to have authored several devotional poems and one or more works on medical topics. Since he is mentioned in a biblical commentary by the Narbonese exegete Joseph Qimhi, Ibn Zabara may have engaged in exegetical research as was common among Hispano-Hebrew literary intellectuals.

YSOPETE YSTORIADO

The earliest extant collections of Aesopic tales are in Latin verse (Phaedrus, 18 B.C.–A.D. 54), and in Greek

prose (Babrius, first century A.D.). A series of recensions in Greek prose (Augustana) dating from the ninth century were printed by Bonius Accursius in 1474. The Accursian fable collection, sometimes also called the *Planudean* for Maximus Planudes (1260–1330), author of a Greek life of Aesop, were the source for Rinuccio Arezzo's (1380–1459) Latin translation of the folk biography and the tales. Relying on Rinuccio, Heinrich Steinhöwel prepared the first modern vernacular version, a German/Latin edition (Ulm, 1474). Translations based on Steinhöwel subsequently appeared in western Europe: Julien Macho (1480), William Caxton (1483), and three anonymous Spanish translations (Burgos, 1488; Zaragoza, 1489; Toulouse, 1496). Two Italian translations relied directly on Rinuccio: Francesco del Tuppo (1485), and Accio Zucco (manuscript, 1462; sixteen printed editions, 1479–1566).

The Spanish translations begin with the *Vida de Ysopo*, a folk narrative with ancient tales about the Babylonian Ahikar, the biblical Akyrios, and the Islamic Loqman that had adhered to the persona of Aesop, who was the prototypical clever slave. The first eighty tales, divided into four books, are based on medieval collections attributed to a fictional Romulus; seventeen tales thought to be Aesopic *Extravagantes*; seventeen attributed to Rinuccio (Remicio); twenty-seven from Avianus (end of fourth century, beginning of fifth); *Fábulas colectas* with fourteen tales from Petrus Alphonsi, eleven from Poggio Bracciolini (1488 edition). The 1489 and 1496 editions eliminate three Poggian tales; 1496 adds three from *Calila e Dimna*.

ZALLĀQAH, BATTLE OF

The opening engagement of a sixty-year-long struggle between León-Castile and the North African Berber Empire of the Almoravids for dominance in the Iberian Peninsula. It was fought on 23 October, 1086, on the plain north of Badajoz in that *tā'ifa* between the armies of the Almoravids commanded by the emir, Yūsuf ibn Tashf'in, and those of León-Castile led by its king, Alfonso VI. The Berber leader had the assistance of his Andalusian allies, chiefly the *tawā'if* of Seville, Málaga, Granada, Badajoz, and Murcia. Alfonso VI was assisted by a contingent from the kingdom of Aragón.

The battle lasted most of the day and both sides employed what were to remain their ordinary tactics. The Christians took the offensive with a frontal charge of heavy cavalry that failed to break the Muslim line of battle. The Muslims then began an attempt to envelop the Christian force, employing their superior numbers. Alfonso VI managed to fight free with a portion of his cavalry but his camp, foot soldiers, and perhaps 20 percent of his mounted warriors were lost in a running fight that lasted into the evening hours. He withdrew first to Coria and then to Toledo to prepare for a possible invasion of his own lands. But Yūsuf instead moved south to Seville and then returned to North Africa. He did not return to the peninsula until 1088.

ZARAGOZA, CITY OF

Founded in 24 B.C. on the site of the Iberian settlement of Salduie, this veterans' colony received the name of

Caesaraugusta and guarded a strategic bridge over the middle Ebro River. The capital of a *conventus* of the province of Tarraconensis, the city was an important center and, to judge by the remnants of its walls still standing, was strongly fortified. It was occupied by the Visigoths, and local uprisings in 496 and 506 were unsuccessful. Frankish attacks were directed against it in 541 and 621, and the city resisted forces of Froyla during his rebellion in 653. Although little is known of the Visigothic city, it appears to have been an important Christian center, and the church of Santa María la Mayor, popularly known as El Pilar, was already gaining fame.

Nevertheless, the city capitulated without resistance to the Muslim invaders in 714. Capital of a *waliate* (province) from 750 and chief city of the upper frontier, it was also the locale of numerous uprisings and civil strife, including that which led to Charlemagne's abortive attempt to seize the city in 778. It gained population and wealth under Muslim domination, profiting from its renowned textile manufacture, and became known as *Medina al-Baida*, the White City. In 1008, Zaragoza became an independent *tā'ifa* kingdom and entered an economic and intellectual golden age. Trade with Catalonia brought it wealth, and its rulers attracted poets, scientists, and scholars to their palace of the Aljafería, recently restored.

Muslim Zaragoza capitulated to Alfonso I of Aragón on 18 December 1118 after a siege of nine months and, in 1119, the Christian inhabitants were given the *fueros* of the *infanzones* of Aragón. Despite royal encouragement, the city was slow to recover from the exodus of Muslim craftsmen, scholars, and administrators. At the unexpected death of Alfonso of Aragón in 1134, Alfonso VII of Castile claimed sovereignty over the "Kingdom of Zaragoza," and the city was held by the Aragónese rulers in vassalage to Castile until 1162.

Zaragoza came to exercise many of the functions of capital of the Crown of Aragón. From 1276 onward, the kings were crowned there, with general *cortes* (parliament) in attendance. Under the union, *cortes* were

held in the city annually, and, even after this requirement was rejected by the crown, Zaragoza remained the favorite site for convening such assemblies. The importance of the city as a manufacturing and commercial center grew slowly, reaching its height in the fifteenth century. It nevertheless remained a city of middle rank, with a population of about twenty thousand and dependent upon the export of agricultural products for its wealth. It failed to acquire a university, and its secular and ecclesiastical centers attracted relatively few intellectual or artistic leaders. Although the leading city of Aragón, it never achieved an importance comparable to the urban centers of Valencia and Barcelona.

ZÉJEL See MUWASHSHAḤA

ZĪRIDS OF GRANADA, THE

The Zīrids were Berbers of the Ṣanhāja confederation in the tenth to twelfth centuries. The main branch was based at Qayrawān, but it was from the western branch, with its capital at Qalʿat Banī Hammād, that there sprang the Zīrids who intervened in the history of the Iberian Peninsula. In general, it was the policy of the ʿĀmirid *hājibs* to recruit troops from North Africa, but the historian Ibn Ḥayyān suggests that al-Manṣūr himself was unwilling to allow Zāwī (b. Zīrī) and his men to cross to al-Andalus because of Zāwī's reputation for shrewdness and cunning, and it was only under al-Manṣūr's son ʿAbd al-Malik, in 1002 or 1003, that they came. The caliphate was at this point descending rapidly into the Civil War of the Berbers (*al-fitna al-barbariyya*). In this, Zāwī backed the caliph Sulaymān (1009–1010, 1013–1016), and one explanation for the

specific Zīrid connexion with Granada is that Sulaymān allocated Granada to them for services rendered. On the other hand the *Tibyān* [see below] has it that in the unsettled conditions then prevailing, the existing inhabitants of Elvira invited the Zīrids in to help them set up a more defensible stronghold on the Alhambra hill. (Perhaps the two stories may be reconcilable.) In 1019 Zāwī was able to beat off an attempt by one of the contenders for the caliphate, ʿAbd al-Rahmān IV, to oust him from Granada, thus confirming the hold that the Zīrids had established there. But Zāwī was soon himself to return to North Africa (1020, or, according to García Gómez, 1025), leaving his nephew Ḥabūs (b. Māksan) in command. Ḥabūs styled himself only *hājib* (chief minister), and gave recognition to the caliphate of Yaḥyā (b. Hammūd) of Málaga, but with chaos all around, Ḥabūs kept his mountainous redoubt secure. The little state (*tāʾifa*) had many of the characteristics of tribal society, with much autonomy of action retained by clan chiefs, but in the circumstances of the day the formula worked well. Perhaps the most remarkable feature of this regime was the reliance it placed on Jewish administrators, in particular on Samuel (b. al-Nagrīlla) and his son, Joseph. The long reign of Ḥabūs's son Bādis (1038–1073) served further to consolidate Zīrid power, and there can be no doubt that the success of this little state was due to the administrative skills of its Jewish *wazīrs*. But the growing power of the Christians to the north to exert pressure and extract tribute (*parias*) meant that those responsible for raising the revenue (of necessity in excess of what was laid down in the Qurʾān, and thus unlawful) became deeply unpopular, and it was easy for the religious leadership to whip up anti-Jewish sentiment. In a pogrom in 1066 Joseph was killed (Samuel had died in 1055). The last of the Granadan Zīrids, ʿAbd Allah, 1073–1090, deprived of the services of this family of state servants, was ground down between the Christians, mainly the Castilians, and the rising power of the Almoravids, who became increasingly exasperated by what they saw as the ineffectual resistance that the various *tāʾifas* could offer to their infidel enemies. In 1090 ʿAbd Allah was forcibly removed from power, and shipped off to confinement in Agmāt in North Africa. It is to this circumstance that we owe a unique source of historical information. ʿAbd Allah in exile wrote his memoirs under the title of the *Kitāb al-tibyān* (Book of the Explanation), a far from straightforward account, but an invaluable one nevertheless. It brings out how the Ṣinhāja-based tribal solidarity on which Zīrid rule had at first rested disappeared in a welter of feuding and intrigue. Internal weaknesses might well have led to the collapse of the state had not the Almoravids come along first, and brought it to a sudden end.
